Comparative protein determinations in horse serum. D. VON DESHÖ. *Physiol. Inst. ungar. K. tierärztliche Hochschule, Budapest. Biochem. Z.* 200, 126-34(1928).—The micro-method of Howe for the pptn. of the serum proteins with Na_2SO_4 gives results in good agreement with the protein detns. made by the gravimetric method in the fractional salting out of the proteins with $(\text{NH}_4)_2\text{SO}_4$. The micro-method was also compared with Robertson's refractometric procedure, and while the results check so far as the total protein content is concerned, the globulin and albumin ratios are not the same by the refractometric and by the chem. method of detn. The n for horse serum globulin was 0.00169 and for albumin 0.00248, and is not the same as that given by Robertson. For total protein detn. the refractometric method is applicable with an av. error of $\pm 3\%$ if the const. 0.00199 is used.

S. MORGULIS

Gold and platinum electrodes and the acid error in the determination of p_H of yeast and blood. L. P. ROSANOV. *Physiol. Inst., Belorusskij Univ., Munich. Zhurnal exptl. Biol. Med.* 10, 141-6(1928).—Kahlbaum quinhydrone, if not recrystd., causes serious errors in the p_H detn. with yeast and blood. With yeast both Au or Pt electrodes give equally good results.

S. MORGULIS

Estimation of amino acids in urine. L. TIXIER. *Bull. sci. pharmacol.* 35, 570-1(1928).—The method is based upon the assumption that amino acids are sensitive to phenolphthalein but not to litmus.

L. W. RIGGS

The estimation of reducing substances in the blood. A. BAUDOUIN. *Bull. soc. chim. biol.* 10, 977-1049(1928).—The first part of this long paper reports a review and crit. exptl. analysis of the principal methods for detg. sugar in body fluids, which have been proposed during the past 15 years. Methods are judged on the basis of exactness, simplicity of manipulation and sensitiveness to permit the use of small quantities of body fluids. The objections to Cu reduction methods are (1) the readiness of the Cu to be reoxidized, and (2) the sensitiveness of cuprometry to slight changes in exptl. conditions, such as concn., alky. and time of boiling. The ferricyanide-permanganate and ferricyanide-iodine methods have an advantage over Cu-reduction methods in that the reagents used are "purely mineral" and the ferrocyanide produced by the reaction has no tendency to be reoxidized by the air. Very slight changes in the technic, however, may lead to an error of 50%. The Hg method of Baudouin and Lewin is described with minute detail and is preferred to the other methods. The second part of this paper is a report on the detn. of sugar in the blood. For diagnostic or prognostic purposes it is recommended to use the total blood and the mercurial method of deproteinization. The chemist engaged in research will use the method best adapted to the problem in hand.

L. W. RIGGS

Precipitation of phosphorus as strychnine phosphomolybdate. Application to microestimation of the different forms of phosphorus in the blood and of phosphorus combined with organic substances, either dry or in solution. JEAN ROCHE. *Bull. soc. chim. biol.* 10, 1061-78(1928); cf. Embden, *C. A.* 16, 267; Myrbäck, *C. A.* 20, 61.—The quant. pptn. of P as strychnine phosphomolybdate for quantities of P of the order 0.1 mg. is only to be realized in solns. less acid than 0.5 N HCl and less alk. than 2 N NaOH. The technic described allows the detn. of 0.02 to 1 mg. of combined P. The estn. of free P, total P and acid-sol. P of the blood is possible by this method, the 3 detns. requiring 1, 0.5 and 1.5 cc., resp., of blood. The error of this method is not more than 2%.

L. W. RIGGS

Relation of the mitochondria-Golgi complex to secretion. Intra-vital staining with neutral red and Sudan III. WEN-CHAO MA AND HEI-CHUN CHANG. *Peking Union Med. Coll. Chinese J. Physiol.* 2, 381-8(1928).—The staining technic is described. The use of Sudan III for staining the Golgi material is new. The mixt. of neutral red

and Sudan III promises to be as useful for Golgi as Janus green is for mitochondria. This action is dependent on the soly. of Sudan III in neutral red soln. L. W. R.

Colorimetric determination of serum proteins by means of phenol reagent. HSIEN WU AND SCHMORL M. LING. Pekin Union Med. Coll. *Chinese J. Physiol.* 2, 399-402(1928); cf. *C. A.* 22, 606.—An alk. soln. of egg albumin in 40% alc. is proposed for the standard in the colorimetric detn. of serum proteins by the authors' method. The relation between the amt. of serum protein and the color reading was detd., and by using this relation instead of Beer's law in the calcn., more accurate results are obtained.

L. W. RIGGS

Sensitive method for the detection of uranium and the localization of uranium in the body during intoxication. HERMANN EITEL. Univ. München. *Arch. exptl. Path. Pharm.* 135, 188-93(1928).—The presence of very minute amts. of U in tissues is revealed by ashing the organs and transforming the U compds. into uranyl compds. which can be detected by their fluorescence under ultra-violet illumination. After fatal U intoxication U can be found in the renal cortex. The medullary portion of the kidney and all other organs are free.

G. H. S.

Method for the perfusion of isolated surviving organs. I. A new apparatus. C JACOB. Pharmacol. Inst. Tübingen. *Arch. exptl. Path. Pharm.* 136, 203-23(1928).—A detailed description of the app., with illustrations, is given. II. **Technic.** *Ibid* 224-38.

G. H. S.

A modified Kjeldahl method for the determination of the nitrogen content of yeast. LEO M. CHRISTENSEN AND ELLIS I. FULMER. *Plant Physiology* 2, 455-60(1927).—Previous studies of N fixation by yeast (*C. A.* 20, 613) indicated that in the earlier stages of growth of yeast the N may be transformed into certain ring compds. not amenable to analysis by the usual Kjeldahl method. The following modified Kjeldahl method for the analysis of the N of yeast is now proposed:—The sample is suspended in 20-30 cc. of a soln. contg. 15% H_2O_2 by wt. to which are added 10 g. of K_2SO_4 , 0.4 g. of $CuSO_4$ crystals and 1 cc. of concd. H_2SO_4 . The mixt. is evapd. almost to dryness over a low flame. After the residue is cool it is digested according to the regular Kjeldahl method. This method gives 96-100% of the N in yeast according to the Dumas method. This method is not necessarily advantageous for all materials but the optimum concn. of peroxide may need to be detd. in each case.

WALTER THOMAS

Determination of hemoglobin by means of the silver iodide photogalvanic cell. KOICHI UCHİYAMA. *Sci. Papers Inst. Phys. Chem. Research* 8, 173-84(1928).—The concn. of hemoglobin (Hb) in human blood is easily detd. by means of the AgI cell of Imori and Takebe (*C. A.* 22, 4069). Three methods of use are given. (1) The decrease of photoelec. potential (x) due to absorption is first detd. for solns. of known Hb concn. and then the Hb concn. of an unknown soln. can be obtained by comparison. (2) There is a linear relation between c , the concn. of the soln., and x given by $c = kx$, where k is the cell const. obtained by using a standard soln. (3) By first detg. x for an unknown soln. and then substituting glass plates of known Hb equiv. until the same value of x is reached.

E. G. VANDEN BOSCHE

The chemistry of Jaffe's reaction for creatinine (GREENWALD) 10.

C—BACTERIOLOGY

C. B. MORREY

A note on the carbohydrate content of the alcohol-soluble antigen of tubercle bacilli. KATHRYN KNOWLTON AND MAX PINNER. Detroit Municipal Sanatorium, Northville, Mich. *Am. Rev. Tuberculosis* 18, 502-4(1928).—The antigenic strength of the alc sol antigen of tubercle bacilli is apparently independent of both proteins and the sp. carbohydrate which leaves but little doubt that it is of lipid nature.

H. J. CORPER

The chemical study of bacteria. XXIII. Comparative yields of water-soluble protein and carbohydrate from tubercle bacilli from various sources. TREAT B. JOHNSON AND ALICE G. RENFREW. Yale Univ., New Haven, Conn. *Am. Rev. Tuberculosis* 18, 505-12(1928).—Four specimens of tubercle bacilli from different sources have been examined for their content in the active protein no. 304 and carbohydrate, resp. While the yield of the protein is very low when autoclaved cells are used, the carbohydrate is still obtainable, but in reduced amts. Both combinations apparently undergo change by heating the cells at 100° or higher. A technic is described for sepg. both fractions from a single unit of cells, and a modified technique is given for extg. the sugar fraction alone.

H. J. CORPER

Stimulation experiments with the sucrase of *Penicillium glaucum*. II. Z. I. KÉRTÉSZ. Univ. Budapest. *Fermentforschung* 10, 36-8(1928); cf. C. A. 22, 2381-2.—The formation of sucrase by *Penicillium glaucum* is dependent upon the presence in the culture medium of a nutrient substance contg. an α -fructoside grouping. When the organism is grown for 5 days on a 5% glucose soln. contg. the necessary inorg. salts the mycelium develops normally but contains practically no sucrase. If the glucose soln. is replaced by 5% sucrose and the organism allowed to develop 2 more days an abundance of sucrase is rapidly formed. If this sucrose medium is then replaced by glucose, the sucrase content of the mycelium rapidly diminishes until on the 14th day it has fallen to less than 5% of the max. reached on the 8th day when the sucrose was removed.

A. W. DOX

Oxidation of phenanthrene by bacteria. W. O. TAUSSON. *Planta Abt. E., Z. wiss. Biol.* 5, 239-73(1928).—Three species of bacteria (*Bacillus phenanthrenicus bakien-sis*, *Bacillus phenanthrenicus guricus*, and *Bacillus phenanthrenicus*) were grown on culture media contg. various hydrocarbon derivs. to det. which ones could be utilized and what the steps were in the decompn. of phenanthrene. No appreciable amts. of naphthalene, paraffin, resorcin, phloroglucinol, pyrogallol and anthracene were utilized by the bacteria. Pyrochatecol, salicylic acid, saligenin and quinic acid were used to good advantage. These results indicate that the utilization of hydrocarbons will depend upon whether the compd. has an open or closed chain, and according to the position occupied by the OH group. The following steps are suggested for the decompn. of phenanthrene: phenanthrene \rightarrow saligenin \rightarrow *o*-hydroxybenzaldehyde \rightarrow salicylic acid \rightarrow pyrochatecol.

A. E. HITCHCOCK

Filtration experiment with tubercle bacilli. GOROKU NAKAJO. Kitasato Inst., Tokio. *Jap. Med. World* 8, 120-5(1928).—After cultural and animal expts. it is concluded that tubercle bacilli are not filterable through Chamberland's L₂ or L₃ with the strains and technic employed.

N. KOPELOFF

Constancy and variability of the properties of the diphtheria bacillus. S. BOHDANOWICZ AND A. LAWRYNOWICZ. *Med. Doswiadczalna i Spoleczna* 9, 51-76 (Polish), 76-7 (French)(1928).—The systematic study of the diphtheria bacilli leads to no sharp characterization. Most of them ferment the carbohydrates and polyatomic alcs. Levulose, galactose, glucose, mannose and maltose were fermented to the amt. of 100-86%, dextrin, starch, salicin, xylose 37.8-9.1%, glycerol and amygdalin 2.7-1.4%. Arabinose, erythritol, dulcitol, sorbitol, mannitol, inositol, lactose, saccharose, inulin, phlorhizin and arbutin were not fermented.

JAROSLAV KUČERA

The bactericidal power of tissues. BRUNO BORGH. *Boll. soc. ital. biol. sper.* 3, 545-6(1928).—Using the Saxl and Donath technic, B. failed to detect any bactericidal activity in minced organs of rabbits and guinea pigs against pneumococcus, streptococcus, staphylococcus, meningococcus, and typhosus. He, therefore, was unable to confirm Saxl and Donath's results.

PETER MASUCCI

Reactivation of culture media by means of sugars. V. CIANCI. *Boll. soc. ital. biol. sper.* 3, 644-8(1928).—Slant agar tubes were inoculated with the organism in question and incubated for 5-7 days at 37°. The tubes were then melted, sterilized and cooled. To some of the tubes was added a sugar utilized by the organism; to some of the tubes nothing was added. These acted as controls. The tubes were again inoculated with the same organism and incubated. On examn., the control tubes showed scant growth, but the sugared tubes showed luxuriant growth. The organisms used at first were *Staph. pyogenes aureus* and *B. coli*. The sugar was glucose. Similar results were obtained with *B. paratyphosus*, *B. lactis aerogenes*, *B. morgani*, and for the sugars, maltose, lactose and sucrose. *B. paratyphosus* was seeded on plain agar and lactose agar and the tubes were incubated. After growth took place, the agar was melted, sterilized and planted with *B. coli*. There was scant growth on the plain medium but luxuriant growth on the sugared medium. Other organisms and other sugars were used with identical results. This enabled C. to make a generalized statement covering the behavior of 2 organisms growing under the conditions described above.

PETER MASUCCI

Studies on the proteolytic bacteria of milk. IV. Action of proteolytic milk bacteria on amino acids and other simple nitrogenous compounds. WM. C. FRAZIER AND PHILIP RUPP. U. S. Dept. of Agr. *J. Bact.* 16, 231-45(1928); cf. C. A. 22, 4571.—Synthetic media contg. simple N compds. as a sole source of N were inoculated with 229 strains of proteolytic bacteria from milk. The growth, increase in NH₃, and change in p_H were noted. The N compds. included: Na₂(NH₄)PO₄, NH₄ succinate, urea, asparagine and the following amino acids: glycine, alanine, leucine, aspartic acid, glutamic acid, tryptophan and tyrosine. The basic medium was: K₂HPO₄ 3.1 g.; KH₂PO₄

0.8 g.; KCl, 0.2 g.; $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$, 0.2 g.; water 1000 cc. Some of the organisms which can use urea as a sole source of N cause an alk. reaction by the liberation of NH_3 , whereas others liberate no NH_3 and cause an acid reaction. Organisms which can use NH_3 as a sole source of N can apparently use any of the simpler amino acids if the medium contains fermentable sugar as a source of C. In media which contain no sugar or similar C compd., in which the amino acid must furnish both N and C, differences in utilization occur which may be useful in grouping the organisms.

JOHN T. MYERS

Some chemical studies of commercial bacteriological peptones. JAMES G. MCALPINE AND GEORGE D. BRIGHAM, Storrs Agr. Expt. Sta., Storrs, Conn. *J. Bact.* 16, 251-6(1928).—"Difco-Bacto, Difco-Proteose, Fairchild, and Witte peptones, all contained about the same amt. of total N. Witte and Difco-Proteose peptones contained the largest amts. of so-called "protein" N, which is probably proteose in nature. The non-protein N of Witte peptone was small and was equally divided between polypeptide and amino N. There was very little free NH_3 . In Difco-Proteose peptone the total N was about half non-protein. The non-protein N was about $\frac{1}{3}$ polypeptide and $\frac{2}{3}$ amino acid. Free NH_3 was negligible. Fairchild peptone contained a small quantity of protein and the non-protein fraction was about half polypeptide and half amino N. Free NH_3 was high. The total N of Difco-Bacto peptone was largely non-protein. There was little free NH_3 .

JOHN T. MYERS

Chemical constitution and germicidal activity of amines, ketones and aldehydes. F. W. TILLEY AND J. M. SCHAFER. U. S. Dept. of Agr. *J. Bact.* 16, 279-85(1928).—The phenol coeffs. of a no. of alkyl and aryl amines and alkyl ketones and aldehydes were detd. The results obtained with primary alkamines indicate that with *B. typhosus* as a test organism, the av. ratios between successive mol. coeffs. vary somewhat with different strains but the general av. was 2.0. With *Staphylococcus aureus* the general av. was 3.3. With alkyl ketones and *B. typhosus* the av. ratio between successive mol. coeffs. was 3.25. Results with aldehydes were unsatisfactory, but the ratio seems to be 2.5 or more.

THOMAS G. PHILLIPS

Some experiments on the action of aluminum on plants. YOSHIJI YOSHII. Lab. of Hans Molisch, Univ. of Vienna. *Science Repts. Tôhoku Imp. Univ.* [4], 3, 547-59 (1928).—*Aspergillus niger* withstands concns. of $\text{Al}_2(\text{SO}_4)_3$ up to 0.005 M, *Penicillium* up to 1 M. In dil. solns. the formation of conidia is hastened. *Elodea canadensis* damaged by a 0.001 M soln. while in more dil. soln. new sprouts and roots are formed. Expts. with branches of many higher plants show that a 0.002 M soln. is toxic to them, but more dil. solns. are stimulating. There are many algae in the soil which can withstand high concns. of the Al salt; thus *Chlamydomonas* grows well in a 0.25 M soln.

DAVID DAVIDSON

Importance of phytochemistry in systematic botany. R. JARETZKY. *Arch. Pharm.* 266, 602-13(1928).—The importance of phytochemistry is discussed and emphasized in systematic botany, as also the recognition of the evolution of chem. substances in detg. the phylogenetic relationship of the plants examd.

W. O. E.

Method for the estimation of the salt content from the p_H value of apple juice, and some comparative analysis of the mineral content of the juice and whole apple. DOROTHY HAYNES AND JANET W. BROWN. Imperial College of Science and Technology, London. *Biochem. J.* 22, 947-63(1928).—If the p_H and titratable acidity of the juice of acid apples are measured, it is possible to obtain a fairly reliable idea of its salt content by comparison with the acidity and p_H of mixts. of malic acid and potassium malate of known concn. The same percentage of potash was found in the expressed juice as in the whole apple. Larger percentages of magnesia and lime were found in the juice than in the whole apple.

BENJAMIN HARROW

Effect of sunlight on sap concentration of citrus leaves. F. F. HALMA AND A. R. C. HAA. *Bot. Gaz.* 86, 102-6(1928).—Increases in sap concn. due to the action of the sunlight on the leaves are due to photosynthetic products; the ash remains the same.

BENJAMIN HARROW

Chemistry of growth as represented by carbon nitrogen ratio. Regeneration of willow cuttings. PHILLIS A. HICKS. Univ. Coll. of South Wales. *Bot. Gaz.* 86, 193-200(1928).—Expts. on the regeneration of cuttings of *Salix viminalis* have been carried out with normal cuttings, and with cuttings injected with KNO_3 and various sugars.

The initiation of growth is due to stimulated respiration, giving energy for the withdrawal of N into the bast, and its consequent upward translocation, particularly to the buds. The injected sugars hasten this process. KNO_3 in excess prevents the commencement of growth.

BENJAMIN HARROW

Effect of alcohol on cells of *Nitella flexilis*. P. A. DAVIES. Univ. Louisville. *Bot. Gaz.* 86, 235-9(1928).—Twenty % (by vol.) of alc. caused the highest initial rise of CO_2 production, followed by 10, 30, 40, 60 and 95% solns., resp. The drop in the initial rises below the normal rates was most rapid in the 95% soln., followed by 60, 40, 30, 20 and 10% solns., resp. The highest initial rise is produced by a rapid penetration of the alc. without a rapid change in the cell structure, allowing a rapid outflow of CO_2 .

BENJAMIN HARROW

Free albumin crystals in the endosperm of *Loranthus Europaeus* seeds. SOROR IMELDA MAYR. *Anz. Akad. Wiss. Wien* 63, 167(1926).—Long crystals of albumin were found in the endosperm of *Loranthus Europaeus* seeds kept in alc. for a long time. These crystals are not found in fresh seeds. Conclusion: When albumin crystals are found in materials kept in alc., one should investigate whether they are formed in the cells or in the alc.

A. L. HENNE

Analytic studies in plant respiration. I. The respiration of a population of senescent ripening apples. F. F. BLACKMAN AND P. PARIJA. *Proc. Roy. Soc. (London)* B103, 412-45(1928).—Apples, stored at a temp. of 2.5° for a period of 8 months, slowly ripen, passing through the senescent stage, which lies between the adolescent and the mature stages and is characterized by a lowered organization-resistance, fundamental changes in the organization of the tissues, and hydrolysis of reserve and semi-reserve compds. more rapidly than during the mature stage. The output of CO_2 is increased during the senescent stage, and is decreased when that stage has been completed. During senescence, 2 independent and opposite processes occur: (a) the starvation drift, which tends to lower respiration, and (b) increased hydrolysis, which tends to accelerate respiration. II. The respiration of apples in nitrogen and its relation to respiration in air. P. PARIJA. Ravenshaw College, Cuttack, India. *Ibid* 446-523.—Glucolysis, which is a measure of respiration, is itself measured by the production of CO_2 . Probably the direct substrate for glucolysis or oxidation is not a normal hexose, but some specialized hexose deriv. which is subject to marked changes of concn., production, and consumption. Glucolysis proceeds more rapidly in air than in N_2 , and is accelerated by an increased O_2 concn. This acceleration is attributed to increased production of the substrate for glucolysis rather than to oxidation.

JOSEPH S. HEPBURN

Properties and reactions of a flavonol-like pigment isolated from the red leaves of *Prunus pissardi*. ST. JONESCO. *Bull. soc. bot. (France)* 74, 460-72(1927).—This pigment is similar to the flavonol, *quercetin*, and is apparently the same substance which Willstätter and Mallison (1915) obtained as a result of reducing quercetin by means of Na amalgam in the presence of HCl. The resulting red color was assumed by these 2 investigators to be due to the reducing effect of nascent H_2 . J. shows, however, that nascent H_2 , generated from Zn will not produce a red color in the presence of HCl. Likewise no red color is produced when metallic Na alone, or HCl alone is used. Both metallic Na and HCl appear to be necessary for the production of the red color. It is suggested that this coloration occurs in 2 distinct steps. The pigment mol. is first transformed by the action of metallic Na into a greatly modified form which renders it susceptible to the subsequent coloration by HCl. H_2SO_4 may be substituted for HCl, but neither HNO_3 nor CH_3COOH was able to produce a permanent red color. Chem. tests showed that this pigment was not an anthocyan, but that its alc. soln. gave the following color reactions which are characteristic for quercetin: green-olive with FeCl_3 ; deep yellow with NaOH and KOH; brownish yellow with NH_4OH ; yellow with $\text{Ba}(\text{OH})_2$; greenish yellow with Na_2CO_3 . Other reactions: it reduces ammoniacal AgNO_3 in the cold; does not reduce Fehling's soln.; amyl alc.- H_2O suspension gives no red color when heated with HCl; pptd. by H_2O and Pb acetate. The salt itself is insol. in H_2O and dil. acids; it is very sol. in dil. alk., EtOH, MeOH, acetone and Et_2O . Isolation of the pigment was accomplished as follows: after being dried and powdered the leaves were extd. with benzene and petroleum ether, the chlorophyll pigments removed, the remaining fraction was extd. with Et_2O , distd. H_2O added to the residue and filtered. The non- H_2O -sol. residue contained the pigment in question. Purification was accomplished by repeated dissolving in EtOH and pptn. by H_2O and finally adding dil. NH_4OH and pptg. by neutralizing with H_2SO_4 . The residue was washed with hot H_2O , dissolved in EtOH, evapd., H_2O added, and then filtered. When dried the pure pigment was a brilliant yellow amorphous powder.

A. E. HITCHCOCK

Importance of nitrogen and phosphorus in the growth of *Oedogonium pluviale*.

HANS FREUND. *Planta abt. E., Z. wiss. Biol.* 5, 520-48(1928).—Zoöspores and filaments of *Oedogonium pluviale* were placed in a complete nutrient soln. and in nutrient solns. lacking various combinations of ions to det. the effect upon dimentional growth relations of the cell. Opt. growth was obtained in a complete Knop's soln. (0.4%). Cell division was practically inhibited when both nitrate and phosphate were omitted. Lack of nitrate alone was more detrimental than lack of phosphate. In solns. lacking either sulfate or Mg the rate of cell division and the length and breadth of the cells were only slightly less than those which occurred in a complete Knop's soln. When both Mg and sulfate were omitted in addn. to phosphate, the relative decrease in cell division was much greater than that for a soln. lacking Mg, sulfate and nitrate. Decreased cell division was correlated with increased cell length and decreased breadth. In light, protoplasmic growth was dependent upon nutrients but the rate of growth was dependent upon light intensity. No growth occurred in the dark, even in a complete nutrient soln. It is believed that the part which nitrate plays in increasing protoplasmic vol. and decreasing cell elongation may be due to viscosity relations. A. E. HITCHCOCK

Nicotine in the metabolism of the tobacco plant. KURT MÖRDES. *Planta abt. E., Z. wiss. Biol.* 5, 563-615(1928).—Analyses were run on the leaves of Bavarian and Maryland Broadleaf tobacco in order to det. what part nicotine plays in the metabolism of the tobacco plant. Nicotine was present in increasing amts. from the youngest to the oldest leaves, but no correlation existed between rate of growth and abs. amts. of nicotine. Conditions unfavorable for growth of the plant did not prevent nicotine from being synthesized. Even when protein N reserves were being used up, nicotine synthesis continued. Decompn. of the nicotine mol. occurred only in the dying parts of old leaves. An abundance of inorg. N was the only factor which inhibited or retarded nicotine synthesis. From these results there appears to be no correlation between nicotine synthesis and protein N metabolism. With the use of silicotungstic acid according to Rasmussen's method, the error in detg. nicotine N was estd. to be less than 1%. A. E. HITCHCOCK

The proportions of potassium and sodium contained in marine algae. GABRIEL BERTRAND AND MME. M. ROSENBLATT. *Bull. soc. chim.* 43, 1133-7(1928).—See C. A. 22, 4151. E. H.

An inheritance study of the distribution of vitamin A in maize. SIGFRED M. HAUGE AND JOHN F. TROST. Purdue Univ. and Bur. of Plant Ind., U. S. Dept. of Agr. *J. Biol. Chem.* 80, 107-14(1928).—Vitamin A was transmitted exclusively with yellow endosperm through the process of crossing and segregation of Reid Yellow Dent and Johnson County White Dent corn. No measurable transfer of vitamin A to white endosperm grains selected from the F_2 segregating ears was obtained. Any genetic relationship must be one of close linkage between vitamin A and yellow endosperm kernel character in dent corn. The 3 classes possessing yellow endosperm, heterozygous F_2 , homozygous F_2 , and homozygous parent, were equally effective in preventing ophthalmia in rats. A. P. LOTHROP

Effects upon rice plants of changing the moisture content of soil. FELECIANO T. PANTALEON. Univ. of the Philippines. *Philippine Agr.* 17, 173-85(1928).—Rice plants deprived of sufficient H_2O for a period of 15 days after attaining an age of 30 to 40 days gave better yields than those continuously well supplied. Plants deprived of H_2O from 17 to 25 days survived but gave increasingly less yields of straw and grain. When deprived of H_2O for 35 days the plants died. Withholding H_2O for periods of 5 to 10 days had no effect upon the time required to attain maturity as compared with controls which were watered daily. A. L. MEHRING

The catalase reaction and the biology of pollen. G. LOPRIORE. *Ber. deut. botan. Ges.* 46, 413-23(1928).—The sex organs of plants are especially active in liberating O_2 from H_2O_2 . This reaction is more intense when these parts are mature, and may therefore be used as an indication of the degree of ripeness. In proterandrous flowers the pollen does not react at the same time as the stigma, nor does it react as vigorously; in proterogynous flowers the pollen is more active than the stigma. Pollen germinates in the presence of dil. H_2O_2 (1 part in 1000). LAWRENCE P. MILLER

Further investigations on Rasdorsky bodies. GEORG BORISSOV. Botan. Lab. Landw. Hochsch. Wladikawkas. *Ber. deut. botan. Ges.* 46, 463-80 (1928); cf. *Ibid* 42, 366; 43, 178.—Rasdorsky bodies is the name given by B. to silica contg. cystoliths found in the root endodermis of plants. The form and development of these bodies in *Andropogon argenteus* Ell., *A. halepensis* Brot., *Sorghum vulgare* Pers. var. *sudanensis*, *A. formosus* Klotzsch., and *Eulalia japonica* Trin. are described and illustrated. LAWRENCE P. MILLER

The intermicellar space in cell membranes. ALB FREY. Pflanzenphysiol. Inst.

d. E. T. H., Zürich. *Ber. deut. botan. Ges.* 46, 444-56(1928).—By a method based on the double refraction of anisotropic layers the intermicellar space of ramie fibers was measured. When air-dry or in abs. alc. this space comprises only about 1% of the membrane thickness; after swelling in H_2O this is increased to 12%. When swelling in H_2O the micellae suffer a slight desorientation from the parallel alignment in the dry state; when $ZnCl_2$ is employed this is considerably greater. Measurements made on lignified and non-lignified cells show that lignification is without influence on the anisotropy of the membrane, and must therefore be regarded as a type of swelling.

LAWRENCE P. MILLER

Germination of *Phacelia tanacetifolia* Benth. JOHANNES STEPHAN. Staatl. Botan. Garten, Dresden. *Ber. deut. botan. Ges.* 46, 499-508(1928).—The % germination of the seed of *P. tanacetifolia* when subjected to light from different portions of the spectrum of about the same intensity decreases with respect to the quality of the light in the following order: darkness, λ 460-540, λ 500-580, λ 420-500, white light, λ 600, infra-red.

LAWRENCE P. MILLER

Color change, variegation and color variation in molds. ADALBERT BLOCHWITZ. *Ber. deut. botan. Ges.* 46, 516-24(1928).—A general discussion with special reference to the effect of p_H .

LAWRENCE P. MILLER

Researches on the pigments of the plastids and on photosynthesis. III. The biology of photosynthesis. V. LYUBIMENKO. Jardin botan., Leningrad. *Rev. gen. botan.* 40, 415-47, 486-512(1928); cf. *C. A.* 22, 3906.—This is a general discussion of the subject with the presentation of much data from the work of L. and his students. Some of the conclusions are: (1) The chem. reactions of photosynthesis are intimately connected with the phys. state of the plastids and with the enzymic equipment of the protoplasm; this is why it has been impossible to obtain photosynthesis in the absence of the living organism. (2) The max. quantity of chlorophyll elaborated by the plastids of various plants is an hereditary character which is transmitted by 2 series of factors, of which only 1 is subject to the Mendelian law. (3) From the detn. of the chlorophyll content of over 600 species of plants from various latitudes, it is seen that the av. content of chlorophyll increases from the poles toward the equator the higher temp. at the equator favoring the development of species adapted to shade, which contain more chlorophyll. (4) In a given plant the quantity of chlorophyll varies with the different leaves according to the intensity of the light to which they are exposed. (5) The energy of photosynthesis is influenced by the presence of carbohydrates in the tissue, and the direct absorption of sugars by the leaves often acts as a stimulant to photosynthetic activity. It is not improbable that the plant obtains part of the energy for the beginning of photosynthetic activity from the enzymic oxidation of substances previously accumulated. (6) Photoperiodic studies from the point of view of dry wt. production show that certain plants require a longer day than others. This may be due to differences in the activity of oxidizing enzymes, plants which oxidize their carbohydrates but slowly not requiring such a long period for photosynthetic work. (7) With pure lines of a given species, differing in chlorophyll content, the greatest dry wt. per unit of chlorophyll is produced by those in which the concn. of pigment is relatively low. (8) Natural chlorophyll is not a mixt. of green and yellow pigments, as is generally believed, but a colored albuminoid giving an aq. colloidal soln. which breaks up on coagulation to the colorless protein and the pigments. (9) The accumulation of chlorophyll in the plastids is not a simple photochem. reaction, but is complicated by the transformation of albuminoid substances, in which enzymes play an important role. L. P. M.

The occurrence and detection of oxidases in wood-destroying fungi. W. BAVENDAMM. *Z. Pflanzenkrankh. Pflanzenschutz* 38, 257-76(1928).—When fungi are grown in solid culture media contg. tannin, a dark zone results if oxidizing enzymes are present. Other substances besides tannin may be used but investigation showed that tannin or gallic acid in a concn. of 0.5% gives best results. By this test oxidases are absent from fungi which attack only cellulose—*Merulius lacrymans*, *Contiophora cerebella*, *Polyporus sulfureus*, *Nectria cinnabarina* and *Nectria galligena*. LAWRENCE P. MILLER

Cotton wilt. DAVID C. NEAL. *Annals Mo. Bot. Garden* 14, 359(1927).—A botanical and nutritional study of the fungus *Fusarium vasinfectum* is described. The fungus either on potato-dextrose agar or on a synthetic nutrient soln. shows optimum growth at a temp. of 28-30°. In the synthetic nutrient soln. (Duggars') the best growth was obtained in cultures started at p_H 3.5, but becomes more acid during growth. Filtrates and exts. of mycelium possess toxic properties. Addn. of Fe or Al salts to media shows no consistent effect upon infection of cotton seedlings by fungus; results indicate that K salts reduce infection. Proper fertilization of soil and the use of wilt-resistant varieties of cotton are recommended as remedial measures.

N. M. NAYLOR

A theory of photosynthesis. KARL FREILICKER. *Biochem. Z.* 199, 12-20 (1928).—"If one thinks of the chlorophyll mol. in its spatial relations the following picture presents itself. The Mg forms the highest point of a pyramid over the 4 N atoms and is the most positively charged point. Should the 4 pyrrole nuclei be placed parallel to the axis of the pyramid, the mol. assumes a resemblance to the magnet with a point sharpened to intensify its action." Indeed, the energy absorbed by the chlorophyll in different positions is concd. at the peak, on the Mg, whereas at the strongest pos. pole the 4 OH ions, corresponding to the 4 H atoms which are added to the chlorophyll mol., become discharged. The further occurrences are the same as are possible in any electrolysis." S. M.

Seaweed from Seychelles. ANON. *Bull. Imp. Inst.* 26, 297-9(1928).—Seaweed identified as *Gracilaria Wrightii* J. Ag., var. *ceylanica* Grun., contains: H_2O 15.8, crude protein 9.4, Et_2O ext. 1.1, fiber 10.6, ash 5.8 (contg. 0.6% SiO_2 on the wt. of the seaweed), N-free ext. 57.3%. It was of good quality, comparable with the best grades of Irish moss.

A. PAPINEAU-COUTURE

Evolution of iodine in Laminaria. P. FREUNDLER. *Bull. soc. chim. biol.* 10, 1123-8(1928).—This paper is mainly a criticism of the work of Dangeard; cf. C. A. 22, 1993, 3193.

L. W. RIGGS

Glycogen as a means of ciliary reversal. G. H. PARKER. Harvard Univ. *Proc. Nat. Acad. Sci.* 14, 713-4(1928).—Small fragments of filter paper soaked in sea water when placed on the ridged lips of the sea anemone were moved outward over the lips to the bases of the innermost tentacles where they were taken up by the tentacular cilia and discharged from the disk of the animal. If, however, before the bits of paper were discharged they were picked up with the forceps, and in their wet condition were worked full of powd. glycogen, and were replaced in the exact spot from which they had been removed, they moved inward. A similar bending inward of the cilia was noted on feeding with foods rich in glycogen. Starch and glucose did not produce this reversal.

L. W. RIGGS

Assimilation problems. PAUL MAYER. Kaiser Wilhelm Inst., Berlin-Dahlem. *Z. angew. Chem.* 41, 672-4(1928).—Survey of the recent investigations concerned with the detection of intermediate substances formed by the plant in assimilating C and N. $HCHO$ is considered to be the intermediate product in the synthesis of carbohydrates, especially on account of the fact that by the so-called "dimedon process," in which 5,5-dimethylcyclohexane-1,3-dione acts as a recipient for $HCHO$, its accumulation in plant cells could be shown. As to the assimilation of N, H_2NOH is likely to be the intermediate product in nitrification as well as denitrification. The importance of this fact is emphasized that H_2NOH itself has been recently shown to be formed in the metabolism of soil bacteria cultivated on nitrates by allowing $AcMe$ to act as the recipient and identifying the formed $HON:CMc_2$ as such.

G. SCHWOCH

The effect of accumulated carbon dioxide on plant respiration. J. J. WILLAMAN AND J. H. BRAUMONT. Univ. of Minnesota. *Plant Physiology* 3, 45-59(1928).—In former investigations on winter hardiness in apple trees, the authors used the continuous aspiration method (*Proc. Am. Soc. Hort. Sci.* 1924, 99-104); but, because of certain mechanical difficulties in this method over long periods, the discontinuance method of allowing the CO_2 to accumulate in the chamber until the end of the period was resorted to. The app. previously described (C. A. 22, 4583) was used. Respiration data are given for one year old apple twigs at 0° , small potato tubers at 22° , and wheat grain at 40° . It was found that when the CO_2 is allowed to accumulate, the rate of production of the CO_2 diminishes in a logarithmic ratio and with apple twigs the amt. of CO_2 produced is proportional to the logarithm of the time and is expressed, after the first 30 or 40 min., by the formula $CO_2/\log t - 0.566 = k$. When accumulated CO_2 is removed, the rate of its production immediately becomes much greater, the increase being proportional to the amt. of CO_2 previously accumulated. It is a matter of several hrs. before the rate attains a const. value. The results are in agreement with the conclusions of Spoehr and McGee (*Carnegie Inst. Washington Year Book* 22, 51-66 (1923)). The explanation of these results favored by the authors is that the accumulation of CO_2 in the tissues increases the H-ion concn. in the latter, which, by bringing the proteins of the protoplasm nearer their isoelec. points, increases the permeability of the protoplasm, resulting in an actual increase of the rate of CO_2 production. The necessity of taking cognizance in all plant respiration studies of the history of the material during the period immediately preceding respiration measurements is pointed out. W. T.

Changes in the buffer system of the wheat plant during its development. ANNIE M. HURD-KARRER. Bur. of Plant Ind., Washington, D. C. *Plant Physiology* 3, 131-53(1928); cf. *C. A.* 20, 2542; 17, 2127.—The expts. were conducted on White Odessa, a common winter wheat, and Jenkin, a spring club wheat; necessary different environmental conditions were secured by growing the plants in different greenhouses at different times of the year. At predetd. intervals some of the plants were cut and 10 cc. of the undiluted expressed juice titrated electrometrically as rapidly as possible (*C. A.* 17, 2127). The p. ds. measured after the addn. of each successive cc. of alkali or acid to the juice were translated into p_H values and plotted against the quantities of alkali or acid producing them. The "blank" corrections (*C. A.* 14, 751) were small enough to be ignored. It was found that the electrometric titration curves change progressively during the seedling stage and during the maturation period, although only minor changes, correlated with environmental factors, occur during the tillering stage and most of the shooting stage. Differences in the form of the titration curve for juice of seedlings in successive stages of development indicate differences in compn. assocd. with increasing photosynthetic activity. The end of this period of change in the curve indicates the end of the seedling stage. The progressive increase in buffer capacity during the maturation period is due to increasing concn. of the juice. The sp. gr. increases regularly during this period, and is closely correlated with the corresponding "titratable acid" values. The initiation of these changes marks the beginning of the maturation period. Heat-coagulable proteins play a very small part in the buffer system of the wheat plant. The buffers remaining in boiled and filtered juice are sol. in either hot or cold 75% alc., but practically insol. in cold 95% alc. W. T.

Further evidence of the essential nature of zinc for the growth of higher green plants. ANNA L. SOMMER. Univ. of Minn. *Plant Physiology* 3, 217-21(1928).—It has previously been shown that Zn as well as B is essential for the growth of barley and sunflowers (*C. A.* 21, 3700). Plants of 2 other families, viz., the Polygonaceae, represented by buckwheat, and the Leguminosae, represented by Windsor beans (*Vicia faba*) and red kidney beans, were studied by the technic previously reported (*C. A.* 21, 3700). All salts were especially purified. The plants were grown in Pyrex containers. Precautions were taken to prevent contamination by dust. The solns. had the following compn.: KNO_3 0.80 g., KH_2PO_4 0.15 g., $MgSO_4 \cdot 7H_2O$ 0.50 g., $CaSO_4$ (satd. soln.) 500 cc., B (as H_3BO_3) 0.0005 g., Mn (as $MnSO_4$) 0.0015 g., Al (as $Al_2(SO_4)_3$) 0.0005 g., NaCl 0.0127 g., Cu (as $CuSO_4$) 0.000125 g., I (as KI) 0.00025 g., F (as KF) 0.00025 g. Iron as $FeSO_4$ was added when needed. An excess of silicon as SiO_2 was added to the solns. The control cultures received in addn. 0.0005 g. per l. of Zn as $ZnSO_4$. Buckwheat plants without Zn grew more slowly than those receiving Zn even during the early stage of development, but none died before reaching the flowering stage. With Windsor beans there was no visible difference between the plants grown with and without Zn until the flowering stage was reached. At this stage there was a rapid abscission of leaves and most of the flower buds fell off. The av. dry wt. at maturity of the Windsor bean plants was (1) without zinc 13.3 g.; (2) with zinc 27 g. The Windsor bean plants receiving addns. of Zn grew well, bloomed freely and produced seeds. The results with red kidney beans were similar to those with the Windsor beans. The paper is illustrated with 2 plates.

WALTER THOMAS

Mineral constituents of Spanish moss and ball moss. EDGAR T. WHERRY AND RUTH G. CAPEN. *Ecology* 9, 501-4(1928); cf. W. and Buchanan, *C. A.* 20, 3179. Two new analyses of Spanish moss and 3 of ball moss are presented. The compn. of material supported by wires proved to be closely similar to that of the same plant supported by nearby trees. Ball moss from an arid region in Texas had 3 times as much ash as that from humid Florida. Contrary to the view of Schorger (*C. A.* 21, 1551) the presence of dust could not be demonstrated, and the results are believed to indicate the marked ability of these plants to ext. inorg. matter from rain water. E. T. W.

The coloring matter of cottonseed hulls (GILL, GREENUP) 27.

E—NUTRITION

PHILIP B. HAWK

Metabolism and vitamin A. C. M. MCCAY AND V. E. NELSON. Iowa State Coll. *J. Metabolic Research* 7-8, 199-204(1925-6). There were no appreciable differences in the vol., sp. gr., acidity, or N partition in the urine of rats fed on complete diets from those of rats fed on a vitamin-A-deficient diet. Albumin was found as a normal constituent in the urine of the rat, its amt. varying directly with the protein intake. H. J. D., Jr.

The chemical and nutritive properties of the grain sorghums. V. G. HELLER AND

ROBERT GREEN. Okla. Agr. Coll. *J. Metabolic Research* 7-8, 205-15(1925-6).—The nutritive value of 20 various sorghums (kafir, milo, shalu, feterita, kaoliang, hegari, yolo, and maize) was found to be comparable to that of corn as detd. by expts. on rats. "The vitamin content was sufficient for all practical purposes but the vitamin A, although sufficient for growth and reproduction, was insufficient for continued rearing of the young." The protein is deficient in some of the essential amino acids which makes it necessary to supplement it with a source of the missing amino acids. H. J. D., Jr.

Feeding of protein to partially nephrectomized animals. HARRY LUNDIN AND ROBERT MARK. Physiatrie Inst., Morristown, N. J. *J. Metabolic Research* 7-8, 221-57 (1925-6).—When about 75% of the total kidney parenchyma was removed in 3 dogs and 80 to 90% in a goat there was a decrease in the N-concg. mechanism but none of the other functions was disturbed. With a removal of greater than 75% of the total kidney tissue, there was in addn. to the impairment in the N-concg. power, a loss in ability to vary the p_H of the urine and a disturbance in the excretion of PO_4 and Cl as well as org. acids. Acidosis occurred and there was a gradual accumulation of urea in the blood; albuminuria and hematuria were present; the blood pressure rose and the animals died in uremia. When a high-protein diet was administered to the animals in which 25% of the kidney tissue remained intact, no further impairment of the kidney functions occurred. The blood urea rose as did the blood pressure, N and H_2O were retained in the tissues but no visible edema occurred. On changing the animals to a low-protein diet, these factors returned to normal. The pulmonary excretion of H_2O was increased in order to counteract the large retention of H_2O when N was stored in the tissues. Administered H_2O was more slowly excreted by the partially nephrectomized animals than by the normal. On the change from a low- to a high-protein diet, there was a preferential retention of S in comparison with that of N, while when the reverse occurred, S was excreted at first more rapidly than N. The Cl excretion was decreased in high-protein feeding. After a high-meat feeding there was a greatly increased excretion of PO_4 , SO_4 and org. acids but a decrease in Cl. The excretion of fixed base was kept low by the high NH_3 excretion and by the excretion of a urine of high acidity. Creatinuria did not occur in the adult dog when fed on a creatine-free diet although it occurred after the high-meat feeding. The creatinine excretion likewise increased in this period as did that of uric acid and amino acids. The blood pressure was increased after removal of 75% of the kidney but returned to normal with the hypertrophy of the kidney remnant. It again rose on high-protein feeding but returned to normal on resumption of the low-protein régime. The removal of 50% of one kidney caused a doubling of the size of the other kidney without being hypertrophied itself.

H. J. DEUEL, JR.

The relationship of bile acids to alimentary cholesterol. K. LOEFFLER. Univ. Freiburg. *Z. physiol. Chem.* 178, 186-91(1928).—From the fact that bile acids are the most potent cholagoges known, it might be expected that these substances would accelerate not only the absorption but also the elimination of cholesterol with the bile. If, however, the absorption but not the simultaneous elimination is accelerated there would be an accumulation in the liver and perhaps also in the entire organism. Cholesterol alone, cholesterol + desoxycholic acid, and cholesterol + cholic acid were fed to mice in daily doses of 20-50 mg. over periods of 84, 74 and 46 days, resp. The diet was well tolerated and no symptoms of sickness appeared. The animals receiving the bile acids developed greatly enlarged gall bladders. Detns. of cholesterol in the liver showed a fairly regular increase throughout the feeding periods. With cholesterol alone the value increased from 0.52 to 2.53 mg. in 80 days, with cholesterol + desoxycholic acid it rose from 0.58 to 3.74 in 74 days, while with cholesterol + cholic acid the increase was from 0.67 to 9.13 mg. in 46 days. It is thus demonstrated that a greater storage in the liver occurs when bile acids are fed along with the cholesterol. It is noteworthy that cholic acid has a greater effect than desoxycholic acid, despite the fact that it forms no addn. product with cholesterol. Whether this difference is due to greater absorption in the 1st instance or to different rates of elimination of the cholesterol remains to be detd.

A. W. DOX

Calcium metabolism with mineral-poor and vitamin-rich diets. HEINRICH ZIMMER. Univ. Berlin. *Z. ges. exper. Med.* 58, 362-9(1928).—Quant. diets rich in vitamins and with known mineral content were fed to dogs and the Ca balance was detd. In both dogs during the 7 and 6 weeks, resp., they were on the Ca-poor and vitamin-rich diets. There was a neg. Ca balance of about 0.47 and 0.18 g. weekly. No relationship was found between the loss of Ca and the C:N ratio.

F. L. DUNN

Note on the effect of ingesting large amounts of pineapple juice upon the p_H of the urine. CAREY D. MILLER. U. of Hawaii. *J. Home Econ.* 20, 498-501

(1928).—The discomfort experienced by new arrivals to Hawaii caused by ingesting large quantities of pineapple juice is not due to acidosis inasmuch as drinking a large amt. of juice by 4 women subjects resulted in an increase in the p_H of the urine, decreased the titratable acid and NH_3 output. A plausible explanation is offered in the presence of the large amt. of CaC_2O_4 crystals in pineapple juice. L. D. ELLIOTT

The adequacy of some New Zealand dietaries. LILLIAN B. STORMS AND E. NEIGE TODHUNTER. U. of Otago, N. Z. *J. Home Econ.* 20, 817-24(1928).—A study of the food consumed by 12 families for 1 week showed that all diets but 1 met Atwater's energy requirements for the resp. occupations. Protein furnished more than 10% of the total calories. The low amt. of Ca, P and Fe together with the high proportion of sugar and fats found in these diets may have a bearing on the poor teeth and high incidence of dental caries existing in New Zealand. L. D. ELLIOTT

Vital economy in human food production. J. R. MURLIN. Univ. of Rochester, N. Y. *J. Nutrition* 1, 91-104(1928).—A review of nutrition investigations particularly with reference to the Penna. Inst. of Animal Nutrition and the work of Armsby.

C. R. F.

Old and new problems of practical nutritional physiology. A. SCHEUNERT. Leipzig. *Z. angew. Chem.* 41, 780-4(1928).—A review of problems and research on nutrition and diet. It requires 600 g. of white or 900 g. of whole rye bread daily to supply sufficient vitamin B for a man. Rye bread lacks vitamins A, C and D and is deficient in minerals. The deficiency is not apparent in a proper mixed diet. C. R. F.

Vitamins. WILHELM STEPP. *Z. angew. Chem.* 41, 788-92(1928); cf. C. A. 21, 761.—A review. No original data are presented. C. R. F.

The effect of sterilization upon the antiscorbutic vitamin. E. REMY. Hyg. Inst., Univ. Freiburg. *Z. Untersuch. Lebensm.* 55, 385-93(1928).—Cauliflower, green beans, spinach, green peas and carrots were cooked in slightly salt water and then put into glass jars and sterilized for 60 min. at 98°. Tomatoes were washed, cut, covered with weak NaCl soln. and cooked 20 min. at 80°. Fifty g. of vitamin C-free basal ration and 70 g. of sterilized food material was fed as daily ration to guinea pigs to det. vitamin C content. Cauliflower, green beans and carrots did not contain enough vitamin after cooking to prevent scurvy. Cooked tomatoes and spinach contained sufficient vitamin to protect the animals. The Bezssonov test of a blue color following the addn. of a phosphomolybdic tungstic acid, $17WO_3(MoO_3)(P_2O_5)25H_2O$, was not as reliable as animal expts. for the estn. of vitamin C. A table of the chem. compn. of the vegetables used in the expts. is given. C. R. FELLERS

The vitamin A content of the liver (particularly that of man). E. LAQUEUR, L. K. WOLFF AND E. DINGEMANSE. Univ. Amsterdam. *Deut. med. Wochschr.* 54, 1495-7(1928).—The vitamin A content of livers was detd. by the $SbCl_3$ reaction of Rosenheim with Lovibond's logarithmic colorimeter. Cod-liver oils varied in their vitamin contents. Hog livers contained less than cattle livers and varied with the season. Human livers obtained at autopsy varied greatly in their vitamin content. ARTHUR GROLLMAN

The availability of disulfide acids as supplementing agents in diets deficient in cystine. II. α -Dihydroxy- β -dithiodipropionic acid. BEULAH D. WESTERMAN AND WM. C. ROSE. Univ. of Ill. *J. Biol. Chem.* 79, 413-21(1928).—Synthetic α -dihydroxy- β -dithiodipropionic acid was incapable of replacing cystine in the diet of rats for purposes of growth. ARTHUR GROLLMAN

Vitamin A deficiency and calcification of the epithelium of the kidney. E. C. VAN LEERSUM. Netherlands Inst. of Nutrition, Amsterdam. *J. Biol. Chem.* 79, 461-4(1928).—The kidneys of rats maintained on a diet deficient in vitamin A showed calcification of the tubular epithelium. Photomicrographs are appended. A. G.

The concentration of vitamin B. IV. The concentration and the separation of the two components of vitamin B. P. A. LEVENE. Rockefeller Inst. *J. Biol. Chem.* 79, 465-70(1928).—Vitamin B, concd. by the method of Levene and van der Hoeven (C. A. 20, 936), was further concd. and sep'd. into its components by means of silica gel. This substance adsorbs the heat-unstable fraction preferentially. In this way a fraction contg. both factors (in the ratio of 1:30) in high concn. was obtained. Daily doses of 2.2 mg. of this material maintained normal growth in rats while 0.07 mg. contained an effective daily dose of the heat-unstable component. HNO_3 destroys the activity of the heat-stable factor. After deaminization, extn. with silica gave a product contg. only the heat-unstable factor. ARTHUR GROLLMAN

Some biochemical relations of phenols. II. The effect of hydroquinone on the vitamin A content of stored oils. RALPH C. HUSTON, HOWARD D. LIGHTBODY AND CHARLES D. BALL, JR. Mich. State College. *J. Biol. Chem.* 79, 507-18(1928).—Feeding expts. on rats indicated a definite *antioxygenic* effect of hydroquinone on vitamin

A of milk fat and of cod-liver oil. There was a correlation between the preservative activity of hydroquinone on vitamin A and its protection of milk fat from decompn.

ARTHUR GROLLMAN

Further evidence of the complex nature of vitamin B. I. Evidence that a third factor exists. CHARLES H. HUNT. Ohio Agr. Expt. Station, Wooster. *J. Biol. Chem.* 79, 723-31(1928).—Vitamin B from yeast was sepd. into (1) the antineuritic, vitamin F, (2) the antipellagic, vitamin G and (3) a fraction left in the yeast residue. All 3 components are essential to growth in rats.

ARTHUR GROLLMAN

The relative antineuritic and antipellagic potency of cow milk. CHARLES H. HUNT AND W. E. KRAUSS. Ohio Agr. Expt. Station, Wooster. *J. Biol. Chem.* 79, 733-8(1928).—Milk from cows under winter feeding conditions was potent in the antipellagic vitamin and relatively poor in the antineuritic vitamin.

A. G.

The importance of bananas in the diet. WALTER H. EDDY AND MINERVA KELVAGG. Columbia Univ. *Wiener med. Wochschr.* 78, 1148-50(1928).—A review of past work on the food value of the banana.

ARTHUR GROLLMAN

Examination of irradiated zymosterol for the presence of vitamin D. ELEANOR M. HUME, HANNAH H. SMITH AND IDA SMEDLEY-MACLEAN. Lister Inst., London. *Biochem. J.* 22, 980-6(1928).—Zymosterol, a sterol obtained from yeast (cf. *C. A.* 22, 1985), is not activated by ultra-violet irradiation.

BENJAMIN HARROW

Absorption spectrum of vitamin A. RICHARD A. MORTON AND ISIDOR M. HEILBRON. Liverpool Univ. *Biochem. J.* 22, 988-96(1928).—Vitamin A gives an absorption band with a max. at 328 μ .

B. H.

Studies on color tests for sterols and for vitamin A. II. A spectroscopic study of the coloration attributed to vitamin A. FRANK WOKES. Univ. Liverpool. *Biochem. J.* 22, 997-1006(1928).—The color produced with AsCl_3 gave bands at about 587 and 475 μ , and that with SbCl_3 gave bands at about 614 and 530 μ . A "second" band is observed on standing, corresponding with the change from a blue to a red color.

BENJAMIN HARROW

The assay of vitamin A. KATHARINE HOPE COWARD AND KATHLEEN MARY KEY. *Biochem. J.* 22, 1019-25(1928).—The test is to keep the animal steady in weight on the deficiency factor and then to det. the resumption of growth, the dose being graded and "without premature slackening."

BENJAMIN HARROW

Vitamin A formation. The feeding of etiolated wheat shoots to rats in darkness. THOMAS MOORE. Nutritional Lab., Cambridge. *Biochem. J.* 22, 1097-1101(1928).—Etiolated wheat shoots are effective as a source of vitamin A. Light, therefore, is not essential.

BENJAMIN HARROW

Color reactions of substances containing vitamin D. WILFRED A. SEXTON. Liverpool Univ. *Biochem. J.* 22, 1133-4(1928).—Shear's claim (*C. A.* 21, 3932) that vitamin D may be recognized by the red color produced when the substance is boiled with aniline hydrochloride in excess of aniline is disputed.

BENJAMIN HARROW

Action of x-radiation upon vitamin D in activated ergosterol. ROBERT R. MORRISON, PHILIP R. PEACOCK AND SAMSON WRIGHT. Middlesex Hospital, London. *Biochem. J.* 22, 1138-41(1928).—0.0002 mg. of activated ergosterol will partially protect against, and cure, exptl. rickets. X-rays exert a destructive effect on vitamin D.

B. H.

Experimental findings in nutrition studies and their relation to clinical practice. JOHN A. MARSHALL. Univ. California. *Dental Cosmos* 70, 1080-4(1928).—An address with bibliography. Dietary deficiencies during the period of tooth formation, from the lower deciduous central incisor to the upper third molar, are very important predisposing causes, but probably are not exciting causes of dental diseases.

J. S. H.

The soy bean and its utilization in the organism. Metabolic investigations upon human subjects. R. O. NEUMANN. *Arch. Hyg.* 99, 1-51(1928).—Analysis of soy beans showed an av. compn. of water 10.93, protein 33.58, fat 17.06, carbohydrate 28.76, roughage 4.85 and ash 4.81%. If the oil is removed (this can be removed to 41%) the protein content increases to 48.50%. Soy-bean flour contains in addn. 1.5% lecithin, and vitamins A and B. The addn. of 10% soy-bean flour to wheat flour raises the protein content from 6 to 8%. The max. which may be added is about 20%; above this the bread is dry and crumbly. The taste does not differ materially from that of ordinary bread, and there is no unpleasant sensation in the stomach. Upon a diet of bread made of soy-bean flour (to 20%), added to a mixed rye-wheat flour, when nothing else was taken except water, the N balance was found to be well preserved; but after seven diet periods of 4 days each there was a slight minus balance and a loss of 1.6 kg. of body wt. The total and dry wt. of the feces was much higher with the addition of soy bean than when the diet consisted of rye-wheat bread alone. The N content of the feces was higher, but this was due to the ingestion of more N. Very

little carbohydrate was found in the feces; but of the ash contained in the diet from $\frac{1}{3}$ to $\frac{1}{4}$ was lost in the feces. In comparison with the rye-wheat bread the soy-bean bread was less well utilized. The av. differences on dry wt. basis were 6.79-20.69%; N, 2.19-3.98%; carbohydrate, 10.40%; ash, 16.31%; calories, 3.52-19.44%.

P. Y. JACKSON

Studies on the mechanism of the specific dynamic action of proteins. HELMUTH REINWEIN. *Deut. Arch. klin. Med.* 160, 268-99(1928).— NH_3 , NH_4 salts and amines cause no increase in the O consumption of surviving liver tissue beyond that caused by the OH ions. The effect is observed with amino acids only when NH_3 is liberated; in high concns. all amino acids exert a neg. action. Expts. with alanine, asparagine and perhaps glutaminic acid show that increased O consumption in the tissue may be accompanied by a decreased consumption of carbohydrate, suggesting the synthesis of sugar from the amino acid residue; but ketogenic amino acids exert a sp. dynamic action upon an entire organism. Histidine caused no increase in O consumption in surviving tissue, although it was largely broken down, yielding NH_3 . Histidine has, however, a noticeable sp. dynamic effect when fed to a dog; apparently this acid is not utilized directly by the liver tissue, or else other factors are concerned in the sp. dynamic effect.

P. Y. JACKSON

Preventing live-stock losses with iodine. GEORGE B. ROTHWELL. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 510, 540-1(1928).—The value of I in the growth, health and nutrition of live-stock is discussed.

K. D. JACOB

The concentrated water-soluble fraction of milk as a source of vitamin B. G. C. SUPPLEE, ODESSA D. DOW AND G. E. FLANIGAN. *J. Dairy Sci.* 11, 420-5(1928).—Numerous feeding expts. were conducted in parallel with variable quantities of dry yeast. The following basal ration was fed: casein purified by AcOH , 18 parts; salt mixt. no. 40, 4 parts; powd. agar agar, 2 parts; butter fat, 5 parts; dextrin, 71%. Several charts, showing growth curves plotted, are given. The evidence is fairly consistent in indicating a vitamin B content of the milk concentrate substantially equiv. to that of dried yeast.

J. C. JURKENS

The influence of vitamin-rich foods on the body weight in old age. ADOLF BICKEL. Berlin Univ. *Arch. Verdauungs-Krankh.* 43, 70-81(1928).—The addn. of vitamin effects increase in body wt. within certain limits.

FRANCES KRASNOW

The nutritional value of the whole potato. STANISLAW K. KON AND ANIELA KLEIN. *Med. Doswiadczalna i Spoleczna* 9, 92-9(Polish), 100(English)(1928).—In a nutritional expt. an adult man and woman lived over a period of 167 days in nitrogen equil. on a diet in which N was practically derived from the potato; the av. daily nitrogen intake was 5.7 and 3.8 g., resp.

JAROSLAV KUČERA

The hypercholesterolemia of fasting as influenced by the separate administration of fats, carbohydrates and proteins. RICHARD E. SHOPE. Rockefeller Inst., Princeton, N. J. *J. Biol. Chem.* 80, 133-40(1928).—A decrease in hypercholesterolemia similar to that observed following feeding with a mixed diet is produced in a fasting animal by the sep. administration of either fat, carbohydrate or protein. No significant increase in blood cholesterol results from a diet of fat alone for 48 hrs. This exptl. evidence adds no weight to the assumption so often made that cholesterol has a function in fat metabolism.

A. P. LOTHROP

Feeding experiments with a diet low in tyrosine. HOWARD D. LIGHTBODY AND MARJORIE B. KENYON. Mich. State Coll. *J. Biol. Chem.* 80, 149-53(1928).—Rats were fed for 12 weeks on diets that differed only in their tyrosine content. The N of the exptl. diets was supplied by gelatin which had been digested with pancreatin and by acid-hydrolyzed human hair supplemented by amino acids. The diets contained 39.7 mg. of tyrosine per 100 g. of food; to one was added an extra 0.2% of tyrosine. Under the exptl. conditions employed the growth of the rats was independent of the tyrosine content of the food.

A. P. LOTHROP

The nutritive properties of gelatin. RICHARD W. JACKSON, BEATRICE E. SOMMER AND WILLIAM C. ROSE. Univ. of Ill. *J. Biol. Chem.* 80, 167-86(1928).—Diets contg 15-55% of gelatin as the sole protein are not suitable sources of N even when supplemented with the amino acids known to be missing or present in relatively small amts. About half the rats placed upon a 35% gelatin diet, to which had been added appropriate quantities of cystine, tyrosine and tryptophan, successfully weathered the change and, after periods of more or less profound "adjustment," maintained body wt. or even grew at varying rates. The diet was not rendered more satisfactory for growth when 15% of gelatin was supplemented by the addn. of the 11 amino acids which seem to be the most likely sources of deficiency. Valine and isoleucine which are absent from gelatin are not limiting factors in the nutritive properties of this protein. Increased pro-

portions of phenylalanine, aspartic acid, glutamic acid and histidine in the supplemented 15% gelatin ration had no beneficial effect. Attempts to improve the quality of gelatin are complicated by what appears to be a deleterious action exerted by the protein when fed at a 35% level, which is shown by the early fatal outcome of many of the expts. and the frequent incidence of severe renal injury. A temporary inhibition of growth of rats upon casein diets can be brought about by substituting gelatin for 35% of the carbohydrate. The peculiar inadequacies of gelatin for growth are not due to the presence in the mol. of linkages which cannot be severed by the digestive processes as hydrolyzed gelatin supplemented with amino acids did not support growth any more successfully than unhydrolyzed gelatin.

A. P. LOTHROP

Synthesis of vitamin B in the rumen of the cow. S. I. BECHDEL, HANNAH E. HONEYWELL, R. ADAMS DUTCHER AND M. H. KNUTSEN. Penn. State Coll. *J. Biol. Chem.* 80, 231-8(1928). See *C. A.* 22, 3914.

A. P. LOTHROP

The availability of ergothioneine in supplementing rations deficient in histidine. BLYTHE A. EAGLES AND GERALD J. COX. Yale Univ. and Univ. of Ill. *J. Biol. Chem.* 80, 249-54(1928). -No evidence was found to indicate that ergothioneine (2-thiolhistidine) can be converted into histidine by the young rat or can diminish the histidine requirement of the growing animal.

A. P. LOTHROP

Dietary requirements for fertility and lactation. XIX. Does copper supplement vitamin B for lactation? BARNETT SURE. Univ. of Ark. *J. Biol. Chem.* 80, 289-95 (1928). cf. *C. A.* 22, 4584. -Expts. were conducted to det. whether Cu might be a limiting factor in synthetic rations used in studying vitamin B requirements for lactation. Addnl. increments of growth could not be secured by Cu administration in dosages which Hart and coworkers found effectual in the synthesis of hemoglobin and also for growth in rats that have become anemic on an exclusively whole milk diet. Increased dosage of vitamin concentrate, on the other hand, never failed to produce a response in the growth of nursing young within 24 hrs. XX. **A differentiation of the vitamin B complex in rice polishings as evidenced in studies of lactation.** *Ibid* 297-307. Rice polishings contain in addn. to large amts. of the thermolabile antiberiberi vitamin an appreciable amt. of the thermostable, antipellagra vitamin for growth. From the standpoint of lactation the polishings are abundant in the former vitamin but deficient in the latter. The lactating animal is inefficient in secreting both the stable and labile factors in the milk.

A. P. LOTHROP

The metabolism of fats. III. PIERA LOCATELLI. *Arch. sci. biol.* (Italy) 12, 40, 11(1928). -Neutral homogenized emulsions of beef fat (8%) were injected into the circulation of dogs. The animals were killed 1/2 hr. later and the liver, lungs, spleen and kidneys were fixed in formalin and stained by Daddi's method. No histological changes indicating the accumulation of fat in the organs, in the parenchyma or in the capillaries of the organs were noted. Neutral and alk. soaps of beef fat and cholesterol dissolved in bile were also injected intravenously. Each organ reacted differently; the animals which received alk. soaps showed deposits of fat in the "capillarihülsen" of the spleen.

PETER MASUCCI

Activation of the antirachitic factors in dry yeast. W. KIRSCH. Univ. Königsberg. *Biochem. Z.* 196, 294-300(1928). -Dry yeast irradiated with ultra-violet rays has potent antirachitic effects and is also effective in curing rickets. These properties were greatly diminished in the prepn. which was preserved for 7 months. Rats which have been directly radiated 1 mm. daily without receiving dry yeast were prevented from developing rickets but their growth was hindered as compared to that of irradiated control rats. Direct radiation of dry yeast for 1 hr. had no influence in reducing its growth promoting action.

S. MORGULIS

Studies on fat and lipid metabolism. VIII. The fat catabolism in the animal organism under excessive fat feeding. S. LETTES. Inst. of Medicine, Kharkov. *Biochem. Z.* 197, 357-62(1928); cf. *C. A.* 22, 1797. -Overfeeding with oleic acid causes a rise in the acetone bodies in the arterial blood and in the blood of the right ventricle of the dog. If olive oil or olive oil together with cholesterol is fed there is a rise in the acetone bodies of the blood of the right ventricle and of the femoral vein. In the latter the rise is accompanied by a loss in neutral fat. Overfeeding with fat leads to a formation of acetone bodies in the liver, lung and in the periphery. The retention of neutral fat in the lungs in normal dogs is not accompanied by a formation of acetone bodies which are formed apparently only from the free higher fatty acids. The anti-ketogenic effect of glucose manifests itself in the liver and in the periphery but not in the lung. The administration of glucose + oleic acid causes a much stronger hypercholesterolemia than oleic acid alone.

S. MORGULIS

Overnutrition and the blood-sugar content. CARL SCHWARZ AND JOSEPH SMUTNEY.

Tierärztliche Hochschule, Wien. *Biochem. Z.* 198, 243-9(1928).—The fasting blood-sugar concn. can be increased within narrow limits by continued overfeeding. But even after increasing the nutrition 200% over the normal requirement the sugar level did not exceed 0.120%, which must, therefore, be considered as the highest concn. for the normal dog.

S. MORGULIS

The effect of hypophysis preparations on the phosphorous and calcium metabolism. A contribution to the method of investigation of mineral metabolism. FUSAKICHI NAKAZAWA. Univ. Wien. *Biochem. Z.* 198, 350-61(1928).—In dogs on a diet consisting of sugar, starch, bacon and salt, which is practically free from N, Ca and P, there was a regular excretion of P and Ca (through the urine and feces) which per kg. wt. and 24 hrs. varied from 14 to 26 mg. P. and from 2 to 6 mg. Ca. The P excretion was invariably several times as large as the excretion of Ca. This observation is opposed to the general assumption of a destruction of bone tissue under the influence of fasting, or of P and Ca starvation. It is much more probable that the excreted Ca and P are derived from destroyed soft tissue. No effect was noted on either the Ca or P excretion through the injection of anterior or posterior hypophysis extract.

S. M.

The biochemistry of avitaminosis. VIII. Effect of avitaminosis of normal and thyroidectomized rabbits on the nitrogen creatinine and creatine excretion and on blood sugar. ALEXANDER PALLADIN, A. UTEVKII AND D. FERDMANN. Ukrainisches Biochem. Inst., Charkow. *Biochem. Z.* 198, 402-19(1928).—Avitaminosis develops as usual in thyroidectomized rabbits on a vitamin-free diet, and the survival of these animals is on the av. the same as in non-operated. In the thyroidectomized animals the excretion of N in the urine is generally less than in non-operated, and creatine, which in the latter appears $1\frac{1}{2}$ -2 weeks before death, does not appear until about 2-3 days before death. The blood-sugar curve, with the characteristic initial hyperglucemia and subsequent hypoglucemia, is the same in operated and non-operated avitaminosis animals.

S. MORGULIS

Studies on the growth-promoting influence of various inorganic iron compounds and of the accumulation of iron in the body on feeding the active magnetic ferric oxide "siderac." A. BICKEL. Univ. Berlin. *Biochem. Z.* 199, 60-8(1928).—Feeding Baudisch's ferric oxide had a marked effect in improving the growth of otherwise well-fed rats and permitted a considerable enrichment of the organism with Fe which was not accomplished with another Fe compd., also prepd. from magnetite and chemically practically undistinguishable from the former.

S. MORGULIS

The relation between the carbon and oxygen urinary coefficients in rabbits fed calcium. E. GOLDSCHMIDT. Univ. Berlin. *Biochem. Z.* 199, 207-11(1928).—The exptl. results of the study of C/N and O/N ratios in urine lead to the conclusion that during the period of Ca feeding there was an increased oxidation of C and a diminished oxidation of H; also an increase in the excretion of C-, N- and O-poor and of H- and also possibly S-rich compds.

S. MORGULIS

The position of the carbon and oxygen urinary coefficient in rabbits following peroral glucose feeding. THEODORE TASLAKOWA. Forschungsinst. Hygiene and Immunitätslehre, Berlin-Dahlem. *Biochem. Z.* 199, 212-5(1928).—No regularity was found in the variation of the urinary C/N and O/N ratios.

S. MORGULIS

Vitamin effects of steryl phosphates and of sterols from erythrocytes. HANS V. EULER, BETT V. EULER AND MARGARETA RYDBON. Univ. Stockholm. *Biochem. Z.* 199, 276-93(1928).—This investigation was inspired by the belief that antirachitic factors may perhaps affect bone formation by activating the enzymic hydrolysis and formation of water-sol. phosphoric acid esters. Diergosteryl phosphate has been studied from the point of view of its action on growth and antirachitic effect. On a basic diet free from vitamins A and D growth often remains normal for 10 weeks with a supply of 0.0002 mg. irradiated ergosteryl phosphate per day. The antirachitic action of 0.1 g. ergosteryl phosphate irradiated in hydrogen or air is thus as great as that of irradiated ergosterol. Recrystd. sterol isolated from red cells m. 147° , $[\alpha] -36^{\circ}$. With daily doses of 0.01 mg. of this prepn. there was found a body wt. increase of 15 g. with the irradiated, and of 7 g. with the unirradiated prepn. for 30 days. Histologically also there was no evidence of rachitis, though the antirachitic effect like the growth-promoting action of the unirradiated prepn. is weaker than that of the irradiated material. Even after many recrystns. the blood cell cholesterol prepn. still contained 1% of ergosterol or some closely related active sterol.

S. MORGULIS

The feeding of foals with acid whey. I. ZAIKOVSKII AND V. IVANKIN. Zootechnische Versuchsstation Detskoje Selo, Leningrad. *Biochem. Z.* 199, 326-32(1928).—The acid whey obtained in the cultivation of kefir organisms retards the growth of foals. Furthermore the sediment of the acid whey contg. fine masses of kefir organisms

has no positive influence on the growth of foals in spite of its protein and vitamin content.

S. MORGULIS

The biochemistry of avitaminosis. IX. Effect of the character of the food on the blood-sugar curve in experimental scurvy and on the sensitivity of guinea pigs to insulin. ALEXANDER PALLADIN AND A. UTEVSKII. Ukrainian Biochem. Inst., Kharkov. *Biochem. Z.* 199, 377-86(1928).—A characteristic blood-sugar curve is observed under the influence of a lack of vitamin C as well as of A, B and C in guinea pigs, which presents an alteration of an initial hyperglucemic and a later hypoglucemic phase. The reaction of the food does not alter this curve in scurvy; it affects the amplitude of the curve. (On an alk. food the hyperglucemia comes on somewhat sooner than on an acid food. Changing guinea pigs suffering from scurvy from an acid to an alk. food produces a second hyperglucemic reaction. Furthermore, guinea pigs on a basic diet manifest a greater sensitivity to insulin than animals on an acid food. X. Acetaldehyde formation in the muscle tissue of normal, avitaminosed and starved pigeons. *Ibid* 200, 108-14(1928).—In the pectoral muscle of normal pigeons during 18 hrs. of autolysis 4.9 mg. of AcH is produced per 100 g. tissue. In the muscle tissue from avitaminosed pigeons there is less AcH formed, and the diminution is greater the more advanced the avitaminosis. Likewise, during fasting there is a diminution in the AcH production which is parallel to the degree of starvation. When normal pigeon muscle tissue is added to previously boiled muscle from starved or avitaminosed pigeons the AcH production is practically normal.

S. MORGULIS

Studies on experimental rickets. I. The antirachitic property of crude "Biosterin," the cholesterol-free unsaponifiable fraction of cod-liver oil. SEIICHI IZUME AND ISAO KONATSUBABA. Central Lab. South Manchuria Railway Co., Dairen. *J. Biochem. (Japan)* 9, 233-41(1928).—The antirachitic factor in cod-liver oil was proved to be resistant to alk. sapon. and non-precipitable by digetinin. This could be properly concd. The cholesterol-free, unsaponifiable fraction of the cod-liver oil, or the crude "Biosterin," has an exceedingly strong antirachitic activity, a daily dose of 0.05 mg. being sufficient to produce healing in the rat.

S. MORGULIS

The formation of bile acids. II. Avitaminosis and bile acid excretion in the bile. KANAF MURAKAMI. Physiol.-Chem. Inst., Okayama. *J. Biochem. (Japan)* 9, 321-31(1928).—In the absence of vitamin A in the food the bile acid excretion of guinea pigs diminishes. The normal excretion is reestablished upon injecting subcutaneously vitamin A.

S. MORGULIS

Nitrogenous metabolism in avitaminosis of chickens. B. A. LAVROV AND S. N. NAT'KO. Inst. Physiol. of Nutrition Narkomzdrav, Moscow. *Zhurnal expil. Biol. Med.* 9, 515-27(1928); cf. *C. A.* 22, 4591.—The N metabolism was studied on 2 chickens fed daily 50-60 g. polished rice. The first physiol. manifestation of the avitaminosis is the lowered crop activity as a result of which the avitaminosis becomes complicated by starvation. Another chicken was fed on oats which furnished the same amt. of N and N-free substances as the 60 g. polished rice (33 g. oats + 16 g. starch), and it was found that the body wt. increased and the N balance was even pos. On changing over to the rice diet there was no further increase in wt. but this remained stationary and the N balance was also pos. but after 7 days the N balance became neg. and the body wt. commenced to decrease. The urinary N elimination shows a sharp rise (280%), but the N in forms other than the uric acid remains unchanged. This is taken as evidence that the neg. balance due to increased uric acid elimination is an expression of the increased decompn. of nitrogenous substances in the organism in the initial avitaminosis stages. A week later these birds developed the classical β -avitaminosis symptoms, and at autopsy showed the presence of an abundance of fat. Death was therefore not caused by exhaustion.

S. MORGULIS

Vitamin A content of the subcutaneous fat of the dolphin (*Delphinus delphis*). S. N. NAT'KO. Inst. Physiol. of Nutrition, Narkomzdrav, Moscow. *Zhurnal expil. Biol. Med.* 10, 163-6(1928).—Young rats were fed a basic diet of 20% casein, 56% purified starch, 4% salt mixt. (Osborn-Mendel) and 5% dry yeast. This basic diet was mixed with fat (1) from the subcutaneous tissue of a young dolphin; (2) from an old dolphin; (3) cod-liver oil; (4) ordinary bacon fat. The dolphin fat gave as good results as the cod-liver oil.

S. MORGULIS

Physical and biological properties of irradiated sterols. R. FABRE AND H. SIMONNET. *Bull. soc. chim. biol.* 10, 1100-10(1928); cf. *C. A.* 22, 3438.—A spectrographic study of cholesterol and ergosterol before and after ultra-violet irradiation is reported. The photochem. transformation of the sterol, which is detectable by optical methods, is not arrested at the biologically active stage of the product. Beginning with certain doses of irradiation the activity does not increase with further irradiation, while the

optical density gradually diminishes in the zone of 2700–3000 A. U. **Biological tests** should be made parallel with the optical tests. **L. W. RIGGS**

The antiscorbutic vitamin in cabbage soup, cabbage puree and turnip juice. ERNEST TSO. Peking Union Med. Coll. *Chinese J. Physiol.* 2, 403–8(1928).—A daily ration of 30 cc. cabbage soup, 5 to 10 g. of cabbage puree or 20 cc. of turnip juice suffices not only to protect young guinea pigs against scurvy but also to promote normal growth during an exptl. period of 5 months. Cabbage or turnip soup, puree or juice can be digested by young infants in quantities sufficient to afford considerable antiscorbutic vitamin. This is fortunate for the inhabitants of North China where inexpensive antiscorbutic foods for infants are scarce. **L. W. RIGGS**

Nitrogen, calcium and phosphorus metabolism in infants fed on soybean "milk." ERNEST TSO, MARTIN YEE AND TUNG-TOU CHEN. Peking Union Med. Coll. *Chinese J. Physiol.* 2, 409–14(1928).—This study with 2 young infants showed that the N absorption may approach 90% of the intake. The Ca content of soy bean "milk" is inadequate. The addn. of cod-liver oil and a small quantity of Ca salt markedly enhanced not only Ca retention but also the P storage. The P content of soy bean "milk" is apparently adequate but its utilization may be restricted by the limited Ca intake. **L. W. RIGGS**

Nutritive value of Chinese foods. HSIEN WU. Peking Union Med. Coll. *Chinese J. Physiol., Report Series* 1928, No. 1, 153–86.—Analyses of over 200 kinds of vegetable and 30 of animal foods are reported, also the compn. of 7 kinds of Chinese wine. In addn. to the usual detns. of food analyses the Ca, P and Fe were detd. and the vitamins were indicated approx. The methods of the Assoc. Off. Agr. Chem. were used. Animal food such as beef and pork which are not peculiar to China were not studied. **L. W. RIGGS**

Influence of the basic ration in the determination of the vitamin content of various sources. C. KUCERA. *Compt. rend. soc. biol.* 99, 988–90(1928).—The importance of a correct basic ration in test animals used for estg. the vitamin B content of foods is emphasized. **L. W. RIGGS**

Photochemistry of ergosterol. STANISLAW K. KON. Univ. Wisconsin. *Nature* 122, 276–7(1928).—The flat Pt surface of a Pt-Te thermopile was coated with a layer of solid ergosterol cemented with ether and was then exposed to monochromatic radiation from an intense quartz-Hg arc using a Hilger quartz monochromator. The results showed the production of vitamin D sufficient to cause a demonstrable deposition of Ca in the bones of a rachitic rat. **L. W. RIGGS**

Vitamins and vital elements suggesting a possible chemical basis for vitamin activity. JOHN E. RUTZLER, JR. *Oil and Fat Industries* 5, 267–72, 295–301(1928).—A review of the origin and characteristics of vitamins A, B, C, D and E is given with 19 references to the literature. A theory is proposed which makes Fe the active factor in nutritional regulation by vitamin A, Mn in vitamin B, probably Zn in vitamin C, P in vitamin D and I in vitamin E. It is suggested that the theory can be substantiated or disproved by spectrographic examn. of foods with an instrument capable of photographing spectra in the ultra-violet region. **L. W. RIGGS**

Vitamins and tumor growth. I. Deficient vitamin B content of chicken sarcoma tissue. WARO NAKAHARA AND EIICHI SOMEKAWA. *Proc. Imp. Acad. Tokyo* 4, 440–3(1928).—Pigeons fed on polished rice and dried chicken sarcoma manifest symptoms and die of polyneuritis at about the same rate as control pigeons fed on polished rice alone. Also, while the daily intake of only 0.1 g. of dried chicken liver protects rats from the reduction of body wt. on vitamin B-deficient diet, 10 times that amt. of dried sarcoma tissue fails to give similar protection. **L. W. RIGGS**

Sparing action of fat on the antineuritic vitamin. HERBERT M. EVANS AND SAMUEL LEPROVSKY. *Science* 68, 208(1928).—If fat be added to an almost fat-free diet, the amt. of antineuritic vitamin required to establish any definite level of growth or frequency of ovulation is always less than is required when fat is absent. Animals on inadequate levels of the vitamin are not only more gravely impaired in stature and ovulation when fat is absent than when present, but they invariably develop beriberi sooner. In these expts. the other vitamins were present in sufficient amts. and the presence of antineuritic vitamin could not be established in the fats used. It would appear that the fats mediate in those unknown metabolic processes for which antineuritic vitamin is essential. These results go far to explain the beneficial effects of fats in highly purified diets. **L. W. RIGGS**

Manganese as a factor in hemoglobin building. R. W. TITUS AND H. W. CAGE. Kansas State Agr. Coll. *Science* 68, 410(1928).—Rats and rabbits were kept on an exclusively whole milk diet when the hemoglobin decreased. The addn. of 5 mg. of

Fe as FeCl_3 per day to the diet had but slight effect in the building of hemoglobin as compared with the addn. of 5 mg. of Mn as MnCl_2 , along with the FeCl_3 . L. W. R.

The photosynthesis of the antirachitic vitamin by ultra-violet radiation of short wave length. HARRY D. GRIFFITH and KATHERINE C. SPENCE. *Brit. J. Actinotherapy* 3, No. 4, 69-72(1928).—Ergosterol was dissolved in xylene. This material was irradiated in 3 regions of the spectrum: longer than 313 mm., 313 to 265 mm. and shorter than 265 mm. Rats were used to ascertain the antirachitic value of the irradiated ergosterol. Controls were run on diet and irradiation. Ergosterol irradiated longer than 313 mm. produced rickets, 313-265 mm. normal ossification and shorter than 265 mm. slight tendency to rickets but later complete ossification. J. T. W.

Mineral content of pastures. Malnutrition disease in sheep (ASTON) 15.

E. K. MARSHALL, JR.

A biometrical study of the size inter-relationships of the glands of internal secretion. FREDERICK S. HAMMETT. Wistar Inst. *J. Metabolic Research* 7-8, 91-163(1925-6).—A study of the wt. relations of the thyroid, gonads, adrenals, hypophysis, thymus and pancreas in 121 rats. An extensive bibliography is included. H. J. DEUEL, JR.

My theory of urine formation. K. BUENEWITSCH. Kaunas Univ., Lithuania. *Zentr. inn. Med.* 49, 410-5(1928).— H_2O and NaCl are believed to be eliminated through the tubules while other urine constituents such as urea and uric acid are excreted in the glomeruli. The H_2O and NaCl may pass into the glomeruli from the tubules, where they assist in washing out the constituents there. The urine also is coned in the glomeruli. By this theory the azotemia, the N retention and the uremia of the retention caused by glomerular injury in glomerular nephritis are explained as well as the failure of edema in this condition on account of the elimination of H_2O and NaCl through the intact tubular cells. This also gives an explanation for the edema and the retention of NaCl in tubular injury and the lack of an azotemia and uremia since these latter constituents are eliminated through the intact glomeruli. There may be many complicated conditions with diffuse injuries in which the function of the glomeruli as well as that of the tubules is disturbed. H. J. DEUEL, JR.

Further observation on the simultaneous fractional gastric and duodenal juice investigation. The importance of the curves of duodenal contents and the chloride. II. M. MARKOFF. Univ. Woronesh. *Zentr. inn. Med.* 49, 442-4(1928); cf. C. A. 22, 5418.—A considerable decrease in the acidity of the stomach contents can occur in some cases without regurgitations of duodenal contents. This is brought about through the neutralization of the acidity by mucus, through the alk. secretion of the pyloric part of the stomach, and by the evacuation of a part of the acid gastric juice into the duodenum. The surface tension of gastric juice is 78-86% in comparison with H_2O while a decrease in value below 72% indicates a mixt. of bile. The surface tension of duodenal juice is 52 to 62% of that of H_2O and is raised at the moment of entrance of the gastric juice. In the differentiation of spurious and real achylia, the character of the Cl curves in the duodenum and the stomach is useful. With a duodenal ulcer the concn. of the Cl in the stomach and the duodenum is higher than in gastric ulcer while these values are low in gastric carcinoma. H. J. DEUEL, JR.

The detoxication process in the fetal organism. MASAO TAKAHASHI. *Med. A. I. Nagasaki Z. physiol. Chem.* 178, 291-3(1928).—Total and conjugated sulfates were detd. in the white, yolk, embryo, amniotic and allantoic fluids of hen eggs at 3 day intervals during incubation. None was found in the white, yolk and amniotic fluid, although more than 50 g. of material was used in each detn. In the embryo and allantoic fluid, however, both inorg. and org. H_2SO_4 were definitely present on the 13th day, after which the amt. of each remained practically const. in the embryo but increased rapidly in the allantoic fluid. The excretion of conjugated sulfates into the allantoic fluid evidently represents a detoxication process. II. Synthesis of ornithuric acid in the incubated hen egg after injection of benzoic acid. *Ibid* 294-7.—After injection of BzONa into a large no. of hen eggs (0.005 g. per egg), those that developed normally during incubation were examd. for ornithuric acid. Within 14 days the BzOH had disappeared entirely. After 14 and 18 day incubation periods considerable ornithuric acid was isolated from the allantoic fluid but none was found in the yolk, white, embryo amniotic fluid. The recovery was 0.4541 and 0.5964 g. ornithuric acid from 5.029 and 3.108 g. BzOH after 14 and 18 days, resp. Control expts. without BzOH gave no trace of either BzOH or ornithuric acid. It is obvious that the fetal chicken can detoxify BzOH

by conversion into ornithuric acid and excretion of the latter into the allantioic fluid.

A. W. DOX

Endocrinology. HERMANN BERNHARDT. Universitäts-Klinik der Charité, Berlin. *Deut. med. Wochschr.* 54, 1382-4, 1423-5(1928).—A review of the advances in endocrinology during 1927 and 1928, with 152 references to the literature. A. G.

Lactic acid metabolism during exercise. I. SNAPPER AND A. GRÜNBAUM. *Deut. med. Wochschr.* 54, 1494-5(1928).—In a series of football players, only traces of lactic acid were found in the urine before entering a game. On hot days, while playing, it appeared in the urine in high concn. less frequently than on cold days. Several g. of lactic acid were excreted in the sweat, in which it occurs in a concn. 10 times as great as that of the blood. The phenomenon of "second wind" can be correlated with the secretion of lactic acid in the sweat.

ARTHUR GROLLMAN

The inorganic phosphate content of resting mammalian muscle. JACOB SACKS AND H. A. DAVENPORT. Northwestern Univ. *J. Biol. Chem.* 79, 493-8(1928).—The inorg. P content of the resting muscle of the cat, rat and guinea pig is slightly over 20 mg. % and of the rabbit and dog, slightly under this figure. There is a rapid *post-mortem* increase in the inorg. P content of these muscles.

ARTHUR GROLLMAN

Chemical studies of muscle contracture. I. The lactic acid content. H. A. DAVENPORT, HELEN K. DAVENPORT AND S. W. RANSON. Northwestern Univ. *J. Biol. Chem.* 79, 499-505(1928).—The lactic acid content of muscles which have undergone permanent shortening from treatment with tetanus toxin is of the same order of magnitude as that of normal flaccid muscle.

ARTHUR GROLLMAN

Studies of gas and electrolyte equilibria in blood. XIV. The amounts of alkali bound by serum albumin and globulin. DONALD D. VAN SLYKE, A. BAIRD HASTINGS, ALMA HILLER AND JULIUS SENDROY, JR. Rockefeller Inst. *J. Biol. Chem.* 79, 769-79(1928); cf. *C. A.* 22, 3917.—The relation between p_H and the amt. of alkali bound by purified albumin and globulin of horse serum was detd. over the range p_H 6.8 and 7.8. At 38° the milli-equivs. of base bound per g. of albumin $N = 0.78$ (p_H 5.16) and per g. of globulin $N = 0.48$ (p_H 4.89). The base bound by the proteins of human serum agreed within 6% with the amts. calcd. from its albumin and globulin contents, by assuming the titration curves as in horse serum. XV. Line charts for graphic calculations by the Henderson-Hasselbach equation, and for calculating plasma carbon dioxide content from whole blood content. DONALD D. VAN SLYKE AND JULIUS SENDROY, JR. *Ibid* 781-98.—The values of the consts. α_{CO_2} and p_K' for human serum are applied to the construction of a d'Ocagne-Henderson nomogram for calcs. by the Henderson-Hasselbach equation. Of the 12 calcs. possible, 10 are of sufficient exactitude to be of practical value. A nomogram is also given for graphic estn. of the CO_2 content of plasma or serum from the CO_2 content observed in whole blood of any hemoglobin or cell content and degree of oxygenation.

ARTHUR GROLLMAN

The energy exchange in obesity. M. STRANG AND FRANK A. EVANS. Western Penn. Hospital. *J. Clin. Investigation* 6, 277-89(1928).—The increase in the energy exchange of the obese is of the same magnitude as their increase in surface area. When reduced by dietary measures alone, the energy exchange diminishes proportionally much more than the wt. or surface area but the metabolism never goes below limits normal for proper wt. "There is, therefore, no evidence of an energy economy in the obese."

ARTHUR GROLLMAN

The routes of central water control and hypophysis antidiuresis. S. JANSSEN. Univ. Freiburg. *Klin. Wochschr.* 7, 1680-1(1928).—The hypophysis appears to produce an antidiuretic hormone that acts directly upon the kidney. An indirect action *via* the central nervous system is rendered rather improbable by the exptl. data presented.

MILTON HANKE

The female sexual hormone, menformone. X. Action after oral administration. ERNST LAQUEUR AND S. E. DEJONGH. Univ. Amsterdam. *Klin. Wochschr.* 7, 1851-3(1928); cf. *C. A.* 22, 2194.—The oral administration of menformone leads to changes that are identical with those obtained after subcutaneous administration, namely: (1) estrual crisis in castrated infantile or senile females, (2) growth of the female genitalia in infant animals, (3) retardation of growth in the male genitalia, and (4) proliferation of the mammary glands in females and in castrated males. It has been possible to obtain a secretion of milk from castrated males after feeding menformone. M. H.

Glucose metabolism of kidney tissue in vitro. II. JAMES T. IRVING. Oxford Univ. *Biochem. J.* 22, 964-7(1928); cf. *C. A.* 22, 618.—Most of the glucose is changed to lactic acid by kidney tissue *in vitro*. A small amount combines with phosphoric acid. These processes are inhibited by HCN.

BENJAMIN HARROW

Studies on the cholesterol content of normal human plasma. III. The so-called

alimentary hypercholesterolemia. JOHN A. GARDNER AND HUGH GAINSBOROUGH. St. George's Hospital, London. *Biochem. J.* 22, 1048-56(1928); cf. *C. A.* 21, 2278.—The level of the cholesterol content of human plasma, taken while fasting, can be raised or lowered by sufficiently prolonged feeding with diets of high or low sterol content.

BENJAMIN HARROW

The pigments of the fat of certain rabbits. STANLEY G. WILLIMOTT. School of Agr., Cambridge. *Biochem. J.* 22, 1057-9(1928).—The coloring matter present in adipose tissue of certain rabbits is xanthophyll.

BENJAMIN HARROW

Influence of the state of nourishment, the amount of customary exercise, of work, and of age upon basal metabolism. HERM. V. HOESSLIN. *Arch. Hyg.* 99, 83-90 (1928).—The influence of the state of nourishment and of moderate exercise, etc., upon the magnitude of basal metabolism indicates that not the area of body surface, but internal conditions regulate the basal metabolism.

P. Y. JACKSON

Oxidases in the glands of the crop of *Columba livia* Bonnat. F. DULZETTO. *Arch. sci. biol.* 11, 341-9(1928).—The technic used was that of Graeff and Gierke. Sections of fresh tissue 10-15 μ were immersed in a mixt. of equal pts. of α -naphthol and dimethyl-*p*-phenylenediamine. After a few min. they assumed a violet and then a dark blue color. The sections were washed in physiol. salt soln. and placed in dild. Gram's soln. for 10 min. and then again washed in physiol. salt soln. contg. a drop of satd. LiCO_3 . The sections were then examd. Glands fixed in 10% formalin were tested by the Schultz and the Graeff-Gierke methods. By means of the indophenol-blue reaction numerous granules of oxidases were demonstrated in the cells of the glands of the pigeon's crop. They were distributed in all the protoplasm especially along the margin of the cells and in the part close to the glandular lumen. There was no nucleus. The absence of fat and lipoidal granules eliminated the hypothesis that the color was due to the latter substances absorbing the color and not to the presence of oxidases. P. M.

The routes of elimination of hormones. I. Lymph and insulin. EMILIO GHIRARDI. *Boll. soc. ital. biol. sper.* 3, 387-8(1928).—The effect of lymph on the glucemic titer was investigated as a possible means of detecting insulin. The lymph was obtained from a temporary fistula in the thoracic duct of normal dogs, and injected intravenously or subcutaneously into starved rabbits. The blood sugar did not decrease but rather increased an av. of 0.037%. Lymph injected into depancreatized dogs had no effect on blood sugar. The conclusion is that lymph has no hypoglucemic action and the hypothesis that lymph contains insulin cannot be supported. P. M.

The relation between alimentary glucemia and pancreatic function. G. MARTINO. *Boll. soc. ital. biol. sper.* 3, 403-7(1928); cf. *C. A.* 22, 2188.—Dogs with a Pavlov pancreatic fistula were given a soln. of peptone (15 g. in 50 cc. H_2O). Blood sugar was detd. at various intervals of time. The results obtained were compared with those from the administration *per os* to the same animal of pancreatic juice eliminated by that animal. Also, pancreatic juice was injected into an intestinal loop and its effect on glucemic titer noted. The results were compared with those obtained by injecting peptone soln. into the same loop. Results: (1) the administration of peptone to dogs with a pancreatic fistula did not increase but rather diminished the blood sugar; (2) the administration *per os* of pancreatic juice eliminated by the same animal produced an increase in blood sugar 15 min. after administration; (3) the injection of pancreatic juice into a Vella intestinal loop was followed by a slight hyperglucemia; (4) the injection of peptone soln. into the same loop did not produce any variation in blood sugar.

PETER MASUCCI

Chemical coördination and nervous coördination. UGO LOMBROSO. *Scientia* 44, 247-58(1928).—The conception of chem. coördination by means of hormones as against that of nervous coördination by reflex action does not appear to be in harmony with anatomical facts. The organs whose physiol. action e. g., the pancreatic and enteric secretion, the development of the mammary gland, etc., is attributed to the direct action of chem. stimuli are abundantly provided with a complex sympathetic nervous system. There is no other function known for this system, except that of directing and coordinating the function of the organs to which it is attached, and its presence, therefore, is an argument in favor of the conception of nervous coördination. The expl. arguments upon which the doctrine of chem. coördination is based are considered, analyzed and interpreted. The stimuli which influence the external secretion of the pancreas are discussed. The vagus contains fibers which inhibit and fibers which stimulate pancreatic secretion, the former predominating. Secretion may be inhibited by stimulating the entire vagus because of the prevalence of inhibiting fibers; secretion takes place by stimulating the degenerate vagus after cutting, on account of the greater resistance to degeneration of the secreting fibers. Secretion has no specific

action; it has properties that are more pharmacol. than physiol. The arguments based on the development of the mammary gland and milk secretion are enumerated, critically analyzed and interpreted. L.'s results from working with artificial "Siamese twins" are against the conception that the development of the mammary gland during pregnancy is due to chem. stimuli. The expts. on the development of the mammary gland, and the external secretion of the pancreas, indicate that there is a correlation between chem. substances (hormones) and nervous function. The nervous tissue stimulated by the hormones in turn causes the development of other chem. substances. To state that an organ can elaborate a chem. substance which, without the intervention of the nervous system, can act directly on another organ, is an assumption that has no exptl. proof.

PETER MASUCCI

The decomposition of sugar in the human placenta and the influence of hormones. S. HAYASHI. Chem. Abteilung, Rudolf Virchow-Krankenhaus, Berlin. *Biochem. Z.* 196, 323-32(1928).—The anaerobic sugar destruction in the human placenta is greatest at p_H 10. Levulose yields the greatest amt. of lactic acid; glucose is next in importance; galactose has no effect. Sucrose gives the largest amt. of lactic acid among disaccharides, and of polysaccharides glycogen gives the max. result. Various hormones promote the anaerobic sugar decompn. by placenta in the following order of decreasing effectiveness: insulin, folliculin, thyroxine, adrenaline, thymoglandol and hypophysin. The human placenta, like muscle or liver tissue, contains a keto-aldehyde-mutase because it can convert methylglyoxal to lactic acid.

S. MORGULIS

Studies on the carbon dioxide combination with hemoglobin. BILLA GROÁK. Univ. Budapest. *Biochem. Z.* 196, 478-87(1928).—Evidence is presented showing that hemoglobin combines with H_2CO_3 or CO_2 not only as an acid, but that between the two there is a specific affinity.

S. MORGULIS

Contributions to the problem of blood sugar. IX. The influence on blood glucolysis of the Hofmeister series. H. K. BARENSCHIEEN AND KARL HÜBNER. Univ. Wien. *Biochem. Z.* 196, 488-94(1928).—The SO_4 and PO_4 ions have a specific accelerating effect on glucolysis of human erythrocytes. All the other anions and cations of the Hofmeister series are without influence on glucolysis.

S. MORGULIS

Behavior of the carbon nitrogen urinary quotient under the influence of parenteral administration of extracts of anterior lobe of the hypophysis. A. ALLEN GOLDBLOOM. Pathol. Inst. Univ. Berlin. *Biochem. Z.* 197, 20-30(1928).—Exts. of the anterior lobe of hypophysis reduce the oxidative processes in the organism. Almost invariably and independently of the dose it causes an increase in the dysoxidizable urinary C. The N is generally increased by small doses but decreases with large doses.

S. M.

Further experiments on the formation of sugar from fat. YUZURA KOJIMA. Physiol. Inst. Univ., Berlin. *Biochem. Z.* 197, 31-71(1928).—In carbohydrate-free rats the formation of sugar from lactic acid was demonstrated, and appreciable quantities of sugar could be shown to originate from protein. The carbohydrate-free rats could not endure feeding with pure fatty acids even when these were carefully neutralized. The addn. of butter or bacon to the basic diet likewise inhibited the sugar formation, as less sugar was excreted than would correspond to the glycerol of the administered fat. Cf. C. A. 22, 1797.

S. MORGULIS

Studies on the physiology of glands. CXIV. Experiments on the exchange of matter between blood and tissues in normal and denervated thyroids. LEON ASHER AND TATEYOSHI HONDA. Univ. Bern. *Biochem. Z.* 197, 72-83(1928); cf. C. A. 22, 1798.—The change in Cl content of the blood has been studied following the simultaneous injection of a specific diuretic (cuphyllin) and 100 cc. sugar soln. into the peritoneal cavity of rabbits. The blood Cl content undergoes quicker and more extensive changes after the denervation of the thyroid gland. Complete thyroidectomy caused only insignificant alterations in the blood Cl. CXV. **The lack of overcompensation of the loss of iron after splenectomy due to blocking of the reticulo endothelial system.** LEON ASHER AND YUZURA KOJIMA. *Ibid* 84-104.—The reticulo-endothelial system was blocked to det. if the diminished excretion of iron following splenectomy in guinea pigs is due to an overcompensation of the liver or reticulo endothelial system. In normal guinea pigs the blocking of the system with India ink had a very slight effect in raising the daily Fe excretion. After splenectomy, the blocking causes a very marked increase in Fe excretion. The increase may be so great that the excretion may be returned to the level existing before the operation.

S. MORGULIS

Potassium, calcium and choline content of blood and its variations following the extirpation of the thyroid in dogs. MARIA MAXIM AND C. VASILIU. Lab. med. Analyses und Biochemie, Bukarest. *Biochem. Z.* 197, 236-40(1928).—In the first 4 to 7 days following thyroidectomy there was a lowering of the K content. The Ca remains un-

changed for a while but rises later. The choline increases immediately after the extirpation, and attains very high values during the tetanic convulsions and the respiratory crisis. The K at that time is also greatly increased. S. MORGULIS

Human fat. A. HEIDUSCHKA AND C. HANDRITSCHK. Tech. Hochschule, Dresden. *Biochem. Z.* 197, 404-9(1928).—Analytica data. S. MORGULIS

Transformation of blood pigments into bile pigments. ELSE PÖLLAK. Organchem. Inst. Tech. Hochschule, München. *Biochem. Z.* 198, 311-6(1928).—Under the action of pyrocatechol hemin gives rise to a pigment of the probable mol. compn., $C_{16}H_{16}N_2O_4$, which spectroscopically has an extinction point at 534.5, and gives no test for pyrrole. S. MORGULIS

Behavior of aldol in the animal organism and in fresh organ pulp. FRITZ LIEBEN AND GABRIELE EHRLICH. Univ. Wien. *Biochem. Z.* 198, 317-27(1928).—In normal as well as in phlorhizin dogs subcutaneously injected aldol does not appear in the urine in appreciable amts. provided the bisulfite-binding capacity of the urine during the preliminary period is taken into consideration. The transformation into sugar in phlorhizinized dogs is possible but cannot be established with certainty when one considers the small doses of aldol that can safely be employed. The D/N quotient is not affected by the aldol, nor is there any change in the β -hydroxybutyric acid excretion. Aldol is therefore thought to be changed to glycogen or to fat, or is perhaps largely oxidized. No evidence was found that aldol is detoxicated by combination with glucuronic acid and as such excreted. Organ pulp destroys more or less added aldol, and β -hydroxybutyric acid appears partly as an intermediate substance. The most effective is liver pulp, the least effective the cold-blooded muscle pulp. In perfusion expts. through living turtles aldol was very largely destroyed. S. MORGULIS

Effect of the sympathicus nerve on the ammonia content of the muscle. HANS-EDWINE BUTTNER. Med. Univ.-Poliklinik, Würzburg. *Biochem. Z.* 198, 478-86(1928).—The traumatic NH_3 formation is about 50% greater in frog muscles on the side where the sympathicus nerve has been sectioned. The same is also true with elec. stimulation, the NH_3 production being 60% higher on the side devoid of the sympathetic supply. The resting value of the NH_3 content, however, is not affected in any regular manner. S. MORGULIS

Nitrogen metabolism of man after total resection of the stomach. L. SOLOVIEV. Inst. of Exptl. Med., Leningrad. *Biochem. Z.* 199, 121-35(1928).—Removal of the stomach has no noticeable influence on the assimilation of animal or vegetable protein in the food. About 6 months after the operation there has been N retention and progressive increase in wt. in the patient. No essential difference was found from the normal N partition, though the proportion of combined S to total S was twice as large as normal. S. MORGULIS

Glycogen formation in the intestinal wall. KONRAD LANG. Lab. Med. Klinik Erlang. *Biochem. Z.* 200, 90-4(1928).—The intestinal wall can form glycogen from glucose, and to a smaller extent from fructose. In depancreatized dogs the intestinal wall still forms glycogen from glucose but in smaller amts. The glycogen formation is increased by insulin. S. MORGULIS

Metabolism of mammalian tissues in various media. I. Respiration of rat-heart explants cultured in plasma of normal and of avitaminosis animals. KAETHE BORNSTEIN. Univ. Inst. für Krebsforschung, Charité, Berlin. *Biochem. Z.* 200, 176-83(1928).—Tissue cultures were made from the heart of rats which were grown in the plasma of normally fed rats and from rats on a vitamin-B free diet. It was found that in the plasma of the avitaminosis rats the respiratory activity of the explanted tissue cultures was about 50% less. S. MORGULIS

Conditions which influence the colloidal osmotic pressure of the (serum blood). I. KORO HIROTA. Kyoto Imp. Univ. *J. Biochem. (Japan)* 9, 71-85(1928).—When a dialyzer is used as the outer liquid the colloidal osmotic pressure of the serum is reduced the more, the greater the concn. of the salt soln. In isotonic solns. KCl and NH_4Cl give a higher osmotic pressure than NaCl, while Na_2HPO_4 , K_2SO_4 , $MgCl_2$, $CaCl_2$ and KH_2PO_4 give a lower pressure. It is impossible to make measurements with the collodion membrane when the outer fluid contains Na_2CO_3 . Acidity of the outer soln. reduces, while alk. increases, the osmotic pressure, so that the reaction of the outer fluid should be the same as that of the inner. The colloidal osmotic pressure of the serum is lowered by diln. with H_2O . The blood serum shows the same colloidal osmotic pressure as the plasma. S. MORGULIS

The significance of the bile acids in the carbohydrate metabolism. IV. Antagonistic effect of bile acids against adrenaline. KANAË MURAKAMI. *Physiol.-chem.*

Inst. Okayama. *J. Biochem.* 9, 261-70(1928).—The administration of bile acids to normal rabbits or to rabbits with the adrenals extirpated causes a lowering of the fasting blood sugar, or of the hyperglucemia produced with glucose. One-sided removal of the adrenal body in rabbits produces an increase in the bile excretion and in the excretion of the bile acids. It is argued that the diminished adrenaline content of the blood following adrenal extirpation is responsible for the increased bile acid excretion and that the resulting hyperglucemia is caused by the increase in bile acid concn. of the blood. V. The effect of diminished bile acid and of excess of bile acid on the sugar content of the blood. TEIJI OKAMURA. *Physiol.-chem. Inst., Okayama. Ibid* 271-83.—The exptl. removal of bile by means of a gall-bladder fistula causes a gradually increasing hyperglucemia, which can be offset by administration of bile acids. In cases of stasis icterus there is evidence of a lowering of the blood-sugar level. Loss of bile acids thus induces hyperglucemia and excessive administration of bile acids induces hypoglucemia. S. MORGULIS

The influence of sectioning the splanchnics upon the sugar excretion threshold. SHIN-ICHI KAWASHIMA. Univ. Tokyo. *J. Biochem. (Japan)* 9, 337-45(1928).—Acetylcholine causes a rise in the sugar excretion threshold as well as in the alimentary hyperglucemia of the normal dog. Sectioning of both splanchnics raises the threshold for the alimentary glucosuria. The sugar assimilation is impaired so that with the same supply of sugar the alimentary hyperglucemia is higher than before the operation. After splanchnicectomy it is no longer possible to demonstrate the effect of acetylcholine in raising the alimentary hyperglucemia. S. MORGULIS

Significance of the bile acids in the carbohydrate metabolism. VI. Effect of the loss of bile acids and of excessive bile acid administration on the adrenaline content of the suprarenals. TEIJI OKAMURA. *Physiol. Chem.-Inst., Okayama. J. Biochem. (Japan)* 9, 445-52(1928).—Removal of bile through a bile fistula causes an increased adrenaline content of the rabbit suprarenal gland. The adrenaline content of the suprarenals is generally lowered in cases of stasis icterus. Similarly, the adrenaline content decreases when bile acids are administered by mouth. S. MORGULIS

Effect of hyperthyroidization on the egg laying of chickens. B. ZAVADOVSKII, L. LIPCHINA AND E. RADSVON. Univ. Moscow. *Zhurnal expil. Biol. Med.* 9, 464-75(1928).—Massive doses of thyroid gland sharply interfere with the egg-laying process, which ceases for variable periods depending upon the dose. A dose of 1-2 g. at one time or doses of 0.01-0.05 g. given repeatedly will just suffice to manifest this influence. With such min. doses the stimulation of the process has been observed, the activation being especially marked in chickens with poor laying ability. S. MORGULIS

Further data on the question of mutual relationship between the sex and thyroid glands. B. ZAVADOVSKII AND L. LIPCHINA. *Communist Univ., Moscow. Zhurnal expil. Biol. Med.* 9, 477-90(1928); cf. *C. A.* 33, 981.—Expts. were made on hyperthyroidized chickens which at the same time were overfed on fresh sexual glands of the same sex. Under these conditions the fading out of the feathers and depression of sex gland activity were less marked than in chicken which were only hyperthyroidized. S. MORGULIS

Presence of acetaldehyde in the surviving heart. M. V. KORCHAGIN. Univ. Moscow. *Zhurnal expil. Biol. Med.* 9, 501-13(1928).—Dimedon was used successfully to find AcH in warm-blooded muscle tissue, but its concn. must not be greater than 0.1%. The dimedon acts injuriously on the surviving heart even in minute doses, and a concn. of 0.025% disturbs seriously the heart action and lowers the sugar consumption by 50%. Nevertheless it was possible to demonstrate, by adding 0.05% dimedon to the nutritive fluid, that the working heart produces AcH. Better results are obtained with the use of $\text{Ca}(\text{SO}_3)_2$, which is less toxic for the heart. The AcH was detected according to Rimin and detd. with $\text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$; also as the aldomedon (m. 139°). About 6 mg. per 100 g. heart tissue is formed per hr. S. MORGULIS

Variations in the dry residue in the superior vena cava blood. L. EIDLIN. State Univ., Saratow. *Zhurnal expil. Biol. Med.* 10, 64-70(1928).—Lymph is discharged into the venous flow for several minutes even after the stopping of the blood flow. During life there is no essential difference between the dry residues of the blood from the superior or from the inferior vena cava. Following death, however, the dry residue of the superior vena cava blood diminishes and varies from 9 to 16%. The amt. of dry residue is related to the mode of death, the lowest dry content being found in cases of mechanical asphyxiation. S. MORGULIS

Alteration of the structure of feathers in hyperiodized chickens. N. A. RASPOPOV. *Communist Univ., Moscow. Zhurnal expil. Biol. Med.* 10, 154-62(1928).—Striking changes in the structure of feathers have been noted. S. MORGULIS

The relation between continuous bioelectric currents and cell respiration. II. E. J. LUND. Univ. Texas. *J. Exptl. Zool.* 51, 265-90(1928); cf. *C. A.* 22, 1381.—Continuous bioelec. currents produced by cells and tissues result from oxidation-reduction potentials developed by the respiratory mechanism of the cell. The p. d. in polar organs, such as *Obelia* stem, and frog skin equals the algebraic sum of the p. ds. of the individual cells. Therefore, cells of an elec. polar tissue have series and parallel arrangements in respect of the summation of their e. m. fs. Isoelec. cells may exist in an otherwise polar tissue. The elec. energy of such polar tissue is derived from the respiratory process of the cell and may occur under both anaerobic and aerobic conditions. The magnitude of the single p. d. at any time and in any locus of the cell is largely detd. by the ratio of concns. of oxidant and reductant. The value of this ratio is detd. by a flux equil. which depends upon the relative velocities of the reactions constituting the oxidative mechanism of the cell. The flux equil. and therefore the elec. potential at a locus may or may not be quant. related to the abs. velocity of respiration, depending upon whether or not the relative velocities of the reaction producing the reductant and removing the oxidant are changed. Wieland's theory of oxidation (*Ergebnisse d. Physiol.* 20, 477 (1922); cf. *C. A.* 16, 1245) in conjunction with this theory of continuous elec. currents explains the reduction of methylene blue and the distribution of elec. potential in the root tip and *Obelia* stem. Oxidation-reduction potentials are probably developed at all cell surfaces and result in polarization. They form the basis for the summation of continuously maintained p. ds. The elec. polarity of the cell is due to the difference in local ratios of concn. of oxidant and reductant in apical and basal ends of the cell. Changes in these ratios at the two ends of the cell account for the observed change in magnitude of elec. polarity, absence of polarity, and reversal of polarity. The theory assumes that stimulation changes the elec. potential and therefore the polarity of the cell because it temporarily accelerates the reaction, reductant oxidant (= respiration), and likewise the ratio, oxidant/reductant. It predicts the existence of a quant. relation between O_2 concn. and the magnitude of the elec. p. d. It may, therefore, be possible to distinguish between the different types of p. ds. which det bio-elec. phenomena. This theory explains how continuous currents may serve as a mechanism of continuous cell correlation and how one cell or a cell group may control the rate and direction of physiol. processes in adjacent cells. **III. Effects of concentration of oxygen on cell polarity in the frog skin.** *Ibid* 291-307.—The velocity of O_2 consumption of frog skin is approx. proportional to the concn. of free O_2 in the medium. The magnitude of elec. polarity in the skin may be increased or decreased by changing the concn. of dissolved O_2 in Ringer soln. applied to both sides of the skin. Complete removal of dissolved O_2 from the medium does not at once remove all elec. polarity, showing that the ratio, oxidant/reductant, in the cell can maintain a p. d. under anaerobic conditions and that elec. energy can be produced anaerobically by the mechanism. When the polarity finally disappears it is associated with the onset of death in the cells due to absence of O_2 . The velocity of oxidation in frog skin is about 10 times as sensitive to the same change in O_2 concn. as is its elec. polarity. An app. is described for detg. the relation between O_2 concn. and elec. polarity in frog skin or other suitable membrane. **IV. The origin of electric polarity in the onion root.** G. MAYOR. *Ibid* 309-25.—The e. m. f. of a given length of onion root is the algebraic sum of the e. m. fs. of the cells of such portion of the root. The slope of the curves of distribution of p. d. are an index of the direction of fall of potential over the root. The elec. polarity of the root fluctuates and may increase, diminish, or be reversed by changes in environment and in the internal processes of the cells. **V. The quantitative relation between E_p and cell oxidation as shown by the effects of cyanide and oxygen.** E. J. LUND. *Ibid* 327-37.—The rate of O_2 consumption and CO_2 production per unit length of *Obelia* stem is greater in the growing, apical, electropositive region than in the older basal, electronegative region. The % depression of elec. polarity by KCN across the ecto-endoderm layer in the apical region is greater than in the basal region. The same is true of the depression of cell oxidation by KCN. The % depression of elec. polarity by KCN in frog skin depends upon the concn. of KCN. The polarity can be reversibly depressed by KCN to about 40% of the normal value. Equal concns. of KCN depress both elec. polarity and velocity of cell oxidation in the same frog skin to the same % values of the normal. High concns. of O_2 in Ringer soln. antagonize the effect of KCN upon the elec. polarity of frog skin. Unequal velocities of reaction in the underlying chem. system probably det. the unequal effects of equal change in O_2 concn. on the polarity of apical and basal cells of the epidermis. C. H. R.

The properties of the gonads as controllers of somatic and psychical characteristics.
 X. **Spermatozoön activity and the testis hormone.** C. R. MOORE. Univ. Chicago.

J. Exptl. Zool. **50**, 455-94(1928).—Largely physiol. The testis hormone is responsible for prolonging the life of the spermatozoa within the epididymis. C. H. R.

General physiology of the heart. XI. Properties of "active substances," differences in their resistance to heat. JEAN DEMOOR. *Arch. sci. biol.* (Italy) **12**, 77-93 (1928); cf. *C. A.* **22**, 2594.—A review with 27 references to the literature is given. Further study is necessary before definite conclusions can be drawn as to the functions of the "active substances." These substances as isolated by different workers do not appear to be abs. equiv. The effect of heat on these substances is not the same in batrachians as in mammals. L. W. RIGGS

The blood pressure of Chinese in China and in the U. S. A. CHEN-LANG TUNG. Peking Union Med. Coll. *Chinese J. Physiol. Report Series* **1928**, No. 1, 93-6.

L. W. RIGGS

Pulse rates and ratios in Chinese students. H. S. D. GARVEN. Mukden Med. Coll. *Chinese J. Physiol. Report Series* **1928**, No. 1, 97-106.—The av. resting pulse rate in 60 Chinese students aged 19 to 29 years was 67.5 (range 50 to 101). The individual difference between the max. and min. of resting pulse rates varied between 21 and 31. Increase in atm. temp. increased the pulse rate in some but not in others. The pulse ratio test for phys. fitness showed a low av. efficiency among Chinese students. Some improvement in the pulse ratio occurred with an increase in atm. temp. L. W. RIGGS

Castration in the pigeon. ALEXANDRE LIPSCHÜTZ AND OTTMAR WILHELM. *Compt. rend. soc. biol.* **99**, 691-2(1928).—The plumage of pigeons remained normal 15 months after complete extirpation of the testicles. Accordingly the characteristic plumage of the male pigeon is not conditioned upon the testicular hormones. L. W. RIGGS

The cardiac hormones. G. KATZ AND E. A. LEIBENSON. *Compt. rend. soc. biol.* **99**, 695-6(1928). L. W. RIGGS

Composition of blood and the menstrual cycle. A study of sugar and phosphorus. CH. O. GUILLAUMIN AND H. VIGNES. *Compt. rend. soc. biol.* **99**, 749-52(1928); cf. *C. A.* **22**, 4637. **Calcium and potassium.** *Ibid.* 753-5. —No particular relations appear to be established between the sugar, P, Ca and K contents of the blood and the menstrual cycle. L. W. RIGGS

Evolution of potential in the fasting stomach. J. SWINGEDAUF. *Compt. rend. soc. biol.* **99**, 796-7(1928); cf. *C. A.* **22**, 2972. L. W. RIGGS

Starvation and glycogen in thyroidectomized dogs. I. I. NITZESCU AND MARIE BENETATO. *Compt. rend. soc. biol.* **99**, 896-7(1928).—Thyroidectomized dogs endured fasting longer and lost less liver and muscle glycogen than controls. L. W. RIGGS

Hemoglobin and its biologic role. JOSEPH BARCROFT. *Compt. rend. soc. biol.* **99**, Appendix to No. 25, 3-28(1928); cf. *C. A.* **22**, 2953. —B. gives a review and discussion with 65 references to the literature. L. W. RIGGS

Pancreatic secretion in disturbed gastric secretion. SEIZABURO OKADA, TSUNAMOTO IMAZU, KWANICHI KURAMACHI, MASAKA MATSUBARA AND TOSHIIO TSUKAHARA. *Proc. Imp. Acad. Tokyo* **4**, 423-4(1928).—The pancreatic secretion is not necessarily disturbed by disturbed gastric secretion. In some cases it is increased. The presence of HCl is not necessary to stimulate normal pancreatic secretory activity. It is probable that some powerful stimulating mechanism for this secretion other than secretin exists. L. W. RIGGS

Heart action in absence of oxygen. IV. Importance of the thyroid for the action of agents active upon the heart. WILLY KÖNIG. Westf. Wilhelms-Univ., Münster i. W. *Arch. exptl. Path. Pharm.* **134**, 29-35(1928).—The tests were made upon the hearts of guinea pigs from which the thyroid had been removed 18-35 days previously. The hearts of animals deprived of thyroid react to stimulating agents in the absence of O much as do the hearts of normal animals when O is lacking. Substances of the caffeine-adrenaline group which exhibit their action on the anoxidative phase of the metabolic process improve heart action but little if at all. Digitalis substances, whose action is assocd. with oxidative processes, cause as great or an even stronger effect than on normal hearts. These facts suggest that the thyroid is of particular importance in connection with anoxybiotic processes. G. H. S.

Fate of heterologous fats in the body. L. SCHIEFFER. Univ. Pécs. *Arch. exptl. Path. Pharm.* **134**, 66-73(1928).—Apparently under physiol. conditions heterologous fats are not deposited as such in the tissues. G. H. S.

Influence of a lipoid hypophyseal hormone upon deamination processes in the organs. RENZO AGNOLI. Kgl. Univ. Genua. *Arch. exptl. Path. Pharm.* **134**, 74-87(1928).—Exts. of the posterior lobe of the ox hypophysis exert no effect upon deamination of glycocoll when it is injected intravenously. Com. hypophysis prepns. are also

inert. Freshly prepd. exts. of the gland stimulate the processes, and lipoid exts. of either dried ox hypophysis or the fresh gland of swine are far more active. Conclusion: The anterior lobe of the hypophysis contains a hormone which stimulates processes of intermediary metabolism. G. H. S.

A particular function of the adrenals in male and female animals and of the testes in the male. HANS HANDOVSKY AND HEINRICH TAMMANN. Univ. Göttingen. *Arch. expil. Path. Pharm.* **134**, 203-11(1928).—Rabbits were subjected to bilateral adrenalectomy and detns. were later made of the carbohydrate, lactic acid and cholesterol of the muscle and of the cholesterol content of the liver. Particular attention was paid to the changes induced in relation to sex. The values for muscle carbohydrate were definitely above normal in the males and below normal in the females, and adrenalectomy somewhat increased the lactic acid of the muscle, particularly in male animals. Removal of testes or of ovaries did not modify the muscle carbohydrate. When, however, the animals were first castrated and later subjected to adrenalectomy data were obtained which indicate, that influenced by the germinal glands, the adrenals produce substances which are involved in the mechanism of carbohydrate metabolism. Apparently the active principles act in opposite directions, depending upon sex. G. H. S.

Physiology and pharmacology of the uterine musculature during the puerperium. HERMANN KNAUS. Univ. Graz. *Arch. expil. Path. Pharm.* **134**, 225-46(1928).—During the first day post partum the uterus begins to lose the properties developed during pregnancy and the altered response of the puerperal uterus to such substances as adrenaline, quinine, pituitrin and ergotamine is referable to the changed physiol. conditions obtaining at this time. G. H. S.

Humoral physiology of the frog heart. I. FRITZ KÜLZ. Univ. Kiel. *Arch. expil. Path. Pharm.* **134**, 252-6(1928). When the frog heart is perfused (in the early part of the year) some substance, inhibitory to the action of the frog intestine, is yielded up to the perfusion fluid. G. H. S.

Perfusion of isolated surviving organs. III. Mechanics of the secretion of urine in the surviving artificially perfused kidney. C. JACOBI AND LOTHAR LOEFFLER. Pharmacol. Inst. Tübingen. *Arch. expil. Path. Pharm.* **136**, 300-30. G. H. S.

G -PATHOLOGY

H. GIDEON WELLS

Immunological studies on various fractions of tubercle bacilli. MAX PINNER. Detroit Municipal Sanatorium, Northville, Mich. *Am. Rev. Tuberculosis* **18**, 497-501(1928). Various protein, phosphatide and fat fractions have been investigated as to their immunological behavior. The results with these chemically well-defined fractions confirm essentially previous similar work done with less pure materials. Probably the most important result is the fact that a phosphatide fraction was found to be a true antigen. H. J. CORPER

The Vernes flocculation test for tuberculosis. Results of 250 cases. ADELAIDE B. BAYLIS. Columbia Univ., New York. *Am. Rev. Tuberculosis* **18**, 513-9(1928); cf. *C. A.* **22**, 4612.—The Vernes flocculation test is of value in the detection of active tuberculosis. The test is of even greater value as a guide in treatment, especially in regulating the mode of life of relatively quiescent cases. It is not sp. for tuberculosis in a bacteriological sense, but is an extremely precise and delicate test, superior to other serological tests which have been employed in tuberculosis. H. J. CORPER

The treatment of pulmonary tuberculosis with a residual antigen: method of preparation and clinical results obtained. C. E. JENKINS. *British J. Tuberculosis* **22**, 126-36(1928).—By an elaborate method of ether extn., NaOH and pepsin digestion and H₂O₂ treatment, J. preps. a "residual antigen" from cultures of human and bovine tubercle bacilli grown on broth agar contg. 2% serum. The antigen is reported not to produce inoculation abscesses and the clinical results approach those with the residual antigens of other organisms. Approx. 1/3 of all cases of pulmonary tuberculosis can obtain appreciable benefit from this antigen. The original paper should be consulted for details. H. J. CORPER

The isoelectric point of the blood with especial reference to syphilis. RICHARD LUCHSINGER. Univ. Klinik Lausanne. *Z. ges. expil. Med.* **59**, 393-420(1928).—A study of the variations in sedimentation time of erythrocytes, cataphoresis and flocculation in various stages of syphilis. Bibliography. F. L. DUNN

A hypoglycemic symptom complex in rabbits. V. V. OPPEL. Militar-Medizinischen Akad. zu Leningrad. *Z. ges. expil. Med.* **60**, 86-101(1928).—An unknown

disease in rabbits which appeared in epidemic form and was characterized by marked prostration and death. The animals were hypoglycemic and the prostration was not relieved by injections of adrenaline. Petroleum ether exts. of the blood showed lowered values. F. L. DUNN

Physicochemical behavior of protein groups of pathological human blood and exudates purified by electrodialysis and studied as the sodium salt. I. The problem, characteristics of the proteinates, isoelectric point, specific viscosity, refraction and Tyndall effect. KARL HARTL AND WILHELM STARLINGER. Univsklinik in Freiburg. *Z. ges. expil. Med.* 60, 288-314(1928). II. Combination with bases, dissociation, mobility, conclusions. *Ibid* 315-35. F. L. DUNN

Theory of diabetes and the action of insulin. CARL OPPENHEIMER. *Pharm. Ztg.* 73, 1327-30(1928).—A discussion. W. O. E.

The blood sugar in tabes dorsalis. FANNY HALPERN AND H. KOGERER. Universitäts Klinik, Wien. *Wiener med. Wochschr.* 78, 910-11(1928).—Tabetic pains accompany high blood sugar values. The occurrence of painful crises in tabetics is, therefore, attributed to some faulty mechanism in carbohydrate metabolism.

Epilepsy after benzene poisoning. GEORG STIEFLER. Spital der Barmherzigen Brüder, Linz, Austria. *Wiener med. Wochschr.* 78, 938-40(1928).—A case is reported in which epilepsy followed benzene poisoning. ARTHUR GROLLMAN

The keeping qualities of specific anti-sera for the precipitin test. FRANK BAMPFORD. *Analyst* 53, 531-2(1928).—Anti-sera prepd. by the Lister Inst. and sent to Cairo in 1923 have been kept for 5 yrs. in an old-fashioned ice-chest with the temp. up to 15° during some days in the summer. On the other hand, recent samples from another manufacturer were useless when they reached Egypt. In still another case, samples were kept by mistake in a temp. of 30-35° for 12 days and were still potent. It appears, therefore, that temp. variations are not in themselves sufficient to account for the variations noted. Probably the trouble is caused by imperfect sterilization. W. T. H.

Fat, lipid and cholesterol constituents of adrenals and gonads in cases of mental disease. DENNIS L. WOODHOUSE. *Biochem. J.* 22, 1087-96(1928).—The percentage of fatty extractives from gonads showed less variation than that from the adrenals. The lowest adrenal content was found in dementia precox and the highest in senile dementia. BENJAMIN HARROW

Hemolysis by brilliant green and serum. ERIC PONDER. New York Univ. *Proc. Roy. Soc. (London)* B 103, 556-74(1928).—The mechanism of hemolysis in systems of this type is explained: "In the sensitization process, a compd. is formed between a protein component of the red cell membrane and either the brilliant green itself or its leuco base. On the subsequent addn. of serum, the serum proteins react with the combined dye in the system to form a hemolysin, which can react with the protein component referred to, and which thus brings about lysis. It will be observed that this hypothesis contains 2 essentials, the first being that the hemolytic reaction is really composed of 2 consecutive reactions, and the second being that the new lysin formed by the combination of the serum proteins and the dye acts upon the same cell component as that to which the dye is united. The dye thus acts as an 'amboceptor' in an unusually strict sense of the term, for it brings together the cell component and the serum proteins by first uniting with the former and then uniting with the latter" JOSEPH S. HEPBURN

Elimination of the normal ring at the boundary of a plant antigen and normal serum by the precipitin ring method. E. HANNIG AND W. SLATMANN. *Planta abt. F., Z. wiss. Biol.* 5, 135-58(1928).—If a phosphate mixt. is added to a plant antigen, the formation of a non-specific ring at the boundary of normal serum and antigen is prevented without at the same time destroying the immune reaction. The success of the reaction depends upon the proper p_H of the phosphate mixt. and also upon the amt. of mixt. added to a given antigen. These values must be detd. for each antigen. For the particular expts. reported p_H 6.5 gave the best results (5 cc. $M/1H_2PO_4$: 6.8 cc. 1.5 M KOH). By the phosphate ring method it is possible to obtain the immune reaction at a greater concn. and in a shorter time than with Mez's modified ring method. It is believed that the normal antigen rings are not caused by normal precipitins as has been supposed, because these rings may be eliminated by a phosphate mixt. without injury to the immune ring. The phosphate procedure is applicable to the capillary method. A. E. HIRCHCOCK

Tapeworm anemia. Therapeutic observations. RAPHAEL ISAACS, CYRUS C. STURGIS AND MILLARD SMITH. Thomas Henry Simpson Memorial Inst. for Medical

Research, Univ. of Michigan. *Arch. Internal Med.* 42, 313-21(1928).—"A case of *Dibothryocephalus latus* (*diphyllobothrium latum*) anemia is described in which the blood picture, increase in bilirubin, achlorhydria, fever, neurologic and other clinical symptoms were indistinguishable from those of pernicious anemia. The patient's mother had died of pernicious anemia. It was found possible to cause a hematopoietic remission with disappearance of symptoms by feeding *liver* daily even though the parasite was not removed. Removal of the parasite which was effected later by the administration of oleoresin of aspidium accompanied the continuance of the convalescence. Evidence for the presence of sol. toxins was not obtainable from intradermal tests with saline suspensions of the tapeworm."

MARY JACOBSEN

Pancreatogenous fatty diarrhea. Report of a case. T. E. HESS THAYSEN. St. Elizabeth Hospital, Copenhagen. *Arch. Internal Med.* 42, 352-67(1928).—A man of 43 presented azotorrhea and steatorrhea without permanent or alimentary glucosuria. The hemoglobin content was 70%. The lipolytic and tryptic activity of the duodenal juice at pH 7 was very slight; the diastatic activity was normal. The pancreas showed rows of shadows in the ducts. The patient improved on a diet contg. 124 g. albumin, 136 g. fat and 268 g. carbohydrates daily. He lost 77.3 g. fat and 54.3 g. albumin daily, showing a balance of 265 calories over his basal metabolic requirements. When contrasted with the extreme waste of protein and fat in pancreatectomized dogs this utilization suggests that the pancreas regulates metabolism by means of an internal secretion. Fatty diarrhea is difficult to explain on the basis of incomplete hydrolysis, sapon, or emulsification of fats. Possibly the pancreas controls the absorptive power of the intestine by a secretion circulating in the blood. In another patient with fatty diarrhea and diabetes who was cured of the former a year before death, autopsy revealed an almost complete atrophy of the pancreas.

MARY JACOBSEN

Chemical analysis of blood in patients having senile cataract. CECIL S. O'BRIEN AND VICTOR C. MYERS. State Univ. of Iowa. *Arch. Internal Med.* 42, 376-8(1928).—The blood of 54 patients was normal except for a slightly increased cholesterol content in 54% cases.

MARY JACOBSEN

Functional insufficiency of the suprarenal glands. C. A. MILLS. Peking Union Med Coll. *Arch. Internal Med.* 42, 390-408(1928).—A report of 40 cases of a disease common in the tropics and in the Orient, especially among foreigners and directly traceable to the heat and humidity. It is characterized by marked vascular hypotension, moderate anemia, hypo- or achlorhydria and gastric hypermotility with symptoms often simulating chronic appendicitis, peptic ulcer or tuberculous meningitis. Hypoglycemia with high sugar tolerance, edema, urticaria, pigmentation of the skin, weakness, loss of wt. and menorrhagia were also observed. It is promptly and completely relieved by the oral administration of *adrenaline*. Autopsy in 1 case revealed changes in the adrenals similar to those seen in animals exposed to moist heat. Hypoadrenalism is a distinct disease entity as is hypo- or hyperthyroidism. Many cases of so-called *sprue* are probably adrenal insufficiency.

MARY JACOBSEN

Pernicious anemia. Edema and reduction in excretion of water. E. MEULENGRACHT, POUL IVERSEN AND F. NAKAZAWA. Bispebjerg Hospital, Copenhagen. *Arch. Internal Med.* 42, 425-39(1928).—"In pernicious anemia edema frequently occurs and the water test often shows a reduction in the excretion of water. These symptoms are present during a relapse and disappear during a remission. It does not seem probable that the symptoms are caused by impairment of the function of the kidneys or by the low amt. of hemoglobin. In many instances a decrease in the total protein with a lowering of the colloidal osmotic pressure in the plasma was found. The latter often occurs in the critical zone of the origin of the edema and may therefore be a contributing factor in the production of edema and probably as well of the reduction in the excretion of water in pernicious anemia. One or more addnl. factors must also be present, however, possibly dilatation of the heart or an increased permeability of the capillary walls."

MARY JACOBSEN

The dextrose tolerance test. Its use in the determination of the severity of diabetes mellitus. MAX. WISHNORSKY. Jewish Hospital, Brooklyn, N. Y. *Arch. Internal Med.* 42, 443-52(1928).—"Various methods for detg. the severity of diabetes are discussed. Classification which takes into account only the amt. of glucosuria is fallacious, for insulin is concerned with the metabolism of all foods—carbohydrates, proteins and fats. Such classifications are also vitiated by the fact that the renal threshold of dextrose is different for each person. A high renal threshold which acts as a compensating mechanism would mask a severe case. The dextrose tolerance test as a method of detg. the severity of diabetes is considered. It is shown that the amt. of glucosuria occurring during the test cannot be taken as an index of the severity

because of differences in renal threshold in different individuals. The height of blood-sugar curve in such tests may be accepted as a criterion of the gravity of diabetes.

MARY JACOBSEN

The intracellular hemagglutinins. TADAO KUBO. Hokkaido Imp. Univ. *Jap. Med. World* 8, 148-53(1928).—The hemagglutinative substance in the ext. of red cells is a sort of hemagglutinin because it can be absorbed by erythrocytes and taken out in physiol. saline soln. Agglutination occurs at room or lower temp. and shows thermoreversibility. Intracellular agglutinin is found in the red corpuscles of rabbit and guinea pig but not in those of man, fowl, pig or cattle blood.

N. KOPELOFF

The calcium and potassium content of blood serum and experimental epilepsy in dogs. V. ZAGAMI. *Arch. sci. biol.* 11, 301-32(1928).—Healthy dogs were used and epilepsy by afferent stimuli was detd. by Amantea's technic. Ca and K were detd. by the Kramer-Tisdall method. The relation between epilepsy and thyroid-parathyroidectomy was also studied. The results are reported in 8 tables from which Z. derives the following facts. (1) In predisposed dogs the Ca content of blood serum is only slightly less than that of the non-susceptible animals, while K is noticeably less in the former than in the latter. The ratio $\frac{Ca \times 100}{K}$ is larger in the predisposed than in the nonsusceptible animals. (2) Epileptic fits whether by afferent stimuli in the susceptible animals, or by faradization of the sigmoid centers in the non-susceptible, cause an increase of Ca and, therefore, a diminution of the ratio $\frac{Ca \times 100}{K}$. (3) Similar but more definite increases of Ca and K are caused by strychnine. (4) Thyroid-parathyroidectomy produces definite variations; there is a very marked diminution of Ca and an increase of K. The importance of the ratio $\frac{Ca \times 100}{K}$ is stressed as being an excellent means of detecting small differences which would be less evident if the values of Ca and K alone were compared. The results indicate that this ratio is higher in dogs susceptible to epilepsy by afferent stimuli. The values of the ratio $\frac{Ca \times 100}{K}$ are schematically given as:

dogs not predisposed :			: dogs predisposed		
min.	med.	max.	min.	med.	max.
27.82	38.10	48.38	42.48	49.97	61.19

PETER MASUCCI

Cholesterol in malaria patients. P. SEV. *Boll. so. ital. biol. sper.* 3, 371 (1928).—Cholesterol was detd. in 36 cases of malaria. The results indicate that in malaria there is a hypocholesterolemia. The intensity is proportional to the vol. of the spleen.

PETER MASUCCI

Certain modifications of the plasma in hepatic necrosis. G. PELLEGGRI. *Boll. soc. ital. biol. sper.* 3, 417-8(1928).—Data are given for total protein, fibrin, serum-globulin, serum albumin and protein osmotic pressure in cases of cirrhosis of the liver. There was a diminution of the total protein in the plasma.

PETER MASUCCI

The lactic acid content of cerebrospinal fluid. G. MARGRETH. *Boll. soc. ital. biol. sper.* 3, 518-9(1928).—The lactic acid content in normal and pathological cerebrospinal fluid was detd. by the Mendel-Goldscheider method. The normal contained 16-18; tubercular spinal fluids 41-60; one myelitic meningitis 24.5; one tabes 25.75 and one luetic 16.25 mg. %.

PETER MASUCCI

The so-called renal diabetes from phlorhizin. MARIO CAPOCACCIA. *Boll. soc. ital. biol. sper.* 3, 597-601(1928).—Intramuscular injections of phlorhizin were made into guinea pigs. The animals were sacrificed at various intervals and a histological examn. was made of the various organs. The urine was examd. for glucose, acetone and β -hydroxybutyric acid. Besides the usual typical renal lesions, 20% of the animals showed lesions in the pancreas. A detailed histological description of this organ is given. The anatomo-pathological picture was somewhat similar to that in diabetes mellitus. The conception that phlorhizin glucosuria is of renal origin is questioned.

PETER MASUCCI

Experimental hemolysis studies. II. K. KLINKE. Univ. Basel. *Biochem. Z.* 197, 381-403(1928).—The hemolysin is adsorbed on the red blood cells where it somehow acts upon the lipid and affects the structure of the membrane, this making the lysis possible. This consists in the adsorption of the loosened fragments of the membrane on the euglobin fraction of the serum.

S. MORGULIS

Preparation of active protein from a precipitating anthrax serum. G. ROSENHOLZ. Inst. exptl. Veterinary, Moskow. *Zhurnal exptl. Biol. Med.* 10, 109-11(1928).—Globulin obtained from a pptg. anthrax serum has specific pptg. properties. The globulin is pptd. through diln. of the serum with distd. water, and the ppt. has quantitatively the pptg. activity of the genuine serum. Because of the ease with which the globulin can be obtained and kept in the dry state, its diagnostic use will undoubtedly supercede that of the anthrax serum.

S. MORGULIS

Death by hypoglycemia in acute trypanosomiasis. A. DUBOIS. *Compt. rend. soc. biol.* 99, 656-7(1928).—Expts. with mice and guinea pigs subjected to exptl. acute trypanosomiasis indicated hypoglycemia as the immediate cause of death.

L. W. RIGGS

Action of ultra-violet rays on the elaboration of bacterial agglutinins. Reduction and suppression of the latent phase. A. BESSEMANS AND A. SELDESCHLACHT. *Compt. rend. soc. biol.* 99, 628-30(1928).—Rabbits injected with an emulsion of typhoid bacilli and subjected to ultra-violet irradiation showed a larger titer of agglutinins than non-irradiated animals.

L. W. RIGGS

Schick reaction applied to the production of serums in horses. J. CELAREK AND W. PORĘBSKI. *Compt. rend. soc. biol.* 99, 1017-8(1928). Sensitivity of horses to streptococcic toxins. *Ibid.* 1019-20 Titration of antiscarlatinous serum. *Ibid.* 1020-1.

L. W. RIGGS

Lesions of the spleen produced in the rabbit by painting with tar. A. BABES AND (MME.) LAZĂRESCO-PĂNĂZU. *Compt. rend. soc. biol.* 99, 1077-9(1928).—A histological study.

L. W. RIGGS

Action of intravenous injections of biliary salts on the rhythm of the normal human pulse. DUMITRESCO MARTE AND D. HAGIUSCO. *Compt. rend. soc. biol.* 99, 1087-8(1928). While intravenous injections of mixts. more of taurocholate and glycocholate 1 to 7 cause only a slight bradycardia, a mixt. more concd. in taurocholate (1 to 2) causes a more pronounced and persistent bradycardia.

L. W. RIGGS

Identity of the urinary proteins of nephritis. WILLIAM H. WELKER, EDMUND ANDREWS AND WILLIAM THOMAS. *J. Am. Med. Assoc.* 91, 1514-4(1928).—Blood serum proteins, albumin, pseudoglobulin and euglobulin constitute an important part of the urinary proteins in nephritis. Peptones are eliminated either in chem. combination or adsorbed by these blood proteins. Some blood protein, the dispersion of which has been increased, is eliminated and this protein is toxic. Possibly the elimination of blood proteins can be explained on the basis that the body uses this means for detoxifying the split protein products and then the kidney removes them from the blood because they now resemble in part foreign proteins.

L. W. RIGGS

Chemical factors in the toxemias of intestinal obstruction. THOMAS G. ORR AND RUSSELL L. HADEN. *J. Am. Med. Assoc.* 91, 1529-30(1928).—The characteristic chem. changes in the blood in acute pyloric and upper intestinal tract obstruction are an increase in the nonprotein N, a decrease in the chlorides and a rise in the CO₂ combining power of the plasma. The relations of these and other changes to the clinical conditions are discussed. These studies have led directly to the recognition that a sufficient quantity of water and NaCl is imperative to combat the dehydration and toxemia incident to such obstruction.

L. W. RIGGS

Filterability of hydatid antigens. C. H. KELLAWAY, N. HAMILTON FAIRLEY AND I. ELEANOR WILLIAMS. Walter and Eliza Hall Inst. *Australian J. Exptl. Biol. Med. Sci.* [3], 5, 189-204(1928).—Ultra-filtrates from hydatid fluid in pyroxylin membranes hardened in 50 and 60% alc. do not contain any antigenic substances detectable by complement fixation, anaphylactic or intradermal tests, nor do they give chem. reactions indicative of the presence of protein. With more permeable membranes hardened in 70 and 80% alc. the ultra-filtrates give positive Spiegler and hemochromogen reactions, react well in anaphylactic expts. and give positive intradermal tests in patients infested with hydatid. They yield only feeble complement fixation reactions with pos. hydatid sera. Though these last membranes do not permit the passage of protein when sheep serum is filtered through them, traces of sheep serum protein are present in ultra-filtrates from hydatid fluid.

Chemotherapy of tuberculosis. I. ERICH HESSE, GERTRUD MEISSNER AND GERHARD QUAST. Univ. Breslau. *Arch. exptl. Path. Pharm.* 135, 82-110(1928).—From among a very large no. of dyestuffs tested for their capacity to stain tubercle bacilli under a variety of conditions, the basic derivs. of the triphenylmethane, azine and thiazine series were found to be possessed of a definite affinity for the organisms. These dyestuffs are capable of effecting a staining of the bacilli *in vivo*; hence it might be assumed that such a union with the organisms would damage the bacteria and thus

be of therapeutic value. No direct therapeutic expts. were performed, but *in vitro* bactericidal tests with the dyestuffs indicated that certain of the stains were effective, both in inhibiting growth and in actually destroying viability. G. H. S.

Experimental study of the death resulting from burns. G. RIEHL, JR. Univ. Wien. *Arch. expil. Path. Pharm.* 135, 369-84(1928).—Guinea pigs subjected to burning, while under ether narcosis or lumbar anesthesia, exhibit a gradual outpouring of adrenaline from the adrenals and a simultaneous increased appearance of free choline derivs. These facts account for the histological changes observed in the adrenal. This outpouring of adrenaline is not great during the first hr. after the injury, and in decerebrate cats a like injury shows the adrenaline content of the glands decreases but slowly during a period of from 2 to 9 hrs. But although an abundance of adrenaline can be detected in the glands by biol. methods, choline derivs. can also be found in exts. of the adrenals. Changes in the adrenals could in no case be assumed to be the primary cause of death. The vascular system of burned animals, sooner or later, lost its characteristic response to substances such as adrenaline and cholazyl, as well as to cardiazole. The gradually falling blood pressure could be increased only by such agents as hypertonic sugar solns., and, in some instances, by ext. of the posterior lobe of the hypophysis. There is no obvious connection between the behavior of the vascular system and the changes observed in the adrenals. G. H. S.

Relationship between the formation of antibodies and various experimental forms of anemia. AKINOSUKE IWATA. *Acta Schol. Med. Univ. Imp. Kyoto* 9, 485-510 (1927).—Immunization was achieved by repeated injections of typhoid bacteria. Three months were allowed for the agglutinin to attain constancy. Anemia was then induced by blood poisons and bleeding. In rabbits exhaustion resulted but the agglutinin value increased. Leucocytes increased and paralleled the agglutinin. Young blood cells increased in no. The stimulation of the hemapoietic tissue by blood poisons or bleeding favors the formation of agglutinin. Agglutinin formation did not change from the normal when typhoid bacteria were injected in anemias caused by blood poisons but in bleeding anemias it decreased. Agglutinin value once increased after injection of typhoid bacteria was unaffected by blood poison injection and bleeding. From this it is assumed that the hemapoietic tissue was stimulated. J. T. W.

The effects of thyroxine injections on the suprarenal glands of the mouse. MARY I. PRESTON. Stanford Univ. *Endocrinology* 12, 323-4(1928). H. J. DEUEL, JR.

Plant extracts with an insulin action. III. Bean-pod extracts. (Phaseolin.) E. KAUFMANN. *Z. ges. expil. Med.* 60, 285-8(1928); cf. C. A. 23, 198.—Material obtained in 1926 showed a definite lowering of the blood sugar in rabbits while material obtained in 1927 showed it only very slightly. K. suggests that this may be due to variations in ripening, season, etc. F. L. DUNN

Fatal case of acute lead poisoning. A. BRÜNING AND B. KRAFT. *Arch. Pharm.* 266, 501-4(1928).—Acute Pb poisoning cannot be detd. by sectional examn. alone, but must be accompanied by a chem. examn. of portions of the cadaver. When introduced orally into the body, the Pb is found chiefly in the stomach and intestines, less so in the large glands. Fühner's procedure and destruction of cadaver material with nitrosulfuric acid (and slight addn. of KMnO_4) shortens the detection of Pb materially, and yields sufficiently dependable results provided the quantities of Pb are not too minute. W. O. F.

The action of certain narcotics on the saponification of fatty acids. M. CHIO AND M. PIRAS. *Boll. soc. ital. biol. sper.* 3, 359-62(1928).—Twenty-five cc. 0.004 N NaOH was placed in each of 5 separatory funnels. One tube served as control; to the other 4 were added, resp., 5 drops EtOH , Et_2O , CHCl_3 and chloral hydrate in aq. soln. 20%. The tubes were shaken and then 3 drops of olive oil was added to each at an interval of 10 min. between each tube. The tubes were then shaken at definite intervals and samples taken for nephelometric measurements. The turbidity was taken as an index of the quantity of soap formed. The 4 narcotics have the property in common of accelerating the action between NaOH, or Na_2CO_3 and fatty acids. P. M.

The position of the carbon and oxygen coefficients of rabbit urine following injections of "präphysonin." A. ALLEN GOLDBLOOM. Univ. Berlin. *Biochem. Z.* 199, 202-6(1928).—Injections of a prepn. of the anterior lobe of the hypophysis produced

alterations in metabolism which are not invariably shown by a parallel change in the C/N and O/N urinary ratios. Both should be detd. S. MORGULIS

Distribution of India ink in the organs of the guinea pig after intraperitoneal injections. C. CRISAN. *Compt. rend. soc. biol.* 99, 1074-6(1928).—A histological study. L. W. RIGGS

Action of strychnine on the absolute strength of the frog heart. ITARO KIKUCHI. *Tôhoku Univ. Tôhoku J. Exptl. Med.* 11, 407-9(1928).—Strychnine perfused in Ringer soln. in concns. of 1:100,000 to 1:50,000 increased the abs. strength of the frog heart as compared with the heart pressures under perfused Ringer soln. alone. L. W. RIGGS

R. A. GORTNER

Oxygen capacity of the blood of certain invertebrates which contain hemoglobin. NAOKYUKI KAWAMOTO. *Marine Biol. Sta., Asamushi, Aomori-Ken. Science Repts. Tôhoku Imp. Univ.* [4], 3, 561-75(1928).—The values of t_h (O tension at which half satn. occurs) of the blood of *anadara* and the perivisceral fluid of *caudina* are 10 mm. and 8 mm., resp., and such small values show an adaptation of the animals to their habitats. The O capacity of the blood of *anadara* does not increase proportionally to the increase of the O capacity of the serum within the range between 50 and 150 mm. of O pressure. This fact may mean probable influence of electrolyte in the blood. The irregular forms of red corpuscles found in the perivisceral cavity in the water vascular system can be considered as the result of degeneration of round biconvex corpuscles found in the blood vessels. The perivisceral fluid of *caudina* plays an important role in the respiratory function of the animal as a whole. The O capacity of the serum of *anadara* and of *caudina* is greater than that of sea water. The dissociation curves of the blood of *anadara* and *caudina* are satisfactorily represented by Hill's equation (*C. A.* 5, 1622). The value of n given by the perivisceral fluid of *caudina is less than one and the writer suggests that the degenerative state of the blood corpuscles might be partly responsible for such an anomaly. The hemoglobin content of the blood of *caudina* increases according to the size (age?) of the shell. D. D.*

Effect of halogen compounds on the growth of the tadpole of *Bufo vulgaris formosus*. E. SHINRYO OHSUCHI. *Biol. Inst. Tôhoku Imp. Univ. Science Repts. Tôhoku Imp. Univ.* [4], 3, 625-46(1928).—Fifty tadpoles each were cultured in pond-water 0.0001 M in NaCl, KCl, NaBr, KBr, NaI and KI with the following results: "The compds. of the same anion show close resemblance in influencing the body weight and dimension in comparison with those of other anions. In the earlier part of the expt., before entering the metamorphosis, the body weight and dimensions are always larger in the chlorides than in the other compds., except the depth of the tail axis; but in the later part Br > Cl > I is the definite order, except in the cases of the tail and total length which are always Cl > Br > I. The above orders become more or less irregular after entering the metamorphosis. NaCl accelerates the growth of the hind limb. In general, the chlorides tend to accelerate, but later to retard the growth of the body. The bromides generally tend to retard at first and then to accelerate the growth of body and of the hind limb, though KBr acts suddenly in decreasing the depth of tail and the width of the trunk after entering the metamorphosis. In general, the chlorides retard the growth of the trunk and of the hind limb, but tend rather to increase the tail dimensions, indicating a prolongation of the period of tail atrophy. The acceleration of metamorphosis is not obvious in KI, while it is very acute in the expt. feeding *Thyroides siccum*." DAVID DAVIDSON

Effect of inorganic salts on photic orientation in *Alloleobophora foetida* (Sav.). IV. Iodides and bromides—NaI, KI, NaBr and KBr. IKITARO NOMURA AND SHINRYO OHSUCHI. *Biol. Inst., Tôhoku Imp. Univ. Science Repts. Tôhoku Imp. Univ.* [4], 3, 647-53(1928); cf. *C. A.* 22, 2997.—The animals were submerged in 1/1.9 N solns. of NaI, KI, NaBr and KBr as well as in mixts. of these solns. and the effect on the positively orienting functioning of the ventral nerve cord or the negatively orienting functioning of the brain was noted. "In the ventral nerve cord, NaI and NaBr cause a weakening of positively orienting functioning, while KI and KBr cause a strengthening at first and then a weakening. In the brain, NaI and NaBr cause a weakening of negatively orienting functioning, while KI and KBr cause a strengthening at first and then a weakening. In NaI + KI, the general tendency of change in positive

orientation appears mainly to follow that of the worms placed in KI, while the change in negative orientation follows mainly that in NaI. In NaBr + KBr, the general tendency of change in orientation appears mainly to follow that occurring in NaBr. In all the cases, the backward crawling is caused mainly by a relative weakening of forward crawling functioning in the ventral nerve cord. The returning movement is caused by a functioning of the brain. In NaI, KI and KBr the movement becomes frequent at the beginning of submergence, while in NaI + KI, NaBr and NaBr + KBr it becomes less. In all the cases except that of NaBr, the winding movement becomes frequent after the submergence."

DAVID DAVIDSON

The influence of fasting on the chemical composition of Anguilla. T. VIEWEGER. Univ. Libre de Pologne, Varsovie. *Arch. intern. physiol.* 30, 133-45(1928).

H. J. DEUEL, JR.

The chronaxie of the nerves and muscles in the insulinized frog. J. M. D. OLMSTED. Liege. *Arch. intern. physiol.* 30, 202-4(1928).—No change in the chronaxie of the heart or the gastrocnemius muscle of an insulinized frog was found even at the height of convulsions. The excitability of the motor nerve did not change before the convulsions but it may be more excitable during the convulsions since the chronaxie is slightly higher immediately following them.

H. J. DEUEL, JR.

Further investigations concerning the specific action of salts in the extraction of urease from amebocytes of *Limulus*. LEE LOEB, I. LORBERBLATT AND MADELEINE E. FIELD. Washington Univ., St. Louis, and Marine Biol. Lab., Woods Hole. *J. Biol. Chem.* 78, 417-31(1928); cf. *C. A.* 21, 2337. —The efficiency coeffs. (cc. 0.04 M HCl neutralized by NH_3 formed when 25 cc. urease ext. is allowed to stand with 25 cc. 1% urea soln. for 22 hrs.) differed with the salt soln. employed for extn. of urease from the amebocyte tissue of *Limulus*. H_2O was least efficient, the efficiency coeff. (e. c.) = 0.48, while the salts of alkali metals in low concn. (0.50 M) were slightly better (NaCl, 2; KCl, 2). The bivalent salts of the alk. earth metals in 0.38 M concn. were far superior (CaCl_2 , e. c. = 130; SrCl_2 , 102; BaCl_2 , 80; MgCl_2 , 37; MnCl_2 , 10) although Cu and Zn were almost ineffective (CuCl_2 , 2; ZnCl_2 , 0.66). The trivalent anions or cations were very inefficient in the extn. of urease (FeCl_3 , 2; AlCl_3 , 0.00; $\text{La}(\text{NO}_3)_3$, 0.44). Sea water was somewhat effective (e. c. = 4) while 0.5 M NaCl with 1% gelatin gave an e. c. of 4, with 2% gum arabic soln., 5, and with 2% boiled starch soln., 1. Values for 0.38 M Na_2SO_4 and K_2SO_4 were 2 and for Na citrate 1. In higher concn. the salts of the alk. earth metals were more toxic and less efficient in the extn. of urease. The salts of the alkali metals become more effective at higher concns. (up to 2.0 M). It appears that one is dealing with an osmotic effect rather than a specific chem. effect because solns. of nonelectrolytes as glycerol become more effective in higher concns. The higher osmotic pressure probably retards the deleterious reaction of the H_2O on the enzyme. The extn. of urease by 0.5 M NaCl soln. was influenced by the addn. of HCl or NaOH as follows: 0.5 M NaCl alone, 1; in 0.001 N NaOH, 9; in 0.005 N NaOH, 52; in 0.0125 N NaOH, 20; in 0.05 N NaOH, 1; in 0.00033 N HCl, 36; in 0.001 N HCl, 30; and in 0.002 N HCl, 6. The addn. of optimal amts. of CaCl_2 to NaCl exts. or the addn. of sufficient NaCl to produce an optimal concn. of NaCl does not increase the activity of the ext. On the other hand, the addn. of CaCl_2 to MgCl_2 exts. increases the activity of the prepn. in proportion to the CaCl_2 added. When mixts. of NaCl and CaCl_2 or of MgCl_2 and CaCl_2 are used for extn., the results are intermediate between those of the individual constituents of the extn. medium, being higher with greater proportions of CaCl_2 and lower the greater the ratio of MgCl_2 and especially of NaCl in the medium. When NaCl is added to CaCl_2 exts., there is a lowered efficiency in proportion to the NaCl added. Addn. of salts of heavy metals decreases the efficiency coeffs. of CaCl_2 as follows: 0.38 M CaCl_2 alone, 131; with 0.5 M NaCl, 56; with 2.0 M NaCl, 29; with 0.38 M CuCl_2 , 0.72; with 0.30 M FeCl_3 , 0.48; 0.285 M CaCl_2 alone, 164; with 0.095 M MgCl_2 , 108. With 0.38 M BaCl_2 soln. the results were as follows: BaCl_2 alone, 119; with 0.5 M NaCl, 69; with 0.38 M ZnCl_2 , 0.40; with 0.38 M CuCl_2 , 2 and with 0.38 M FeCl_3 , 0.64. Similar results were obtained with 0.38 M SrCl_2 soln., the efficiency coeff. of this ext. alone being 127 and with 0.5 M NaCl 94. It is assumed that urease, a substance closely allied to it, or a substance markedly influencing its activity, unites with the various cations and that the efficiency coeffs. of urease when in these combinations vary. Ca, Sr or Ba is more potent than the Mg compd. but the latter preserves the urease in such condition that the Ca may subsequently replace the Mg and activate it further. In combinations with the alkali metals the enzyme is so bound that a reversible reaction is not possible when CaCl_2 or MgCl_2 is added. The addn. of MgCl_2 or CaCl_2 to a NaCl soln. must precede the extn. if it is to be effective. The specific effect of the salts depends on their interaction

with the enzyme or with a specifically assocd. substance after it has been liberated from the tissue rather than on a difference in extn. There are 3 different modes of salt effects on the interaction of salt and urease: (1) combinations of actions with enzyme or closely assocd. substance in which alk. earth metals are the best cations; (2) injurious salt effects of non-specific character in which the salts of heavy metals are most potent followed by alk. earth and alkali metal salts and (3) the osmotic effects of the salts. Increased osmotic effects of salts and nonelectrolytes act favorably on the enzyme. The results may not apply to other enzymes extd. from the amebocyte tissue nor to urease extd. from other sources.

H. J. DEUEL, JR.

The effect of insulin, thyroxine and temperature on the sugar metabolism of *Paramecium*. W. E. BURGE AND A. M. ESTES. Univ. Ill. *J. Metabolic Research* 7-8, 183-6(1925-6).—The glucose metabolism of the unicellular organism, *Paramecium caudatum*, was increased by excessive doses of insulin while thyroxine exerted no effect on the carbohydrate metabolism in moderate amts. With large concns. of this hormone the carbohydrate oxidation was decreased, presumably because of the toxic effect of this substance. The carbohydrate utilization was decreased by low temp. and increased by higher temp. in the same way as the general metabolism of the cold-blooded animals is influenced.

H. J. DEUEL, JR.

The action of amines upon the smooth muscle of leeches. JULIUS ORIENT. Univ. Cluj (Klausenburg) Rumänien. *Z. ges. expl. Med.* 59, 540-7(1928).—The NH_4 ion has an irritating action upon smooth muscle followed by paralysis. The effect is least marked in $(\text{NH}_4)_2\text{SO}_4$ and most marked in NH_4CNS . In leeches the toxicity of the amines increases as alkyl radicals are substituted, when the free base is used. The salts were inactive. Guanidine was strongly toxic.

F. L. DUNN

Insect poisoning from arsenic in smoke. H. POPP. *Z. angew. Chem.* 41, 805-6(1928).—Bees in the neighborhood of metal works were thought to be poisoned by As settling from the smoke. Examn. of 5 g. of bees showed over 0.1 mg. As. The lethal dose for bees was detd. as about 0.002 mg. per bee or 27 mg. As per kg.

C. R. F.

The physiology of ciliary movement in actinians. I. The action of hydrochloric and acetic acids. CARLO IUCCI. *Arch. sci. biol.* (Italy) 12, 623-39(1928).—The acoutium of *Sagartia bellis* was used; the duration of the time of resistance of ciliary movement was taken as an index of the action of the acid. The movements were observed microscopically from the time of immersion to the arrest of ciliary motion. For HCl at p_H 2.5 the results may be approx. expressed by the formula: $T = K - 1/\text{CH}^+$; the time of resistance is inversely proportional to H-ion concn. For acetic acid the activity of the solns. is greater than that of HCl of the same p_H ; it increases with increasing concn. At p_H 4.5 the time of resistance in HCl is more than 3 hrs. and that in 0.01 N AcOH is 7-8 min. and in 0.1 N it is less than 10 seconds. This behavior is explained by the fact that besides the H ions there are also undissocd. AcOH and Na^+Ac^- mols. penetrating into the cell, although at a lower velocity.

The effect of oxidation potentials and of hydrogen-ion concentration on the multiplication of protozoa and alteration of their species. V. V. EFIMOV, N. I. NEKRASSOV AND A. V. EFIMOV. Timirjasev Research Inst., Moscow. *Biochem. Z.* 197, 105-18(1928). A hay infusion undergoes definite physicochem. changes on standing. The conductivity of the fluid increases very rapidly in the first 2-3 days but much more slowly afterward. There is at first an acid reaction which changes to a more alk. reaction, depending on how long the infusion has been standing and may even become $p_H = 8.0$. The oxidation potential shows at first a high reducing power but the fluid becomes more and more oxidizing and attains an $r_H = 35$. These physicochem. changes of the infusion are accompanied by an alteration in the rate of multiplication of various infusoria. *Paramecium caud.* multiplies until its population attains a max. of 1000-2000 per cc., then they diminish in number until only a few are present. In their place *Spirostonium ambig.* appear in constantly increasing numbers to give place to *Bursaria tr.* It is thus apparent that each species must have its own opt. physicochem. conditions.

S. MORGULIS

Observations on the gases of the blood of carp. HELENE WASTL. Univ. Wien. *Biochem. Z.* 197, 362-80(1928).—The O_2 and CO_2 dissocn. curve of defibrinated and oxalated carp blood was detd., the gas analyses being made with Van Slyke's const.-vol. app. The O_2 content of normal arterial blood varied between 7.98 and 11.80 vol. % (av. 9.51%), the CO_2 av. 44.86%. The O_2 capacity is very variable. The O_2 -dissocn. curve, especially under low O_2 tension, is much steeper than in the corresponding curves for warm-blooded organisms, and the effect of CO_2 on the O_2 dissocn. is very marked. The CO_2 -dissocn. curve for carp blood is much flatter and lower

than that of warm-blooded animals or frogs. No difference was observed between defibrinated and oxalated bloods. The CO_2 -dissocn. curve is distinctly different for the reduced or fully oxygenated carp blood. The carp blood has a much lower buffer value than warm blood.

S. MORGULIS

Studies on fish bile. III. The bile of *Cyprinus carpis*, *Carassius auratus*, *Au-guilla japonica* and *Anago anago*. TAKUICHI HATAKEYAMA AND TAKEJI OKAMURA. *Physiol.-Chem. Inst., Okayama. J. Biochem. (Japan)* 9, 333-5(1928).—The bile of the enumerated fish contains taurocholic acid.

S. MORGULIS

Response and adaptation of insects to external stimuli. WILLIAM ROBINSON. *Univ. Minn. Ann. Entomol. Soc. Am.* 21, 407-17(1928).—When water is adsorbed on tissue colloids its properties are changed with a consequent change in the physiology of the organism. Colloid-bound water differs from free water as a solvent for certain compds. in its f. p., compressibility, elec. conductance, and probably in its effect upon enzyme activity. Any condition which changes the amt. of bound water in an organism may have considerable effect upon response and adaptation. The elec. charge on the colloidal particles greatly influences the thickness of the layer of adsorbed water. This charge is affected by the H-ion concn. When the temperature commences to fall some kinds of colloids adsorb more water whereas others lose water. The possession of one or the other type of colloid by an organism determines, in some cases, whether the species can endure winter temps. Three types of insects were used in the expts.: the Promethea moth (*Callosamia promethea*), white grubs (*Phyllophaga* sp.) and the granary weevil (*Calendra granaria*). The first species is exposed to low winter temps. in northern U. S.; the second descends into the soil in winter below or near the frost line; the third is a non-hardy species probably of tropical origin. In a temp. fall from 5.6° to -15.6° the quantity of bound water in *Callosamia* increased from about 70 mg. to 300 mg. per 1000 mg. of total weight or 429%. *Phyllophaga* made practically no gain and died when frozen, whereas the non-hardy *Calendra* actually lost bound H_2O and died without having been frozen. It is believed that the water-binding response of these insects is directly proportional to their winter hardiness. Factors other than colloid activity may be involved. One cause of death from freezing is the loss of water due to the flow of free water from the cells to the intercellular spaces where ice crystals are forming. Water is continually being removed from the cells by this process. Colloidally bound water, however, is held with a force much greater than the osmotic pressure and this force may largely counteract the loss of water from the cells due to freezing. A correlation was found between the water content of the food of certain insects and their body water content. The food of the granary weevil contains 9-11% water, whereas the body moisture equals 46%; the food of the rice weevil (*Calendra oryzae*) about 16%, the body moisture 48%; the food of the locust borer (*Cytlene robiniae*) about 30%, the body moisture 58%. Another group including the Colorado potato beetle (*Leptinotarsa decemlineata*), white grub (*Phyllophaga* sp.), mourning-cloak butterfly (*Aglais antiopa*), willow sawfly (*Crabro americanus*) and imported cabbage worm (*Pieris rapae*) have a food moisture content of 65% to 86% and body moisture content of 65% to 90%. Those species which live upon food low in water obtain body water by metabolic processes within the organism. There is also a correlation between the amt. of bound water and the total water in the insect, those species which live on food with low water content showing the greatest per cent of bound water, those species living on food high in moisture showing the smallest per cent of bound water.

C. H. RICHARDSON

Digestive enzymes of the oriental fruit moth. H. S. SWINGLE. *Ann. Entomol. Soc. Am.* 21, 469-75(1928).—The fore intestine of the oriental fruit moth or "oriental peach moth" (*Laspeyresia molesta*) varies from p_H 6.8 to 7.2, approaching 7.2 as a const.; mid intestine nearly const. at p_H 7.2-7.3; hind intestine 7.2 in anterior portion to 6.8 to 7.4 in posterior part. A colorimetric method for detg. the p_H of the intestine is described. Invertase, lipase, trypsin and erepsin were found in the tissues of the mid intestine and in the contents of the digestive tract. Invertase and trypsin were especially active. Tests for pepsin, cellulase, lactase, maltase and amylase were neg. The adult moth contained only one digestive enzyme, invertase, secreted by the cells of the mid intestine. This suggests that moths should be fed sucrose but expts. showed that they lived about as long on water alone as upon dild. sucrose soln. and laid a normal no. of eggs. With neither water nor sucrose they died in a few days. Methods are given.

C. H. RICHARDSON

The physiology of insects—Metabolism. PAUL S. WELCH. *Univ. Mich. Ann. Entomol. Soc. Am.* 21, 476-88(1928).—A symposium article which discusses the following: circulation—blood compn., blood pigments, blood p_H , blood sugar, histological

elements, function of organs of circulation; respiration—gas exchange and related phenomena, differential respiration, functions of air stores, respiration during metamorphosis and the effects of anesthetics, As compds. and other internal influences upon respiration; nutrition—transformations of foodstuffs, insect foods and their sources, vitamins and other nutritional features. Bibliography. C. H. RICHARDSON

Carbon dioxide, a chemical accelerating the penetration of respiratory insecticides into the tracheal system by keeping open the tracheal valves. E. H. HAZELHOFF. Sugar Cane Expt. Station, Paseroean, Java. *J. Econ. Entomol.* 21, 790(1928).—CO₂ has a marked influence on the ordinary respiratory movements of insects and, in lower concns., on the tracheal valves. (cf. Hazelhoff, *Diss. Utrecht* 1926, *Proc. K. Acad. von Wetenschappen Amsterdam* 29, 492(1926); *Z. für vergl. Physiol.* Abt. C, 5, 179 (1927)). When at rest at room temp., the American cockroach (*Periplaneta americana*) displays no respiratory movements and its tracheal valves are nearly closed. If the insect is brought into an atm. contg. 2 or 3% CO₂, the valves open immediately, allowing a more rapid diffusion of respiratory gases. When the CO₂ pressure is raised 7 or 10% more, respiratory movements of the abdomen appear. The width of the spiracle opening is therefore regulated by the concn. of CO₂ in the vicinity of the spiracle. It is also increased when metabolism is increased by raising the temp. The same relations were found in some other insects. A small quantity of CO₂ will probably accelerate the penetration of HCN, CS₂ and other respiratory insecticides into the tracheal system of insects, thereby increasing insecticidal action. C. H. R.

Color changes in crustaceans, especially in Palaemonetes. E. B. PERKINS. Harvard Univ. *J. Exptl. Zool.* 50, 71-105(1928).—The color changes of *Palaemonetes vulgaris* were studied largely from the physiol. standpoint. Anesthetics cause an expansion of the chromatophores probably due to temporary blindness of the animal. Exptl. evidence tends to show that the eyes are endocrine organs which produce a substance that is carried by the blood to the chromatophores, bringing about their contraction. The mechanism of chromatophore expansion was not ascertained.

C. H. RICHARDSON

Factors involved in changes in form in ameba. S. O. MAST. Johns Hopkins Univ. and Marine Biol. Lab., Woods Hole, Mass. *J. Exptl. Zool.* 51, 97-120(1928).—If *Ameba proteus* is transferred from a culture medium to specially purified water it becomes inactive and strongly radiate in a few mins. The change probably depends upon the H-ion concn. of the culture medium. If left in pure water the ameba usually attaches and then successively becomes lobose, monopodal, slightly radiate and globular. The % of individuals which attach themselves to common glass is considerably higher than that of individuals which attach themselves to Pyrex glass, quartz or petalim. The time necessary to attach and become lobose is 10 times as long for these substances as for common glass. If amebas which have become radiate in purified water are transferred to a soln. of proper concn. of any one of 14 salts, they attach themselves at once and become lobose in a few mins. and assume the other forms mentioned. The time for these changes is greatly reduced as compared with water. Bases bring about similar changes of form. In general, acids inhibit attachment whereas bases facilitate it. Lactose solns. (0.05-0.001 M or weaker) gave the same results as water. Change of form is therefore not definitely correlated with the osmotic concn. of the medium. Any given form may occur in an endless no. of different environmental conditions. Form in ameba is probably directly dependent upon the water content of the organism.

C. H. RICHARDSON

The relations of dietary insufficiency to vitality in the ciliate, *Didinium nasutum*. C. D. BERRS. Univ. N. Carolina. *J. Exptl. Zool.* 51, 121-33(1928).—Individuals of *Didinium*, which were fed upon food-starved *Paramecium*, showed a decrease in fission rate, increase in death rate, decrease in encystment rate, loss of ability to encyst and other abnormalities. Those cultured upon well-fed *Paramecium* were normal. The decline of the former individuals is attributed to an inadequate diet. The symptoms of degeneration induced by this diet closely resemble changes observed by Maupas in various ciliates and attributed by him to senescence.

C. H. RICHARDSON

Studies on chemical changes during the life cycle of the tent caterpillar (*Mala-cosoma americana* Fab). III. Soluble ash and sulfates. WILHEM RUDOLFS. N. J. Agr. Expt. Sta. *J. N. Y. Ent. Soc.* 35, 219-29(1927); cf. *C. A.* 21, 3237.—The sol. ash (chiefly carbonates and sulfates) of the egg mass, larva and pupa of the eastern tent caterpillar is lowest at the beginning of each stage in the life cycle, increasing with its duration. In the egg mass, it is nearly const. during the winter dormant period, but increases shortly before hatching. The egg mass also contains an insol. ash which behaves like a Na silicate (glass). It does not increase with the age of the

egg mass but it is present and increases rapidly in the growing larva. The sol. ash of the egg mass is 0.41% at deposition and 5.46% at the time of hatching. The sol. ash of the larva drops to 3.52% 5 days after hatching and reaches a max. of 7.37% when the growth rate is most rapid, dropping somewhat just before pupation. In the 12 days of pupal life, the remarkable increase of 58.6% in sol. ash is attained. Only 10% of fat is used in this stage of tissue reconstruction. The problem of the source of sol. ash will be considered in a later paper in which glycogen will be discussed. The freshly laid egg mass contains 1600 p. p. m. of sulfates. The sulfate content rises rapidly during the formative period of the embryo, remains nearly const. for a time, and increases again before hatching to nearly 5000 p. p. m. Sulfates fluctuate during the larval stage but reach a lower level than that in the egg mass when it contains the developing embryo. The sulfate content of pupa and adult is relatively low. It is assumed that the sulfates derived from protein are deposited in the egg cases. The ratios, $N:SO_4$, with $N = 10$, were calcd. and plotted for the entire life cycle. During the active growing period the larva produces sulfates more rapidly than N accumulates, but just before pupation, the relation is reversed. In the second part of the egg stage, N decreases but slightly faster than sulfates are formed; in the first part of this stage, when active tissue building takes place, sulfates increase much more rapidly than N substances disappear. This indicates that during the first part of the egg stage, N substances are not used in metabolic processes but for tissue reconstruction whereas in the second part of this stage the N substances are used for maintenance. In the pupal stage sulfates did not increase in relation to the N content, indicating that if N substance was utilized it was not oxidized but transformed into tissue without waste. The ratios, carbonates:sulfates ($CO_3 = 100$), for the egg masses change very rapidly after egg deposition and while the embryonic larva is forming. During the larval feeding period and the pupal period, however, these ratios remain nearly const. The ratios, N :carbonates ($N = 10$), rise after egg deposition and when the embryo is forming, rise abruptly during the growth period of the larva and the first part of the pupal period. The ratios, moisture:sulfates (moisture = 100), increase rapidly when the larvae are forming within the egg after which they remain nearly const. until the eggs hatch. As soon as the larva starts feeding the ratios drop rapidly because body moisture increases more rapidly than sulfates are formed; when it is $\frac{1}{3}$ grown this relation is reversed. In the prepupal stage another fall in the ratio is observed. In the pupal stage it remains const. The ratios, moisture:carbonates (moisture = 100), follow the course of the ratios, moisture:sulfates, until the larvae are $\frac{1}{3}$ grown. This shows that nearly all the food consumed up to this time is utilized to build new tissue and maintain life and almost none is stored. Although the ratios, moisture:sulfates, decreased when the larvae were nearly full grown, the ratio, moisture:carbonates, continued to increase and also increased (51.8%) during the pupal stage. This increase is explained by the decrease in glycogen during this stage. The ratios, fat:sulfates (fat = 100) and fat:carbonates (fat = 100), follow a similar course throughout the egg and larval stages. Fat:carbonate ratios increase during the pupal stage because of the change in glycogen content at this time. Conclusion: N plays an important part at the 3 critical stages, *i. e.*, (1) formation of embryo; (2) prep. for pupation; (3) when the pupae transform to the adult. Fats are used and stored for energy and do not appear to be important at any critical stage for tissue building. The moisture content during the different stages is directly related to the rate of activities during these stages.

C. H. RICHARDSON

Sericin and fibroin. E. W. PIERCE. *Am. Dyestuff Rept.* **17**, 684 (1928); cf. Grove-Palmer, *C. A.* **22**, 4255.—The dissection of the silkworm reveals 2 sacs, one on each side, discharging into the spinning app. The contents of these sacs are liquid and the material is neither fiber nor gum, but a colloidal protein dispersion. There is no sep. supply of sericin to coat the spun fiber. The contents of the sacs will not form silk fiber either by evapn. or oxidation. There are, however, 2 tiny glands, whose function has never been detd., that are also connected with the spinning tubes. These glands are so small that their contents could not yield enough gum to coat an inch of fiber. The hypothesis advanced is that the content of the main sacs is a liquid which, as it exudes into the air, receives a very small quantity of a coagulant or clotting material from the small glands.

L. W. RIGGS

Photodynamic effects of eosin on the eggs of the sea urchin, *Strongylocentrotus purpuratus*. A. R. MOORE. Univ. Oregon. *Arch. sci. biol. (Italy)* **12**, 231-4 (1928).—The photodynamic action of eosin on the unfertilized eggs of the sea urchin kills the eggs and cytolyzes them. Sunlight changes the eosin to a toxic form capable of killing the eggs in the dark, but not cytolyzing them. Cytolysis is the result of the action of

light upon the toxic eosin-protoplasm complex, and is not fundamentally an oxidation. The photodynamic action occurs in 2 phases: (1) A long incubation phase concerned with penetration of the toxic eosin into the egg and accumulation in critical concns., and (2) a short period in which toxic eosin combines with some constituent of the protoplasm resulting in the death of the egg. Fertilized eggs when not killed by exposure to light in eosin soln. develop only to the gastrula stage, where they remain. The stomodaeum does not develop, nor does the primary mesenchyme deposit a skeleton; but when these abnormal larvae are transferred to sea water the skeleton is deposited. Hence toxic eosin acts as a block to the secretion of the calcareous skeleton.

L. W. RIGGS

Glandula uropygialis of birds. HSIANG-CH'UAN HOU. McGill Univ. *Chinese J. Physiol.* 2, 345-80(1928).—This paper contains 51 references to the literature. The statement of previous workers that elastic fibers are present in the capsule and the septa of the oil gland has not been confirmed. Ablation expts. with careful isolation and comparison with normal controls show that birds (pigeons, hens, ducks and geese) without the oil gland suffer a progressive impairment of general health with gradual loss of wt. Discoloration of the plumage and deterioration of the individual feathers occurred with loss of their efficiency in protecting against cold or wetting. Some birds without the gland eventually die with symptoms suggestive of rickets. Removal of the gland results in a depletion of the oil droplets on the feathers. This seems to account for the changes in color of the plumage, the behavior of the feathers toward CHCl_3 and MeOH treatment, and in the smooth contour of the feathers. Ablated birds remove the oil droplets from the feathers and eat them. Feathers absorb water whether there is oil in them or not. Graphs of the rate of intake and output of moisture by feathers when they are exposed to wet and dry atms., resp., are of the exponential type. The oil gland and feathers of birds contain cholesterol. Chicks with the oil gland intact, after developing rickets on a rachitic diet, improved rapidly on daily irradiation with a Hg vapor lamp. Chicks with the oil gland removed, when treated in the same way, showed little or no improvement.

Pigmentation in *Glossosiphonia paludosa*. VICTORIA VOINOV. *Compt. rend. soc. biol.* 99, 1081-3(1928).—In *G. paludosa* the green and yellow pigments are of alimentary origin and arise from ingested hemoglobin. These are biliary pigments which are eliminated by the tegumentary route after oxidation.

L. W. RIGGS

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Conception of a food. ALEXANDER JANKE. Tech. Hochschule Wien. *Pharm. Zentralhalle* 69, 694-9(1928).—The conception of a food as a natural product should be governed solely by its biochem. formation through the activity of the living cell. Such natural products are characterized by the presence of certain essential substances (vitamins, enzymes), as also by a specific odor and taste of harmonious character, and eventually also by a definite microscopically demonstrable structure. The characterization of a food must be such that the consumer is in no doubt as to its source and cannot therefore be defrauded. This demand constitutes a fundamental pillar of modern food legislation. Under the term "vinegar" (Essig) is to be understood the natural product resulting from the fermentation of alc. liquids, as distinguished from dild. acetic acid.

W. O. E.

The development of food laws. J. KAUPER. *Z. angew. Chem.* 41, 786-8(1928).—A history.

C. R. F.

Recent developments in chemical technology of foods at the exhibit of nutrition in Berlin. EUGEN FISCHER. *Z. angew. Chem.* 41, 784-6(1928).—For the rapid detection of milk from cows having chronic mastitis of the udder measurements of the Cl content were made by adding to 10-cc. samples of milk 5 cc. of a AgNO_3 soln. and 5 cc. of a soln. of NH_4CNS . The concn. of the soln. is so adjusted that good milk remains

white and infected milk turns orange or red. For quant. results, the excess AgNO_3 is titrated against NH_4CNS soln., a special buret being used on which the amt. of NH_4CNS soln. used equals the mg. of Cl present. A simple bacteriol. examn. of milk is made by filling the test tubes $\frac{1}{2}$ full of a sugar bouillon soln. contg. bromocresol purple and inserting a smaller inverted tube within the larger. The tube is yellow if only *Streptococcus lactis* is present. A trace of gas indicates a proportional no. of *B. coli*. A blue color with or without gas shows an alk. reaction and indicates spore-forming bacteria. In the examn. of sausage for horse flesh adulteration the sausage was defatted with C_6H_6 , shaken with 0.85% NaCl soln., filtered and 1 cc. of the ext. placed in each of 2 tubes. Tubes 3, 4, 5 and 6 contained 1 cc., resp., of ext. of horse flesh, beef, pork and NaCl soln. To tubes 1, 3, 4, 5 and 6 is added 0.1 cc. of horse antiserum. To tube 2 is added 0.1 cc. canine-antiserum. Horse protein is indicated by pptn. in tubes 1 and 3. C. R. F.

Criteria of the validity of analytical methods used by cereal chemists. ALAN E. TRELOAR AND J. ARTHUR HARRIS. Univ. of Minnesota. *Cereal Chemistry* 5, 333-51(1928).—The 2 criteria of fundamental importance for detg. the validity of analytical methods when these are based solely on samples of unknown compn. seem to be: (1) Av. yields and differences of av. yields of the same constituent of wheat or flour as detd. by 2 or more methods. (2) Consistency of the results obtainable by any method of detg. a constituent when applied by various workers. In both cases the significance of differences in results due to various methods must be tested by comparison with their probable errors. Formulas bearing on these points are submitted and illustration of their application is given. Computations made on data given in the reports of the Comm. on Methods of Analysis of the Am. Assoc. of Cereal Chemists have brought out the following main points concerning these data: (a) Protein detns.—more consistent results are obtained in the protein detn. than in either moisture or ash detns. When adequate digestion is given, no one method of detg. protein is shown to yield more consistent results than the others. It has not been shown that higher protein results are obtained by digesting more than 60 min. (b) Ash detns.—the glycerol-alc. method of detg. ash in flour gives significantly higher av. yields than the straight muffle method and tends to give more variable results. (c) Systematic errors—personal or lab. equation among analysts. The demonstration of the existence of this "systematic error" is important for 2 reasons: (1) It shows that the concordance of results obtained by the same worker, using 2 different methods of making the same detn., furnishes no real proof that he is really reporting the true value for his sample: (2) This "systematic error" must be taken into account in detg. the significance of the difference in the av. yields obtained by 2 methods, differences always having a lower probable error (and a higher probability of significance) when correction for this factor is made. L. H. BAILEY

Refrigeration in the food industries. A. WALTER. *Z. angew. Chem.* 41, 797-801 (1928).—A brief discussion of the types of machines and the use of refrigeration in the brewing, meat packing, cold storage, milk and ice cream industries. C. R. F.

Mold food of the Far East. G. MALCOLM DYSON. *Pharm. J.* 121, 375-7(1928).—The methods of manuf. of 3 types of mold food products of China, Japan and Java are succinctly described. They are: (1) *Shoyu* or soy bean sauce (C. A. 2, 555, 1846; 7, 3187), a deep brown salty liquid of meat-like flavor, prepd. in 3 stages: (a) *Shoyu-koji*, the soaked, steam-cooked, cooled soy beans are mixed with nearly an equal wt. of crushed roasted wheat to provide aeration and prevent subsequent overheating; (b) *tane-koji* or growing of the mold (chiefly *Aspergillus flavus*, Link and *A. oryzae*, Ahlb.) propagated on semi-softened rice. The mass is mixed with (a); the mixt. in 1.5 to 2 inch layers is spread on wooden trays and kept for 18 hrs. at 24-25°. The grains now covered with silky mycelium are stirred and again left for 8 hrs. at 30°, finally for 40 hrs. at 35-6°. (c) *Shoyu-moromi* or mashing (C. A. 6, 3106; 12, 1811; 19, 3286); stir the greenish yellow ripened beans into tubs filled with brine and inoculate with a shoyu yeast culture, a strain of *Zygosaccharomyces*; allow to stand for about 6 months, then draw off the sauce, part at a time; after 2 years the sauce is ready for bottling. The meat-like flavor is caused by *Na glutamate* (cf. Ikeda, C. A. 6, 3134) resulting from the splitting of proteins (i. e., edestin) by enzymes. Shoyu may be evapd. to a thick ext. having the flavor of meat; (2) *Miso*, white and red (C. A. 7, 3168) are solid, mold-fermented soy-bean products, used as porridge in Japan. The cooked soy bean is mixed with crushed rice or barley, then ripened by means of the shoyu mold. The ripened cereal is matured in weak brine for 10 days, then removed and salted. (3) *To-fu* (C. A. 3, 2182) is a mold-ripened soy bean curd cheese. *Natto* (C. A. 7, 3168) is a similar but inferior product. Modern technical uses of proteolytic enzymes generated by molds are the clearing of jellies and fruit exts., and the degumming of silk. S. WALDBOTT

Technical control of flour milling. I. O. JOVRUD. Portland, Ore. *Food Indus-*

tries 1, 57-9(1928).—In order to secure uniformity of compn. in flour blends it is necessary to make detns. of moisture, color, protein, ash and baking test. In order to produce a short patent flour of the proper strength and quality, a wheat blend contg. the necessary quantity and quality of gluten must be selected.

C. R. F.

Some oxidizing effects of flour bleaching. EARL B. WORKING. *Kans. Agr. Expt. Sta., Manhattan, Kans. Cereal Chemistry* 5, 431-5(1928).—The bleaching of flour has developed along such lines that the actual destruction of color is scarcely more important than the accompanying effects generally known as "maturing." Theoretically, this maturing should be similar to the development obtained in dough by the use of oxidizing agents. The use of lactic acid and a heavily over-bleached flour will give the same results in developing a dough for a no-dough-time baking method as will the use of acid with Na chlorate or other oxidizing agents. The quality of normal flour improves for some time after milling, reaches a max. and then begins to deteriorate. Preliminary expts. and general observation indicate that this deterioration begins sooner in bleached flour than in unbleached. Thus it seems possible that large bakeries could prolong the period of max. quality in their flour by buying unbleached flour and bleaching shortly before use. In this way the severity of the oxidation could be accurately adjusted to the needs of the flour at the time and to the fermentation schedule desired. L. H. B.

A critical study of some methods used in flour colorimetry. F. VISSER-T HOOFT AND F. J. G. DELEEUW. Novadel Process Corporation, Buffalo, N. Y. *Cereal Chemistry* 5, 351-65(1928).—The rapid gasoline extn. method described by Coleman and Christie (*C. A.* 20, 2547) can easily be carried out by using a shaking machine. This permits the use of tightly closed glass-stoppered bottles and eliminates all evapn. The colorimeter designed by Kent-Jones and Herd (1927) is less tiring to the eye than the Duboscq colorimeter and having a const. source of light makes the worker independent of the daylight. However, the Kent-Jones instrument requires more time to make a reading and it is no more accurate. The Kent-Jones colorimeter involves the use of standard solns. of different concns. This principle is only permissible if the unknown soln. has the same components as the standard soln. The error does not appear in sep. gasoline value tests of the same sample of flour because in each instance the same error is made. But results are very misleading when a flour is compared with another flour that has twice the amt. of carotinoid pigments. The last flour will give a gasoline value that is between 2 and 3 times as high. It has been shown that this error is probably due to differences in H-ion concn. of the standard soln., because it could be largely corrected by the use of buffer solns. instead of distd. water. The use of a standard soln. made of org. dyes, as used by Sprague (*C. A.* 22, 1176), also avoids this error. An objection to the org. dye standard soln. is that not all samples of org. dyes have the same purity and therefore not the same color value. Jørgensen (*C. A.* 21, 3848) pointed out that it is advisable to use buffer solns. of known H-ion concn. for the prepn. of the official standard solns. of $KCrO_4$. The extn. with alk. MeOH does not, in the 16 hrs. specified by Kent-Jones, give a complete extn. of all the coloring matter sol. in this solvent. Approx. 40 hrs. are required to obtain const. results. It was found necessary to shake the ext. thoroughly at the end of the extn. period. Shaking for 16 hrs. gives the same result as standing for 16 hrs. and shaking at the end of the extn. period. Extg. for 16 hrs. at 30° gives the same results as extg. for 40 hrs. at room temp. Tests in which different amts. of bran were added to a sample of flour showed that there is a direct relation between the bran content of the flour and the MeOH value.

L. H. BAILEY

Wheat and flour. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Council, Year Ending March 31, 1927*, pp. 34-40(1928).—The compns. of the Marquis and Vermilion varieties of wheat and of the flours made from them are compared. In general, the Vermilion variety is lower in protein. The flours contained approx. the same percentages of gluten but that from Vermilion wheat was soft, sticky, weak and not resilient while the gluten from Marquis wheat was firm and resilient. Differences in the compn. of Marquis and Garnet wheats grown in 11 localities from the same seed stock indicate that environmental factors such as soil and season largely affect the protein content of the same variety of wheat. Flour made from Marquis wheat was slightly superior to that of Garnet wheat in point of protein content but there was slight difference in the pH values of the flours. In general Garnet flour had the higher diastatic value.

K. D. JACOB

Effect of stage of maturity on composition and baking quality of Marquis wheat. C. P. MANGELS AND T. E. SROA. N. D. Agr. Expt. Sta., Fargo, N. D. *Cereal Chemistry* 5, 385-94(1928).—Marquis wheat harvested in the dough and hard dough stages averaged lower in yield and test weight per bushel than that cut at a more mature stage. There was no increase in yield after the crop reached normal maturity. Protein content

of wheat showed no consistent variation at different stages of maturity for different seasons. Variation in prevailing climatic conditions during the maturing period is probably responsible for lack of consistency in protein content variation for different stages of maturity. The protein content of patent flour from 1927 crop samples varied as did protein in wheat. The ash decreased as wheat matured, but the sugar content remained const. from the dough to the extra late stage. Diastatic activity showed a tendency to decrease as wheat matured. Baking tests with straight-grade flours from wheat harvested at different stages of maturity showed slightly better quality for the mature wheats. Baking tests with patent flours from wheat of the 1927 crop, harvested at different stages of maturity, show no significant difference in loaf vol. or color, but those from the dough and hard dough stages were lower in texture. N distribution in flour from wheat harvested at different stages of maturity showed some variation, but less than would be expected. Glutenin remained practically const., but tended to decrease in dead ripe and extra-late stages. N sol. in 70% alc showed consistent increase with maturity, while N sol. in 5% K_2SO_4 showed consistent decrease. N not pptd. by tungstic acid and amino N was highest in the dough stage, but was at practically a const. level after the glazed stage.

L. H. BAILEY

New developments in the technic of flour and bread production. M. P. NEUMANN. *Z. angew. Chem.* **41**, 792-4(1928).—Mech. advances in the technic of baking are discussed. The addn. of 0.2-0.5% of acid salts, especially $NH_4H_2PO_4$, gives a more plastic, porous and better baking dough. The treatment of meal with Cl gas contg. $NOCl_2$ whitens and increases the baking quality of the meal.

C. R. F.

The mechanical method of modification of dough. C. O. SWANSON. Kansas Agr. Expt. Sta., Manhattan, Kansas. *Cereal Chemistry* **5**, 375-85(1928).—Swanson points out the advantages of testing flours by the effect of mech. treatment of the dough.

How the experimental baking test has developed. C. L. BROOKE AND R. C. SHERWOOD. State Testing Mills, Minneapolis, Minn. *Cereal Chemistry* **5**, 366-74(1928).—A historical sketch of the development of exptl. baking.

L. H. BAILEY

Factors influencing checking in biscuits. J. A. DUNN AND C. H. BAILEY. Agr. Expt. Sta., St. Paul, Minn. *Cereal Chemistry* **5**, 395-430(1928).—When a biscuit is removed from the oven there is an appreciable difference in the moisture content of the inner, more moist, portion and the outer, dried portion. This moisture gradient can be regulated by the baking procedure. During the curing period this moisture gradient tends to diminish. All portions of the biscuit tend to come into hygroscopic equil. with the relative humidity of the curing chamber. The portions of the biscuit that absorb moisture in order to reach this equil. increase in size, or swell. Those that lose moisture shrink. When the relative humidity is low (20%) and the biscuit is not thoroughly baked, the center shrinks and the rim expands. If this change in size goes on after the biscuit has become rigid, checking will occur whenever the strain developed exceeds the elastic limit of the section under strain. Conditions that will prevent checking are (in order of their importance) thorough baking, curing in a humid atm., keeping the biscuit warm as long as possible, thorough mixing and inclusion of some invert sugar in the formula. During baking the swelling power of a hard-sweet biscuit increases, particularly during the last stages. This is probably due to the gelatinization of the starch. Biscuits contg. sugar and whose shortening content varies from approx. 5 to 20% are most susceptible to checking. This includes snaps, hard-sweet biscuits and sugar cookies.

L. H. BAILEY

Progress in the field of milk hygiene. M. SEELEMANN. *Z. angew. Chem.* **41**, 794-6.—A review of German methods of milk control and hygiene since the war.

C. R. F.

The significance of the undetermined constituents of milk. O. LAXA. *Lait* **8**, 1-4(1928).—The difference between total solids, and sum of constituents detd. directly—fat, protein, ash and lactose—varies between 0.1% and 0.4% with an av. of 0.2%, total solids being always the higher. By analyzing dried milk, this difference was increased almost tenfold, showing that the discrepancy is due to constituents undetd., citric acid etc., and not to any inadequacy in analytical methods.

H. F. ZOLLER

The variation in per cent of chlorides and the presence of nitrates. (Sundgan milks). C. LOBSTEIN AND J. WALLART. *Lait* **7**, 835-43(1927).—The administration

of NaCl to healthy cows up to 200 g. mixed with the ration during a 4-5 day period results in no increase of this salt in the milk. Nitrates are normally not present in milk and cannot be found after having been fed experimentally. Positive nitrate reactions are due to lesions or to extreme doses during veterinary treatment. H. F. ZOLLER

Gerber or Babcock? G. ROEDER. *Lait* 7, 354-63(1927).—A detailed exposition of the two tests, favoring the Gerber, and answering the arguments set forth by Possi-Escot (*Lait* 6, 601-5(1926)). H. F. ZOLLER

The Høyberg method. B. SPUR. *Kemisk Maanedshlad* 9, 2(1928); cf. C. A. 21, 1501; 22, 3934.—In the Høyberg method for the detn. of fat in milk and cream no centrifuge and no H_2SO_4 are used. A special butyrometer is used, into which milk and reagents are pipetted, and mixed by shaking. The butyrometer is immersed in a water bath at 50° for 15 min. and the height of the oil-layer read. The reagents consist mainly of amyl alc., ethyl alc., NaOH and water. Hydrolyzed fats go into the alc.-water layer. The method can be used on conserved milk samples, and is used in several Danish dairies. It is being tried in the Danish Government Research Dairy.

KRISTIAN HØJENDAHL

Høyberg method of fat determination in milk. J. VAN WOERDEN. *Lait* 8, 678-83 (1928).—Results of the fat test by Høyberg (*Lait* 6, 518-33, 639-55(1926); cf. C. A. 21, 970) and Gerber methods are given. Use of freshly prepd. liquid in the Høyberg test is advocated. The Høyberg test gives an av. value slightly higher than the Gerber test but the difference is generally less than 0.05%. There is a tendency to wider fluctuations in per cent of individual samples than in the Gerber method, but not sufficient to condemn the test. The Høyberg method is efficient, accurate and is performed without a centrifuge. H. F. ZOLLER

Study of per cent of butterfat of milk from cows of the Flemish breed. M. PAGET. *Lait* 8, 288-305(1928).—As a result of detailed study of butterfat yield, P. concludes that mixed morning and evening milk from any single cow should contain at least 2.7% and that mixed milk from small herds (2-12) and from larger herds (over 12) should contain at least 3.3-3.5%. H. F. ZOLLER

Utilization of whey and of casein serum. M. BEAU. *Lait* 8, 387-93(1928).—Lactose, lactic acid and vinegar can be made from whey or serum but not with any great commercial success. A possibility exists of concg. and then drying these liquids to make a meal which can be used for stock feeding. Typical analysis of such a product, known as lactosine, is: H_2O 6, protein 10, fat 1, carbohydrates 75, ash 8%. H. F. ZOLLER

Action of the halogens on milk and its constituents. A. J. J. VANDELVELDE. Univ. Ghent. *Lait* 8, 495-500(1928).—See C. A. 22, 2794. H. F. ZOLLER

Detection of hydrogen peroxide in pasteurized milk. A. TAPERNOUX. École Veter. Lyon. *Lait* 8, 410-1(1928).—See C. A. 22, 643. H. F. ZOLLER

Elimination of sodium and of chlorine in cow milk; adulteration by addition of sodium salts. L. BARTHE AND E. DUFILO. *Lait* 7, 817-23(1927); cf. C. A. 22, 456.—The detn. of Na and Cl by methods given by the authors reveals adulteration by the addition of NaCl, Na_2CO_3 , $NaHCO_3$ or other Na salts. H. F. ZOLLER

Enzymes and their utilization to detect heated milk. C. LIND. *Lait* 7, 935-46 (1927).—Heated milk can be detected by the destruction or weakening of enzymes, viz., catalase test, aldehyde-reductase (Schardinger), reductase-peroxidase (Storch) or by chem. methods based on coagulation of albumin. None is infallible and a combination of tests and methods must sometimes be followed, particularly with regard to low-temp. pasteurization. H. F. ZOLLER

Polarimetric determination of sucrose in mixtures of milk and sucrose. G. W. MONIER-WILLIAMS. *Analyst* 53, 569-82(1928).—In the method described, which is based on the work of Jackson, Gillis, Vosburn and Zerban, angular notation is given as more suitable than the saccharimetric notation and the correction for the vol. occupied by proteins and fat is obviated by detg. the total water present in the dild. milk and sucrose mixt., defecating with dry reagents and subsequently detg. the ratio of sucrose to water in the clear filtrate. The total solids are detd. on the milk and sucrose mixt. by the standard method and from this the % of water is computed which is represented by a in the formula below. For condensed milk, a known wt. of the condensed milk is dild. with a known wt. of water to about 3 times the original vol. Take about 350 g. of the milk sucrose mixt., treat with 1.5 g. of powdered citric acid (to coagulate the casein) and after shaking, add a mixt. of well-triturated phosphotungstic acid (9 g.) and dry sand (45 g.). Filter through a dry filter and reject the first runnings. Det. the total solids in the usual way on one portion of the filtrate, omitting the addition of NH_4OH , because the acid content is not high enough to cause much inversion of the sucrose and there is less decompn. on heating the acid soln. The total solids are repre-

sented by y in the formula. To another 50 cc. of the filtrate, add 2.675 g. of NH_4Cl , make up to exactly 100 cc. and allow to stand for 1 hr. Then polarize in a 200-cc. jacketed tube at $18-22^\circ$ (recorded to 0.2°). The mean of the polarimeter readings is given as A in the formula. To another 50-cc. portion of the filtrate, add 10 cc. of 0.5 N HCl and heat at 60° for 12 min., agitating the contents of the flask for the first 4 min. Then cool, add 10 cc. of 5 N NH_4OH slowly from a buret. Cool, make up to exactly 100 cc. and filter the soln. if it is cloudy. After an hr. polarize at the same temp. as before. A convenient device for keeping the temp. const. is shown and by which a rapid circulation of water at a const. temp. is maintained in the jacketed polarimeter tube. It is important to measure this temp. very accurately. The mean of the readings for the inverted sugar is called B in the formula and $A - B$ is the change of rotation on inversion of the filtrate as dild. for polarization. The % of sucrose present in the mixt. is given by the formula $100(A - B)x/[87.9 + 0.06c - 3(t - 20)]2y$, in which c is the % of total sugars in the inverted soln., as dild. for polarization, t is the temp. of invert polarization, B is the invert reading of the filtrate as dild. for polarization, x is the % by wt. of water in the dild. mixt. and y is the wt. of water in 50 cc. of filtrate. In the analysis of mixts. of milk with known quantities of sucrose the greatest percentage error was 0.06 on 13.50% of sucrose. W. T. H.

The chemistry of sour milk. L. L. VAN SLYKE. N. Y. Agr. Expt. Sta. *Tech. Bull.* 140, 1-14(1928).—This publication reviews work done in the Division of Chemistry of this Station on various problems associated with the souring of milk. The work was first undertaken in an effort to add to the knowledge of factors involved in the manuf., ripening and digestibility of cottage-cheese. Later studies have had to do with the chem. changes in certain constituents at different stages of souring and the detn. of the amt. of free lactic acid in sour milk. C. R. F.

Condensed milk. CHAS. E. SEARLE. *Food Manuf.* 3, 505-6(1928).—The author briefly discusses condensing, homogenization, filling, sterilization, cooling and testing. J. A. KENNEDY

Use and effect of salt in butter and margarine. WILLIAM CLAYTON. Salt Union Std. Runcorn. *Research Bull.* No. 1; *Lait* 7, 913-27(1927).—The bacteriol., physical and chemical aspects are reviewed. Bibliography. H. F. ZOLLER

Janus green and methylene blue in the reductase test (Barthel). L. SOEP. *Lait* 7, 927-35(1927). See *C. A.* 22, 1810. H. F. ZOLLER

New method for the study of cheese ripening process. C. BARTHEL, E. SANDBERG AND E. HAGLUND. *Lait* 8, 285-8(1928).—Instead of using the customary water ext. to follow hydrolysis, the authors squeeze the liquid directly out of the cheese. This liquid will form the basis for research on analytical methods and on rennet action in cheese ripening. It is obtained by putting the cheese through a small cutting mill and mixing with twice its wt. of sand. The mixt. is wrapped in a tightly woven cloth and the liquid is squeezed out in a small cylindrical iron press. Fat can be removed by the centrifuge. From one kg. cheese 62 cc. liquid was obtained. H. F. ZOLLER

The calcium of cheese. KATHARINE BLUNT AND EMMA SUMNER. Univ. of Chicago. *J. Home Economics* 20, 587-90(1928).—The av. Ca content of 32 samples of Swiss cheese was 1.05%, of 29 samples of cheddar 0.71% and 38 samples of commercial cottage cheese 0.077%, showing the latter to be not the rich source of Ca it is usually considered. L. D. ELLIOTT

Bacteriological study of frozen eggs and their sanitary control. J. VERGE AND E. GRASSET. Veterinary School, Alfort. *Rev. Hyg. Med. Prev.* 50, 748-68(1928).—Direct microscopic examn. was unsatisfactory. Samples of imported Chinese eggs, taken while frozen, gave bacterial counts on gelatin (120 hrs.) of 85,000 per g. for the yolks, 30,000 for the whole eggs and only 5000 for the whites. After standing for 48 hrs. at lab. temp. these counts were, resp., 3,600,000, 4,000,000 and 360,000. The agar counts were somewhat lower than the gelatin counts. It is recommended that frozen eggs be used immediately after thawing. Among the organisms recovered were *Sarcina alba*, *Staph. albus* and *aureus*, liquefying bacillus similar to *B. coli*, *B. coli*, enterococcus of Thiercelin, a species of *Corynebacterium*, an organism similar to *B. pseudo-tuberculosis rodenium*, *P. vulgaris*, *B. fecalis alcaligenes*, and bacilli of the paratyphoid group. The Redfield formula though difficult of application, with certain modifications, merits trial. Frozen eggs must be regarded as a highly perishable food whose wholesomeness should be strictly maintained. C. R. F.

Mechanical handling of mayonnaise dressing. L. V. BURTON. *Food Industries* 1, 60-1(1928).—Descriptions and figures of equipment are given. C. R. F.

Composition and nutritive value of Philippine food fishes. ABELARDO VALENZUELA. *Philippine J. Sci.* 36, 235-42(1928).—The nutritive values of many species

of fresh fish, preserved fish and shell fish were detd. Av. protein content of fresh fish was 21.15%; smoked or dried fish, 44.92%. Av. calorific value of fresh fish was 99.02 cal.; smoked or dried fish, 237 cal. Calorific and protein values of mollusks are tabulated.

JOHN T. WOLF

Quick freezing of filleted fish. LEICESTER H. SHERRILL. General Seafoods Corp., Gloucester, Mass. *Food Industries* 1, 33-5(1928).—CaCl₂ brine with its low f. p. is used to freeze fish very rapidly and thereby prevent distortion and the objectionable formation of ice crystals within the flesh. App. is described.

C. R. FELLERS

Concentration of fruit, vegetable and meat juices. CH. LEMALE. *Food Manuf.* 3, 515-7(1928).—A discussion of the main factors involved in the concn. of fruit, vegetable and meat juices, with particular reference to *tomatoes*; some particulars of the Lemale concg. plant are given.

J. A. KENNEDY

Specifications for California canned fruit. ANON. *Canners League of Calif.*, San Francisco, 4th Ed., 30 pp.(1928).—Canning specifications for apricots, peaches, pears, cherries, grapes, plums and fruits for salad are given together with the % sugar to be used in packing several grades. A 2 min. draining period on a 1/8 in. mesh screen is the recommended method of detg. drained wt. of canned fruit.

C. R. FELLERS

Heat transfer determinants of the bottle pasteurization of fruit juices. K. L. FORD AND A. G. OSBORNE. Glass Container Assocn. Res. Lab., New York. *Glass Container* 8, No. 1, 1-42(1928).—Heat-transfer expts. using thermocouples located at different points in glass containers show considerable temp. variations during pasteurization of fruit juices at 170° F. Agitation of the container greatly accelerated heat transfer to the contents, resulting in effective pasteurization at a lower temp. and a marked improvement in the flavor of the beverage.

C. R. F.

Effect of acid wash on the keeping qualities of apples. FERRIS M. GREEN. Colo. Agr. Expt. Sta., *Bull.* 343, 1-18(1928).—Washing apples in weak HCl or Na₂CO₃ soln. does not affect keeping qualities if properly handled. Sal soda is not as efficient as HCl in removing arsenical residues.

A. L. MEHRING

Arsenical spray residue and its removal from apples and pears. F. D. HEALD, J. R. NELLER AND F. L. OVERLEY. Washington Agr. Expt. Sta., *Bull.* 226, 1-100(1928).—Various methods of cleaning fruit that had been sprayed with arsenicals were compared. Eleven varieties of uncleaned apples contained from 0.015 to 0.075 (av. 0.032) grain As₂O₃ per lb. of fruit. The amt. remaining after wet cleaning ranged from 0.008 to 0.015 (av. 0.011) and after dry cleaning from 0.021 to 0.027 (av. 0.024) grain As₂O₃ per lb. Varying the concn. of HCl from 0.3 to 1.0% by wt. and the temp. from 48° to 98° F. had practically no effect upon cleaning efficiency. With solns. contg. less than 0.3% HCl increasing the temp. to 95-98° did increase it. Fruit held in storage 4 months was more difficult to clean than it was when first picked. Applying apple soap spray 6 days before harvest was without benefit. All of the wet-process machines cleaned pears to below the tolerance of 0.01 grain per lb. Arsenical burning around the calyx is connected with wet cleaning. Jonathan apples are very sensitive to this injury. The alkali process was as bad as the most injurious acid process in causing calyx burn.

A. L. MEHRING

Examination of sprayed apples for arsenic. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, p. 74(1928).—Analyses for As were made on 56 samples of apples from various parts of Canada. One-third of the samples were entirely free from As, or contained As in negligible traces. Ninety-five % of the samples contained As in amts. less than 0.01 grain per lb.

K. D. J.

Apple wraps. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, p. 76(1928); cf. C. A. 21, 3688.—Analyses of papers used for wrapping apples gave the following results: oiled wrappers—H₂O 5.02-6.02, petroleum ether ext. 13.53-18.18, butyro-refractometer reading at 25° 52.1-72.7, refractive index 1.460-1.474; No. 6 sulfite wrapper—H₂O 6.03, petroleum ether ext. 0.23, paraffin wax wrapper—H₂O 5.41, petroleum ether ext. 20.64; glassine wrapper—H₂O 6.77, petroleum ether ext. 0.17%.

K. D. JACOB

Composition of Philippine pineapples. A. H. WELLS, F. AGCAOILI, H. TAGUIB AO AND A. VALENZUELA. *Philippine J. Sci.* 36, 157-85(1928).—An outline of the growth of pineapple culture in the Philippines. This includes cost of production, profit and discussion of climate and soil. Smooth Cayenne and native pineapples are described and their differences in chem. compn. shown. The smooth Cayenne is the best variety for table and canning use.

JOHN T. WOLF

Determination of the state of maturity of peas in canned goods. A study of methods. Ed. LASAUSSE, B. GUERITHAULT AND PELLERIN. *Bull. sci. pharmacol.* 35, 575-9(1928); cf. C. A. 22, 1813, 3193.—It is insufficient to depend on any single detn.

to place the product in or out of the class of "Petits Pois." (Cf. Muttelet, *C. A.* 19, 1442; 20, 1674, 1675, 2546; 21, 1315. Froidevaux, *C. A.* 21, 613.) L. W. RIGGS

Relation of kernel density to table and canning quality in different varieties of maize. C. W. CULPEPPER AND C. A. MAGOON. U. S. Dept. Agr., *Tech. Bull.* 97, 1-15 (1928).—Among the factors detg. the quality of canned sweet corn are the nature, amt. and relative proportions of the different polysaccharides present in the kernel. These constituents together with the H_2O present det. the consistency of the kernel and the smoothness or creaminess of the canned corn. The *sp. gr.* was detd. by use of a pycnometer and by measuring the vol. by a weighed sample of seeds in a buret contg. light paraffin oil. The density of developing maize varied with the stage of maturity and with the type or strain, while mature seeds varied with the moisture content, variety and certain environmental conditions. The density increased constantly during development of the kernel. Developing sweet corn has the lowest density of all types of maize studied. Low density is correlated with high quality. When mature, air-dry seeds are soaked in H_2O , there is a marked difference in the behavior of varieties in regard to the rate of H_2O absorption and the total quantity imbibed. The amt. of swelling is likewise quite different. Sweet corn swells most, flint varieties only moderately, while starchy types swell but little. The seeds of sweet corn decrease in *sp. gr.* during soaking while those of flint corn increase. These data may be valuable in detg. the best types of sweet corn for canning. C. R. F.

Better flavor developed in cocoa by improved roasting methods. FRANK C. GEPHART. *Food Industries* 1, 62-4(1928).—Roasting performs 2 important functions: it renders the shell more friable and easily removable when the beans are cracked, and it develops the sensitive flavor and aroma of the finished product. Roasting causes loss in H_2O , caramelization of starch, a loss in astringency due to change in the tannin complex, and possibly loss in theobromine content. Theobromine is present in the raw nib to the extent of approx. 1%, but after roasting it is reduced to 0.75%. The fat is rendered more easily extractable because of its release from the cellular structure of the bean. Fat is volatilized during the roasting process, and in long roasting the loss may be appreciable. $AcOH$ and $AcOH$ esters present in the fermented beans are largely lost during roasting, which develops the true flavor and aroma of chocolate. The chemistry of this change is not well understood although *d*-linalool has been found in roasted beans. C. R. F.

Manufacture and composition of chocolate products. FRANK C. GEPHART. *Food Industries* 1, 100-6(1928).—Typical analyses of cacao beans, powder and butter as well as chocolate liquors, coatings and milk chocolate are tabulated. A general description with illustrations of the chocolate industry is given. C. R. F.

The cause of fermented honey and its control. F. W. FABIAN. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 2, 18-9, 22(1928).—Honey contains yeasts which are capable of fermenting the honey if sufficient moisture is present. Honey, when placed in a moist atm., may absorb sufficient water to dil. it to a degree where the yeasts present are able to grow and cause fermentation. Unripe or improperly cured honey, on account of excessive moisture present, is more apt to spoil than ripe or properly cured honey. The moisture content should be reduced by evapn. with heat or by vacuum before the honey is placed in storage. Comb honey loses wt. very slowly and takes up water slowly. It is possible to prevent honey from fermenting by heating to a temp. of 145° F. for 30 min. Directions for making honey vinegar from fermented honey are given. J. A. KENNEDY

A study of the cause of honey fermentation. F. W. FABIAN AND R. I. QUINET. Mich. Agr. Expt. Sta., *Tech. Bull.* 92, 1-40(1928).—An 8-yr. study of honey spoilage showed that the critical moisture point at which fermentation occurred was approx. 21%. A study of 8 extd. honey samples showed an increase in H_2O content from 5 to 12% at 20°. Since absorption of H_2O in extd. honey occurs mainly at the surface, the sugar concn. becomes reduced, thereby allowing yeasts to grow there. On honey agar contg. 10% honey, bacteria and molds predominated, but where the honey concn. was 30% or over the organisms found were largely yeasts. Comb honey stored in a dry place loses H_2O . In a 7-yr. period over $CaCl_2$ the loss of H_2O from comb honey was 7.5%. Comb honey stored in a moist place gains from 3.5 to 5.7% H_2O . Molds grew on all concns. of honey. All honey samples, whether spoiled or not, contained yeasts capable of fermenting the honey. Twenty-five yeasts were isolated and carefully studied, 2 being new species. Honey may be pasteurized readily at 62.5° for 30 min. though care must be exercised, because of the high viscosity, that the entire mass reaches that temp. Overheating darkens the honey. C. R. FELLERS

Desiccating shredded coconut. A. E. BUCHANAN, JR. *Food Industries* 1, 9-12

(1928).—A full description of the prepn. of various coconut products at the Postum Co.'s Hoboken Plant. Sugar and NaCl are added for flavoring while glycerol is incorporated in shredded coconut to render the shreds less brittle. Careful lab. control of the water content is necessary to prevent spoilage or deterioration. In the prepn. of canned coconut, the air is exhausted from the container and product by vacuum, and replaced by CO₂ which operation is said to aid in preserving the quality of the product. Oil extd. from fresh coconut parings averages from 0.5 to 1.0% free fatty acids as against 1 to 8% in imported copra. C. R. F.

Packaging problems of confectionery. STROUD JORDAN. *Food Industries* 1, 13-6 (1928).—Chocolate-coated candies may be stored satisfactorily at temps. from 5.5° to 18.3°. To avoid serious loss due to sweating the removal from cold storage must be made in progressive steps. H₂O from outside air collects on candies and dissolves some of the surface sugar. On evapn. minute sugar crystals reform on the surface, thus accounting for the characteristic white or gray bloom on chocolates. The use of air-tight containers, vacuum seals, etc., is discussed. C. R. F.

Gas production in the making of sauerkraut. L. M. PREUSS, W. H. PETERSON AND E. B. FRED. Wisconsin Univ., Madison, Wis. *Ind. Eng. Chem.* 20, 1187-90.—Cabbage was packed in a 58-gallon metal barrel and allowed to ferment. The gas evolved was almost 100% CO₂, with a possible trace of H₂ and CH₄, and volatile org. compds. Most of the gas was given off within 40-160 hrs. Because of a correlation between gas evolution, acidity of juice, and bacterial count, it was concluded that the gas production is due to bacterial activity and not to yeast growth or plant cell respiration. Washing the cabbage improved the flavor of the sauerkraut. Cabbage at an initial temp. of 20-25° fermented more quickly, but at 25° some pink sauerkraut was formed. AMY LEVESCONTE

Nutritive value of hardened oils. II. S. UENO, M. YAMASHITA AND Y. OTA. *J. Soc. Chem. Ind. (Japan)* 31, 393-9; *Suppl. Binding* 92 3B(1928); cf. C. A. 22, 804.—The animal test showed the nutritive value of the low-temp. hardened oils (sardine oil, herring oil, finback whale oil, chrysalis oil) superior to that of their original oils. Y. TOMODA

A summary of research studies relating to casein and some of the applications. I. L. VAN SLYKE. N. Y. Agr. Expt. Sta., *Tech. Bull.* 139, 1-41(1928).—This publication reviews the work done in the Division of Chemistry of this Station for the period of 1901 to 1918 on the chemistry of milk, particularly the chemistry of the casein of cow milk, including some of the practical applications of the studies as related to the cheese industry. C. R. F.

Investigation of soda water for lead. H. W. PETHERICK. Ann. Rept. Commissioner of Health of Queensland, Australia, *Bull. Hyg.* 3, 402(1928); cf. C. A. 22, 2998.—A series of 394 samples of soda water were collected and examd. for Pb from all cld. and refreshment rooms in Brisbane and South Brisbane. In addn., a large no. of samples of tap water and water from supply cisterns were examd. Notice to discontinue sale pending action to remove sources of Pb was given in every instance in which lead was in excess of 100 gr. per pint but a large no. of soda fountains had to be dismantled. The sources of Pb were found to be the interiors of carbonators, which were potted at the seams, at the end of agitator shafts, and elsewhere with solder that contained Pb. This had to be replaced with Pb-free material and often fresh Sn lining had to be provided. In every case, this did not remove all the Pb from the soda water, and in cases in which it did not do so recourse was had to the use of harmless chem. soln. fed to the carbonator with the water. This at last reduced the lead to within the prescribed limit. C. R. F.

Mussel poisoning in California. K. F. MEYER. Calif. Dept. Health, *Weekly Bull.* 7, No. 22, 85-6(1928).—In 1927, there were 102 human cases of mussel poisoning with tetrodotoxin in Calif. All were due to eating the large mussel, *Mytilus californicus*, which had been freshly gathered from rocks near shore. The nature of the poisonous substance is not definitely known but is probably a N complex or protein. There is no known test for detg. the harmlessness of mussels. They should not be eaten during the summer. C. R. F.

Technical control of the dairy industry. W. H. E. REID. Univ. of Mo., Columbia. *Food Industries* 1, 3-8(1928).—A general discussion of lab. control methods on butter, ice cream, cheese, condensed and powd. milk and casein. No new data are presented. C. R. FELLERS

Washing powders for dairy use. A. W. PHILLIPS, M. J. MACK AND J. H. FRANDSEN. Mass. Agr. Expt. Sta., *Tech. Bull.* 13, 179-87(1928).—Analyses of 36 com. washing powder showed the 3 important ingredients to be Na₂CO₃, Na₃PO₄·12H₂O and NaOH.

Soaps were found in appreciable amts. in but 7 samples. All ingredients were usually not present in the same sample. Na_2CO_3 possessed excellent water-softening power, greatly aided washing mechanism, was a poor emulsifier, rinsed easily and neutralized odors. It had a mild corrosive action on tin-coated utensils or the hands. $\text{Na}_2\text{PO}_4 \cdot 12\text{H}_2\text{O}$ softened water readily and possessed excellent emulsifying properties but it had poor washing power. It rinsed easily, was a good casein solvent, had feeble corrosive action on metals and gave a desirable buffer effect which kept the caustic strength of the cleaning soln. uniform. NaOH was a poor water softener and emulsifier, rinsed only with difficulty, had a strong caustic action on the skin and corroded metals vigorously. However, it possessed good washing powers. The most desirable compn. for washing powders was found to be $\text{Na}_2\text{CO}_3(\text{anhyd.})$ 60%, $\text{Na}_2\text{PO}_4 \cdot 12\text{H}_2\text{O}$ 40%, with a total alkali content of 58%. By purchasing these chemicals in bulk and compounding, a very great saving in cost is effected. The washing efficiency of the powders increased up to 60°. Below 35°, the bactericidal action was greatly reduced. All powders showed disinfecting powers in 0.6% soln. by rendering the wash water sterile. C. R. FELLERS

Live stock feeding. P. DE SORNAY. *Rev. agr. Maurice* 5, 170-1(1928).—The feeding value, calcd. according to Kellner's formula, is 75.7 for peanut cake, 76.5 for copra cake and 68.6 for acacia seed; the protein-carbohydrate ratios are, resp., 1:1.5, 1:5.5, and 1:1.6. These ratios are too narrow, and the products must be supplemented by carbohydrate feeds. Acacia seed has a very hard, indigestible outer layer which amounts to 46% of the total wt. This fact must be considered in comparing its price with that of similar products. F. W. ZERBAN

The non-protein nitrogen compounds of feeding stuffs: their significance and utilization. W. L. DAVIES. Univ. of Reading. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 690-2(1928).—Feedingstuffs may be divided into 3 classes on the basis of the types of protein and non-protein N present: (1) those of animal origin, supplying animal protein and contg. their own special type of non-protein N compds.; (2) those of seed origin, where the protein is stored as an easily digestible and balanced protein; here, the source of protein is in the resting stage of plant life, the non-protein N being at a min., usually infinitesimally small; (3) those prepd. from the growing plant, contg. the N compds. distributed in the state and quantities required for active plant metabolism. The non-protein N is relatively high and the constitution of the compds. variable in nature. To this class belong hay, straw, roots, silages, grass and such factory residues as sugar-beet pulp. The non-protein N compds. include the protein degradation products (proteoses, polypeptides and amino acids), true amides, NH_4 salts and small quantities of nitrates. In general, the soly. in water of the N compds. of class (1) feeds increases as the content of true protein decreases. NH_3 and methylamine bases constitute a considerable portion of the non-protein N compds. present in class (1) feeds, particularly in low-grade fish meals. The latter may be dangerous to animals if more than approx. 20% of the N is sol. in H_2O . Such N compds. also contribute to the taint conferred on pork and bacon when hogs are fed on rations contg. excess fish meal. The non-protein N content of class (2) feeds is negligible. In class (3) feeds the true protein content of the dry matter of very young plants constitutes a high % of the total N and is mostly H_2O -sol. At the flowering stage of the plant the true protein becomes H_2O -insol. and decreases to a min. while the non-protein N increases to a max. On low-protein diets these non-protein N compds. have a certain protein-sparing action in the metabolism of the animal and some of them appear to possess a well-defined physiol. action in assisting N retention and protein building in the animal body. Non-protein N tends to increase the digestibility of the non-N constituents of the ration, but there is no conclusive evidence as to the exact nutritive value which can be allotted to the non-protein N of the "crude" protein. K. D. JACOB

The fodder value of dried grass. F. COLIN SUTTON. *Ind. Chemist* 4, 401-4 (1928).—The grass (cut young and short) is dried in a "Pehrson" rotary louvre drier, the hot air, driven by a fan, entering through louvres and passing through the grass as it is carried upwards on the rising side of the cylinder. The moisture in one trial was reduced from 80.3% to 19.3%. Milch cows eat the dried grass eagerly. Figures are given which show an increased yield of milk when part of the mixed strong fodder (crushed oats, crushed rape cake, crushed earth nuts, crushed soy cake and crushed sunflower cake) is replaced by dried grass. Drawings are included of the drier, which is suitable for drying coal, wood chips, bark, saw-mill refuse, peat, sugar beet slices, refuse from breweries and distilleries, sand, clay, sodium nitrate, sodium sulfate, etc.

E. G. R. ARDAGH
Silage investigations. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, pp. 41-5(1928).—The object of the investigations

was to det. the effect on the compn. of the silage of stage of growth, H_2O content of material as ensiled, length of ensiling period, and type of silo, e. g., glass jars as compared with small stave silos for exptl. ensiling. *Alfalfa silage*.—Alfalfa wilted for 5 hrs. before ensiling gave silage with a higher protein content than that obtained from unwilted material and the crop when cut at the full-bloom stage gave silage richer in protein than that ensiled when at the 0.1-bloom stage. Silage prepd. in the stave silo in every case contained less protein, on the H_2O -free basis, than that prepd. in tightly closed glass jars. There were indications that alfalfa cut at full-bloom stage will more frequently yield a better preserved silage than that from 0.1-bloom crop. *Sweet clover silage*.—On the H_2O -free basis, the av. protein content of 12 silages from sweet clover cut at the bud stage was 21.4%, while that of 6 samples from full-bloom clover was 19%. Silages prepd. in tightly closed glass jars in general appeared to be in better condition than those prepd. in stave silos, but the type of silo, ensiling period and wilting did not have any marked influence on the protein content of the silages. *Oats, peas and vetch silage*.—These silages were composed of a mixt. of 2 bushels Banner oats, 0.75 bushel Arthur peas and 0.25 bushel common vetch, the stage of maturity given being that of the oat crop. The silages, as a whole, were remarkably uniform in compn. The silages from the crop cut at the "dough" stage showed a slightly lower protein content, with no concomitant rise in fiber, than those from the crop ensiled at the "milk" stage. Detailed analytical data on the silages are given.

K. D. JACOB

The importance of properly balanced rations in trials to determine digestibility as shown in experiments with dried apples. C. W. HOLAWAY, W. B. ELLERT, G. F. EHEART and M. P. MILLER. Virginia Agr. Expt. Sta., *Tech. Bull.* 32, 18 pp.(1927).—Dried apple pomace, being a bulky feedstuff with a low protein and high energy content, widens the protein-energy ratio when added to a basal ration, thus causing a pronounced depression of digestibility of the protein of the whole ration. This general depression reduces the amount of digestible protein in the whole ration to such an extent that the results show that apparently none of the apple pomace protein is digested and furthermore that less of the protein in the basal ration is digested when this material is added to it. Three expts. were conducted, with a basal ration of grain and silage. (1) The dried apple pomace was added to the basal ration and coeffs. were obtained by trial. The coeffs. for the dried apple pomace constituents were computed by difference and pronounced negative results were obtained for the protein of the pomace. (2) The same basal ration was used, but when pomace was added a special corn gluten feed was used instead of the corn meal, thus balancing the lack of protein in the apple pomace and making it possible to secure basal and basal pomace rations that were comparable in amount and ratio of constituents. In making these computations, the value of the protein in apple pomace assigned by Henry and Morrison was used, and since this is altogether too high the apple pomace ration was wider than it should have been and the depression effects still persisted. In this expt. two of the four cows apparently digested 22% of the apple pomace protein, while two still gave negative results. A third expt. was conducted and in balancing the protein of the basal and basal pomace rations no value was allowed for the apple pomace protein. The results were uniform and the digestible coeff. for the protein of dried apple pomace was found to average 37% under these conditions. In these trials the quantity of protein involved in the variation due to the depression effect amounted to 130% of the total protein contained in the apple pomace. This was 0.325 lb. daily per cow or 12% of the total protein fed. The digestible coeffs. found for dried apple pomace under balanced conditions were: dry matter, 66%; crude protein, 37%; ether ext., 32%; crude fiber, 54%; nitrogen-free ext., 80%.

J. J. SKINNER

The evolution of the mineral supplement. FRANK E. CORRIE. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 681-4(1928).—This paper discusses the importance of mineral elements in the feeding of stock, and summarizes the results obtained by prominent research workers in this subject.

K. D. JACOB

Soy-bean meal for fattening hogs. EARL H. HOSTETLER. N. C. Agr. Expt. Sta., *Bull.* 259, 1-12(1928).—The % compn. of soy-bean meal is crude protein 39.7, carbohydrates 34.7 and fat 4.5, indicating the very high nutritive value. Four trial feeding tests with hogs indicated that soy-bean meal did not give increased returns over corn or fish meal.

C. R. F.

Tin plate for cans for preserved goods (SERGER) 9. Flaxseed (SHUTT) 27. A new metric test for tannic acid (RAE) 7. Apparatus for mixing food materials (U. S. Pat. 1,691,535) 1. Pump for milk (Brit. pat. 287,267) 1. Withdrawing yeast from vat [for use as animal feed] (Brit. pat. 287,052) 16.

Preserving milk or other beverages and foods. FRANK J. ANDRESS (to Brownie Corp.). U. S. 1,691,538, Nov. 13. The material is treated with H_2O_2 at temps. at which the H_2O_2 is active as a germicidal agent (but below the temp. at which the material would be injuriously affected) and NaOH or other suitable substance is then added to neutralize acidity.

Homogenizing ice cream mixes and reducing their viscosity. EDWARD A. SNOW. U. S. 1,690,799, Nov. 6. After being forced through a homogenizing valve under a pressure sufficient to effect homogenization, the viscosity of the material is reduced by passing it through a constricted opening under a pressure lower than that used for the homogenizing. An app. is described.

Margarine composition. JOHN C. SHERMAN (to Brown Co.). U. S. 1,691,087, Nov. 13. A substantially water-free compn. comprises hydrogenated peanut oil which is substantially solid at ordinary temps. and a dry "milk-like" product of peanuts in a state of such fine subdivision that the particles, in homogeneous mixt. with the oil, constitute the disperse phase of a colloid of which the oil is the dispersion medium.

Apparatus for drying fruit in air streams. EDWARD A. WHITE. U. S. 1,691,874, Nov. 13.

Dry powder from fruit juice and sugar. FLOYD W. ROBINSON. U. S. 1,690,131, Nov. 6. A dry powder which on addn. of water forms a liquid of palatably sweet fruit flavor and normal acid and pectin content is prepd. by drying natural fruit juice such as orange, lemon or grape juice together with sugar sufficient for preservative action, coned. acids and pectin of the fruit, and addnl. natural fruit flavor proportioned to the excess sugar content.

Pectin. R. PAUL and R. GRANDSEIGNE. Brit. 286,914, April 29, 1927. Dry, white and purified pectin is obtained from a pectous soln. by treating it in several stages with acetone, compressing the pectin jelly pptd., drying and crushing it. An app. is described.

Fish preparations containing amino acids. F. BILLON. Brit. 286,709, March 11, 1927. Fish or fish offal is chopped and reduced to a paste and mixed with 0.1-0.3% of chloropicrin, rapidly dried and the chloropicrin thus driven off, or the operation may be effected to cause autolysis and formation of amino acids. The resulting powder is de-oiled.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Our mutual interest in research and engineering. CHAS. W. APPLESON. *N. E. L. A. Bull.* 15, 713(1928).

Principles of patent law involved in the Weiss patent litigation. ANTHONY W. DELLER. *Ind. Eng. Chem.* 20, 1361-3(1928).—A review of the case in which the Weiss patent on the use of diphenylguanidine as a vulcanization accelerator was found invalid.

Some economic factors in chemical price making. WILLIAMS HAYNES. *Ind. Eng. Chem.* 20, 1348-52(1928).

Heating by oil circulation in the chemical and allied industries. L. DELESTRE. *Chimie et industrie* 20, 623-30(1928).—A discussion of the advantages of oil as a heat-transferring medium, with an outline of installations of the Merrill process in various industries.

Solvents from natural gas. HARVEY S. GARLICK. *Ind. Chemist* 4, 363-7(1928).—At Belle, W. Va., the Sharples Solvents Corp. is manufg. $C_5H_{11}OH$ from C_5H_{12} obtained from natural-gas gasoline. The carefully fractionated C_5H_{12} is chlorinated, the $C_5H_{11}Cl$ distd. to remove unchanged C_5H_{12} , and the $C_5H_{11}Cl$ hydrolyzed with NaOH obtained (like the Cl) from the neighboring electrolytic alkali plant. Pure HCl is obtained as a by-product. In addition to the pure mixt. of amyl alcohols the acetate is also manufd. (in using AcOH in the presence of H_2SO_4). The amyl alc. has a boiling range of 116-136° and has the following compn.: diethylcarbinol 8%, methylpropylcarbinol 18%, active amyl alc. 32%, isoamyl alc. 16%, normal amyl alc. 26%. The acetate is 85% ester and 15% amyl alc.; its b. p. range is 128-148°. Other com. products, e. g., amyl chloride and amylene dichloride, are also obtainable. The individual steps in the process are described, and several views of portions of the plant are included.

Chemical warfare and its medical significance. H. L. GILCHRIST. *Military Surgeon* 63, 477-92(1928).—G. gives a brief history of chem. warfare, mentioning some

of the different gases used, clinical conditions produced, a brief survey of treatments, parts of the body affected by mustard gas, some of the causes of gassing, and the after-effects of gases.

J. A. KENNEDY

Fatal poisoning probably due to arsine. M. LABORDE. *Rev. Hyg. Med. Prev.* 50, 790-1(1928).—Two laborers who were cleaning out a tank which had contained H_2SO_4 were stricken ill in about 8 min. with a severe diffuse bronchitis and gastro-intestinal symptoms. One man died; the other recovered without apparent bad effects. The H_2SO_4 contained 1000 p. p. m. of As. It is thought that AsH_3 was present in the mud in this tank and caused the fatal accident.

C. R. F.

Silicosis. E. L. COLLIS. *Trans. Ceram. Soc. (Eng.)* 27, 161-7(1928).—A study of the mortality among English men showed 12.3% deaths among the limestone masons were due to phthisis while 44.2 56.7% were similarly caused among the sandstone masons in several large towns. Among all males in England this disease causes 14.6% of the mortality. Coarser SiO_2 dust leads to bronchitis while the finer SiO_2 more frequently leads to pneumonia and silicosis. The SiO_2 dust risk is indicated by excessive mortality due to bronchitis and phthisis with the above normal mortality due to pneumonia and Bright's disease. The SiO_2 deposited on the lung tissue apparently dissolves, the adjacent cells are mummified and break down in the lymph nodes. Thereafter results the formation of the fibrous tissue, developing the actual fibrosis of the lung or silicosis. This condition is especially favorable to tuberculous infection, with generally fatal results.

H. F. K.

Insulation materials. H. WARREN. *Electrician* 101, 601-3(1928).—A brief general survey of natural and vitrified insulations, molded composites, sheet materials, varnishes, treated materials and wire coverings. There has been a marked increase in the use of synthetic molding compds.

C. G. F.

Magnesia product (U. S. pat. 1,690,771) 18.

Purifying gases. GES. FÜR LINDE'S KISMASCHINEN A.-G. Brit. 286,622, March 5, 1927. Washing for removal of readily absorbed gases such as H_2S and CO_2 by absorption in water is effected in 2 stages in which the H_2S and CO_2 are successively removed and the water contg. H_2S is regenerated separately from the remaining water. An app. and details of procedure are described.

Purifying gases. H. A. GOLLMAR (to Koppers Co.). Brit. 286,633, March 7, 1927. Fuel and other gases are freed from H_2S and other acidic constituents by washing with an alk. liquid contg. a compd. of As or metal of the "tin group of qualitative analysis" such as a soln. formed from Na_2CO_3 and As_2O_3 by heating with water. After use of the soln. to absorb H_2S it is aerated and a thioarsenate is formed. Sulfidation and limeation (with additions of fresh reagent as required) are then repeated, with recovery of free S. NaOH or Na sulfide and As sulfide or other As compds. also may be used as may also compds. of K, NH_4 , and Sb or Sn. Cf. C. I. 22, 3005.

Purification of gases. HUTH AND RÖTTGER. Ger. 466,351, Feb. 2, 1926. Gases forced under pressure into a container provided with a rotary filter cap.

Purifying gases. FREDERICK W. SPERR, JR. (to Koppers Co.). U. S. 1,690,437, Nov. 6. The greater portion of the impurities is removed from gases such as coal gas by a first washing and the gas is then subjected to a second washing with freshly regenerated or washing liquid. An app. is described. U. S. 1,690,438 specifies washing gas with a liquor such as Na_2CO_3 soln. to absorb impurities, aerating the wash liquor to regenerate it and washing the air to remove the impurities, and recirculating the air from which the impurities have been removed back to the liquid regeneration stage. An app. is described.

Gas purification. OSKI AKT.-GES. Ger. 466,356, Dec. 25, 1923. Addn. to Ger. 466,347 (Erich Oppen, inventor). The individual pieces of the wire emission electrode of a gas purifier as described in the prior patent are formed with a core of unalloyed semiconductor.

Washing gases. ERZÖST-GESELLSCHAFT M. B. H., WILHELM LINDHEIMER AND JOSEPH WALMRATH. Ger. 466,435, Jan. 7, 1926. The washing liquid is sprayed by centrifugal force round a sprinkler which has a stepped or steeply descending base.

Removing gas from molten substances. CARL BENEDICKS. U. S. 1,691,458, Nov. 13. Molten material such as glass or quartz is stirred with an electrically heated stirrer or other suitable body having a higher temp. than that of the molten mass; sep. of gas is localized on the body thus used for stirring.

Dust extraction. JAMES KEITH and BLACKMAN CO., LTD. Ger. 466,352, Aug. 14, 1926. Dust is expelled from gases by a screw fan.

Dust extraction. HERTHA MÖLLER, ARNOLD LUYKEN, GERTRUD LUYKEN, ERNST LUYKEN, NORA LAMPING, ILSE VOGG-CASTENDYK, IRMGARD FREUDE, FRITZ-KARL CASTENDYK, HEINRICH LUYKEN, GERDA LUYKEN, ELISABETH LUYKEN AND JOHANN LUYKEN. Ger. 466,343, Sept. 7, 1916. Suspended substances are extd. from gases by drying the gases and subjecting them to a high-tension current.

Separation of dust from smoke. ÉMILE PRAT. Fr. 637,272, Nov. 5, 1926. The larger particles in smoke are sepd. by a shower of water and the smaller by a metallic screen.

Separating solids or liquids from gases. GEORGES F. BRUT. Fr. 637,596, Nov. 10, 1926. The gas is caused to sweep over walls sloping in such a direction that the current assists gravity to eliminate solid or liquid particles from the gas.

Purification of liquids. PIERRE AMET. Fr. 638,948, Dec. 31, 1926. Liquids, particularly *lubricating oils*, are purified by a filter made of a metal sheet rolled into a spiral, or metal sheets partially superimposed which are continually or intermittently displaced so that the liquid is caused to pass by capillary action through the small spaces between the sheets or parts of the spiral.

Purification of chemical agents. SOCIÉTÉ HENKEL AND CIE G.M.B.H. Fr. 637,393, July 9, 1927. Chemical agents such as borax or Na_2CO_3 used for the manuf. of products contg. active O are boiled in soln. in the presence of silica gel and crystd.

Clarifying beer, vinegar and other liquids. A. J. MURPHY AND MURPHY & SON, Ltd. Brit. 286,861, Feb. 18, 1927. Finings for use in clarification are prepd. by "cutting" isinglass with lactic acid and water. H_3PO_4 or other suitable inorg. or org. acid also may be added.

Recovery of vapors. HENRI L. BARTHÉLEMY. Fr. 638,901, Dec. 28, 1926. Vapors are recovered by means of solvents made into a foam with water. An example is given of the recovery of acetone from air by a foam obtained by agitating water, NH_4 oleate and black industrial glycerol. Cf. C. A. 22, 3939.

Atomizing and mixing. A. RIEBECK'SCHE MONTANWERKE A.-G. Ger. 466,355, Mar. 23, 1926. The substances are forced under pressure through nozzles into a mixing chamber and out of this through atomizing devices.

Artificial fog. MINIMAX GES. (to Excelsior Feuerloschgerate A.-G.). Brit. 287,145, March 16, 1927. Large vols. of artificial fog are produced by bringing suitable chemicals (among which H_2SO_4 and chlorosulfonic acid and water are mentioned) into contact with air or other gas in a closed receptacle and discharging the fog thus produced into the air by suction or pressure or both. An app. is described.

Heat regulation in exothermic catalytic reactions. CHARLES W. MORTIMER. U. S. 1,691,903, Nov. 13. In regulating the temp. for catalytic reactions such as oxidation of aromatic hydrocarbons by use of a temp.-regulating liquid of const. b. p. such as Hg, the vapor of the liquid is divided and the incoming gases are also divided, a portion of the incoming gases are heated with one portion of the vapor and the other portion of the vapor is separately condensed. An app. is described.

Catalytic processes. COMPAGNIE DE BETHUNE. Fr. 639,058, Jan. 11, 1927. In exothermic synthesis such as MeOH from CO and H, a liquid is added to the reaction gases to control the temp. of the reaction. With MeOH water is a suitable liquid.

Catalytic gas reactions. SOCIÉTÉ NATIONALE DE RECHERCHES SUR LE TRAITEMENT DES COMBUSTIBLES. (André Raineau, inventor). Fr. 638,869, Dec. 23, 1926. An app. is described in which the catalytic chamber is externally cooled by the fresh gas which then becomes heated by the reaction products in a heat-exchanger and finally elec. just before entering the contact chamber. The whole is enclosed in an atm. cooled by water.

Determining gases by radiation measurements. HANS SCHMICK (to Siemens & Halske A.-G.). U. S. 1,691,138, Nov. 13. In testing gases such as those contg. CO_2 , a selective radiator (suitably a Bunsen flame with gas to be tested for CO_2) is used, the emission bands of which overlap as little as possible the absorption bands of the test gas.

Testing liquids. KARL LUDWIG. Ger. 466,653, May 20, 1927. A thin plate is provided with a no. of different sized holes and the largest hole covered by a film when the plate is dipped in a liquid gives a measure of the viscosity. By an examn. of the film the compn. of the liquid may be detd.

Treating solids with liquid reagents. JAMES E. EGGLESON (to General Chemical Co.). U. S. 1,690,363, Nov. 6. In treating *ores* with acid solns. or in other treatments of solids with liquid reagents, the solid and liquid are digested together, the solid is sepd. by settling while in a state of rest and the supernatant liquid is then withdrawn; the deposited sludge is washed with a flowing stream of wash water flowing counter-current to it under conditions providing for continuous settling of sludge from the wash water and the settled sludge is continuously withdrawn. An app. is described.

Hydraulic classification of coarse and fine granular materials. R. WUNSCH (to Erz- u. Kohle Flotation Ges.). Brit. 287,499, March 22, 1927.

Dewatering colloids, particularly peat. GES. FÜR MASCHINELLE DRUCKENTWASSERUNG M. B. H. Ger. 466,856, Dec. 28, 1919. The dewatering of colloids, particularly peat, is effected by intimate admixt. with non-porous, dry addns. of like nature in the form of granules not exceeding 1.5 mm. in diam.

System of filtering juices or other materials on rotary filters. HENRY A. VALLEZ. U. S. 1,691,001, Nov. 6. Paper pulp may be used as a filtering medium.

Emulsions and dispersions for dyeing, tanning and other purposes. I. G. FARBENIND. A.-G. Brit. 287,464, March 18, 1927. Products obtained by sulfonating, in the presence of a phenol, wool fat or fatty acids derived from it, are used in emulsifying solid and liquid hydrocarbons and derivs. such as alcs., phenols, nitro or amino compds., halogenated hydrocarbon derivs., CS_2 , bituminous substances, animal and vegetable oils, fats and fatty acids, waxes, resins, dyes and tanning substances. Several examples are given.

Preparation of emulsion. NIELS BENDIXEN. Ger. 466,353, Jan. 13, 1925. The liquid is forced through pores in a partition at an angle to the main stream.

Regulation of the temperature in exothermic reaction. SOCIÉTÉ CHIMIQUE DE LA GRANDE PAROISSE AZOTE ET PRODUITS CHIMIQUES. Fr. 32,856, Aug. 9, 1926. Addn. to 626,501. Circulation of the gaseous reaction products as well as, or instead of, the gases before reaction is used to regulate the temp. of the catalysts in exothermic reactions.

Charging vessels under pressure. I. G. FARBENIND. A.-G. Fr. 637,386, July 9, 1927. Solid materials, such as used in the manuf. of iron carbonyl or in the destructive hydrogenation of carbonaceous materials, are charged into high-pressure reaction vessels by a displacing device such as a piston located in a receptacle connected with the reaction vessel with the intervention of wide closing-means, the receptacle being capable of exposure to the pressure of the vessel or to the atm.

Respirator canisters. DEUTSCHE GASLÜHLICHT AUER-GES. and HANSEATISCHE APPARATEBAN GES. VORM. L. VON BREMEN & CO. Brit. 287,562, March 25, 1927. Exhaustion of canisters charged with material which generates O by the action of CO_2 and moisture is indicated by a substance of strong odor such as menthol which is liberated under the conditions prevailing at exhaustion of the main charge.

Refrigerating apparatus of the multiple-effect type. NICOLAI H. HILLER. U. S. 1,691,286, Nov. 13.

Refrigerating apparatus of the compression type. J. A. GRIER and J. A. WARREN. Brit. 288,138, April 22, 1927.

Compressor and condenser for refrigerating apparatus. JOHN R. REPLOGLE (to Electric Refrigeration Corp.). U. S. 1,691,305, Nov. 13.

Condenser for refrigerating apparatus. JOHN O. CARREY (to C & C Engineering Co.). U. S. 1,691,180, Nov. 13.

Filter for use with refrigerating apparatus. FRENCH E. DENNISON and WARD S. IRELAND (to National Refrigeration Corp.). U. S. 1,690,282, Nov. 6. Cylindrical screens are spaced from each other and have a decreasingly finer mesh from the outside to the inside.

Insulating material. ANDRÉ CUNY. Fr. 638,791, Aug. 3, 1927. A heat and elec. insulating material is made of superimposed layers of asbestos fibers and glass wool, sewed, glued or interlaced.

Heat-resisting and insulating material. L. F. TOOTH. Brit. 287,363, June 22, 1927. A binder of cement or fireclay, slagwool, crushed burnt brick and a small quantity of Al powder (or other material adapted when mixed with water to cause evolution of gas and produce a porous product) are used together and may be molded into bricks or blocks or used in lining or constructing furnaces.

Heat insulator. SOCIÉTÉ D'ÉTUDES POUR LE TRANSPORT ET LA MANUTENTION DE LIQUIDES ALIMENTAI: SOCIÉTÉ "TAMALA." Fr. 637,721, July 13, 1927. A heat insulator suitable for metallic walls is composed of powd. cork and bakelite.

Electrical insulating bushings. MONTFORD MORRISON. U. S. 1,691,356, Nov. 13. A heated insulating tube which may be formed of impregnated paper is placed around a conductor and is allowed to shrink in position on the conductor.

Insulating device for electric gas purification plant. SIEMENS-SCHUCKERTWERKE AKT.-GES. (Carl Hahn, inventor). Ger. 466,513, Jan. 29, 1924.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Ground water of the New Haven area, Conn. JOHN S. BROWN. U. S. Geol. Survey, *Water-Supply Paper* 540, 206 pp.(1928); cf. *C. A.* 19, 2716.—The geology of the region is described. Chem. analyses of 51 samples representing ground water in 12 townships are reported for the mineral constituents of these waters. The records of wells (dug, driven and drilled) are tabulated for the different towns. L. W. RIGGS

The water supply of Concepcion, Argentina from the Uruguay River. EIGENBRODT. *Gas u. Wasserfach* 71, 943-6(1928).—The water is purified by alum coagulation and quick sand filtration. Some details of the novel filtration scheme are given. Costs of operation are given. R. W. RYAN

Dissolved and suspended mineral matter in Colorado River. W. D. COLLINS AND C. S. HOWARD. U. S. Geol. Survey. *Ind. Eng. Chem.* 20, 746-8(1928); cf. *C. A.* 21, 2947.—Typical and av. analyses of the dissolved mineral matter contained in Colorado River water regularly collected at Grand Canyon and Topock, Ariz. in 1925-7 are tabulated. The av. dissolved solids found were, resp., 768 and 827 p. p. m. for 1925-6 and 1926-7, the chief ion being SO_4 . The av. water would be satisfactory for drinking, but not for use in boilers, since even if softened it would contain excessive Na salts. It could be used for irrigation with efficient drainage. Contents in % of suspended matter are given. Insufficient data on the amt. of silt carried in suspension and by the "bed-load" now make unreliable an est. of the life of storage reservoirs. C. H. BADGER

Diurnal variation of the gaseous constituents of river waters. III. ROGER WM BUTCHER, FREDERICK T. K. PENTLOW AND JAMES WM. A. WOODLEY. Fisheries Research Station, Alresford, Hauts, England. *Biochem. J.* 22, 1035-47(1928); cf. *C. A.* 22, 1202.—A continuation of expts. from September to December. The main factors governing the oxygen content of the river Lark are (1) the quality and type of plant life present, these factors being governed by the season of the year; and (2) the prevailing actinic conditions. BENJAMIN HARROW

An apparatus for adding gypsum to irrigation water. S. C. SCOFIELD AND ELMER W. KNIGHT. U. S. Dept. Agr., *Circ.* 38, 1-5(1928).—When irrigation H_2O contains substantially more Na than Ca, an injurious effect occurs in the phys. condition of the soil. CaSO_4 added to soft waters improves this phys. condition very markedly. An automatic gypsum distributor was designed to add the proper amt. of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ to the irrigation ditch. Analyses proved that most of the gypsum went into soln. where the amts. added per acre per yr. varied from 967 to 2000 lbs. C. R. FELLERS

Chlorine content as an index of the potability of water supplies. L. GILLET AND C. H. GUILLEAUME. Sanit. Service of Luxemburg. *Tech. Sanit. Munic.* 23, 177-80(1928).—If deductions are made for the Cl derived from minerals, then for each region, fairly definite limits for Cl as an indicator of pollution may be established. The mineral Cl content of waters underlying certain geological strata are given. Great credence is placed on the Cl content as a basis of detg. the potability of water. C. R. F

Chlorination of drinking water. HAYO BRUNS. *Gas u. Wasserfach* 71, 1057-64(1928).—The development of the chlorination of drinking water is reviewed and the necessity of careful control pointed out if typhoid epidemics are to be avoided. The history of numerous epidemics is given, bacterial tests are reviewed and methods of detg. free chlorine content given. The correct excess chlorine content is about 0.1 mg. l. and this can be detd. by the benzidine, *o*-tolidine or naphthoflavone tests, which are sensitive to about 0.03 mg. per l. Development of an objectionable odor and taste due to chlorination of phenols, etc., may sometimes be avoided by excess chlorine, later destroyed with Na_2SO_3 , $\text{Na}_2\text{S}_2\text{O}_3$, or KMnO_4 . This taste develops more strongly in cold weather. Many references and 3 illustrations of app. are given. R. W. RYAN

Is prechlorination worth using? J. S. WHITENER. *The American City* 38, No. 5, 123(1928); U. S. Pub. Health Eng. Abs. E-660C, 81(1928); cf. *C. A.* 22, 3472. C. R. FELLERS

Use of liquid sodium aluminate in the clarification of the Denver water supply. O. J. RIPPLE, G. J. TURKE AND C. H. CHRISTMAN. *Ind. Eng. Chem.* 20, 748-52(1928); cf. *C. A.* 21, 2344.—The use of Na aluminate-alum at the North Marston mech filter plant replacing lime-alum for coagulation has lengthened the av. filter run from 24.6 to 29.8 hrs. and reduced the av. wash water used from 2.38 to 1.88%. It forms an easily controlled, highly hydrated floc; the reaction is more rapid and complete; less alum is necessary; and it does not break up in getting to the filters. Mud balls form less rapidly. The optimum Na aluminate dosage, 2.1 p. p. m. (0.125 grain), is kept const. while the

alum dosage is varied to maintain a turbidity of not more than 0.2 p. p. m. in the filtered water. Chemicals cost \$0.092 per million gal. of raw water treated. This is offset by a corresponding saving of \$0.051 in wash water used, better efficiency of plant operation and improved water supply. Charts show the improved bacteria and microorganism removal. The filtered water is chlorinated, the residual Cl av. 0.07 p. p. m. C. H. B.

The action of permutite in softening industrial waters. I. MUTTI AND M. BASINI. *Ann. chim. applicata* 18, 387-94(1928).—When both Ca and Mg salts are present sodium permutite (NaP) reacts to a greater extent with the Mg salt. When Mg salts alone are present, CaP will react so as to transform completely the Mg salts, whereas, MgP will only react to a partial extent with Ca salts. When Ca and Mg salts react separately with NaP, then the Ca salt is transformed to a greater extent, as would be predicted from its greater mol. wt. The explanation of the apparent exception to this rule in the case when the salts are both present at the same time is clear from the above considerations, CaP being formed at first almost completely, but this in turn reacting with the Mg salts present as this reaction takes place more readily. A. W. CONTIERI

Filtering and washing process in open installations for removing iron. G. THIEM. *Gas u. Wasserfach* 71, 852-4(1928).—The method and theory of washing the filters are discussed and illustrated for fine and coarse filters. R. W. RYAN

The electroosmotic water-purification process of the Siemens-Elektro-Osmose G.m.b.H. KURT ILLIG. *Siemens-Z.* 8, 349-58(1928).—A more detailed exposition of the process and app. described in *C. A.* 22, 470. Only magnetite anodes are fully successful. The cathodes may be of almost any metal; Fe, Zn and Sn are used. Vulcanized fiber is used for all diaphragms except at the anodes in the last stages, where chrome gelatin is used. The app. is supplied in four sizes, with capacities of 2.5-250 l. per hr. 110 or 220 v. can be used. The cells are built of rubber-coated steel, with hard-rubber or hard rubber-coated steel separators. The initial cost is higher than for thermal app., but the space required and operating cost are much less. 15-40 kw. hrs. per cu. m. is the energy consumption, as against 139 for the most efficient distn. equipment. The app. is as yet too costly for the production of large quantities of pure water for boiler feed, but a comprehensive research program is under way looking to the development of higher-capacity app. built in more economical fashion. App. is also being developed for the many places in which only a few liters per day are required. At this time the yearly production of electroosmotically purified water is about 15 million liters. B. MILLER

The use of copper coils in distilling apparatus for the preparation of distilled water. H. W. VAN URK. *Pharm. Weekblad* 65, 1075 7(1928).—Unless the Cu is protected by a coating of Sn, traces of the metal are likely to be found in the distd. H₂O. A. W. DOX

Chemical disposal tanks. DANIEL FLORENTIN. Paris Municip. Chem. Lab. *Tech. Sanit. Munic.* 23, 169 72(1928).—The septic tank with its system of biol. purification does not give the desired results under all conditions. Chem. destruction of contaminated sewage is safe and easy of accomplishment. A charge consisting of 12 kg. NaOH scales in 30 l. of H₂O should last a family a yr. and the % of NaOH or Na₂CO₃ should never fall below 2 or offensive odors may result. Two installations were studied over a period of 1 yr. with inconclusive results. More data are necessary before definite recommendations can be made. C. R. FELLERS

Decomposition of cellulose. H. HEUKELEKIAN. N. J. Agr. Expt. Sta., *Ann. Rept.* 1927, 272 84; *Pub. Health Eng. Abstrs.* E-545, 32(1928).—Expts. were carried on during the past yr. in an effort to study the fundamental processes of sludge digestion, not from the standpoint of changes in bacterial life, but as measured by the decompn. of org. material. Two methods were employed: (1) following the changes in the cellulose content of digesting material and (2) adding cellulosic substance to ripe sludge and following the changes induced. The native cellulose of fresh solids as well as cellulose added to ripe sludge in the form of filter paper decompn. rapidly; the decompn. of cellulose takes place in the early part of the digestion, mainly during the first 3 weeks. The decomp. of cellulose gives rise to acidity, which retards the general course of the digestion. Cellulose decompn. takes place under acid conditions, but the addn. of CaO accelerates the rate of decompn.; the decompn. of cellulose is accompanied by the production of gas, the vol. of which is much smaller than that produced in the decompn. of an equal quantity of mixed org. matter in fresh solids. There is a lag of 5 or 6 days before the decompn. of cellulose starts while the rapidity of the decompn. of cellulosic substances is correlated with their cellulose content. The cellulose content of the solids collected from the inlet end of an Imhoff tank is higher than that from the outlet end. The digestion of the material from the inlet end was similar to the type of digestion obtained from the mixt. of solids. The material from the outlet end had a shorter period

of acid digestion, lower acidity and a higher alky. and higher ash content than the material from the inlet end. C. R. FELLERS

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

A new soil map of Yugoslavia. KOCH. Geol. Museum, Zagreb. *Ernähr. Pflanze* 24, 361-2(1928).—The map is reproduced and discussed. LAWRENCE P. MILLER

Timiriazev and the Timiriazev Agricultural Institute. R. B. HARVEY. Cambridge Univ., England. *Plant Physiology* 3, 227-30(1928).—A brief biographical sketch of Clement Arkadevich Timiriazev, the noted Russian plant physiologist, together with an account of the work of the Academy in Moscow named after him. The paper is illustrated with 3 plates. WALTER THOMAS

Contribution to the study of soils. III. The absorbent power of soils with respect to ammonia. J. CLARENS and PERON. *Bull. soc. chim.* 43, 962-9(1928).—The annual study of the soil from the point of view of its reaction with respect to alkalies by the hydroquinone method for example, the detn. of the bases and of the replaceable acid radicals, gives useful indications of the reserves of the soil, and, consequently of the lime, the nature and the quantity of the amendments and of the fertilizer to employ. E. F. SNYDER

Electrodialysis of soils. III. Effect of different fertilizer treatments of soils on the bases and acids extracted by electrodialysis. HARRY HUMPHELD. Iowa State Coll. *J. Am. Soc. Agron.* 20, 1141-59(1928); cf. *C. A.* 22, 836.—Advantages of electrodialysis of the soil as compared to the detn. of replaceable bases by the neutral salt method are given. The dialysis of 3 widely different soils shows that satisfactory end points were secured with each soil. Fertilizer treatments over a term of years have a measurable effect on the quantities and kinds of extractable acids and bases. The effect of treatments of rock phosphate on the P and of superphosphate on the P and S were especially striking. Applications of farm manure seemed to cause a slight decrease in the total bases extd. A change of soil type within a range of plots may have a greater effect on the amts. of extractable acids and bases than any of the treatments. E. F. S.

Electrodialysis of soil. K. N. TARANOV. *Ukrainskii Khim. Zhurnal* 3, No. 2, Pt. techn. 89-112(1928).—The electrodialysis of four different samples of soil was investigated with d. c. and a cell consisting of 3 sections sepd. by collodion membranes. By means of electrodialysis a definite amt. of bases (Ca, Mg) and of phosphoric acid can be extd. This amt. coincides with amts. obtained by usual methods applied in the study of soils. The p_H of the soils decreases very markedly as the result of dialysis. The H ions in the electrodialyzed soils should be sepd. into 2 rather distinct groups: H ions replaced by neutral salts and those replaced only by basic salts. The hygroscopicity of soils decreased on dialysis. G. B. KISTIAKOWSKY

Systems of soil survey. V. J. KONINGSBERGER. *Facts About Sugar* 23, 1166-7(1928); cf. Willcox, *C. A.* 22, 4701; Earle, *C. A.* 23, 228.—The system used by Bennett and Allison in Cuba and that used by Arrhenius in Java may be likened to taxonomy and physiology, resp., involving two different technics that cannot be compared. The Paserocean expt. station uses both and considers them equally important but independent. Arrhenius' work in Java would have been impossible if the data from the

former had not been already available. Practical aspects of soil surveys. O. W. WILLCOX. *Ibid* 1167.—W. replies to K.

M. J. PROWITT

Muck-soil reaction as related to the growth of certain leaf vegetables. E. V. HARDENBURG. Cornell Univ. *Plant Physiology* 3, 199-210(1928); cf. Rhode Island Expt. Sta., *Bull.* 160.—Lettuce, mustard, endive and parsley were grown in pot cultures on a highly fertilized low-lime muck soil (p_H 5.0). S , $Al_2(SO_4)_3$ and $CaCO_3$ were applied in varying amts. to provide a soil reaction ranging from p_H 4.0 to p_H 7.0. Because of the highly buffered nature of the muck, none of the treatments provided as wide a range of H-ion concn. as expected. Even 10 lime applications at the rate of 10 tons per acre did not give a p_H value greater than 7.0. S proved more active than $Al_2(SO_4)_3$ as an acidifying agent. No trace of Al toxicity was evident in any of the 4 vegetables from the 8000-lb. application of $Al_2(SO_4)_3$; this was due apparently to the buffer influence of the muck soil. The largest top wts. of lettuce were obtained within a p_H range of 5.0 to 6.5. The increased applications of lime to lettuce reduced the growth of both top and roots, decreased the total ash content, and the absorption of Al , Fe and Ca to a moderate extent. This influence is explained on the basis of change in permeability of the root tissues, which reduced the intake of the elements mentioned and probably of other nutrients as found also by Crist (*C. A.* 20, 3310). Parsley and endive appear to respond to decreasing acidity more consistently than either lettuce or mustard. No obvious correlation between H-ion concn. and root-and-top ratio exists for lettuce, mustard and parsley. Root development in endive appears to be favored by a culture medium which approaches neutrality. The water requirement of lettuce, mustard and parsley increased rather markedly with each increase in lime application. There was a corresponding, though much less marked, decrease in the water requirement of endive for each increment of lime. With all 4 vegetables, the max water requirement was reached in the more acid cultures. WALTER THOMAS

Soil alkalinity on recent burns. ROBERT MARSHALL AND CLARENCE AVERILL. Northern Rocky Mountain Forest Expt. Sta., Montana. *Ecology* 9, 533(1928).—Although forest soils are normally acid, the logical explanation for the alk. character of recent burns lies in the alky. of wood ashes. It is suggested that such alky. may contribute to the scarcity of reproduction in the western white pine type during the first 2 or 3 yrs following large fires, until leaching has removed the lye from the soil.

E. F. SNYDER

A type of bacteria abundant in productive soils, but apparently lacking in certain soils of low productivity. H. J. CONN. N. Y. Agr. Expt. Sta., *Tech. Bull.* 138, 1-26 (1928).—A species of bacteria, apparently not described before, has been found abundantly in good soils of this region, but is almost lacking in certain soils not so well suited for the growth of general crops, notably Volusia silt loam and Hoosick coarse sandy loam. This organism is here named *Bacterium globiformis*, n. sp. *Bact. globiformis* is unable to grow in acid soils, and the 2 soils of low productivity just named are both acid in reaction. Liming, nevertheless, is not sufficient to allow this organism to thrive in them if it is inoculated into the soil after sterilization. In addn. a suitable C and N source must be supplied. In either of these soils this organism is able to grow readily if furnished with N in the form of an NH_4 salt or an amino acid, and C in the form of a sugar, a polyhydric alc. or one of certain org. acids. Even an acid as simple as acetic is an available source of C. A further study of the physiology of this organism seems desirable in order to learn why certain soils fail to support its growth. C. R. F.

Response of oats and soy beans to manganese on some Coastal Plain soils. L. G. WILLIS. N. C. Agr. Expt. Sta., *Bull.* 257, 1-13(1928); cf. *C. A.* 22, 3013.—Unproductive spots occur in fields throughout eastern N. C. on which corn is stunted and soy beans are chlorotic. Typical cases of the chlorosis have been remedied by applications to the soil of $MnSO_4$ after the chlorosis had developed. Such treatment was without effect on corn planted with the soy beans. Soils producing this condition are approx. neutral or alk. while adjacent soils bearing normal crops are acid. Chlorosis similar to that responding to Mn treatment has long been considered evidence of K_2O deficiency, since K_2O fertilization has been found an effective remedy. The prevalence of this type of chlorosis on soils having poorly drained or impervious subsoils is taken to indicate that the comparative immunity of crops on other soil types may be due to greater root development into the more penetrable lower horizons. Results of pot expts with oats show that injury caused by applications of CaO or $Ca_3(PO_4)_2$ to a soil which was deficient in Mn for soy beans can be prevented by the addn. of $MnSO_4$.

C. R. F.

The drift in potential of the quinhydrone electrode. L. D. BAYER. Ohio Agr. Expt. Sta. *J. Am. Soc. Agron.* 20, 1125-40(1928).—The fluctuation in p_H values

measured with the satd. calomel, 0.05 *N* K H phthalate, and 0.01 *N* HCl plus 0.09 *N* KCl electrodes varied with different soils. The calomel cell is preferred because of its stability. Electrodes such as the Pt cone, Pt foil, Pt gauze and Au foil showed significant differences in results. Mech. stirring reduced the deviations in the p_H values of these soils. The lower part of the soil suspensions tended to be more acid than the upper. Recrystd. quinhydrone did not materially affect the changes in p_H when compared with a good com. product. The deviations in p_H were not influenced by passing CO₂-free air or H through the soil suspensions. Allowing the soil-water mixts. to stand overnight did not reduce the p_H fluctuations. The care of the metallic electrodes is of prime importance. A soln. of definite p_H or a control soil is used to check the accuracy of the electrodes. The more nearly correct reading is obtained at least 1 minute after the electrodes are immersed in the soil suspension. E. F. SNYDER

The actual acidity of the podzol soils and the influence of liming. NIL P. REMEZOV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 42, 5-26(1927).—With the aid of the Gemmerling-Sabanin sampling tube as described by Kachiinskii (Soil Moisture and Methods of studying it, 2nd ed. Novaya Derevhya, Moscow, 1924) soil samples were obtained in glass cylinders. The soil in these cylinders, which are a part of the sampling app., remains in natural condition. The soil is brought to its moisture-holding capacity and then forced out as the soil soln. by the Schlösing method. It is shown that in the same field the p_H varies, depending on the meteorological and biological factors. The fallow plot showed a higher acidity. In the unlimed plots the acidity increased with the increase of nitrates. The reverse was true on the limed plots. A satd. soil shows a higher acidity than a dried soil. On the podzol type of soil the acidity increases with the depth of the horizons. J. S. J.

The qualitative and quantitative determination of replaceable sodium in alkali and non-alkali soils. R. H. BRAY. Univ. of Illinois. *J. Am. Soc. Agron.* 20, 1160-6 (1928).—Barber and Kolthoff's method for the rapid detn. of Na has given satisfactory results when applied to replaceable Na in soils. A qual. test for replaceable Na is proposed which is sensitive to amts. as low as 0.02% replaceable Na. E. F. SNYDER

Mineral content of pastures. Lime-deficient areas and a hitherto unsuspected malnutrition disease in sheep. B. C. ASTON. *New Zealand J. Agr.* 37, 145-51(1928); cf. *C. A.* 22, 4182.—Bone-weakness in animals grazed on certain burned-over N. Z. soils of volcanic origin was traced to a deficiency of Ca in the soil. The soils were highly acid, having in some cases a lime requirement of 10 tons per acre, and unlimed pastures were characterized by vegetation which thrives on acid soils. K. D. JACOB

The causes of plant suffering from overliming. I. V. BOBKOV, B. A. GOLUBER AND A. F. TYULIN. *Zhurnal Oputnoi Agronomii* (Russia) 23, 165-202(1927).—Overliming may cause injury not only to peat soils, but also to mineral soils, especially on light forest virgin soils. The addn. of lime to such soils increases the alky. of them and intensifies the biological processes. The result is an increased quantity of lime, bicarbonates, ammonia, nitrites (sometime) and nitrates in the soil soln. In some of the expts. it was noted that the plant suffered because of an accumulation of NH₃. After the disappearance of the NH₃ the plants recuperated. Application of excessive amts. of lime to heavy soils did not impede the growth of plants even though the alky. increased; neither was there any accumulation of N on these soils. J. S. JOFFE

Investigational work with fertilizers. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, pp. 5-13(1928).—Urea gave results which compared closely with mixts. of NaNO₃ and (NH₄)₂SO₄ as a source of N for potatoes. Cyanamid gave lower results, particularly when applied at time of planting. The 13-48 and 20-20 grades of ammo-phos both gave results which were practically the same as those obtained with equiv. mixts. of NaNO₃, (NH₄)₂SO₄ and superphosphate when applied to potatoes and turnips on light sandy loam and clay loam soils. Superphosphate was more effective than Sydney fortified basic slag as a source of P₂O₅ for turnips. K. D. JACOB

Gore experimental area. Notes on operations, season 1927-28. R. MCGILLIVRAY AND J. E. DAVIES. *New Zealand J. Agr.* 37, 120-4(1928).—Superphosphate had a deleterious effect on the germination of swedes, the plants remaining yellow and their growth being uneven for some time. Superphosphate gave the lowest yield of swedes and Seychelles Island phosphate the highest, the yields with Ephos basic phosphate, Walpole Island phosphate, sulfurophosphate and Nauru Island phosphate being intermediate when all fertilizers were used at the rate of 200 lb. per acre. K. D. JACOB

Fertilizer experiments in the Jaroslav district. M. D. BAKHULIN. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 40, 5-64(1927).—B. summarizes all the available information on the fertilizer expts. of the districts with rye, oats, flax, potatoes, root crops,

clover and meadow hay. It has been established that the different types of loam and sandy soils responded favorably to fertilizers. In this district P does not seem to be the min. factor, except in a few cases, especially with rye. J. S. JOFFE

The use of rock phosphate flour. A. N. LEBEDYANTZEV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 18-20(1926).—L. presents a program of research on the use of rock phosphates in place of superphosphate, not only for the zone of podzol and degraded chernozem soils, but also for the chernozem zone and the southern chernozems which blend into the brown chestnut soils. The expts. at the Shotilov station are cited, whereby it is shown that raw phosphate when finely ground—0.02 mm. and lower—gave just as good results as sol. phosphates applied in the form of Na_2HPO_4 . J. S. JOFFE

The work of the Engelhardt regional agricultural experiment station with raw phosphates. V. N. POSTNIKOV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 33-6 (1926).—Comparative expts. on the use of various sources of P conducted for a period of 11 years show the value of raw phosphate on podzol unsatd. soils. J. S. JOFFE

Lime and phosphoric acid in the soil. M. A. EGOROV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 37-45(1926).—Data are presented to show that $\text{Ca}(\text{HCO}_3)_2$ is the form of Ca which ties up the P_2O_5 in the soil. The greater the amount of CO_2 in the soil, the smaller is the effect of acid phosphate. At the same time in certain loam soils the P_2O_5 was parallel with the Fe and not with the Ca. J. S. JOFFE

The phosphate nutrition of plants and soil acidity; a contribution to the question of rock phosphate fertilizing on chernozem soils. E. V. BOBKOV AND A. L. MASLOVA. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 39, 5-38(1926).—Six types of soil were used: 3 chernozem varieties, 2 loam (dark gray forest and podzolized light) and a coarse-sandy soil. Ten g. of each soil were treated with 100 cc. solns. contg. 2, 4, 6, 9 and 12 cc. of 0.1 N HCl or 4, 7, 10 cc. 0.1 N $\text{Ca}(\text{OH})_2$, left for 24 hrs., filtered and the filtrate was analyzed for P_2O_5 , CaO, Fe_2O_3 and p_{H} . The forest loam with an original p_{H} 6.8 began to give up its P_2O_5 soon after the smallest quantities of acids were added; at p_{H} 6.2 14.3 mg. P_2O_5 were found against 8.6 mg. in the original soil; at p_{H} 5.3 the P_2O_5 content went up to 45.7 and at p_{H} 3.69 (12 cc. HCl added) 113.4 mg. Two varieties of chernozem and the podzolized loam did not show any increase in P_2O_5 until the p_{H} reached 4.0, although the original p_{H} of these were close to that of the other loam, namely, 6.81, 6.4 and 5.9. In the sandy soil the p_{H} had to go down to 2.5 to show any increase in P_2O_5 . All soils released more Ca as the acidity increased. The soil forest loam which released most of the P_2O_5 released the largest amt. of Ca. This did not release any Fe with the addn. of even 6 cc. HCl. The same was almost true for the other soils. Thus the P is apparently combined with the Ca cation. Vegetation expt. on the soils mentioned showed that the soils which released its P most readily did not respond to P fertilizers. The Neubauer method permits the detection of the influence of finely ground phosphates in the soils which respond to P fertilizers in the vegetation expts. It is suggested that the P content of a soil as shown by the titration curves may give an index of the P requirements of the soil. J. S. JOFFE

Experiments with lime and phosphates on the Kriukovo and Volokolamsk experimental plots in 1925. S. V. SHCHERBA. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 41, 39-84(1927).—Applications of lime—150 to 1500 poods per desyatina—gave slight positive effects on oats with very marked residual effect on rye. The 1200 to 1500 poods of lime gave an increase of over 130% on vetch and oats as a result of the residual effect of liming the rye. Barnyard manure alone gave just as good results as lime; the addn. of both materials showed an additive effect. The residual effect of the lime was twice as large as that of manure. Phosphates (untreated) gave no increase when added with manure; by itself it did increase the yield of rye. Six poods of phosphates gave just as good results as 12 and 18 poods per desyatina (a pood equals 36 pounds; a desyatina equals about 2.7 acres). The soils of the exptl. field are of the heavy type. J. S. JOFFE

Tricalcium phosphate in phosphorites. Solubility of tricalcium phosphate in decinormal nitric acid. MASSIMO TRAMONTANO. *Atti accad. fisiocrit. Siena* 1928, 405-9.—By treating 5 g. of phosphorite with 500, 654.5 and 1.000 cc. 0.1 N HNO_3 at the ordinary temp., agitating for $\frac{1}{2}$ hr., taking the quantity of soln. equal to 1 g. of product, pptg. with molybdic reagent, dissolving the ppt. in 2.5% NH_4OH , and pptg. with magnesia mixt. it was found that pure $\text{Ca}_3(\text{PO}_4)_2$ is completely sol. if enough acid is to absorb 2 atoms of Ca (128.5 cc. = 1 g. $\text{Ca}_3(\text{PO}_4)_2$). The fact that the theoretical quantity of HNO_3 is not sufficient for a complete soln. of the phosphate is due to the soly. of the numerous salts present. 0.1 N HNO_3 must not be employed for detg. % of P_2O_5 in phosphorites assimilable by plants, because the acid affinity of the HNO_3

is greater than that of the vegetable acids more usually present in plants. 0.1 N HNO_3 can be used to det. total P_2O_5 in phosphorites. A 1% soln. gives better results. R. S.

The absorption of phosphoric acid by the soil. V. V. GEMMERLING. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 46-50(1926).—Gemmerling presents data which show that the main mass of mineral phosphoric acid in red and podzolized soils is bound with the sesquioxides and not with the Ca; in chernozem soils the largest portion of phosphoric acid is combined with Ca and possibly Mg. J. S. JOFFE

The application of lime. D. N. PRYANISHNIKOV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 51-4(1926).—A theoretical discussion on the probable role of Ca in the various soil reactions. J. S. JOFFE

The microbiology of soils in relation to liming and phosphate applications. E. E. USPENSKII. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 65-71(1926).—The work conducted at the institute warrant the following theses: (1) NO_2 , NO_3 and other products of microbial metabolism detns. are not sufficient for the evaluation of the role of microbes. (2) In solving the problem of liming and P application more attention should be paid to *Azotobacter*, denitrifiers, nitrifiers and *B. mycoides*. The biol. retrogression of phosphoric acid is connected with the total number of microbes and the number of acid formers. Wherever peat is involved the urea bacteria enter the field. The protozoa are not important under field conditions. (3) An account of the number and state of the microbial flora under conditions of liming and P applications gives indications of the transformation of P and N in the soil. (4) Liming to a reaction beyond the neutral point (p_H 7.6) increases the activities of the denitrifiers. J. S. J.

The value of peat as a material for the preparation of composts and peat manure. D. N. PRYANISHNIKOV. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 34, 72-5(1927).—Peat added to sand cultures with K and P_2O_5 salts efficiently supplied the nitrogen to plants. Composting peat with raw phosphates showed that the phosphorus becomes water-sol. Alk. composting of peat (4% of wood ashes or equivalents of CaO) brought 12% N into sol. state in 72 days. Inoculation of the composts with manure exts. did not increase the efficiency of the composts. J. S. JOFFE

Citrus chlorosis as affected by irrigation and fertilizer treatments. P. S. BURGESS AND G. G. POHLMAN. *Ariz. Agr. Expt. Sta., Bull.* 124, 183-232(1928).—For the past 8 or 10 yrs. many of the older citrus groves in Ariz. have been deteriorating both in yield and in quality of fruit produced. The leaves are chlorotic, the set of fruit is small and in many cases much dead and weak wood is in evidence. As the poor conditions noted have been brought about, not by org. diseases, but apparently by a general physiol. derangement of the trees, this work was done in an endeavor to find whether certain soil treatments might not be of value either in preventing a further decline, or in actually improving present conditions. The lab. work on the soils included mech., chem. and bacteriol. studies. They showed the soils to be free from toxic concns. of the alkali salts, but fairly high in CaCO_3 and alk. in reaction, p_H 8.1 to 8.5. Total N was low in all cases but its availability was high. Total P_2O_5 was fairly high but its availability was slight. The bacteriol. studies indicated a fair degree of microbiological activity. N fixation was especially high. Soil soln. studies are reported together with results from the use of various salts as clay coagulants. The mech. analyses and soil profiles of the important citrus soil types are discussed. From this lab. work it appeared that org. matter, N and sol. phosphates should be of value on the soils in question. The fertilizer and soil-amendment studies were conducted in 8 or 10 of the poorer groves, both in the Salt River Valley and on the Yuma Mesa. Both surface applications and deep treatments were included. Although a slight improvement was usually shown where both manure and double-superphosphate were applied deeply, the results of the fertilizer treatments were largely negative. Spraying the chlorotic foliage with FeSO_4 and MnSO_4 also was without permanent effect. The field moisture-control work was extremely successful. Where the irrigation program was changed to conform to the information secured from the soil-moisture studies, a remarkable recovery usually took place. After 1 or 2 yrs. of work several of the older chlorotic groves appear to be well on their way towards profitable production. It appears best to give a heavy irrigation, 5 to 6 inches in basins, and then allow the soil to approach closely the wilting point before another irrigation is given. This gradual drying-out between irrigations permits of thorough soil aeration, which is of great importance in citrus culture. Pot-culture work with grapefruit seedlings in the greenhouse showed that excessive amts. of CaCO_3 in the substratum caused chlorosis but that this condition could be alleviated to a large extent by the application of org. materials. Peat and muck gave the best results followed by alfalfa and manure. C. R. F.

Results of experiments on the Dolgoprudnoe experimental field for the year 1925.

N. G. KOSHECHKIN. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 41, 5-37(1927).—Limestone at the rate of 600 poods per desyatina (1 pood equals 36 pounds; 1 desyatina equals about 2.7 acres) without barnyard manure and with 1200 poods, 2400 and 3600 on rye showed that lime alone had no effect. With the highest application of manure the increase of grain was 37.8%. With oats the lime alone gave almost as much of an increase as lime with the highest amt. of manure. Lime without and with N, K and P fertilizers showed that without lime the effect of the fertilizers was not noticeable, except with phosphates.

J. S. JOFFE

Variation in alkaloid content of the pomegranate due to certain soil treatments. E. MAURIN. *Bul. soc. bot. (France)* 75, 280-2(1928).—The alkaloid content of the pomegranate was more than doubled by the application of CaHPO_4 or a soln. of thorium X to the soil. $(\text{NH}_4)_2\text{SO}_4$ and FeSO_4 were only slightly less effective, but K_2SO_4 reduced the alkaloid content. The favorable treatments should be of commercial importance for growers who raise the pomegranate for its alkaloid content. A. E. HITCHCOCK

An interpretation of the results of fertilizer experiments carried out in N. W. Occ. Negros. ROBERT L. PENDLETON AND V. G. LAVA. *Sugar News* 9, 652-7(1928).—The conclusions were based upon data from about 50 reports by different workers, and were reached with the use of "Students" method of calcg. odds. The variety used was Negros Purple. The region was grouped into (a) the low nearly flat recent alluvial soil comprising the Silay series of brown to gray brown color of andesitic origin, the Isabela dark heavy soils, and the Pulupandan light coastal soils both of andesitic and calcareous origin; and (b) the irregular slightly to deeply eroded older uplands comprising the Guimbala-on series of brown or grayish brown soils, the Santa Rosa series of dark-colored soils, the poor Bago soil and the Guimbala-on "volcanic ash" soils. In lowland soils (1) 250 kg. of $(\text{NH}_4)_2\text{SO}_4$ per hectare produce an av. increase of about 44 piculs of sugar; (2) 500 kg. $(\text{NH}_4)_2\text{SO}_4$ per hectare produce an increase of about 57 piculs sugar; (3) 624 kg. of ammophos per hectare give an av. increase in yield of about 60 piculs sugar; (4) 2000 kg. of slaked lime gave no significant increase in yield; (5) 2000 kg. per hectare of copra coke give an av. increase in yield of about 37 piculs sugar (in mixed upland and lowland). In upland soils: (6) 500 kg. of $(\text{NH}_4)_2\text{SO}_4$ per hectare give no significant increase in yield.

V. G. LAVA

Fertilizer experiments at Binalbagan. GREGORIO B. LONTOK. *Sugar News* 9, 170-2(1928).—The object of the expt. was to find out whether or not P_2O_5 and K_2O are needed in the district. First ratoons of Negros Purple cane were used on a silt loam. The fertilizers used were ammophos (16% N, 20% P_2O_5), "Big Crop" (10% N, 6% P_2O_5 , 2% K_2O), "Filfer" (17% N, 6% P_2O_5 , 3.5% K_2O) and $(\text{NH}_4)_2\text{SO}_4$ (20% N). All of the plots were given 100 kg. of N per hectare. The yields in piculs of sugar per hectare, together with % P_2O_5 and K_2O in the juice, are as follows: $(\text{NH}_4)_2\text{SO}_4$: 96, 0.068, 0.091; ammophos: 92, 0.066, 0.081; "Filfer": 85, 0.074, 0.075; "Big Crop": 82, 0.073, 0.073; control: 26, 0.108, 0.075. It is concluded that N is the only element that should be applied to the soil as fertilizer.

V. G. LAVA

Increasing sugar yields per hectare by application of ammonium sulfate in the Laguna-Batangas District. MANUEL L. ROXAS. *Sugar News* 9, 450-9(1928).—The application of 250 kg. per hectare of $(\text{NH}_4)_2\text{SO}_4$ to different soil types in the Laguna-Batangas district produced in 1927-28, a yr. of pronounced drought, about 33% more sugar than the unfertilized fields in the spring months; the increase was 54% in the 1926-27 season when the weather was more favorable. There were more heavier stools per hectare with $(\text{NH}_4)_2\text{SO}_4$. Under Luzon conditions it is suggested that the best time to apply the fertilizer is at time of planting.

V. G. LAVA

Magnesium fertilizers and nitrogen content of the wheat grain. M. JAVILLIER AND A. CREMIER. *Compt. rend. acad. agr. France* 14, 986-90(1928).—Mg as carbonate and as the silicate of colloidal Mg has not increased the N of the wheat grain.

E. F. SNYDER

The disappearance of nitrate under timothy. L. G. JONES. *Texas A. and M. Coll. J. Am. Soc. Agron.* 20, 1167-75(1928).—A study in pots was made of the ultimate fate of NO_3 when applied to Dunkirk silty clay loam soil growing timothy of different ages, and when added to similar soil kept free of vegetation. A complete inventory was kept of the income and outgo of NO_3 and of total N. The expts. were conducted over a period of 14 months. NO_3 disappeared in a comparatively short time when added to timothy sod. This disappearance during a given time was more complete from the soil growing timothy than from the bare soil. Where the crop was growing, this disappearance, the largest application of NO_3 excepted, was accounted for by the N taken up by the crop (roots and tops). At certain stages of growth the crop contained considerably more N than was contained in the added NO_3 . Considering the N of the

crop as "conserved," there was a net gain of total N by the soil where timothy was growing. Although not entirely conclusive, the figures indicate that added NO_3 may be lost from bare soil of this type by denitrification. E. F. SNYDER

The value of hairy vetch and crimson clover for green manure. R. P. BLEDSOE. Georgia Agr. Expt. Sta., *Bull.* 146, 188-208(1927).—Vetch cut when in full bloom contained 3.8% N. When cut earlier the N content was greater. Crimson clover cut in full bloom contained 2.9% N, and larger quantities when cut earlier. Calcns. are given showing the quantity of N added to the soil with varying dates of cutting green manure crops. J. J. SKINNER

Artificial farmyard manure. V. R. GREENSTREET. *Malayan Agr. J.* 10, 194-203 (1928).—Expts. were made to study the decompn. of grass and dry padi straw alone and with addition of Adco and sugar. The work was done with materials contg. an excess of pentosan over lignin. Conditions producing most efficient decay are alk., a sufficient supply of air, and a min. moisture content of 75%. Under the conditions of the expts. in the tropics, the materials decayed equally well without the addn. of the Adco provided it was kept alkaline. J. J. SKINNER

Insecticides and fungicides. FRANK T. SHUTT. Dept. Agr., Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, pp. 66-73(1928).—*Sol. As in Ca arsenate-lime S sprays.*—Combined sprays of Ca arsenate and lime-S, the latter contg. 24.8% total S, with and without added lime, were prepd. and allowed to stand for 40 hrs. The supernatant liquid then contained 0.69% H_2O -sol. As_2O_3 . When lime was used the sediment contained 0.49% H_2O -sol. As_2O_3 and 1.42% when lime was not added. To avoid foliage injury, due to liberation of sol. As, only freshly prepd. combined sprays should be used and care should be taken to effect thorough agitation of the mixt. before use. *Oils for mosquito control.*—Continuous oil films on water could not be obtained with straight mixts. of light and heavy petroleum oils. Addn. of 0.004% soln. of NaOH in water or alc. caused the oil to spread evenly and rapidly in a continuous film when sprayed on water. Application of the treated oil at the rate of 1 ounce to 15 sq. ft. gave a continuous film, which remained for at least a week even though subjected to occasional heavy rains. *Adherence of arsenical sprays to apple leaves.*—The Pb arsenates in admixtures with limes showed superior adhesion to Ca arsenate in the same fungicide. Arsenicals when incorporated in the Al sulfate-lime S spray persisted on foliage for a longer period than when used in the straight lime-S mixt. Ca arsenate was more adhesive to foliage when present in Bordeaux mixt. than any of the arsenicals which can be used in lime-S sprays. *Analyses are given of a number of insecticides, fungicides, spraying oils, etc.* K. D. JACOB

Chemical methods of combating plant diseases. G. HILGENDORFF. Biol. Imp. Inst., Berlin. *Z. angew. Chem.* 41, 801-5(1928).—A discussion of the use of such plant disinfectants as Bordeaux mixt., S and As compds., nicotine, phenol and coal-tar solns. C. R. F.

Composition of fluorides and fluosilicates sold as insecticides. R. H. CARTER AND R. C. ROARK. Bur. Chemistry and Soils, Washington, D. C. *J. Econ. Entomol.* 21, 762-74(1928).—Samples of fluorides and fluosilicates from 14 manufs. were analyzed chemically and microscopically. NaF was detd. gravimetrically as CaF. Fluosilicates were det. volumetrically by titration in Pt dishes with standard NaOH free from SiO_2 and CO_2 , phenolphthalein being used as indicator. Moisture was detd. by drying at 110° for 3 hrs. The following method was used to det. the bifluorides: 0.5 g. sample is weighed into a Pt dish, 1.0 g. solid KCl added and the whole dissolved in 25 cc. water. 20 cc. neutral alc. is then added. The mixt. is cooled to approx. 0° , and titrated with standard NaOH free from SiO_2 and CO_2 until the red color of the phenolphthalein persists for 1 min. CO_2 was detd. according to Hepburn (*C. A.* 21, 1076) and the results were calcd. to Na_2CO_3 . p_H was detd. colorimetrically. An arbitrary method was used to ascertain the no. cu. in. per lb. consisting of a detn. of the wt. of material occupying a known vol. Twelve samples of com. NaF had the following % compn.: total F 40.3-43.9, NaF 89.2-98.8, NaHF 0-0.04, Na_2SiF_6 0-2.17, Na_2CO_3 0-4.39, moisture 0.004-1.02, impurities by difference 0.4-0.5, p_H of 2% soln. 6.8-10.5, cu. in. per lb. 21.9-51.2. The % compns. of 11 samples of com. Na_2SiF_6 follow: total F 57.1-60.3, Na_2SiF_6 94.4-99.8, NaHF 0.02-0.14, moisture 0.04-0.21, impurities by difference 0.14-5.5, p_H of 0.5% soln. 3.1, cu. in. per lb. 22.6-28.5. Four samples of MgSiF_6 gave total F 41.7-41.9, purity 100+%, p_H 0.5% soln. 3.0-3.1. A few figures are also given for CaSiF_6 , CuF_2 , BaF_2 , and cryolite. Analyses of 10 special mixts. and dusting powders are also given. NaF and Na_2SiF_6 may be obtained commercially in a satisfactory degree of purity. Com. NaF is higher in cu. in. per lb. than Na_2SiF_6 . Solns. of all fluosilicates give an acid reaction whereas solns. of NaF are neutral or alk-

line. The acidity of fluosilicate solns. may account for the burning of foliage which sometimes follows application. The addn. of a small quantity of $\text{Ca}(\text{OH})_2$ or Na_2CO_3 to fluosilicates to decrease acidity decomposes some of the fluosilicate in soln. to the fluoride without increasing the p_{H} value of the soln. The fluorine in soln. is pptd. by Ca as insol. CaF_2 . The size of the crystals affects their rate of soln. and therefore the time between application and insecticidal action, the effectiveness of the material as a dust and the adhering qualities of the dust particles. The other fluorides and fluosilicates available in a high degree of purity are: BaF_2 , cryolite, MgSiF_6 , CuSiF_6 , CaSiF_6 . Based on cu. in. per lb. the values for these compds. are low compared to Ca arsenate and other good dusting powders. Variations in crystal size, dusting qualities, adhesiveness and rate of soln. rather than in the F content are believed to cause the observed variations in apparent toxicity to insects of com. Na_2SiF_6 . Variations in effects on plant tissue of com. Na_2SiF_6 are probably due to variation in crystal size. C. H. R.

An operation in practical control of codling moth in a heavily infested district—second report. THOMAS J. HEADLEE. N. J. Agr. Expt. Station. *J. Econ. Entomol.* 21, 774-8(1928).—A report on procedure which resulted in 82% of apples picked being free from codling moth (*Carpocapsa pomonella*) injury. The timing, compn. and methods of applying insecticides (oil emulsions, lime-sulfur soln., nicotine, PbHAsO_4) were the most important factors in producing this result, but orchard sanitation measures play an important though minor part. C. H. RICHARDSON

Some macroscopical effects resulting from the fumigation of *Plodia* larvae with carbon disulfide in relation to revival potentialities. J. C. HAMLIN and W. D. REED. Bur. of Entomology, Washington, D. C. *J. Econ. Entomol.* 21, 783-8(1928).—Grown larvae of the Indian-meal moth (*Plodia interpunctella*) revive 1-2 weeks after fumigation with CS_2 (2 lb. per 1000 cu. ft. of space). The larvae which will survive may be detected by normal color, turgidity of the body and resistance to shriveling. Reviving larvae commonly show congestion of the intestinal tract which subsequently causes the death of some of them. Some larvae which survived a 6-hr. exposure to CS_2 ultimately developed into adults. C. H. RICHARDSON

Experiments on control of *Eutettix tenellus* (Baker). E. A. SCHWING. Spreckles Sugar Co., Sacramento, Calif. *J. Econ. Entomol.* 21, 790-1(1928).—The beet leaf-hopper may be controlled by a spray consisting of "Oronite fly spray," a com. petroleum oil product, emulsified with an aq. soln. of whale oil soap. Dilns. are given. C. H. RICHARDSON

Specifications for petroleum oils to be used on plants. E. R. DEONG. *J. Econ. Entomol.* 21, 697-702(1928); cf. C. A. 22, 4708.—Flash point, fire point, pour point, color and gravity or Baumé density are of little value in evaluating petroleum lubricating oils for insecticidal purposes. The presence of S as low as 0.05% may be hazardous to plant tissue. Oil emulsion contg. free S cannot be recommended at the present time. The distn. range is of little significance in field work except as an indicator of the proportions of volatile and non-volatile oils. Volatility is an important characteristic of insecticide oils. It is detd. as follows: A weighed quantity of the oil, usually 0.5 g., is placed on a sheet of asbestos paper 3 in. square and kept at a controlled temp. ranging from 50° to 100° according to the oil fraction used. Weighings are made every 24 hrs. until 95-100% of the oil has evapd. From duplicate samples a curve of volatility is obtained. The sulfonation test (Gray and DeOng, C. A. 20, 963) has been devised to det. the proportions of the chemically inert hydrocarbons of the paraffin series and the chemically active hydrocarbons of the aromatic and olefin series contained in petroleum oils. The presence of a larger or smaller quantity of these two classes of oils has been found to offer the best basis for the grouping of tolerable and intolerable fractions. The viscosity (Saybolt at 37.8°) of an oil is an important characteristic from the standpoint of evapn. and penetration. The present trend in the use of oils on citrus in So. Calif. is toward a viscosity of 35-80 sec. Expts. show that oils of almost 100% concn. of satd hydrocarbons may on exposure to air and sunlight break down through oxidation, yielding such quantities of acid as to become decidedly injurious to plant foliage. Oils differ greatly in their resistance to oxidation, a factor that may have entered into known instances of oil injury. A method based on that of Sligh (C. A. 19, 1491) is given for the detn. of degree of oxidation in lubricating oils. The acidity of oils oxidized by this method is detd. by titration as follows: 50 cc. of the oil are added to 50 cc. 95% alc. and 50 cc. 0.1 N NaOH. The mixt. is refluxed 1 hr. and the excess NaOH titrated with 0.1 N HCl with phenolphthalein as indicator. Expts. show that for use on foliage at summer temps. in Calif. petroleum oils should have an unsulfonated residue of 88-99%, the lower % being permitted for volatile oils of 40-50 sec. viscosity (Saybolt). These oils should also be stable and not easily oxidized.

Oils for foliage use at low temps. (7.2–15.6°) may be more viscous and less volatile. Such oils are apparently more effective for California red scale (*Chrysomphalus aurantii*) and for insect and mite eggs. Oils for use on deciduous trees during the dormant season should have an unsulfonated residue of 65–75%, and a viscosity of 85–120 sec. Resistance to oxidation is not so important for these oils as for oils intended for use on foliage. The lowered insecticidal value resulting from the use of highly refined oils may be partly compensated for by incorporation with them of more toxic compds. such as nicotine. Specially refined pine oils are useful for blending with petroleum oils.

C. H. RICHARDSON

The effect of certain hard water on the stability of cold mix lubricating oil emulsions. J. R. EYER AND F. M. ROBINSON. N. M. Coll. Agr. and Mech. Arts. *J. Econ. Entomol.* 21, 702–7(1928).—Petroleum lubricating oil was emulsified with com. casein-lime mixt. and dild. with certain hard waters from New Mexico. The action of these waters on the emulsion was detd. by a modification of the Herschel demulsibility test (U. S. Bur. Standards, *Bull.* 86, (1917); cf. C. A. 11, 537). Oil emulsions dild. with water contg. MgSO_4 in amts. greater than 5 parts per 100,000 were unstable, the oil sepg. out in proportion to the amt. of MgSO_4 present. CaSO_4 and NaCl , normal constituents of New Mexico hard waters, did not affect the stability of the emulsions. C. H. R.

Studies on the resistance of certain insects to hydrocyanic acid. A. M. BOYCE. Univ. Calif. *J. Econ. Entomol.* 21, 715–20(1928).—This paper is a progress report on the tolerance of insects to HCN and the possibility that this tolerance may be inherited. The existence of areas in Calif. where the California red scale (*Chrysomphalus aurantii*) and the black scale (*Saissetia oleae*) are so resistant to HCN that former doses no longer give adequate control, are discussed. The pomace fly (*Drosophila melanogaster*) was subjected to doses of HCN which consistently killed a high % of the flies. Seven generations were reared from the original parents and fumigated. An indication of slight development of resistance to HCN is shown. Expts. were also made with the melon aphid (*Ophis gossypii*) which gave similar results. Conclusion: Tests made so far have not shown that through continued selection any marked degree of resistance to HCN is developed by these insects. The expts. are being continued with other species of insects.

C. H. RICHARDSON

Spraying of rubber. HERBERT ASHLANT. *Bull. Rubber Growers' Assocn.* 10, 677–9(1928).—It is judged that in the past season (one of the worst for leaf-fall) rubber trees would have lost nearly 90% of their leaves except for spraying. Nothing has been found to be better than Bordeaux mixt., though Burgundy mixt. is practically as effective. At least 3.5 gals. per tree is necessary, the quantity being much more important than the concn. Well applied in adequate quantity, Bordeaux mixt. prevents secondary leaf-fall almost entirely. Lower proportions of CaO (down to 1.5 lb. per 4 lb. CuSO_4 per 50 gals. of water) gave as good results as the usual proportion or abnormally high proportions (up to 6 lb.), and the only advantage of a high CaO addn. is the greater visibility of the spray. Adhesives are advantageous only when much of the foliage is immature. Resin-soda is the best adhesive, whereas Na silicate is useless. Economically better results are obtained by spending the money not on adhesives but on a larger quantity of Bordeaux mixt.

C. C. DAVIS

The bud mite (blister mite) of the pear. WILLIAM B. PARKER. *J. Econ. Entomol.* 21, 676–7(1928).—The pear leaf blister mite (*Eriophyes pyri*) was not controlled with lime-sulfur (1%), highly refined petroleum oil emulsion (1–4% oil) or S applied as a dust.

C. H. RICHARDSON

A unit system for recording the results of insecticides against the citrus black scale. R. S. WOGLUM AND J. R. LA FOLLETTE. Calif. Fruit Growers Exchange, Los Angeles. *J. Econ. Entomol.* 21, 678–82(1928).—In evaluating the results of spraying operations, 5 units of scale-bearing branch, 6 to 10 inches long, are taken per tree and the no. of scale per unit detd. by counting. Units are taken from 40 trees per 10-acre block to give the rating of an orchard.

C. H. RICHARDSON

District Argentine ant control in citrus orchards. HAROLD J. RYAN. *J. Econ. Entomol.* 21, 682–90(1928).—Although an effective poison bait contg. Na_2AsO_3 has been used for some years to control the Argentine ant (*Iridomyrmex humilis*) in citrus orchards, the individual grower has not been able to suppress it effectively, because of renewed infestation from untreated orchards. This paper gives the details of a cooperative project in which 45,000 acres of citrus orchard were treated. A new cheap paper poison container was developed. A decrease of 50% in no. of infested orchards was obtained. Costs are given.

C. H. RICHARDSON

Poisons for cutworm baits. CLAY LYLE. Miss. State Plant Board. *J. Econ. Entomol.* 21, 748–50(1928).—Paris green was compared with Na_2SiF_6 as a poison for

the black cutworm (*Agrotis ypsilon*) and the fall armyworm (*Laphygma frugiperda*). The compds. were administered in a bait consisting of 50 lb. wheat bran, 1 lb. of the poison compd. and enough water to moisten. Paris green is more toxic and more rapid in its action than Na_2SiF_6 . *Agrotis* is more easily killed by these compds. than *Laphygma*.

C. H. RICHARDSON

The stimulation and immunization of beet seeds against blight. V. STEHLIK AND FR. NEUWIRTH. *Listy Cukrovar.* 41, 53-66(1928); cf. C. A. 22, 181.—(A) A review of 20 papers. (B) In lab. expts. seeds from 9 sources were grown upon sterile agar-beet media; all seeds developed *Phoma Betae*. Dry Betanal, Abavit B, Germisan 225 dry, Ostan, Tillantin C, Wet Betanal and Wet Germisan retarded growth of *Phoma Betae* for a few days but had no effect after that. In a very humid atm. Germisan was quite effective; in a dry atm. the infection appears later and acts more slowly. Distd. H_2O was found as effective as solns. of germicides. (C) Field expts. In one field the beet (seeds soaked in wet Germisan) developed less blight than the field control. In another field, the incidence of blight was greater for seeds treated with Germisan than for controlled fields. The soaking of seeds in germicidal solns. has no influence upon the yield of beets, does not increase the sugar content of beets or the yield of sugar. S. and N. advise discontinuing the practice.

FRANK MARESH

Grape culture and the present fight against disease. F. STELLWAAG. *Z. angew. Chem.* 41, 806-9(1928).—From 1 to $1\frac{1}{2}\%$ Bordeaux mixt. is most used against fungus. An org. Cu compd., "Nosperat," which when mixed with $\text{Ca}(\text{OH})_2$ is used as a spray. S is used against mildew. In fighting hay and wireworm nicotine or As is used. From 1 to $1\frac{1}{2}$ kg. of an 8-10% com. nicotine soln. is added to 100 l. spray soln. From 200 to 300 g. of cotton-oil soft soap is added as a spreader. Nicotine- SO_2 acts as a corrosive poison while raw nicotine is mainly a stomach poison. A mixt. is most effective. Arsenic is mixt. with Cu and $\text{Ca}(\text{OH})_2$ and used as a combined spray against fungus and worms. Trade names of com. compds. are given.

C. R. F.

Report on control of tomato mildew. W. H. RICE. *New Zealand J. Agr.* 36, 100-2(1928).—Dry flowers of S and several proprietary S dusts did not control tomato mildew (*Cladosporium fulvum*) on plants grown in hot-houses. The mildew was greatly reduced and growth of the plants favored by application to the soil of a mineral product, contg. approx. 25% free S, obtained from White Island (C. A. 22, 838). An excess of superphosphate favored mildew attack, while a predominance of K_2O retarded the trouble and N in excess also had a retarding effect on the disease.

K. D. JACOB

Transmission of tobacco mosaic. A. MOUTIA. *Rev. agr. Maurice* 5, 179-80 (1928).—Expts. have shown that tobacco mosaic may be transmitted to sound tobacco planted in soil on which diseased plants have grown previously.

F. W. ZERBAN

Constituents of the leaf and their relation to the burning qualities of tobacco (HALEY, *et al.*) 17. Examination of sprayed apples for arsenic (SHUTT) 12. Arsenical spray residue and its removal from apples and pears (HEALD, *et al.*) 12. The protection of plants and culture of beets along the Rhine (NEUWIRTH) 28. Withdrawing yeast from vats [for use as a fertilizing material] (Brit. pat. 287,052) 16.

Spent-soil compost. RICHARD H. MORRIS, 3RD. U. S. 1,691,077, Nov. 13. A bed of soil contg. 20% of fibrous peat mixed with 80% straw and horse manure is maintained moist and at a temp. of about 15° for over 3 months, while cultivating mushrooms in the bed; the peat used is primarily alk. and is inoculated with a substance such as HgCl_2 or a phenol deriv. which is toxic to mushroom disease germs, and the mat. is shredded to break up the fibrous portions and is uniformly mixed.

Nitrate fertilizer. COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUFACTURES DE PRODUITS CHIMIQUES DU NORD RÉUNIES (Établissements Kuhlmann). Fr. 637,196, July 7, 1927. A granulated fertilizer is obtained by incorporating powd. and heated KCl or NaCl or a mixt. (sylvinites) of these in a boiling soln. of $(\text{NH}_4)\text{NO}_3$ of 80% or more, and mixing the whole; the water present is vaporized during the mixing.

Superphosphate fertilizers. LUIS ADELANTADO. Fr. 637,228, July 8, 1927. See Brit. 276,297 (C. A. 22, 2434).

Insecticide. HOWARD W. AMBRUSTER. U. S. 1,691,454, Nov. 13. An insecticide suitable for use on plants comprises a finely pulverized ore contg. native Fe arsenate.

Insecticide. MARIE LUCIE PIGNODOL. Fr. 637,673, May 25, 1927. A liquid insecticide contains oil of aspic, mirbane and pennyroyal.

Insecticides. ASSOCIATED OIL CO. Brit. 287,371, July 4, 1927. Fr. 637,716, July 13, 1927. Basic nitrogenous compds. suitable for use as insecticides are obtained

from the ext. sepd. in the purification of hydrocarbon materials such as petroleum or shale oils with liquid SO_2 . The ext. is treated with dil. H_2SO_4 or other suitable acid (used repeatedly if desired to obtain a high concn.) and the acid soln. is then neutralized with NaOH or other alkali and the free bases are distd. off, preferably in steam, and dried. The material may be mixed with a suitable petroleum oil, clay, diatomaceous earth or other material, for use, and may be used in free or sulfate form (using alkali with the sulfate to liberate the bases slowly in use).

Fungicides for seed or grain. I. G. FARBENIND. A.-G. Brit. 287,246, Dec. 20, 1926. As_2O_3 or arsenic acid or a salt of these As compds. is used together with a phenol or homolog contg. Hg in its nucleus and other substances may be added such as CuCO_3 , CuSO_4 , talc, gypsum or infusorial earth. A suitable mixt. comprises nitrophenol Hg 1.5, As_2O_3 1.5 and gypsum 97%.

"Immunizing" seed grain. I. G. FARBENIND. A.-G. Brit. 287,093, March 14, 1927. Org. As compds. such as aminophenylarsine oxide, to be used for immunizing seeds by dry or wet treatment, are converted into the colloidal state, suitably by a process such as described in Brit. 243,361 (C. A. 20, 3781) as applied to Hg compds. The colloidal As compd. may be mixed with talc and with other fungicides or bactericides.

Plant treatment. I. G. FARBENIND. A.-G. (Hans Wesche and Werner Ext, inventors.) Ger. 467,213, May 20, 1927. Seedlings are cauterized by a mixt. of sol. alkali org. compds. contg. Hg and salts of HCNS or HF , such as mercurized cresol-sodium and NaF .

16—THE FERMENTATION INDUSTRIES

C. N. FREY

The recovery of carbon dioxide from fermentation in distilleries and breweries. F. LÜDDE. *Apparatchau* 40, 229-31(1928)—Notes are given on the amt produced in Germany and the cost of liquefying.

J. H. MOORE

Synthesis of 2,3-butylene glycol and its nature, especially its odor. SUTERICH MARUYAMA AND TUNEDO HIGASHI. *Bull. Inst. Phys. Chem. Research (Tokyo)* 7, 934 9(1928); English Ed. 1, 90-1.—2,3-Butylene glycol has been detected in various fermentation products, specially in Japanese Saké and Shoyu. Its odor has been reported as resembling that of Shoyu, though Kekulé reported it to be odorless. The glycol was synthesized from BuOH through the butylene (Fourneau, C. A. 16, 2495), its 2,3-dibromide and the diacetate. Its constitution was verified by oxidation to diacetyl and pptn. of Ni dimethylglyoxime. The glycol is colorless and odorless. The odor previously reported is to be attributed to an unknown substance picked up from the fermentation materials.

A. L. HENNE

A talk on vinegar. A. E. ROWSE. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 3, 15(1928).

J. A. KENNEDY

Black vinegar. Its cause and cure. CLYDE H. CAMPBELL. Penna. Dept. Agr., Harrisburg. *The Glass Packer* 1, 15 6(1928).—Neither tannin nor Fe alone will cause black vinegar; the proper ratio of both is necessary. The usual sources of Fe in vinegar are Fe pipes, tanks, connections, rust from barrel or tank hoops, and accidental Fe contaminations. Black vinegar has a very objectionable metallic, astringent taste. To reclaim such discolored vinegar, the addn. of tannin at the rate of 5 g. per gal. (9 oz. to 50 gal.) is recommended. This causes a slow pptn. of Fe tannate which is insol and can be filtered off. Likewise singlass added at the rate of 1 oz. dry substance to a 47 gal. hbl. is effective if the pptn. is carried on at low temps. Unless kept cold, clouding occurs following filtration. A mixt. consisting of 5 g. tannin plus 6 g. gelatin per gal. is particularly efficacious. As little as 0.01% Fe in vinegar will produce this discoloration.

C. R. FELLERS

The "Balsam" vinegar of Modena. F. PARISI. *Ann. chim. applicata* 18, 395-408 (1928).—A famous product of Modena is its "balsam" vinegar hundreds of years old and made according to the following formula. Grapes are crushed and allowed to ferment in vats 24 hrs. until mash rises to the top when the liquor below is withdrawn, and boiled to about 70-80% of the original vol. Either chalk or soda ash is then added to neutralize excess acid, the liquid is decanted off, cooled and placed in oak barrels to age and thus turn to vinegar.

A. W. CONTIERI

Behavior of spirit vinegar and vinegar essence in ultra-violet light of the Hanau quartz lamp. H. WÜSTENFELD AND H. KREIPE. *Deut. Essigind.* 32, 345-7(1928).—The present investigation was undertaken to find a simple and certain method for the differentiation of spirit vinegar, resulting from the rapid fermentation process, from

vinegar essence and its aq. dilns. Spirit vinegar develops in ultra-violet light characteristic luminescence phenomena, while the materials from which it is produced (spirit, water, nutrient salts, carbohydrates) as also acetic acid are without such action. All observations point to the probability that the luminescent substances present in finished vinegar are formed by bacterial activity. The usual method of simple qual. observation of luminescence phenomena by means of the quartz lamp in connection with Ostwald color charts and of the chrometer has been placed on a secure footing. With this method and also the nephelometer method one is able to differentiate spirit vinegar from pure aq. acetic acid. The fact that spirit vinegar, like other natural foods and condiments, exhibits luminescence phenomena, thus indicating an entirely different compn. from dild. acetic acid obtained synthetically, would seem to forbid that two so different products should enter trade channels under the same designation "vinegar" (Essig). If spirit vinegar is to be simply termed "vinegar" then dild. acetic acid should not be given the same designation. W. O. E.

Difficulties encountered in saccharification (in the brewing industry). J. RAUX. *Brasserie et malterie* 18, 230-4, 262-8(1928).—A brief general discussion of these difficulties, their causes and remedies. A. PAPINEAU-COUTURE

Present-day malts and the brewing process. P. PETIT. *Brasserie et malterie* 18, 241-5, 257-62(1928).—A discussion of their effects on the quality of the beer. A. PAPINEAU-COUTURE

Wines produced from grapes damaged by insects "eudemis." II. J. HENRIE FABRÉ AND ERNEST BRÉMOND. *Inst. Agricole d'Algérie. Ann. fals.* 21, 323-39(1928); cf. C. A. 22, 663.—A study of the effects of partial de-acidification by means of increasing amts. of CaCO_3 , K_2CO_3 , Na_2CO_3 and $(\text{NH}_4)_2\text{CO}_3$ on the compn. of such wines. Addn. of 300 g. CaCO_3 and 500 to 600 g. of Na_2CO_3 , K_2CO_3 or $(\text{NH}_4)_2\text{CO}_3$ per hl. improved the taste of the wine, but further addn. gave it a bitter taste. In most cases the total and fixed acidities were progressively decreased, but the volatile acidity was unaffected. Total ash was increased by CaCO_3 [slightly lower with 200 than with 100 g. per hl., but otherwise increasing proportionally to the CaCO_3 addn.], K_2CO_3 and Na_2CO_3 , but was unaffected by $(\text{NH}_4)_2\text{CO}_3$. Addn. of CaCO_3 has the same effect on the alky. of total and insol. ash and on total Ca in the ash as on the total ash, but with time the total Ca and the alkalinities slowly decrease due to gradual pptn. of org. Ca salts. Addn. of K_2CO_3 and Na_2CO_3 increases the alky. of total and sol. ash, but does not affect the alky. of the insol. ash. $(\text{NH}_4)_2\text{CO}_3$ also has no effect. CaCO_3 and K_2CO_3 rapidly reduce total tartaric acid. K_2CO_3 and $(\text{NH}_4)_2\text{CO}_3$ increase total K_2O . Na_2CO_3 and $(\text{NH}_4)_2\text{CO}_3$ have but little effect on total tartaric acid but later increase NH_3 content, and total K_2O . Analysis of wines from damaged grapes of known origin and purity are given. Fraudulent de acidification of such wines should be suspected when total ash > 4 g. per l., alky. of total ash > 6 g. per l., total tartaric acid < 4 g. per l., total K_2O > 6 g. per l., total Ca > 0.3000 g. per l., and NH_3 > 0.05 g. per l. A. P.-C.

Tests on the clarification of liqueur wines by centrifuging. J. DUBAGUIÉ. *Station Oenologique de la Gironde. Ann. fals.* 21, 460-3(1928).—Supercentrifuging is efficient for removing yeast cells from relatively common wines; but in white liqueur wines exhibiting an opalescent turbidity which is normally eliminated by storing in casks for a sufficient length of time, supercentrifuging may spoil the taste, and frequently the opalescence returns to a greater extent than before supercentrifuging. A. P.-C.

(The antiseptic value of) hop resins. CAVENAILS. *Bull. assoc. élèves inst. sup. fermentations Gand* 29, 377-84(1928).—Comparative biol. tests showed that the antiseptic principles of hops are much more sol. in worts than in distd. H_2O . Max. extn. of the antiseptic constituents is obtained with 1 hr.'s boiling, and boiling for a longer period reduces the antiseptic power of the wort, the decrease being more marked the higher the d. of the wort. With worts having a very high d. the max. antiseptic power is reached at the end of 30 min.' boiling. With worts having a d. of 10° Balling or less the antiseptic power is proportional to the amt. of hops; but with 15° wort the antiseptic power increases more slowly than the amt. of hops added. The optimum ϕg value from the standpoint of antiseptic value is from 5 to 6; above 6 the antiseptic value is very considerably reduced. High N content of the wort greatly reduces the antiseptic power, probably because the lupulone is almost completely pptd. by coagulation of the proteins during boiling. Storage of hops in presence of water reduces the antiseptic power, but this action seems to affect only the H_2O -sol. antiseptic constituents and to have little or no effect on the wort-sol. constituents. When the wort was boiled in large flasks the antiseptic power was higher than when it was boiled in small flasks, probably because in the latter case there is a greater tendency to caramelization which affects the hop resins and reduces their antiseptic power. A. PAPINEAU-COUTURE

Clarifying beer, vinegar and other liquids (Brit. pat. 286,861) 13.

Fermentation. RENÉ E. TROTTER. Fr. 638,894, Dec. 28, 1926. In a continuous fermentation process the vats are provided with diaphragms through which the active yeast passes while the dead or used-up yeast is sepd. The vats are made in the form of a cone at the bottom and a truncated cone at the top.

Hops and malt. KARL S. FELIX and ERNST KLAPP. Ger. 466,433, May 15, 1925. Malt ext. and pulverized hops are mixed in a closed container and heated in boiling water.

Withdrawing yeast from vats. ZELLSTOFFFABRIK WALDHOF and O. LÜHR. Brit. 287,052, March 12, 1927. In continuous or intermittent withdrawal of yeasts from vats (e. g., for use as a *fertilising material or animal feed*), a gyratory motion is imparted to the bottom layer of material in the vats and this motion is confined to the bottom layer by an arrangement of baffles.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

The essential oil of *Myrtus communis* L. F. L. VODRET. *Ann. chim. applicata* 18, 421-8(1928).—The oil is green, $d_{15} 0.8961$, $[\alpha]_D^{10} = +18.4$, $n_D^{20} = 1.4702$, viscosity at $20^\circ = 1.23$; it shows no fluorescence in Wood light. Its soly. at 15° in 70% EtOH is 1.26; in 80%, 1.1; in 90%, 2.1. Acid no. is 1.36; sapon. no. 22.8; acetyl sapon. no. 53.10; I_2 no. 201.1; ethers % calcd. as $C_{10}H_{18}O$ 7.5; alcohols calcd. as $C_{10}H_{18}O$ total 31.71 (free 5.29, combined 25.82); aldehydes, traces; phenols present; it freezes below -12° .

A. W. CONTIERI

Chemical and pharmacological evaluation of belladonna leaves and the extract prepared therefrom. TH. EXLER. Univ. Leiden. *Pharm. Weekblad* 65, 1152-77 (1928).—The official methods for detn. of the alkaloid content of belladonna according to the German, U. S., Swiss and Dutch Pharmacopeias give discordant results with one and the same sample. The German method is considered unreliable, the U. S. method devious and conducive to high results, and the Swiss and Dutch methods more convenient, rapid and free from sources of error. Procedures which tend to hydrolyze or racemize the alkaloid should be avoided. In 70% EtOH atropine is stable at p_H 5 at 80° , but in aq. soln. the hydrolysis in 5 hrs. amts. to 20%. Hyoscyamine is stable in aq. soln. at p_H 5, the decrease in rotation amounting to only 3-4% after 5 hrs.' warming but in alc. soln. at the same p_H 5 hrs.' heating results in racemization equiv. to a 17.5% decrease in rotation. In the gravimetric detn. of atropine by silicotungstic acid a correction must be applied if the hydrolysis product tropine is present. In the physiol. detn. where the antagonistic action toward pilocarpine on the isolated intestine is measured, 2 parts of hyoscyamine are equiv. to 3-4 parts of atropine. Tropine here has no effect even in doses 500 times the usual hyoscyamine or atropine dose. The colloidal constituents of belladonna ext. are also without influence. Colloids which are retained by an ultrafilter impervious to Congo red have neither an activating nor an inhibiting effect on the ext.

A. W. DOX

Sproetin and spraetin. C. A. ROJAHN. Univ. Halle. *Apoth. Ztg.* 43, 1291-2 (1928).—Two proprietary salves are shown to have the following essential compn: sproetin—fats 30, vaseline 45, talc 20, salicylic acid 2%; spraetin—fats 10, vaseline and tar products 64, talc 23, salicylic acid 0.7%; both products had from 2 to 3% moisture.

W. O. E.

Alkaloids of *Hyoscyamus reticulatus* L. R. A. KONOWALOWA and O. J. MAGIDSON. *Arch. Pharm.* 266, 449-52(1928).—In addn. to a small amt. of hyoscyamine, *H. reticulatus* L. contains about 1% of a liquid, easily volatile base, tetramethyldiaminobutane, probably related in some way to the plant proteins.

W. O. E.

Estimation of the hydrochlorides of procaine and codeine. E. SCHULEX and G. VASTAGH. Hygienic Inst., Budapest. *Arch. Pharm.* 266, 452-5(1928).—The method depends on the decompn. of procaine when heated with 0.02 N NaOH under prescribed conditions. A soln. (about 50 cc.) contg. up to 40 mg. of the alkaloids is treated with 1 cc. aq. NH_3 , then extd. 5-6 times with $CHCl_3$, a few cc. of the final ext. being checked by evapn. on the H_2O bath and addn. of Mayer's reagent as to completeness of this operation. Pass the united $CHCl_3$ portions through a pledget of cotton, evap. the solvent, dissolve the residue in 5-10 cc. alc. (neutral to methyl red), add 0.02 N HCl in excess, then neutralize this excess with 0.02 N NaOH. Now add double the amt.

of 0.02 N NaOH equiv. to the acid required to neutralize the bases, then heat the mixt. 0.5 to 1 hr. on a boiling H₂O bath. To the cooled liquid add 1 cc. aq. NH₃ and ext. 5-6 times with CHCl₃ or until all extractable alk. material (codeine) is removed, evap. the solvent on the H₂O bath, and continue the heating 1 hr., eventually with an air blast. Dissolve the residue in alc. as before, add the acid in excess, this excess being later detd. by back-titration with alkali. The amt. of acid thus required to neutralize the base yields the codeine-HCl (calcd.), which subtracted from that previously detd. for the combined bases will disclose the amt. of procaine in the mixt. W. O. E.

Evaluation and aging of ergot preparations. A. PRYBIL AND K. MAURER. *Arch. Pharm.* 266, 464-79(1928).—An exptl. study showing that the fresh fluid exts. made in accordance with Am. and Ger. Pharm. specifications show the highest alkaloid content. Under the influence of aging the alkaloid content of fluid exts. of whatever specification made suffers steady diminution, from which it follows that the best method for the prepn. of an ext. with high alkaloid content is of little value unless the ext. can be stabilized. The stabilization of a fluid ext. is independent of the stabilization of the drug itself. Numerous com. brands of the ext. were examd. and the results are tabulated. W. O. E.

Parent plants of radix primulae. L. KOFLER. Univ. Innsbruck. *Arch. Pharm.* 266, 479-84(1928).—In discussing the question as to the true source of primula root the conclusion is reached that with our present knowledge no difference can be made in the use of *Primula officinalis* Hill and *P. elatior* Schreb, although the latter appears to have been involved in most cases. W. O. E.

Preparation and constitution of hydrargyrum salicylicum. E. RUPP. Univ. Breslau. *Arch. Pharm.* 266, 504-6(1928).—Finely powder equimol. quantities of HgSO₄ and Na salicylate (5% excess of the latter) mix and treat with water until a thick magma results. Heat on the steam bath 15 min. with const. stirring and add sufficient H₂O to maintain the original consistency, then every 5 min. test a small amt. (size of a pea) with a few cc. of NaOH soln. On complete soln. add several times the vol. of warm water, collect on a suction filter, wash until free of sulfates, then dry at 80° to 100°. Nitration expts. show that the Hg atom enters the benzene nucleus about equally at the *o*- and the *p*-positions. W. O. E.

Chemistry of mercury salve (unguentum hydrargyri cinereum). R. DIETZEL AND J. SEDLMEYER. Univ. Munich. *Arch. Pharm.* 266, 507-17(1928).—Expts. were undertaken covering methods for detg. the Hg contents of such salves, the nature of changes in the product on storage, and isolation of fatty acid salts of Hg eventually present, and finally the prepn. and properties of such fatty acid salts of Hg. Changes taking place in salves specially prepd. in accordance with pharmacopeial procedure are noted and discussed; certain salts of Hg also were specially prepd. and characterized, notably the stearate, palmitate and oleate. W. O. E.

Utilization of the ash picture in determining pharmacognostically used barks. WALTHER BLARENSTEINER. Univ. Wien. *Sitzb. Akad. Wiss. Wien Abt. I*, 137, 1-16(1928).—In the present study an attempt has been made to demonstrate the value of the ash picture in the diagnosis of a group of pharmaceutically important drugs (barks), notably those official in the VIII. d. of the Austrian Pharmacopeia, as *Cortex Frangulae*, *Rhamni purshiani*, *Quercus*, *Quillajae*, *Chinae*, *Cinnamomi*, *Quebracho*, *Cascarillae*, *Granati*, *Viburni*. For purposes of ashing only good sections should be taken, since the arrangement of the ash constituents in the spodogram is frequently very characteristic, not however the presence of definite crystals as such, for which reason the ash picture of powdered or otherwise comminuted barks is rarely of service. The necessity for maintaining a correct arrangement of ash constituents requires a special method, which was developed and renders possible a presentation of the ash of very thin sections unchanged. The investigation has shown that the spodogram of barks may be utilized for purposes of identification, since the mineral constituents can be made to retain their original arrangement and thus permit reconstruction of the original anatomical structure. W. O. E.

Constituents of the root of *Helleborus niger* and *viridis*; new alkaloids of *Helleborus viridis*. O. KELLER AND W. SCHÖBEL. Univ. Jena. *Arch. Pharm.* 266, 545-72 (1928).—The substance isolated by O. Keller (1910) from the root of *Helleborus niger* has been identified as the glucoside helleborin and the formula therefor, C₂₁H₃₅O₈, suggested. From the root of *Helleborus viridis* the same glucoside was isolated and in its general properties characterized as such. The root of *H. niger* is free from alkaloids; that of *H. viridis* on the other hand contains about 0.2% alkaloidal material. By means of a specially elaborated method the following alkaloids were isolated and characterized: *celliamine*, C₂₁H₃₅NO₈, a tertiary base contg. no MeO groups, but possibly a MeN group,

although proof of the latter is lacking; *sprintillamine*, $C_{21}H_{41}NO_4$, a tertiary base contg. no MeO groups. The N contains, however, a Me group. This base yields a very difficultly sol. *HCl salt*, $C_{21}H_{41}NO_4 \cdot HCl$. Exhaustive methylation *via* Nöling converts it into the quaternary iodide, *sprintillammonium iodide*, $C_{21}H_{41}NO_4 \cdot MeI$; *sprintilline*, $C_{21}H_{41}NO_3$, a tertiary base contg. no MeO groups. There are some indications of the presence of a MeN group, though proof therefor is lacking. *HCl salt*, $C_{21}H_{41}NO_3 \cdot HCl$; an alkaloid "V" of very low basicity, having the compn., $C_{22}H_{41}NO_4$. The root of *H. viridis* contains sucrose, characterized by the m. p., behavior towards Fehling's soln., $[\alpha]$, elementary analysis and crystallographic properties. It contains further 1% of a greenish fat, a perfume volatile with steam; brown dyestuff and resin. The pharmacological examn. of celliamine, sprintillamine and sprintilline shows a typical cardiac action. W. O. E.

Iron cacodylate and estimation of cacodylic acid. O. J. NOSKOWA AND V. A. TERECHINA. *Univ. Perm. Arch. Pharm.* 266, 599-602(1928).—Iron cacodylate, $(Me_2AsO_2)_2Fe$, was prepd. by treating cacodylic acid (8 mol.) with dialyzed $Fe(OH)_3$, evapg. the dialyzate in vacuum and freeing the residue of excess cacodylic acid by extr. with $CHCl_3$. Cacodylic acid was detd. in the product by mineralization *via* d'Emilio (H_2SO_4 , K_2SO_4 and $KMnO_4$), reduction of the resulting H_3AsO_4 with KCN S, followed by titration with I. Satisfactory values are reported by this method. W. O. E.

Saponification velocity of menthyl succinate, acetate and isovalerate. V. A. NEKRASOVA. *Univ. Perm. Arch. Pharm.* 266, 595-9(1928).—The sapon. medium used was 0.5 N KOH in connection with temps. obtaining in a thermostat at 33-6° and a boiling H_2O bath. After 3.5 hrs.' treatment in a thermostat about 26% of menthyl succinate remained unchanged, while at boiling- H_2O -bath temp. sapon. was almost complete (99.76%) after 1 hr. After $\frac{1}{2}$ hr. at boiling- H_2O -bath temp. 97.24% menthyl acetate was saponified, while at a temp. of 33° only 68.69% was decomposed. Menthyl isovalerate was relatively much more stable, 93.63% remaining unaffected after 3.5 hrs. at 36°, and 8.45% after 8 hrs. at 99-100°. W. O. E.

Quantitative methods of the D. A.-B. 6, and their practical application in the laboratory. KARL HERING. *Arch. Pharm.* 266, 582-95(1928).—An address. W. O. E.

Results of drug plant experimentation in the year 1927. JOHANN APPL. *Heil- und Gewürz-Pflanzen* 11, 142-55(1928).—An account of work undertaken and cultural results obtained with *A Artemisia*, *Althaea*, *Ruta*, *Melissa*, *Rheum*, *Hypericum*, *Hyssopus*, *Salvia*, *Thymus*, *Mentha* and *Majorana*. W. O. E.

Chemical composition of *Iris germanica* rhizome cultivated in Hungary. J. KABAY. *Heil und Gewürz-Pflanzen* 11, 155-61(1928).—Monthly values for the period of March to November for total ash, H_2O -sol. ext. and ash, sugars (glucose and sucrose), and starch are reported, from which it appears that the Hungarian product differs markedly from the foreign, in that the H_2O -sol. portion is considerably higher, while the starch content is much lower. Sugar is also higher and the mucilage content likewise considerable. W. O. E.

Alkaloid content of *Hyoscyamus* leaves infected with *Peronospora* and mildew. ELEMER KOPF. *Heil- und Gewürz-Pflanzen* 11, 161-3(1928).—The results of extended study of these diseases show that as they progress the alkaloid content gradually falls from 0.165 (for entirely healthy leaves) to 0.122 (partially infected), 0.045 (completely diseased), and 0.028% (after 3 months' storage of the latter). In view of such marked loss of diseased leaves during storage, their harvesting and marketing would appear to be ill-advised, since the alkaloid content would be practically nil. W. O. E.

Chemistry of western Australian sandalwood oil. I. A. R. PENFOLD. *J. Proc. Roy Soc. N. S. Wales* 62, 60-71(1928).—The object of this paper is to summarize the present state of knowledge regarding the chemistry of the com. oil and the reasons for the divergent analyses published to date. In the present investigation it was found that the Western Australian oil reacted just as readily with phthalic anhydride in CaH_2 on the H_2O bath as the santalols of the East Indian oil, and appeared to be of a primary character, contrary to the experience of Rao and Sudborough, who, however, make no reference to the presence of santalols in the oil examd. by them, whereas P. found these alcs. to be present to the extent of 40-45% in the com. samples furnished by the various West Australian manufrs. Curiously, however, the santalols were not detected in oils distd. by P. This observation is being followed up and will be dealt with in a subsequent paper. Rao and Sudborough sep'd. 2 alcs. which they designated α - and β -fusanol, which, with the exception of variation in b. p. possessed const. not far removed from each other. They appear to approximate very closely to the santalols. Apparently it is inadvisable to characterize alcs. of this nature by optical activity alone, as the values given for α - and β -fusanol are 5.7° and 2.6°, resp. A levorotatory alc. has been

isolated with $[\alpha] -70.4^\circ$, being the principal component of a sandalwood oil obtained from *Santalum lanceolatum*, which is used by the W. Australian manufs. to bring the $[\alpha]$ of their oils up to the requirements of the B. P. for the East Indian oil. Some of the various alcs. present have been characterized by means of their resp. allophanates, that of the santalols, m. $162-3^\circ$, while the other alcs., for which the term fusanol might be retained, yield similar derivs., m. $148-52^\circ$. On the other hand that from the *l*-rotatory alc. referred to above is a cryst. deriv., m. 114° . With the exception of santalol none of these other alcs. yielded santalenic acid. A *d*-rotatory alc. of apparently a secondary character was also isolated in small quantity from the W. Australian oil, but it failed to yield a cryst. allophanate. For purposes of comparison, com. samples of E. Indian oil were examd. at the same time and under similar conditions. The chem. and phys. characters of the resp. oils of the W. A. manufs. are in close agreement, and the exptl. work leaves no doubt at all that these oils differ in chem. compn. from the E. Indian oil, although the santalols are present to the extent of about 45%. No valid reason has been advanced as to why the Australian oil cannot find a market on its own intrinsic merits as the product of *Eucarya spicata*. The authorities should undoubtedly make provision for it in the B. P. under its own generic name, as it is futile to include it under the same heading as the oil of *Santalum album*, more especially as the chem. and phys. characters of the Australian oil can be made similar by the addn. of the distillate of *Santalum lanceolatum*.

W. O. E.

Occurrence of a number of varieties of Eucalyptus dives as determined by chemical analysis of the essential oils. II. With remarks on the *o*-cresol method for estimation of cineole. A. R. PENFOLD AND F. R. MORRISON. *J. Proc. Roy. Soc. N. S. Wales* 62, 72 S(1928); cf. *C. A.* 22, 604. —Numerous field and lab. expts. have shown marked differences in the character of oil obtained from various types of the same species growing closely together, notably with respect to the presence or absence of piperitone and phellandrene, which substances render the oil undesirable for pharmaceutical purposes. During this work the *o*-cresol method for detg. the cineole content of oils was tested against the older and better known H_3PO_4 process, with very satisfactory results; it is believed the B. P. authorities should adopt this method as standard. Also in *Perfumery Essential Oil Record* 19, 468-70(1928).

W. O. E.

Seeds of *Pentadesma butyraceum*. L. ROSENTHALER. Univ. Bern. *Pharm. Ztg* 73, 1307(1928). —These seeds, not infrequently used to adulterate Semen Colae, are reported in certain quarters to contain caffeine, in others to be caffeine-free. It is now shown that they contain no caffeine.

W. O. E.

Reactions of colchicine. LAD EKKERT. Univ. Budapest. *Pharm. Zentralhalle* 69, 662(1928). Certain known color reactions of colchicine are enumerated. Dissolve a few mg. pure cryst. or amorphous colchicine in about 0.5 cc. concd. H_2SO_4 , then heat carefully, whereupon a canary-yellow liquid results, passing over golden yellow, saffron, brown-red, blood-red to deep garnet. Even with only 0.5 mg. of alkaloid the soln. becomes garnet. Not only in dil. or concd. H_2SO_4 , but also in concd. or dil. HCl, dil. HNO_3 , and AcOH is a soln. of colchicine yellow. A warmed soln. of the alkaloid in H_3PO_4 or lactic acid becomes golden yellow. A yellow soln. also results with tartaric, citric or salicylic acids. On heating 0.1 g. colchicine with 0.003 to 0.005 g. tartaric acid and 1 cc. concd. H_2SO_4 , the soln. becomes green; with citric or salicylic acid instead of tartaric, the soln. becomes garnet.

W. O. E.

Evaluation of cresol-naphthenic acid soap solutions. GREGOR KOGAN. *Pharm. Zentralhalle* 69, 681-4(1928). —To 10 cc. of the sample add 20 cc. H_2O and 10 cc. dil. H_2SO_4 , and then with const. shaking Na_2SO_4 to satn. Follow with 20 cc. Et_2O , shake 3 min. and transfer the mixt. to a separatory funnel. Withdraw the aq. layer to a 2nd funnel, then wash the Et_2O again with 20 cc. dil. (5%) H_2SO_4 , and unite the aq. layer with the 1st portion withdrawn. Wash these united portions with 20 cc. of Et_2O , withdraw and set aside the aq. layer for examn. of bases (soln. A). Transfer the Et_2O to the 1st separatory funnel and wash twice with two 50-cc. portions of 10% Na_2CO_3 soln., finally collecting the latter in a flask for estn. of the naphthenic acids (soln. B). Warm the Et_2O (now contg. the cresols and hydrocarbons) by immersion in H_2O at 50° until the solvent is eliminated, add to the residue 25 cc. 15% NaOH soln. and 45 cc. H_2O (a turbidity may here result, if not add an addnl. 30 cc. H_2O). In the event that hydrocarbons are pptd., treat the mixt. with 20 cc. of Et_2O . Remove the sepd. H_2O (cresolates) to a flask (soln. C). To the Et_2O add 3 g. anhydrous Na_2SO_4 , then after some min. pass the liquid through an 8-cm. folded filter, washing both filter and funnel twice with 5 cc. anhydrous Et_2O . Evap. the Et_2O at 50° and bring the residual hydrocarbons in a desiccator to a const. wt. The amt. of hydrocarbons should not exceed 0.5%. To the cresol soln. (C) add an excess of dil. H_2SO_4 sat. with Na_2SO_4 .

and ext. with 20 cc. Et_2O , then again twice with 10 cc. Et_2O , finally uniting and drying the Et_2O portions over 2 g. Na_2SO_4 . Pass the liquid through a folded filter into a weighed flask, washing the sulfate, funnel and filter twice with 10 cc. dry Et_2O . Evap. the solvent, dry the residue 40 min. at 100° , cool in desiccator and weigh. The residue should not be less than 35%. Acidify soln. B contg. the naphthenic acids with dil. H_2SO_4 , then sat. with Na_2SO_4 and ext. with 20 cc. Et_2O , pour off the latter and again ext. with 20 cc. Et_2O . Unite the Et_2O portions, dry over 3 g. Na_2SO_4 for 1 hr., then filter into a tared flask washing the sulfate, funnel and filter 3 times with 5-cc. portions of dry Et_2O . Evap. the latter and bring the residue to a const. wt. in a desiccator. The naphthenic acids should not be less than 33%. The residue is tested for the I no. Soln. A is examd. for bases by treatment with excess NaOH soln., extn. with Et_2O , the latter dried and evapd. at room temp. There should be entire absence of odor indicating presence of bases. Further suggestions are given for the detection of fatty and resin acids.

W. O. E.

Technic and examination of hemoglobin preparations. C. MASSATSCH. *Apoth. Ztg.* 43, 1307-8(1928).—A discussion of the methods ordinarily followed in prepg. hemoglobin specialties, with some suggestions for their evaluation. The results obtained in the examn. of 7 different brands are presented in tabulated form.

W. O. E.

Stability of powdered opium. AXEL JERMSTAD. Univ. Oslo. *Pharm. Zentralhalle* 69, 693-4(1928).—Two samples of powd. opium examd. in 1920 had morphine contents of 11.26% and 16.20%, resp. Ten years later these values had fallen to 10.94% and 15.82%, resp., from which it appears that this commodity if properly handled will suffer no undue loss of morphine over a period of years.

W. O. E.

Salvia officinalis. H. WALDECK. *Pharm. Zentralh.* 69, 709-15(1928).—A discussion of the role sage has played in the popular and scientific mind, with especial reference to its large-scale culture and marketing by a leading German firm.

W. O. E.

Rapid method for the examination of ergot in the apothecary. K. HERING. *Apoth. Ztg.* 43, 1381-2(1928).—Prep. an infusion of 1 g. powdered ergot (previously defatted by repeated extn. of a 2-g. sample with petr. ether in a separatory funnel) with 20 cc. distd. H_2O and 1 drop HCl , filter and to 4 cc. of filtrate (= 0.2 g. ergot) add 1 drop aq. NH_3 , then ext. with 10 cc. of Et_2O by vigorous shaking. Pipet 5 cc. of the clear Et_2O soln. into a test tube contg. 2 cc. pure H_2SO_4 , whereupon a cornflower-blue zone should shortly appear when viewed in a moderate light. This test will indicate a drug satisfying the lowest D.A.-B. 6 provisions.

W. O. E.

Sodium phenylethylbarbiturate. HÅKAN SANDQVIST AND THORSTEN HJ'SON LINDSTRÖM. *Pharm. Inst., Stockholm. Arch. Pharm.* 266, 613-6(1928).—This substance is available in 2 com. forms, as luminal sodium and as substitutes for this. In examg. the latter, on heating at about $140-50^\circ$, or even over H_2SO_4 at the ordinary temp., it was shown to suffer loss in wt., due apparently to the presence of EtOH . The prescribed Pharm. test (Na content), or titration of the product alone, offers no unqualified assurance of purity. A better procedure is to det. the org. component, as follows: Render an aq. soln. of the salt distinctly acid (methyl orange) with HCl , evap. to dryness on the H_2O bath, then ext. the residue repeatedly with pure absolute Et_2O . Evap. the solvent in a tared container and weigh the residue after drying at $90-5^\circ$. This wt. multiplied by 0.9957 gives the amt. of org. component.

W. O. E.

Adjustment of liquids to a definite specific gravity. CARL OTTO. *Pharm. Ztg.* 73, 1307(1928).—The readjustment of Liq. Kal. acetatis (d. 1.250) and of EtOH (d. 0.8047) to lower concns. is discussed.

W. O. E.

Muscatele sage oil (Ol. Salviae sclareae). ELEMER KOPP. *Pharm. Zentralhalle* 69, 677-80(1928).—The yield of oil depends on the condition of material distd. whether fresh, wilted or dry, the variations being from 0.03 to 1.0% volatile oil. The Roumanian product is characterized by its high content of linalyl acetate (41.8 to 59.2%) and linalol (13.8 to 26.5%), whether obtained from the fresh or dry plant.

W. O. E.

Chemical changes in tincture of iodine on storage. W. KNOLL. *Apoth. Ztg.* 43, 1324-5(1928).—A summary of results obtained respecting the keeping qualities of tincture of iodine shows that the addn. of little (0.2%) or no KI to tinctures leads to their instability. The statement of Valentin that a 5% tincture prepd. with 80% alc. is stable is without foundation in fact, even in the presence of 0.2% KI. A KI content of 1.75% (army specification) or of 2.8 to 3% (D.A.B. 6) renders the prepn. stable. The use of 70 or 90% alc. has no effect on the stability of tinctures fortified by the addn. of KI. For the prepn. of such tinctures 70% alc. may be used without disadvantage. A small addn. of NaHCO_3 , similar to that made in KI tablets, is without effect on the

stability of tinctures, so that the prepn. of tincture of iodine from tablets for army purposes is justified. W. O. E.

Plant lecithin. BRUNO REWALD. *Pharm. Ztg.* 73, 1377(1928).—The differences in the nature of plant and animal lecithin, and the difficulties heretofore experienced in the prepn. of the latter are pointed out. With soy-bean cake now available as a ready source of supply it is shown to what extent plant lecithin may be advantageously substituted for egg lecithin, notably in combination with cod-liver oil, pills, malt, blood preps., etc. W. O. E.

Testing bismuth subnitrate for calcium salts. C. STELLBAUM. *Pharm. Ztg.* 73, 1363(1928).—The belief is expressed that eventual contamination of Bi subnitrate with Ca salts is due to the filter paper employed in tileir manipulation. W. O. E.

Testing bismuth subnitrate for calcium salts. J. HERZOG. *Apoth. Ztg.* 43, 1353-4(1928).—Exception is taken to S.'s suggestion (cf. preceding abstract) as to the source of Ca in the subnitrate. Rather is the error, or contamination if any, due to the German Pharm., which specifies the addn. of too little Na_2S in pptg. the Bi as the sulfide, so that the filtrate yields with aq. NH_3 a ppt. of basic Bi compds. easily confused with CaC_2O_4 . W. O. E.

Ash pictures of technically valuable barks. KARL CZAPLA. *Tech. Hochschule Brünn. Sitzb. Akad. Wiss. Wien Abt. I*, 137, 17-44(1928).—The ash pictures of all the com. important barks examd., particularly those used for tanning, possess characteristic structures well-suited to the detn. of the several barks as developed from their resp. sections. The ashes of coarsely comminuted barks, as also that of bark mixts. involving 2 different barks, may in connection with the ash pictures of single barks serve to identify each one. The ashes colored by eosin soln., "Direct Sky Blue" (greenish), or "Chlorantine Red" yield especially striking differences. The occurrence of Fe as also Mn in the bark ashes, with respect to the outer and inner layers, may serve in differentiation. By virtue of the blue color in ashes produced by ZnCl_2 (indicative of K_2CO_3 and CaCO_3) the barks (or their ashes) may be divided into 5 groups. In view of the foregoing it is now possible to formulate a scheme for the systematic identification of the several barks. W. O. E.

Notes on the spirits of the National Formulary V. RALPH E. TERRY. *Univ. of Ill. Am. J. Pharm.* 100, 625-30(1928).—A brief history as to the source, formula, changes, a phys. description of the product as made according to the present formula, identity tests, etc., of the spirit of formic acid. W. G. GAESSLER

Siegesbeckia orientalis. R. ALLENDY. *Hahnemannian Monthly* 63, 765-73(1928).—A detailed account of the physiol. action and therapeutic use of the annual herbaceous plant, *Siegesbeckia orientalis*. JOSEPH S. HEPBURN

A new biological method for detecting small quantities of morphine. P. TREMONTI. *Boll. soc. ital. biol. sper.* 3, 393-6(1928).—By means of the Lâwen-Trendelenburg technic, the arteries of the posterior extremities of the frog were perfused with physiol. salt soln. The soln. inserted into the aorta was gathered from the median vein and collected into graduated tubes. The time of observation was 10 min. The no. of drops for each min. and the total no. of cc. of liquid obtained for the entire period were recorded. The drug to be tested was either injected directly into the circulation or added to the perfusing liquid. Drugs such as morphine have a marked vasoconstrictor action and modify the normal flow of the liquid. By this method it was possible to detect morphine up to a diln. of 0.0002 mg. per cc. when the drug was injected into the circulation, and in amts. of 0.002 mg. when added to 10 cc. of perfusion liquid. It was also possible to differentiate drugs that have an isoquinoline nucleus like papaverine (vasodilators), from those having a phenanthrene nucleus like morphine (vasoconstrictors). PETER MASUCCI

Determination of synthetic camphor in pharmaceutical preparations. J. BOUGAULT AND (Miss) BL. LEROY. *Faculté de Pharm. de Paris. Ann. fals.* 21, 456-60(1928).—Introduce 0.5 g. camphor dissolved in 5 cc. 90% EtOH into a test tube, add 1 g. NH_4OH -HCl dissolved in 5 cc. H_2O and then 2 cc. 20% NaOH soln., seal the tube, heat 2 hrs. in a boiling water bath, let cool, transfer the contents of the tube to a sepg. funnel washing with a little 2% NaOH, add 20 cc. H_2O and 3 cc. 20% NaOH, if the soln. is more than slightly opalescent filter, neutralize with HCl (bringing back to neutrality with Na_2CO_3 if necessary), ext. the camphor oxime with 20, 10 and 10 cc. Et_2O , washing each ext. with 5 cc. H_2O , evap. in the open atm. for 12 hrs., dry in a CaCl_2 desiccator for 12 hrs., weigh and add a 4% correction to compensate for evapn. of camphor oxime.

The corrected wt. $\times 152/167$ gives the wt. of camphor. For the analysis of camphorated oil, the camphor is first sepd. by steam distn., finishing with a little alc., and the detn. carried out on an aliquot of the distillate. Com. synthetic camphor can contain camphene, borneol and isofenchone as impurities. The first 2 are eliminated, but the 3rd is converted into an oxime and is counted as camphor; its presence can be detected by taking the m. p. of the oxime after weighing. Synthetic camphor can now be prepd., however, as pure as the natural Japanese product. The oxime of natural camphor m. 117-8°, that of synthetic camphor m. 116-7°, and a mixt. of equal parts of the two m. 110-2°.

A. PAPINEAU-COUTURE

Henning's olfactive prism and the preparation of (perfume) bases. OTTO GERHARDT. *Parfumerie moderne* 21, 415-23(1928).—The classification and evaluation of odors according to Henning's prism (based on the assumption that odors can be classified as spicy, flowery, fruity, resinous, putrid or burnt, or as mixts. of these in varying proportions) is considered to be of little or no use in the mixing of perfumes, as the bases utilized are themselves complex. The difficulty and complexity of the problem of blending perfume bases is briefly discussed. A list is given of the commoner perfume materials and their utilization.

A. PAPINEAU-COUTURE

Tuberose. ETABLISSEMENTS ANTOINE CHRIS. *Parfums de France* 6, 287-92 (1928).—A brief review of its cultivation and of the extn. and compn. of the perfume.

A. PAPINEAU-COUTURE

New constituents of the volatile oil of concrete oil of *Polianthes tuberosa* L. F. ELZE. *Riechstoffind.* 154 (Aug., 1928); *Parfums de France* 6, 308-9(1928).—Steam distn. of the ext. obtained by treating *P. tuberosa* L. flowers with low-boiling petr. ether gives a 6% yield of oil having d_{15}^{20} 1.003, n_D^{20} —3°15', acid no. 25.0, ester no. 230.0, Me anthranilate 1.4%. Eugenol, methyl benzoate, geraniol and nerol (in the free state and as acetic, and probably also propionic, esters), benzyl benzoate and farnesol were identified.

A. PAPINEAU-COUTURE

Botanical, chemical and pharmacodynamic study of common tansy. *Tanacetum vulgare* L. LÉON CROUY. *Bull. sci. pharmacol.* 35, 481-6(1928).—The essence of tansy contains β -thujone and small amts. of *l*-camphor and borneol. This essence is toxic, causing convulsions of the rabic type. It contains no alkaloid. A glucoside hydrolyzable by emulsin is present, but has not yet been obtained in the cryst. form. The Et₂O ext. of tansy is inactive toward tenia but is an effective ascaricide.

L. W. RIGGS

The opening and digestion of capsules inspected by aid of the radioscope. MAURICE-MARIE JANET. *Bull. sci. pharmacol.* 35, 486-95(1928).—The disintegrating actions of water, saliva and gastric juice on medicinal capsules were studied *in vitro*. The actions of the fluids of the mouth, esophagus and stomach were followed by the observation of a capsule contg. a Bi salt by means of the radioscope. Under certain conditions the capsule opened in the mouth or esophagus, but more frequently in the stomach in from 1 to 30 min. The passage of the intact capsule into the duodenum has been observed by Adam (*Thèse Doct. Univ. Pharmacie, Paris* 1928) but not by the author, who regards it as exceptional.

L. W. RIGGS

Report of the permanent commission for the standardization of serums, serologic reactions and biologic products. M. TIFFENEAU. *Bull. sci. pharmacol.* 35, 517-33 (1928).—The report of this commission, under the League of Nations, gives directions by biologic methods for the standardization of the following named therapeutic substances: arsenobenzenes, digitalis, squill, insulin, hypophysis and ergot. Thyroid, male fern and oil of chenopodium were considered but no biologic method was described for their standardization.

L. W. RIGGS

Seeds of *Euphorbia paralias* L. PAUL GILLOT. *Bull. sci. pharmacol.* 35, 561-4 (1928).—Analysis of the seeds gave moisture 7.08%, oil 38.05, proteins 22.43, sugars 2.58, mineral matter 5.39, cellulose 24.47. The oil obtained by pressure was golden yellow in color and showed an absorption band at 675 μ ; rotary power +4°30', d_{15}^{15} 0.9368, n_D^{15} 1.4845, Crismer index 62°, m. p. —25°. Free aliphatic acids in mg. KOH per g. of oil 3.36, insol. aliphatic acids + unsapn. matter 96.17%, sapon. index 194.0, iodine index 196.3, acetyl index 10.0, unsapon. matter 1.55%, bromoglycerides insol. in Et₂O 43.6%, degree of oxidation 19.12%. The oil gives an immediate ppt. with the Halphen Br test and the oil turns violet and the acid yellow with Bellier's resorcinol test. Oil extd. from the seeds by petr. ether has practically the same characters as oil obtained by pressure.

L. W. RIGGS

Gum arabic. L. AMY. *Bull. soc. chim. biol.* 10, 1079-90(1928).—Solns. of gum arabic are heterogeneous and contain a substance in the state of gel which was isolated and is the subject of further study. The gum acid is a strong monobasic org. acid.

Its dissocn. const. is about 2.0×10^{-4} , mol. wt. about 1600 and its solns. are unstable, changing rapidly by hydrolysis and yielding both insol. and reducing products. There is evidence of the existence of dialyzable acids, of which a thermolabile part plays an important role in the oxidizing activity of gum arabic.

L. W. RIGGS

Further assays of Chinese *Ephedra* species. CHIH-TUNG FENG AND BERNARD E. READ. Peking Union Med. Coll. *Chinese J. Physiol.* 2, 337-44(1928); cf. C. A. 22, 2031, 2243.—Assays of the sep. male and female plants of *Ephedra equisetina* and *E. sinica* show that during the flowering season there is a greater amt. of alkaloid in the male than in the female plants. Sep. monthly analyses show that this difference in the sexes amounting to 13 to 17% in May gradually lessens until after the fruiting season, when the alkaloidal content is practically the same for the 2 sexes. Assays of the various parts of the whole plant of *E. equisetina* show that the root, berries and seeds contain no alkaloid. The nodes contain only 32% of the alkaloid contained by the internodes, but they contain a greater proportion of pseudoephedrine than do the internodes. Further seasonal analyses of *E. sinica* collected in winter show a decrease in the alkaloidal content of nearly 50%.

Work and proposals of the international conferences on the biological standardization of therapeutic agents. E. KNAFFL-LENZ. *Arch. expil. Path. Pharm.* 135, 259-332 (1928).—A statement covering the conclusions reached at the conferences of Edinburgh, Geneva and Frankfurt. The substances considered, and concerning which recommendations are made in this report, are digitalis substances, ergot preps., *Cannabis indica*, hypophysis ext., adrenal ext., thyroid preps., insulin, silix mas preps., oil of chenopodium, vitamins and arsenobenzene preps.

G. H. S.

Plumbagin. A. MADINAVEITIA AND M. GALLEGO. *Anales soc. españ. fís. quim.* 26, 263-70(1928) —From the roots and stems of *Plumbago europea* there has been isolated a medicinal compd., yellow crystals, slightly sol. in H_2O , more sol. in boiling H_2O , very sol. in boiling alc., less so in cold alc., very sol. in ether, $CHCl_3$, C_6H_6 and acetone, sol. in alkalis, with violet color discharged by Zn reduction or by atm. oxidation, sol. in H_2SO_4 with intense red color changing to violet on heating m. 76° . Plumbagin is probably a methyljuglone, but so far the position of the CH_3 radical has not been detd. definitely.

E. M. SYMMES

The adsorbing properties of some aluminum silicates used in pharmacy. R. PORTILLO. *Anales soc. españ. fís. quim.* 26, 271-86(1928).—There are a no. of remarkable pharmaceutical compds., either natural or artificial, which can be regarded as kaolin mixed with an excess of SiO_2 and H_2O , whose activity is attributed to their adsorbing powers. SiO_2 and total H_2O were detd., and the rest was assumed to be Al_2O_3 , although in most cases there were traces of Fe and Mg oxides. Tabulation of results shows that there is no simple relation between adsorbing powers and chem. compn., but degree of dispersion and degree of hydration have a large influence. By use of methylene blue to det. adsorption many previous errors were eliminated.

E. M. SYMMES

Certain constituents of the leaf and their relation to the burning qualities of tobacco. D. E. HALEY, E. S. NASSET AND OTTO OLSON. Penna. State College. *Plant Physiology* 3, 185-97(1928).—Eighteen selected mature plants of cigar leaf tobacco (Hibshuan strain, Pennsylvania Broadleaf) grown on the expt. plots at Ephrata, Pa., under different combinations of fertilizer treatment were used in the present study. After being air-cured in a shed the plants were air-dried under lab. conditions and the leaves, stems and stalks separately finely ground for analysis. A comparison of the data on what the authors describe as "sol. and insol. alky." of the ash with the ether ext. of both the cured and fermented material indicated that the org. acids probably occur almost entirely in combination with the alkali and alkaline earth metals. The burning quality of the cigars made from these samples was related more to the alky. of the ash than to the amt. of ether-sol. org. acids. The alky. of the ash was affected by the season and the kind of K salt used. If consideration is to be paid to burning quality, fertilization with K_2SO_4 is preferable to KCl. The phenomenon of base exchange in soils and the removal of what the authors describe as certain "active" substances such as $CaCl_2$ by leaching are believed to be influential factors in the burn and compn. of tobacco; but the ability of the plant to secure sufficient K, especially in soils high in colloids, may also be a factor. The CaO content of these samples was too high and the K_2O content too low for max. burning quality.

WALTER THOMAS

Constituents of *Polypodium hastatum* Thunb. K. SUZUKI. First Junior Coll., Tokyo. *J. Pharm. Soc. Japan* 48, 712-6(1928).—From alc. ext. of dried leaves of *Polypodium hastatum* Thunb., a variety of fern used by some in treatment of gonorrhea in Japan, coumarin was isolated in 0.22% yield.

NAO UYEH

Oxymel of squill. FRANK BROWNE AND P. A. W. SELF. *Pharm. J.* 120, 442-3

(1928).—The re-heating of honey for the purpose of purifying it is one of the causes of darkening and bulky pptn. of its mixt. with vinegar of squill (oxymel). Three out of 5 samples of honey from widely different countries showed this behavior. The sepd. clear liquid had the same physiol. strength as the original unstrained liquid (J. H. Burn); the amorphous sediment contained fatty matter, pollen grains and spores of molds (T. E. Wallis). To prep. a dark oxymel which is sometimes desired, boil 500 g. com. honey with 250 cc. H_2O until nearly all the H_2O is evapd., remove the scum, again add 250 cc. H_2O , boil off the H_2O again and skim off, then add H_2O to bring the honey to d. 1.36. Finally mix 200 cc. of vinegar of squill (d. 1.070) with 500 cc. of dark purified honey. Very little contraction takes place, and d. will be 1.28–1.29. S. W.

Acidum nitrohydrochloricum dilutum. Brit. Pharm. G. J. W. FERREY. *Pharm. J.* 120, 443–4(1928).—Dil. nitrohydrochloric acid prepd. from strictly Brit. Pharm. strong acids (31.79% HCl (80 cc.), 70% HNO_3 (60 cc.), H_2O 500 cc.) requires 27.43 cc. N $NaOH$ for neutralization; hence the required 26.6 cc. is too low as an av. value. As the Brit. Pharm. strong acids are usually above the strict Brit. Pharm. strength, a range of 26.5–28.5 cc. would be more appropriate. The allowance made by the Brit. Pharm. for loss of acid strength on mixing or keeping, is unnecessary with its present method of prepn. In Brit. Pharm. 1867, the concd. acids were mixed, allowed to stand 24 hrs., then mixed with the H_2O ; this involved a slight loss of Cl , i. e., of acidity. S. WALDBOTT

Psoralea corylifolia. J. C. GHOSH. Calcutta. *Pharm. J.* 121, 54–5(1928).—The seeds of this plant (natural order Leguminosae), and of *Vernonia anthelmintica* (Compositae) have long been used in India as a remedy in leucoderma or white leprosy, but the results are contradictory, being vitiated on account of the use of the same vernacular name for both plants. The oleoresinous ext. of the seeds of *P. corylifolia* seems to have given good results (Kanny Loll Dey, *Pharm. J.* Sept. 24, 1881). The possible causes of discrepancies in later results with seeds of the same plant are set forth. Expts. with both plants named are now conducted by the Calcutta School of Tropical Medicine, with a view of detg. the remedial effect of each in leucoderma. S. WALDBOTT

A new test for the activity of medicinal charcoal. HARRY BRINDLE. *Pharm. J.* 121, 84; *Chemist and Druggist* 109, 115(1928).—Expose the powd. charcoal dried at 110–120° in a closed vessel (desiccator) and in a thin layer to air satd. with the vapors of H_2O , $CHCl_3$, $EtOH$ and turpentine separately, and det. the % of increase of wt. in each case every 24 hrs. Some charcoals adsorbed the full quantity, others seldom less than 90% during the 1st 24 hrs. Detn. of $CHCl_3$ adsorption is unsatisfactory, on account of its evapn. during weighing in air. Active charcoal adsorbs H_2O from the air rapidly, e. g., 5% during a few min. exposure. With 8 samples of charcoals, including ordinary levigated, wood charcoal, gas-mask charcoals, purified animal charcoal, medicinal, and exptl. active charcoal, adsorption of H_2O varied from 9.55 to 83.62%, that of $EtOH$ from 9.43 to 84.49, of turpentine from 7.63 to 86.89%. A charcoal adsorbing below 15% of H_2O , is classed as inactive; active charcoal adsorbs from 30 to 100% of H_2O . As a rule, a given charcoal shows the same ratio of activity towards the several vapors used. S. WALDBOTT

A comparison of the adsorptive power of medicinal charcoals. HARRY BRINDLE. *Pharm. J.* 121, 84–5; *Chemist and Druggist* 109, 116–7(1928); cf. preceding abstr.—The adsorption powers of 18 different charcoals were compared by (1) B.'s H_2O -adsorption test, (2) a modification of Miller's $BzOH$ -adsorption test (*C. A.* 20, 3615) and (3) the $HgCl_2$ test of the Germ. Pharm. In (1) the adsorptive range was 9.55–83.62%, in (2) 2.9–23.05%, in (3) 0.7–6.2%. On the basis of an empirical activity standard of 100 for the best sample (No. 18), 7 com. samples were declared inactive, while 9 were considerably active with all the tests used. The H_2O and $BzOH$ tests gave concordant results on duplicate detns. made on the same sample; with the $HgCl_2$ test, results were erratic. The chief factor governing the activity of charcoal is a slow oxidizing action during manuf., brought about by passing a slow current of air or better, steam over the charcoal during carbonization. S. WALDBOTT

Mercury ointment. J. H. FRANKLIN. *Pharm. J.* 121, 85–6; *Chemist and Druggist* 109, 117–8(1928).—Several formulas are suggested to reduce the time required for "killing" the Hg upon trituration; the Brit. Pharm. formula requires at least 1 hr. The use of hydrous lanolin with white petroleum jelly, or hydrous lanolin with pale yellow beeswax and benzoated lard as ointment bases will reduce the time to 20 min. In another formula: Hg 300, powd. resin 15, prepd. suet 50, benzoated lard sufficient to make 1000 parts, trituration will cause the Hg to disappear easily within 10 min. S. WALDBOTT

A note on suppositories. ALER RAE. *Pharm. J.* 121, 315(1928).—Detn. of the

sp. gr. of medicaments commonly prescribed in suppositories being desired in order that correct allowance may be made for their vols. in admixt. with cacao butter (A), R. found that 10 g. of medicament displaced g. of A as follows: Boric acid 6.9 g., gallic acid 6.8, tannic acid 8.3, Bi salicylate 4.0, Bi subnitrate 2.8, Ext. bellad. virid. 8.5, gallae pulv. 7.4, ichthyol 9.1, morphine-HCl 8.5, opii pulv. 7.7, plumbi acet. 4.6, Quinin. hydrochl. 8.3, resorcinol with 5 g. of H₂O for soln. 13.4, zinci oxid. 2.3 g. S. W.

The weight of the base in suppositories. F. R. C. BARNESON. *Pharm. J.* 121, 346 (1928).—An accurate method is given whereby the quantity of base required for any suppository may be easily and quickly detd. Weigh out the active medicament for 1 suppository, mix this with a little of the melted base but insufficient to fill the mold. Fill up the mold with more of the base. When set, the trial suppository is removed and weighed. Deduct the wt. of the medicament to obtain the quantity of base needed. The method not only applies to the theobroma base but also to compd. bases, e. g., theobroma-wax, coconut-stearin, or to gelatin. S. WALDBOTT

Pharmacy as a career. R. R. BENNETT. London School of Pharmacy. *Pharm. J.* 121, 316-7(1928)—An address. S. WALDBOTT

Methylated iodine preparations. WM. JOHNSTON. *Pharm. J.* 121, 374-5(1928).—The pungent odor noted by MacEwan and Gregory (*Ibid* Jan. 27, 1883) upon dissolving I in methylated spirit, which was attributed by them to an allyl compd. contained in the denaturant, J. found to be caused chiefly by the acetone present in the latter; possibly also by some of its other constituents. S. WALDBOTT

A works museum. (Thomas Morson and Son.) T. E. WALLIS. *Pharm. J.* 121, 378(1928).—A descriptive account of the collection of specimens in materia medica, portraits, relics and manuscripts illustrating the progress of the firm of manufg. pharmacists named. S. WALDBOTT

A century of pharmacy in Manchester. W. KIRKBY. *Pharm. J.* 121, 379-81 (1928).—Historic details concerning the forerunners of the Manchester Pharmaceutical Assoc. S. WALDBOTT

William Kirkby. ANON. *Pharm. J.* 121, 382(1928).—Biography, with photograph, and review of publications. S. WALDBOTT

Edmund White, 1866-1928. ANON. *Pharm. J.* 121, 441-4, 467-8(1928).—Obituary, with portrait, and memorial tributes by W. J. U. Woolcock, D. L. Howard, F. W. Gamble, E. T. Neathercoat and G. A. Mallinson; also see *Chemist and Druggist* 109, 574-5(1928). S. WALDBOTT

A discussion of the pharmacopeial specifications for cresol. HUBERT OHAVER. Parke, Davis and Co. *J. Am. Pharm. Assocn.* 17, 547-9(1928).—After the U. S. P. X. was issued there was some agitation to change the specifications of compound cresol soln. or to admit a high-boiling cresylic acid. The claims were (1) that cresylic acids b. 193-205° had greater germicidal value than the U. S. P. cresol; (2) were less corrosive to tissue; (3) were cheaper and (4) more readily available. The first claim has been shown to be true for the 2 organisms *B. typhosus* and *B. aureus*. It is not known whether the assertion holds for other organisms but since the high-boiling cresols in general have higher phenol coeffs. it seems probable that they are more efficient as disinfectants. The second argument has not been proved. The third claim is undisputably true. Authorities disagree on the 4th. Examn. of many market samples of high-boiling acids demonstrates that the products are widely variant in phys. properties. No change in the U. S. P. standards should be made without carefully considering these facts. L. E. WARREN

Facts regarding the manufacture of physical constants and keeping qualities of soap, chloroform and camphor liniments. SAMUEL SHKOLNIK. U. Ill. School Pharm. *J. Am. Pharm. Assocn.* 17, 550-3(1928).—In making U. S. P. soap liniment the directions require that the unfinished product shall be set aside in a cool place for 24 hrs. and filtered. This procedure removes most of the Na palmitate. The Brit. prepn. is made from K soap which is sol. in EtOH. This does not require filtering. If CHCl₃ liniment be made from soap liniment which has not been filtered the Na palmitate will remain in soln. permanently and the total solids will be slightly higher than normal. The following consts. were noted: soap liniment $d_{20} 0.876$; direct rotation 1.51-1.67°; solids 5.96 g. per 100 cc. CHCl₃ liniment $d_{20} 1.060$; direct rotation 1.15-1.23°; solids 4.16 g. per 100 cc. Camphor liniment $d_{20} 0.939$; camphor 19.96%. Storage produced no appreciable changes in the consts. L. E. WARREN

The standardization of digitalis preparations. E. E. SWANSON and C. C. HARGRAVES. Lilly Laboratories. *J. Am. Pharm. Assocn.* 17, 641-5(1928).—Four biological methods were studied. The biological methods were (1) the U. S. P. 1-hour frog, (2) Houghton's 12-hour frog, (3) guinea pig, and (4) Hatcher's cat. The results by the

U. S. P. methods were compared with the colorimetric methods of Knudson and Dresbach. The samples tested included fluidexts., tinctures and the trade prepn., digiglusin. In one series the 1-hour frog method was compared with the colorimetric method, with ouabain as a color standard and in another series standard digiglusin was used as a color standard. The colorimetric method assays low for digiglusin and high for tinctures and fluidexts. The colorimetric method with ouabain as a standard gave low results as compared with the biological method. The colorimetric method with digiglusin as a standard gave inconsistent results. Since digitalis is given by clinicians in repeated doses until the therapeutic effect is obtained, and the amts. given to produce this effect vary with the individual patient, a more accurate method than those now in use is not absolutely essential.

L. E. WARREN

Notes on digitalin standardization. L. W. ROWE. Parke, Davis & Co. *J. Am. Pharm. Assocn.* 17, 645-7(1928).—The U. S. P. 1-hour frog method cannot be used for the assay of digitalin since the time is so short that complete absorption cannot take place. The Houghton M. L. D. method may be used as the time (12-18 hrs.) permits of nearly complete absorption. However, some indefinite results may be expected. The guinea pig method may be employed but the expense is high. The cat method gave unpromising results. Intraperitoneal injection of the white mouse gave the most promise but not sufficient tests were made to warrant establishing a standard.

L. E. WARREN

A study of the absorption and antiseptic properties of several types of iodine ointments. W. H. ZEIGLER. Med. Coll. South Carolina. *J. Am. Pharm. Assocn.* 17, 648-50(1928).—The ointments studied were the U. S. P. iodine ointment, the stainless N. F. ointment, the N. F. iodized petroxolin, an ointment with petroleum as a base, and one from which the KI had been omitted. In dogs 6 g. were rubbed into the axilla, the animal was bandaged and the urine tested for I at intervals of 4-6 days. In human beings one application only was made. Tests on the urine were made 5 or 6 times *per diem* for 2 days. The U. S. P. ointment was readily absorbed. The same ointment made with a petrolatum base was also absorbed. The 1 petroxolin N. F. V. and the U. S. P. ointment without KI were absorbed. The tests for I in the urine of subjects treated with the "stainless iodine ointment" were neg. The U. S. P. ointment possesses antiseptic properties but the stainless ointment of the N. F. V. does not.

Flaxseed (SHURT) 27. Variation in alkaloid content of the pomegranate due to certain soil treatments (MAURIN) 15. A new colorimetric test for tannic acid (RAE) 7. Benzodiazines (Brit. pat. 288,159) 10. Benzodiazine condensation products (Brit. pat. 287,179) 10.

HOFSTEDE, H. W.: *Mededeelingen van de Afdeeling Nijverheid No. 4 Citronell-olie*. Buitenzorg: Archipel Drukkerij. 189 pp.; Fl. 8.50. Reviewed in *Parfums de France* 6, 297(1928).

Hemostatic medicinal preparation. FREDERICK MARTINEZ and ADOLFO GOMEZ. U. S. 1,690,869, Nov. 6. An aq. ext. is formed from fibers of the outside of the fruit of the *Cocos nucifera*.

Medicinal compositions for external use to stimulate cell growth, etc. I. G. FARBERIND. A.-G. Brit. 287,465, March 18, 1927. Solns. for treating wounds or fractures are prepd. by treating expressed animal cell juices or exts. or albumins or degradation products of these with microorganisms and then removing the latter. The liquids obtained may be used directly or may be evapd. to dryness. A prepn. from peptone and an agar culture of *Bacillus coli* is described.

Medicinal composition from tannic acid, zinc oxide and glycerol. RUSSELL S. PATERSON. U. S. 1,690,175, Nov. 6. Tannic acid and ZnO are mixed and ground together, glycerol and water are successively added and the mass is allowed to harden and then redissolved in distd. water. The product is suitable for use as a urethral injection.

"Enteric" coated medicinal capsule. ERNEST H. VOLWILER (to Abbott Laboratories). U. S. 1,690,760, Nov. 6. Capsules which may be formed of gelatin are coated with nitrocellulose.

Active substances from squill. CHEMISCHE FABRIK VORM. SANDOZ. Brit. 287,147, March 16, 1927. Cardioactive substances are extd. from fresh squill (suitably after grinding with Na phosphate, $Al_2(SO_4)_3$, or $MgSO_4$ and drying) by use of $EtOAc$ or $CHCl_3$.

or other suitable org. solvents not readily sol. in water, in the presence of water and easily sol. salts. The extn. may be facilitated by the addn. of small quantities of EtOH, MeOH, acetone or benzoic or salicylic acids.

Unsymmetrically disubstituted barbituric acids. WERNER SCHULEMANN and KURT MEISENBURG (to Winthrop Chemical Co.). U. S. 1,690,796, Nov. 6. Details are given of the prepn. of hypnotic compds. among which are described Δ^2 -cyclohexenylethylbarbituric acid (m. 172°), Δ^2 -cyclohexenylallylbarbituric acid (m. 149°), Δ^1 -cyclohexenylethylbarbituric acid (m. 170°), and Δ^1 -cyclopentenylethylbarbituric acid (m. 168°).

Benzoic acid salts of aminobenzoic esters. HERMAN SEYDEL. U. S. 1,690,705, Nov. 6. Esters such as Et *p*-aminobenzoate benzoate, m. 70–71°, are produced by reaction between benzoic acid and *p*-H₂NC₆H₄CO₂Et or like compds. They are *anti-septics* and *local anesthetics*.

Theobromine. NAAMLÖÖZE VENNOOTSCHAP SOC. VOOR CHEMISCHE INDUSTRIE KATWIJK. Brit. 287,507, March 22, 1927. Theobromine is extd. from material such as cacao fruits by mixing the ground material with a large excess of an alk. earth hydroxide (including magnesia), adding only such a quantity of water that the mixt. maintains its dry appearance and then (suitably after several hrs.) adding more water to obtain a soln. of the theobromine of the desired concn. The soln. may be sepd. by filtration and the theobromine recovered from the soln. by use of CO₂ or other acid. A temp. of 70° is suitable for the process.

Glucosides. F. HOFFMANN-LA ROCHE & Co. A.-G. Brit. 288,129, April 1, 1927. In addn. to the easily sol. glucoside obtained as described in Brit. 265,941 (C. A. 22, 480) by treating exts. of *Adonis vernalis* with adsorbents, a difficultly sol. glucoside is simultaneously adsorbed. It remains as an oil when the residue obtained by evapg. to dryness the soln. of the glucosides extd. from the adsorbent is washed with ether to remove fats and with water to remove the water-sol. glucoside.

Phosphorus compound from animal proteins. SVIGEL POSTERNAK (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,690,752, Nov. 6. In order to obtain mixts. of the nuclei contg. P and Fe contd. in egg yolk, the defatted egg yolk is subjected to pepsin digestion in the presence of an inorg. acid such as HCl and this digestion is arrested at a suitable stage by materially diminishing the acidity of the mixt., the ppt. formed is filtered out and is subjected to trypsin digestion in a feebly alk. medium, the digestion liquor is then acidified, filtered and the filtrate is treated with sol. metal compds. such as CaCl₂ or Ca(OAc)₂, which serve to isolate a mixt. of metal salts of the 3 P nuclei. The product may contain about 11% P, 1.25% Fe and 9–10% Ca and may be used as a *tonic therapeutic agent*.

Ergotoxine. WELLCOME FOUNDATION, LTD., and G. M. TIMMIS. Brit. 286,582, Dec. 23, 1926. Ergotoxine is converted into sol. salts by alkylsulfonic acids. Prepn. of the methyl- and ethylsulfonates is described. Cf. C. A. 23, 241.

Pneumonia toxin and antitoxin. E. LILLY & Co. Brit. 286,744, May 11, 1927. Pneumococcus is cultivated in beef broth prepd. from beef not more than 6 days after its slaughter, sterilized in an autoclave under pressure, free from added carbohydrate and not over a week old. After 24 hrs.' incubation, the culture is filtered and the toxin obtained is preserved with tricresol and standardized on the basis of skin-test units. It may be used for obtaining an antitoxin in the usual manner from a rabbit, sheep or horse.

Vitamins. W. MERCK, K. MERCK, L. MERCK, W. MERCK and F. MERCK (trading as the firm of E. Merck). Brit. 286,665, March 8, 1927. In order to obtain antirachitic vitamin, provitamin substances are irradiated in the presence of "photochemical stabilizers" such as erythrosin, fluorescein, eosin or similar dyes and it is stated that I and CHI₃ may be used. Irradiation of dil. solns. of ergosterol is described.

Hormones. SCHERING-KAHLBAUM A.-G. Brit. 288,132, March 31, 1927. A therapeutic substance is prepd. from the anterior lobes of the pituitary body by treating the fresh or dried glands with a physiol. extn. agent such as Ringer's soln. or with an alk. medium such as NaOH or Ba(OH)₂ soln. Details are given.

Therapeutic hormone preparations from ovaries, corpus luteum and placenta. MAX HARTMANN (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,690,932, Nov. 6. The animal tissue is dried and treated with a volatile org. fat solvent such as ether, phosphatides are pptd. and sepd. and the filtrate is subjected to a temp. of between –50° and –70° in order to sep. active and inert substances. Cf. C. A. 22, 845.

Tubercle wax. I. G. FARBENIND. A.-G. Brit. 287,941, March 30, 1927. Wax obtained from tubercle bacilli and freed from fatty acid and from most of the bacillary substances is purified by digestion with dil. acid (suitably of 5% strength) and may

be further purified by repeated soln. in ether, drying with Na_2SO_4 and pptd. with acetone or alc.

Bactericidal and trypanocidal compounds of desoxycholic acid with safranine and acridine dyes. FRIEDRICH W. R. OSTEN and E. GRUBE. Brit. 287,965, Dec. 30, 1926. Addn. products are obtained, e. g., by adding a compd. such as tolusafranine to a soln. of desoxycholic acid in alc., ether or HOAc, and boiling under pressure for several hrs. The products are capable of effecting the soln. of water-insol. or slightly sol. therapeutic substances such as quinine.

Mucin-solvent tooth paste. CLARENCE C. VOGT (to Glenn F. Bowman). U. S. 1,691,504, Nov. 13. Na_3PO_4 1, is dissolved in glycerol 12, soap 2.5 and a powd. abrasive such as pptd. CaCO_3 6 parts are added and the substances are thoroughly mixed.

Disinfectant. KARL DAIMLER, FRITZ JUST, GERHARD BALLE and SIGISMUND FUCHS (to I. G. Farbenind. A.-G.). U. S. 1,691,228, Nov. 13. Na butylnaphthalene-sulfonate or other suitable aromatic sulfonic acid substituted by at least 1 side chain contg. at least 3 C atoms is used as a disinfectant, suitably for treating fabrics, the hands or surgical instruments.

Disinfectant and antiparasitic composition suitable for use in hats. F. HAMMOND. Brit. 286,798, Dec. 13, 1926. A compn. which may be formed into tablets comprises thymol and an absorbent of CO_2 such as ZnO , to which a perfume may be added.

E. M. SYMMES

Gas investigations in the Opl tower system (sulfuric acid plant). I. W. HANSEN. *Chem.-Ztg.* 52, 813-5(1928).—A detailed description of app. and analytical methods used in examg. gases from a tower acid plant. It is recommended that exit gases be drawn at a rate of 20 l./hr., with 100-150 l. as a sample, through an absorption train contg. 2 wash bottles, each holding 50 cc. 0.1 N NaOH, 2 or 3 similar bottles each holding 50 cc. 0.5 N KMnO_4 , and 1.0 cc. H_2SO_4 (sp. gr. 1.25), capillary flow-meter or indicator, trap for entrained liquid, and a large flask (to equalize pressure). By the titration of the NaOH and KMnO_4 , and the use of a nitrometer the SO_2 and NO content can be detd.

W. C. EBAUGH

Application of the MacDougall furnace to the sulfuric acid industry and elimination of the dust contained in the gases. B. PENTEGOV. *Mém. Univ. d'État d'Extrême-Orient* 73, 51-4(1927); *Chimie et industrie* 20, 468-9(1928).—The construction of the MacDougall furnace was modified as follows to adapt it to the production of SO_2 for Pb chambers: (1) A cast Fe sleeve over the central opening of each of the chambers

down which the pyrites traveled through the peripheral opening, reducing the amt. of excess air rising along the central axis without having taken part in the combustion and enabling the SO_2 content and temp. of the gases to be increased considerably. (2) The area of each of the 6 peripheral openings was doubled by decreasing the thickness of the wall of the furnace at the corresponding point. A sleeve was placed in each opening and 3 of the sleeves

were provided with a baffle which allowed the gases to pass but prevented the pyrites from falling. This reduced the velocity of the gases and also the amt. of dust entrained. Moreover, the reduction to 3 of the no. of openings allowing the pyrites to pass improved the roasting. With a 6-chamber furnace 5.9 m. high by 5.9 m. in diam., 20 tons of pyrites could be burned per 24 hrs. With the above-mentioned improvements the S content of the roasted pyrites was reduced from 12.1 to 2%, and the SO_2 content of the gases was increased from 4.8 to 70%. The dust-removing chamber is constructed as shown. The 4 following factors have been taken into consideration: (1) velocity of flow of gas as low as possible, (2) variation of this velocity, (3) change in direction of the gas, (4) shocks and friction against a solid surface. These principles follow from the laws of coagulation of colloids and suspensions of solid particles in gases. n are Fe bars fixed diagonally, provided with a cleaning device k ; in the horizontal tunnel are suspended angle-irons forming the filter o ; p is a concrete filter. This chamber is very efficient, and the Glover acid, after concn., contains only 0.1-0.06% non-volatile residue and 0.01% Fe.

A. PAPERNAU-COUTURE

Safe removal of caustic soda from drums. H. L. KAUFFMAN. *Chem. Met. Eng.* 35, 638(1928).—At the Parco, Wyo. refinery of the Producers and Refiners Corp. a sheet iron building houses four 1300 gal. and one 900 gal. iron tanks. Above these tanks a steel rail support and chain hoist permit workmen to raise NaOH drums (previously perforated with an axe) and lower them into hot water with safety. A concrete dyke 18 in. high surrounds all tanks. All connecting pipe lines are placed in the dyke. Each of the larger tanks has air, steam and water lines, and a pumping-out line.

W. C. EBAUGH

Evaporating system for salt solutions. A. MITTENBERG. *Ukrainskii Khem. Zhurnal* 3, No. 2, Pt. techn. 43-64(1928).—A detailed investigation of the efficiency of a vacuum evaporator, with steam heating, working on a technical scale.

G. B. KISTIAKOWSKY

Reduction of tricalcium phosphate by carbon. K. D. JACOB AND D. S. REYNOLDS. U. S. Dept. Agr. *Ind. Eng. Chem.* 20, 1204-10(1928).—A study was made of some of the factors affecting the volatilization of P from mixts. of pure $\text{Ca}_3(\text{PO}_4)_2$ and pure C under closely controlled conditions. Reaction begins at 1150° and under favorable conditions is complete in 1 hr. at 1325° , or in 10 min. at 1500° . At the lower temps. graphite is less efficient as a reducing agent than the amorphous forms of C. There is some evidence that a phosphate more basic than $\text{Ca}_3(\text{PO}_4)_2$ is formed to a certain extent during some stage of the reaction. Less than 0.2% of the P originally present as $\text{Ca}_3(\text{PO}_4)_2$ is converted into Ca_3P_2 at temps. up to 1500° . In the presence of an excess of C reduction of $\text{Ca}_3(\text{PO}_4)_2$ follows the course of a monomol. reaction, the velocity coeffs. being 0.0113 and 0.0639 at 1250° and 1400° , resp.

K. D. JACOB

The lime industry of the Philippine Islands. F. D. REYES. *Philippine J. Sci.* 36, 139-56(1928).—A summary of the lime industry in the Philippines, including a comparison of methods, efficiency and costs.

JOHN T. WOLF

New systematic study of the iron content of special red lead. L. SPRINGER. *Chemtech. Ber.* 6, 186-8(1928), cf. *C. A.* 22, 2898.—Results on 3 red lead samples are compared, with HCl and HNO_3 as solvents, and 2 g. and 10 g. samples, the PbO being removed both quant. and qual. The Fe was detd. colorimetrically with KCNS. If care is used in removing the PbO a 1-g. sample is sufficient to give good results, the quant. removal having slight advantages. The Fe specification for red lead is too low, as a sample under 0.010% calcd. as Fe_2O_3 , especially when analyzed in HCl soln., is seldom found.

J. A. GRANT

Fine grinding of calcite containing a small amount of graphite, from near Perth Ontario. R. K. CARNOCHAN. *Can. Dept. Mines, Mines Branch* No. 688, 31-2.—The calcite was pure white, contg. CaO 50.55, MgO 1.68, SiO_2 2.80, CaF_2 0.95, Fe 0.16, C 0.35. The purpose of the tests was to det. if products could be prepd. from the calcite suitable for use in paint, linoleum, rubber goods, etc. The treatment recommended is to remove the graphite by oil flotation, dry the cleaned calcite and grind in a pebble mill in closed circuit with an air separator. If a finer product is desired the cleaned calcite should be ground wet in a pebble mill in closed circuit with a Dorr bowl classifier.

Reconcentration of low-grade graphite concentrates from Buckingham, Quebec. *Ibid.* 35-40.—The purpose was to find an economical method of raising the grade of the concentrates. The Gayco or any similar separator is unsuitable for this work. Good results can be obtained by small-scale flotation and the longer the charge is ground before flotation the higher the grade of concentrate and the greater the recovery.

Grinding test on Rosedale bentonite. *Ibid.* 86-7.

L. W. RIGGS

The application of oxygen and hydrogen to industrial operations. Hydrogen, nitrogen and the electric furnace. F. P. WILSON, JR. *Gen. Elec. Rev.* 31, 493(1928).—A review in particular of the commercial annealing, brazing or oxide-reducing furnaces containing H or H + N atoms, the furnaces being elec. heated.

C. G. F.

Specific gravity of various kinds of carbon black. WERNER ESCH. *Kautschuk* 4, 160(1928).—In spite of opinion to the contrary (cf. Hock, *C. A.* 22, 3742), it is maintained that the d. of C black is about 1.75 and of lamp black about 1.90. Data of other investigators are given in support of these values.

C. C. DAVIS

Density and porosity of limestone and coke. K. SMOLENSKI AND W. REICHER. *Gazeta Cukrownicza* 62, 693(1928); *Listy Cukrowar. Rozhledy* 47, 8.—The authors detd. the d. of finely pulverized materials (actual d.) and materials in lump (porous form (apparent d.)). The actual d. of limestone was 2.69-2.71, the apparent d. 2.14-2.675, showing a porosity of 1.2-20.3%. The limestone contained 91.4-99.9% CaCO_3 . The coke showed an actual d. 1.72-1.76, apparent d. 0.94-1.12, porosity 36.1-45.6%.

F. MARESH

Heat losses in the lime kiln. CH. LONGENECKER. *Rev. matériaux construction*

trav. publics 1928, 333-4.—After a discussion of the heat losses in lime burning it is suggested that powdered coal can be used to good advantage in vertical kilns.

F. O. A.

The economical organization of the lime kiln. E. MASSELON. *Rev. construction trav. publics* 1928, 364-7.

Bibliography of investigations, progress and novelties in the technology from the standpoint of the theory of colloids, during the years 1923-1927. OTTO. *Rev. gén. mat. plastiques* 4, 579-87, 649-51 (1928). A. PAPINEAU

The problem of accelerated hardening in the technology of proteino MANFRED. *Rev. gén. mat. plastiques* 4, 643-9 (1928); cf. C. A. 22, 3963.—A of patented processes, bringing out that the hardening by incorporation which generate CH_2O is intimately linked with plastification if max. phys. properties are to be developed. A. PAPINEAU

Asbestos, its selection and suitability for technical uses. TH. HOFFMAN *sion* 3, 21-2, 33-4 (1928).—The occurrence, compn, resistance to heat, acid elec. insulating properties and commercial products of hornblend and s bestos are discussed. J.

Suitable protection against acids and alkalis (STAEMMLER) 9. Purn (Brit. pat. 287,267) 1. Recovery of ZnCl_2 in paper making (Ger. pat. 4 Apparatus for evaporating salt solutions (Brit. pat. 286,982) 1.

Hydrochloric acid. EDSON R. WOLCOTT (to Texas Co.). U. S. 1,691,45 NaCl and clay are intimately mixed with a carbonaceous binder such as asphalt and the mixt. is subjected to destructive distn. at a temp. of less than 1500° to form a porous cake adapted for producing HCl by contact with steam at elevated temps.

Sulfuric acid. A. P. JAEGER (to Selden Co.). Brit. 286,708, March 10, 1927. A catalyst for oxidizing SO_2 to SO_3 comprises a catalytically ineffective base-exchange material physically combined with a catalyst, e. g., a zeolite comprising silicates of 2 or more metals, one of which at least may be a heavy metal and which may contain Al, Be, Cd, Zr, Zn or Ti may be used with a catalyst such as a metal of the 5th or 6th group such as V, Mo, W, U, Cr, Mn, As, Sb, Ta, Nb or Bi, with or without the addition of activating ingredients among which are listed Mn, Be, Al, Ti, Fe, Cu, Zr, Zn, Pb, Ag, Ce, Ni, Co, B and the rare earths. Pt and V compds. are especially suitable and vanadates and vanadites of Fe, Cu, Ag, Ni, Co, Ti, Zr, Ce, Al, Ca, Cd, U, Cr or Mn may be used. Inert or "diluent" carriers also may be used and some salt solns. and acid compds. have a stabilizing effect on the material. Many details are given.

Sulfuric acid. SOC. GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Brit. 286,980, Aug. 23, 1927. Sulfurous gases are catalytically oxidized and after removal of the SO_2 formed the remaining gases are treated in towers or chambers packed with broken flint or the like and washed with nitrosylsulfuric acid. The SO_3 produced in the first stage of the process may be absorbed in the H_2SO_4 produced in the second stage. (C. A. 23, 243.

Sulfuric acid. SOC. GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Brit. 286,865, Feb. 19, 1927. In making H_2SO_4 in packed chamber or towers as described 249,914 (C. A. 21, 991) a substance having a high heat capacity such as is used as the packing material in order to counteract fluctuations in temp. within the chamber may be maintained almost const. by varying the temp. of the acid which is circulated through the chamber and the latter is in the cube or of a cylinder, the height and diam. of which are equal

Ammonia synthesis. KALI-INDUSTRIE A.-G. and T. THORSSELL. Br April 1, 1927. A N-H mixt. for NH_3 synthesis is obtained by passing a and steam over Fe oxides; the higher oxides produced are then treated in chamber with reducing gases, and the operations, which are carried out w heat supply, are then repeated. Details are given as to the extent of oxide Fe oxides. The reducing gases may be water gas or coke or blast furnace gas

Synthetic ammonia. WALTER H. KNISKERN (to Atmospheric Nitrogen U. S. 1,690,585, Nov. 6. In liquefying NH_3 from gases contg. it the mixt. in successive stages to a cooling action produced by evapg. portions of the liquid cooling agent at pressures which are progressively lower from one stage next, the resulting vapors of the cooling agent are recompressed to the same pressure as the compressed vapors are condensed to liquid form, and the liquid is returned to the evapg. stages. An app. is described.

Synthetic ammonia. R. S. RICHARDSON (to Nitrogen Engineering Corp.). Brit. 287,072, March 12, 1927. A mixt. of H and N is circulated in a cycle to and through a single catalytic converter, part of the NH_3 is removed at one point and a further part is removed at another point beyond the pump and the inlet for fresh gases and this portion takes with it impurities from the gases and from the lubricating oil in the pump. Various features of app. are described.

Synthetic ammonia. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 637,336, July 8, 1927. A mixt. of N and H for the production of NH_3 is made by treating an industrial gas rich in CO , such as the gas formed in the prepn. of carbides in elec. furnaces, with steam, with or without catalysts, and absorbing the CO_2 formed.

Alkali nitrates. I. G. FARBENIND. A.-G. Fr. 637,393, July 7, 1927. See Brit. 283,771 (C. A. 22, 4211).

Alkali hydride. DEUTSCHE GOLD UND SILBER-SCHNEIDANSTALT, (formerly Roessler) Fr. 637,794, July 19, 1927. See Brit. 276,313 (C. A. 22, 2444).

Alkali cyanide lye. NAAMLooZE VENNOOTSCHAP NEDERLANDSCHE MIJNBOW EN HANDEL, MAATSCHAPPIJ. Ger. 467,117, Jan. 19, 1927. Alkali cyanide lye, free from K ferrocyanide, is prepd. from cyanide raw material contg. Fe by lixiviation with concd. NH_4OH , treating with alkali sulfide and then with heavy metal salts.

Decolorizing alkaline earth metal thiocyanate solutions. ROBERT R. FULTON. U. S. 1,691,345, Nov. 13. Solns. such as those of Ca thiocyanate for dissolving cellulose are treated with a deriv. of a water-sol. aliphatic acid such as CH_3O and heated at $120\text{--}130^\circ$.

Chromium compounds. ÉMILE BAUMGARTNER. Fr. 638,718, Aug. 2, 1927. Na_2CrO_4 is reduced with SO_2 , giving a soln. of $\text{Cr}_2\text{O}_3\cdot\text{SO}_2$ which is acted on by alkalies, neutral salts or acid salts of weak acids to obtain compds. such as $2(\text{Cr}_2\text{O}_3\cdot n\text{H}_2\text{O})$. $\text{Na}_2\text{Cr}_2\text{O}_7$, which are useful for *anti-rust* paints and for tanning.

Purifying vanadate solutions. SELDEN Co. Brit. 287,401, Sept. 14, 1927. A crude Vanadate soln. from which vanadic acid is to be prepd. is subjected to oxidation (suitably with a halogen or peroxide) to render impurities readily removable on subsequent treatment, as with NH_3 . Numerous details, modifications and auxiliary treatments are described.

Treating zinc solutions with ammonium carbonate. S. C. SMITH. Brit. 287,186, Sept. 18, 1926. Zn salt solns. such as those of ZnSO_4 or ZnCl_2 obtained from ores are treated with $(\text{NH}_4)_2\text{CO}_3$ in the presence of free NH_3 in a quantity suitably about half that chem. equiv. to the Zn in the soln., suitably by passing CO_2 into the cooled ammoniacal soln. under pressure. A granular ppt. is obtained which can be readily filtered and washed.

Lead, zinc, copper and silver salts. F. DIETZSCH. Brit. 287,207, Dec. 8, 1926. Oxidized, oxide or roasted ores are treated with a soln. of thiosulfate simultaneously with or after treatment with a soln. of SO_2 to ext. Cu or Pb and Zn or Ag. Solns. of cuprous sulfite and Pb sulfite or sulfate are formed and if the Pb is present almost wholly as sulfate the SO_2 may be omitted. The metals may be pptd. and the thiosulfate regenerated. Various details and modifications are given.

Aluminum chloride. ALMER M. McAFEE and GERALD I. ROBERTS (to Gulf Refining Co.). U. S. 1,690,900, Nov. 6. A mass of aluminous material such as bauxite and C is established in a reaction chamber and is graded so that it is denser at the walls of the chamber than at other points and a mixt. of Cl and combustion-supporting gas such as O or air is passed through the mass under conditions (suitably while maintaining a temp. of about $600\text{--}700^\circ$) for AlCl_3 formation, preferably so that the gases travel in a path away from the walls of the chamber.

Aluminum sulfate and alums. JEAN G. HERBOS. Fr. 638,760, Aug. 2, 1927. $\text{Al}_2(\text{SO}_4)_3$ is prepd. without heating by making a paste of bauxite and H_2SO_4 and a paste of bauxite and water and adding one to the other in a vat. The soln. of $\text{Al}_2(\text{SO}_4)_3$ is freed from Fe by pptg. it as Prussian blue or oxidizing it with dichromate. The corresponding alums may be pptd. by adding an alkali sulfate or chloride.

Ammonium chloride. CHEMISCHE FABRIK GROSS-WEISSANDT and PAUL SEIDLER. Ger. 467,184, Aug. 11, 1926. Addn. to Ger. 463,184. Larger crystals of NH_4Cl are prepd. by the crystn. of the NH_4Cl ext. of such plants as are non-ligneous, such as soy-bean wax. Cf. C. A. 22, 2444.

Ammonium sulfate. SOCIÉTÉ DES MINES DE DOURGÈS. Fr. 638,997, Jan. 4, 1927. In the prepn. of $(\text{NH}_4)_2\text{SO}_4$ from synthetic NH_3 wherein large crystals are obtained by reducing the ferric salts in the acid used to ferrous salts by the action of H_2S , H_2S used is obtained from ammoniacal vapors from ammoniacal liquors of coke-oven plants.

Calcium arsenate. CARLETON ELLIS and VERNON T. STEWART (to Chadeloid Chemical Co.). U. S. 1,690,627, Nov. 6. Powd. quicklime is reacted on with a soln. of arsenic acid contg. water in excess of that required completely to hydrate the lime and the product is desiccated by the further addn. of pulverized quicklime. U. S. 1,690,628 specifies grinding quicklime with arsenic acid while in the presence of an insufficient quantity of water to produce a pasty mass.

Calcium cyanamide. JOSEPH BRESLAUER and ÉDOUARD DE LUSERNA (to Soc. d'études chimiques pour l'industrie). U. S. 1,691,044, Nov. 13. See Can. 275,516 (C. A. 22, 1209).

Ferric hydroxide. J. WAGNER. Brit. 287,702, March 8, 1927. A strong current of air contg. up to 10% of crude dust-free CO₂ is passed through a tank contg. iron or steel shavings and filled with water to which has been added up to 3% NaCl and up to 1.5% of chloride such as those of Fe or Mn, or according to one description CaCl₂ or NH₄Cl. The aq. liquid is circulated and the product is removed by filtration.

Pure lead carbonate from crude lead sulfate. RENÉ DALOZE. U. S. 1,691,841, Nov. 13. Crude Pb sulfate (such as slime from lead chambers) is treated with a soln. of an alk. earth metal acetate such as Ca(OAc)₂ in excess to effect a double decompn. between the Pb sulfate and the alk. earth metal acetate, the resulting soln. is sepd. from insol. matter and the sepd. soln. is treated with an alk. earth metal base such as Ca(OH)₂ and the tri-basic Pb acetate formed in soln. is decompd. with CO₂ to produce Pb carbonate.

Potassium nitrate, etc. KALI-INDUSTRIE A.-G., T. THORSSELL and A. KRISTENSON. Brit. 287,133, March 16, 1927. In producing KNO₃ from KCl by use of HNO₃ of a strength up to 35%, the mother liquor, after sepn. of solid nitrate formed, is treated (suitably with FeCl₂ or Cu) to reduce its content of N compds. to NO, which is driven off and converted to HNO₃ for further use. Numerous details are given.

Zirconium oxychloride. RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. Brit. 287,424, Nov. 2, 1927. The product obtained by sintering Zr ores with lime and an alk. earth metal halide, as described in Brit. 282,023 (C. A. 22, 3621), is treated with HCl of such concn. that a soln. which when cold is almost satd. with CaCl₂ is obtained, by which a high yield of Zr oxychloride crystals is obtained. Various details are given.

Removing nitrogen oxides from gases containing hydrogen. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE). Brit. 287,577, March 25, 1927. Gases such as coke-oven gas freed from tar (but not necessarily from H₂S) are passed over reduced metals such as Fe or Cu which may be slightly heated. Fe may be used which has been used as a catalyst in NH₃ synthesis. The treated gas may be subjected to low temps. to effect partial liquefaction and obtain H or gas rich in H without generation of explosive products. Cf. C. A. 22, 3715.

Copper and carbon compound. GEBR. SIEMENS & Co (Erich Birnbrauer, inventor) Ger. 466,514, Nov. 9, 1921. Addn. to 454,804. In the process of 454,804 for the prepn. of a substance from Cu and C the powd. C is intimately mixed with the Cu ppt. before reduction with H.

Hydrogen. I. G. FARBENIND. A.-G. Brit. 288,056, Dec. 30, 1926. In operation of a process and app. such as described in Brit. 263,859 (C. A. 22, 32) a gas contg. 14% CH₄ and 86% H may be passed through the furnace arc to produce a gas which passes through the smaller outlet tube contg. C₂H₂ 7 and H 93%. The C₂H₂ is removed by washing to obtain pure H. In a furnace using a flat arc and producing 2% of N oxides, the gas recovered by the smaller outlet tubes contains 5% of the oxide.

Carbon. I. G. FARBENIND. A.-G. Brit. 286,845, Feb. 4, 1927. C is obtained from CO (or a gas contg. it) by decompn. the CO into C and CO₂ by heating to a high temp. with the addn. of a small quantity of an org. compd. or a carbonyl of a metal such as Fe carbonyl which serves as a catalyst to accelerate the decompn. The acetyl-acetone compds. of Fe, Ni and Co may be used, and with CO and Fe carbonyl a temp. of 400° and pressure of 100 atm. are suitable.

Carbon from carbon disulfide and other compounds. ANTON LEDERER. Fr. 637,817, July 20, 1927. In production of C by decompn. of C compds. such as CS₂, a temp. of 1100-1750°, preferably 1600-1700°, is used to obtain a hard, coherent and brittle C of about 1.8 d. A temp. of 1750-2100°, preferably 1800-1890°, gives a gray C which is lustrous, coherent and very soft, and of density about 2.3 or more and of a metallic character. The black may be converted into the gray by heating to above 2800°. The gray C can be heated in air or O to 700° without appreciable loss of weight, and can be obtained in metal-like plates by deposition on a flat core. Strips of the gray

C or filaments formed by powdering it and mixing with binders and squirting can be used for elec. incandescent lamps, working at high c. ds.

Active carbon. T. FUJISAWA. Brit. 287,982, Jan. 13, 1927. "Soot" prepd. by incomplete combustion of oils, fats, waxes, resins or gases of high C content is heated to dull redness and exposed to the atm. while stirring in a layer of 2 in. of less thickness, and is then cooled in a closed vessel.

Apparatus for distilling hydrogen peroxide. J. D. RIEDEL A.-G. Brit. 287,281, Feb. 4, 1927. Various structural details are described of an app. which may be made of ceramic materials, Ta or Cr-Ni alloys.

Magnesia product. THOMAS S. CURTIS (to Pacific-Southwest Trust & Savings Bank, trustee). U. S. 1,690,771, Nov. 6. A product suitable for use as *elec. insulation* comprises magnesia which has been heated sufficiently to convert it substantially wholly to periclase without fusion.

Molded articles of clay and magnesium cement. HARVEY E. MANNING. U. S. 1,690,305, Nov. 6. In forming articles such as bowls of tobacco pipes, kaolin clay is mixed with MgO and nitro-hydrochloric acid, to form a thin pasty mass which will set slowly upon standing in a vacuum, forming a product of low gravity; the mass is allowed to set under less than atm. pressure, and sol. materials are removed by washing.

Phosphorus and aluminous cement. I. G. FARBENIND. A.-G. Brit. 287,036, March 19, 1927. P and an aluminous cement are obtained by melting phosphates under reducing conditions in an elec. or shaft furnace with a slag formed by fusing (under reducing conditions) Al_2O_3 70-90 and lime 30-10 parts. Bauxite of high Fe content may be used in forming the slag and the Fe eliminated as a regulus.

Condensation products of urea and formaldehyde. HENRI BARTHELEMY (to Soc. industrielle des matières plastiques). U. S. 1,691,427, Nov. 13. A sirupy soln. of the initial condensation product of urea and CH_2O is treated with an org. anhydride of the aliphatic series such as Ac_2O to facilitate production of molded articles.

Condensation products of thiourea, etc., and aldehydes. K. RIPPER. Brit. 287,568, March 25, 1927. Thiourea or its derivs., which may be admixed with urea or its derivs., is condensed with an aldehyde such as CH_2O or its polymers to produce a hydrophobe resin which disintegrates on contact with water or aq. solns. into a powder which may be molded under heat and pressure. Methylolurea and methylolthiourea also may be used as starting materials. Various details and examples are given, some of which include the use of fibrous or other fillers and auxiliary ingredients.

Condensation products for making buttons, etc. SILUR TECHNISCHE UND CHEMISCHE PRODUKTE GES. and I. THORN. Brit. 287,727, April 9, 1927. Urea or thiourea is condensed with CH_2O , with or without an acid catalyst, and starch or a similar material is added "in an amount which is a multiple of the urea" and the material is dried and pressed. Other resinous substances, softening agents such as wool fat, etc., also may be added.

Plastic substances. GEORGES BIA and JEAN ÉTIENNE DOUZAL DE GRANVILLE DE BIELIZE. Fr. 638,887, Dec. 27, 1926. A dielec. nonbrittle plastic substance is made by condensing phenol with a large excess of CH_2O . A catalyst such as MgO , Na_2CO_3 or a mixt. of Na_2CO_3 and $NaBO_2$ may be used, and a little paraffin is added to render the substance elastic.

Adhesive for surgical dressings, etc. JOHNSON & JOHNSON. Brit. 286,527, June 15, 1927. A weak soln. of gum tragacanth, Irish moss, agar-agar, Indian gum or the like is added to rubber latex to cause "creaming" and the "cream" is then treated with solns. such as Na silicate or other alk. compd. such as Na phosphate, NaOH or Na_2CO_3 and with a germicide such as CH_2O , thymol, phenol or cresol and more gum soln. is added to cause further "creaming," the material is warmed to 70° , a warmed soln. of agar agar and Na silicate is stirred in and a perfume is added. The mixt sets to a jelly when cold and is squeezed through fine gauze to give it a pasty consistency.

Vegetable glue. IRVING F. LAUCKS and GLENN DAVIDSON (to I. F. Laucks, Inc.). U. S. 1,691,661, Nov. 13. Adhesives such as those prepd. from soy-bean flour contain reaction products of CS_2 with other substances present which serve to increase the resistance of the glue to water. Cf. C. A. 23, 248.

Size. GERHARD HÖNSCH. Fr. 637,476, July 11, 1927. A size powder sol. in cold water consists of a mixt. of finely divided animal glue and a liquefying agent such as Na α -naphthosulfonate, Na salicylate, NaCl, $CaCl_2$ or $Ca(NO_3)_2$. The adhesive properties may be increased by tanning agents, siccatives or casein. If for use in the making of paper, casein and an agent which will also liquefy the casein are added.

Absorbents. BRITISH DYE STUFFS CORP., LTD., JAMES BADDILEY and ERNEST CHAPMAN. Fr. 637,498, July 12, 1927. See Brit. 280,262 (C. A. 22, 3025).

Photomechanical printing surfaces. A. W. NORDLANDER (to Aktiebolaget Rapidografi). Brit. 287,460, March 18, 1927. Printing surfaces, or grain screens, are produced from gelatin films contg. one or more Ag salts, with a preliminary hardening of the film by successive treatments with an alum bath and a CH_3O bath. Various details are given.

Photomechanical printing surfaces. F. ULLMANN. Brit. 288,023, March 24, 1927. To prevent chem. action between a Zn plate and the dichromate emulsion, the cleaned and fat-free plate is treated with a metal salt such as AlCl_3 which has a tendency to form a double salt, and is then washed and dried before the application of the sensitized coating.

Impression or transfer rolls with a core of sponge rubber coated with a gum composition or other material. LLOYD V. CASTO (to Oxford Varnish Corp.). U. S. 1,691,336, Nov. 13. Rolls are specified which are suitable for use on printing app.

Embossed articles. ERNST SAUER. Ger. 466,328, Aug. 25, 1927. Gelatin reliefs are formed in celluloid by stamping. The reliefs are soaked in water and coated with AmOH or AmOAc . This is then washed off and the water removed by an aspirator.

Material for expansion joints. ALBERT C. FISCHER. U. S. 1,691,234, Nov. 13. Resilient material such as granular cork is distributed throughout a mass of ductile bituminous material so as to provide for free contraction and expansion. Cf. C. A. 23, 258.

Wetting agents. BRITISH DYE STUFFS CORP., LTD., and JAMES BADDILEY and ERNEST CHAPMAN. Fr. 637,848, July 18, 1927. Sec Brit. 279,990 (C. A. 22, 3042).

Packing material. WALTER W. EVANS (to B. F. Goodrich Co.). U. S. 1,690,161, Nov. 6. Packing material adapted for bottle seals comprises a relatively thick resilient backing layer and a relatively thin, impervious plastic facing layer adherent to the backing layer and composed of unvulcanized rubber, wax and a reinforcing pigment such as BaSO_4 . The backing layer may be formed of cardboard and is substantially free from impregnation by the material of the facing layer.

Sound record tablets. THOMAS A. EDISON (to Thomas A. Edison, Inc.). U. S. 1,690,159, Nov. 6. A blank which is to be impressed with a sound record groove is treated with a priming or sizing coating of varnish contg. a fusible condensation product such as a phenol resin and the coated blank is dried between successive coatings of varnish, and the duration of successive drying periods is progressively increased, and the coated blank is finally further cured by heating.

Projection screens. ZAIDAN HOJIN RIKAGAKU KENKYUJO. Brit. 288,135, March 31, 1927. Dark colored glass or the like is coated with a thin layer of gelatin or similar material on which crystals such as NH_4 manganous phosphate or NH_4 cobaltous phosphate, or both are deposited. The preliminary coating may contain pigments or colloidal coloring substances, and, instead of glass, metal or wood surfaces may be used. Rubber, varnishes, mica, stannic sulfide and other materials also may be used.

Modifying the physical properties of "isocolloids." L. AUER. Brit. 287,943, Sept. 30, 1926. The viscosity of "isocolloids" (defined to include colloidal substances of which the dispersed phase and the dispersion medium are both of the same chem. compn. but in a different phys. state, and which may include fatty oils, resins, mineral oil fractions of high b. p., goudron, tar, asphalt, rubber and similar substances and styrolene) and other phys. properties of the "isocolloids" are modified by adding various salts such as Co linoleate and KCNS (which on heating to 300–350° with linseed oil, rapeseed oil or mineral cylinder oil, in vacuum, yield a tacky product suitable for making linoleum), or with about 2% each of Na_2HPO_4 and MgO , and 1% of NH_4Cl , or with 5% of Na phenolate or trichloroacetic acid or with MgSO_4 and formic acid. Various products are obtained suitable for use as rubber substitutes, *manuf. of lacquers*, etc.

Synthetic gems. I. G. FARBERIND. A.-G. Ger. 466,310, Feb. 11, 1926. Gems of the spinel group are made by fusing a mixt. of MgO and Al_2O_3 in the mol. proportions 1 to 4 or 5, resp.

Polishing pad. SABURO YAMANAKA. U. S. 1,690,960, Nov. 6. A pad suitable for polishing varnished or metal surfaces comprises a body of hair felt with which is incorporated a mixt. formed of powd. horn 1, powd. squid shell 2, powd. pumice stone 7 parts and gelatin.

Bolter for carbon black or other pulverent materials. WM. S. HOSKINS (to Columbian Carbon Co.). U. S. 1,691,572, Nov. 13.

Vermin-proofing composition. CHARLES DICKENS. Ger. 466,780, Feb. 26, 1925. A vermin-proofing compn. particularly effective against toredo comprises Se or Te dissolved in a concd. aq. soln. of BaS .

Composition for fireproofing cloth, paper or other materials. CHARLES LICHTENSTADT. U. S. 1,691,726, Nov. 13. ZnNH_4 phosphate, mono- NH_4 phosphate and NH_4Cl are used together.

Apparatus for generating fire-extinguishing foam from acid and basic solutions. FRANK A. EPPS, ADDISON O. BONIFACE and WILLIS D. WITTER (to American LaFrance and Foamite Corp.). U. S. 1,691,710, Nov. 13.

Dental plate of rubber coated with metal. HENRY F. BUTTNER. U. S. 1,691,755, Nov. 13. The rubber surface is first subjected to the combined action of an ammoniacal AgNO_3 soln. and an aq. soln. contg. sugar, alc. and a small proportion of HNO_3 , and is then subjected to the combined action of a AgNO_3 soln. and gallic acid.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

An elementary laboratory method for the determination of the density of glass. A. R. PAYNE. *Glass Ind.* 9, 191-4(1928); cf. *C. A.* 22, 4215.—Samples of about 3 g. each are freed from projections and sharp edges, weighed in air and then in H_2O as usual. Temp. corrections must be made for the buoyancy of the H_2O and for the cu. expansion of the glass, which for the ordinary SiO_2 - Na_2O - CaO bottle glass is about 0.00003. Correction tables for the usual temp. ranges are given. H. F. K.

Microstructure of glass. N. N. SMIRNOV. *Trans. State Expt. Inst. Silicates* (Moscow) 1926, No. 23, 5-29.—The conditions responsible for the appearance of various cryst. products in glass as indicated by a number of mineralogical and chem. analysis are: CaSiO_3 in the form of needles of the monoclinic system of wollastonite crystallizes at 1000° and in the form of hexagonal plates at very high temps. Both of these forms are characteristic for glass of a high Ca content. Apparently Ca silicate forms supersatd. solns. in sodium silicate; at a high content of Mg and Fe in glass other pyroxenes of the augite series crystallize. SiO_2 crystallizes from glass as tridymite and cristobalite. It is possible that the concn. of Ca salts takes place in connection with the accumulation of the more heavy part of the glass in certain places of the bath. A miniature magmatic differentiation takes place and the heavier silicates of calcium crystallize. The observations of Smirnov show that these silicates belong not only to wollastonite, but apparently to the other compds. of the type $3\text{CaO} \cdot 2\text{SiO}_2$ and $2\text{CaO} \cdot \text{SiO}_2$. J. S. JOFFE

Effect of heat treatment on the physical properties of glass. A. Q. TOOL AND D. B. LLOYD. *Bur. Standards. Fuels and Furnaces* 6, 353-6, 364(1928).—Heat treatment of glass not only removes the strains introduced by rapid cooling, but also changes such physical properties as density, refractivity and thermal expansivity. Elec. cond., color, transmission, etc., are also affected by the degrees to which physicochem. reactions are advanced by heat treatment. Changes in the density of thermometric glass resulting from different heat treatments account for the major part of the error in the ice-point. If a thermometer is held for a considerable time at temps. below its previous effective treating temp. its ice-point will rise, while if held above this temp. the ice-point will fall. Slight variations in the ice-point observed after small temp. changes may be due to suppression of physicochem. processes affecting the density. Variations in refractivity lie between 2 and 5 in the fifth decimal place for each degree change in the effective annealing temp. Differences of one in the third decimal place may be obtained by varying the heat treatment of pieces of glass secured from the same melt. The end condition of the physical properties of a glass is detd. by the temp. of the heat treatment, independently in most cases of the previous history of the glass. During heat treatment the rate of approaching physicochem. equil. doubles for temp. increments lying between 5° and 15° . A knowledge of the behavior of glass following heat treatment is of especial value in manufg. optical app. J. W. SHIPLEY

The petrographic microscope as an instrument for the glass technologist. HERBERT INLEY. *Bur. of Standards. J. Am. Ceram. Soc.* 11, 812-28(1928).—It is of value in identifying crystalline defects in glass and impurities in raw materials. C. H. K.

Value of the thermal expansion factor of aluminum oxide in glass. I. KITAIGORODSKY AND S. RODIN. *J. Soc. Glass Tech.* 12, 164-9(1928).—Measurements of the thermal expansion of glasses contg. 9-14% Al_2O_3 showed the value of the coeff. for Al_2O_3 to be about 0.52×10^{-7} as found by English and Turner rather than 5.0×10^{-7} as given by Winkelmann and Schott. H. F. K.

Study of the glasses boric oxide-silica. ARNOLD COUSEN AND W. E. S. TURNER. *J. Soc. Glass Tech.* 12, 169-90(1928).—Mixts. of pure powd. quartz and purified B_2O_3 were melted, cooled, powd. and remelted until clear homogeneous glasses were obtained which contained 0-61.45% SiO_2 and their properties detd. Small clear beads contg. up to 80% SiO_2 were made, showing the probability of complete miscibility of these oxides in all proportions. The thermal expansion of B_2O_3 itself and the B_2O_3 - SiO_2 glasses shows no change points and remains const. in the range between the ordinary temp. and the lower critical temp. The straight portion of the curve in the critical range shows progressive shortening with increasing SiO_2 % while the actual critical temp. range is continuously increased. The thermal expansion coeff. decreases with increasing SiO_2 content. When plotted against compn. the coeff. graph is a smooth curve without max. or min. between the values for B_2O_3 and for SiO_2 glasses. The formation of compds. such as $B_2O_3 \cdot SiO_2$ or $3B_2O_3 \cdot 2SiO_2$ is not indicated. The density of pure, fused, well-annealed B_2O_3 is 1.8442. This is higher than the best previous values because of the later better annealing and H_2O removal. The density of B_2O_3 - SiO_2 glasses increases proportionally with the SiO_2 content. Apparently these oxides form only simple solns. when fused together. H. F. K.

Some physical properties of glass tank block refractories. A. ERNEST MACGEE. *J. Am. Ceram. Soc.* 11, 858-67(1928).—Properties depend largely upon compn. Crushing strength was 7000-12,000 lbs. sq. in.; porosity 20%; apparent sp. gr. 2.6; Young's modulus $7.5-10.0 \times 10^5$ lbs. sq. in.; transverse strength 1440-2080 lbs. sq. in.; impact strength $2.4-3.2 \times 10^6$ g. cm. per sec. expressed as momentum; coeff. of linear expansion $5-9 \times 10^{-6}$ over the interval 30-850°. High- SiO_2 tank blocks have very high coeff. of expansion, especially at about 250°, due probably to cristobalite conversion. Bodies, strong enough at first, may fail in consequence of "thermal" fatigue. Bodies resistant to spalling show low and uniform rate of expansion, high tensile and transverse strength, low Young's modulus, high thermal diffusivity and resistance to thermal fatigue. C. H. KERR

Notes on Kallauner and Seger methods of rational analysis. WILBUR F. FISCHER. Iowa State College. *J. Am. Ceram. Soc.* 11, 842-4(1928). A comparison is made of the Seger, Kallauner and calcd. rational analysis, on a Florida kaolin and a Temball clay. There seems to be no definite effect of the increased concn. of the digesting acid in the Kallauner method. The Kallauner results agree more closely than the Seger results with the calcd. compn. As a plant control method the Kallauner is preferred, largely because of the time saved. C. H. KERR

X-ray investigation of the effect of heat on china clays. T. N. MCVAY AND C. L. THOMPSON. Univ. of Illinois. *J. Am. Ceram. Soc.* 11, 829-41(1928).—X-ray diffraction patterns were obtained from an English china clay and a Georgia sedimentary kaolin, both raw and fired to various temps. The chief cryst. constituent of the raw clays was found to be kaolinite. Upon dehydration the kaolinite lattice was destroyed and the clays gave no diffraction pattern. Mullite was formed in both clays at 950° and the amt. increased with increase in firing temp. In addn. to the mullite, free Al_2O_3 was present in the Georgia clay from 950° to 1100° and cristobalite at temps. above 1200°. C. H. KERR

Florida clay in bone china bodies. C. E. JACKSON. *Trans. Ceram. Soc. (Eng.)* 27, 151-2(1928).—An English formula for bone china calls for 50% calcined bone, 20% Cornwall stone, and 30% English china clay. The china clay was replaced in 3% increments with the more plastic Florida china clay. The ware fired to cone 11 showed that the latter clay was satisfactory for this purpose. The more refractory Florida clay caused the ware to have a little less translucency and more absorption. The best ware contained a mixt. of 9-12% English and 21-18% Florida clays. H. F. K.

An investigation of the hydrometer method for determining colloid content. PAUL J. SLEGEL. Iowa State College. *J. Am. Ceram. Soc.* 11, 851-3(1928).—Two clays, bentonite and Florida kaolin, were used in the study of the George Bouyoucos hydrometer method for detg. the colloid content in a clay suspension. This hydrometer method was not found to be an accurate measure of % colloid. It checked the heat of wetting, which also is unsatisfactory. C. H. KERR

Variations in pyrometric cone equivalent of silica cements and fire clays. SANFORD S. COLE. Mellon Inst. *J. Am. Ceram. Soc.* 11, 854-7(1928).—Samples of 100 SiO_2 cements and 5 fire clays were tested, in cone form, for deformation point, in 3 ways: (1) as received, (2) ground to 65-mesh, and (3) after calcining at 1400° and grinding to 65-mesh. Tests (1) gave closer checks than tests (2) or (3). Grinding lowered the deformation point $1\frac{1}{2}$ to 2 cones. Calcining and grinding lowered it nearly 2 cones. C. H. KERR

Brick clays in the region of Moscow. N. N. SMIRNOV. *Trans. State Exptl. Inst. Silicates* (Moscow) 1926, No. 19, 5-22.—Smirnov gives a survey of the available raw materials for the manuf. of bricks in the region. J. S. JOFFE

Microstructure of silicate bricks. N. N. SMIRNOV. *Trans. State Exptl. Inst. Silicates* (Moscow) 1926, No. 20, 5-18.—Microscopic observations and chemical analyses show the presence of cryst. Ca hydrosilicate in silicate bricks. The cryst. form of the cementing substance obtained is the cause of the strength of the brick. For this reason all the operations in the manuf. of silicate bricks should be directed toward a max. formation of this cryst. cementing substances. The following might be done to attain this end: (1) The lime should be ground as fine as possible. The fineness of the material serves as centers of crystn. (2) The lime should be completely slaked. The sand and lime should be admitted into the drum simultaneously and in equal proportions. (3) Max. pressure is desirable for the close contact of the lime with the sand. (4) The steaming should be continued as long as possible in order to obtain a large, granular crystalline mass and a max. amount of soluble SiO_2 . The microscopic observations are illustrated. J. S. JOFFE

Temperature—Property characteristics of refractories. J. F. HYSLOP. *World Power* 10, 253(1928).—A review. C. G. F.

Refractory failures. HUGH E. WEIGHTMAN. *Power* 68, 624-7(1928).—Failures often may be attributed to (1) improper furnace design, (2) overloading of the refractory or (3) mechanical stresses set up in operation. Ten photographs illustrate failures due to such causes. D. B. DILL

Some effects of coal ash on refractories. T. N. MCVAY AND R. K. HURSH. Univ. of Illinois. *J. Am. Ceram. Soc.* 11, 868-73(1928).—Coal ash slagging of various refractories was studied by means of the petrographic microscope. No feldspar was noted in the slags. Diaspore brick were more deeply penetrated by the slag, because of their porosity. Varying the temp (1500-1600°) or the length of time of slagging action did not change the reactions or cause any new compds. to be formed. Compds. present, magnetite, mullite, etc., were the same as those found in refractories subjected to the same temps. in the boiler furnace. C. H. KERR

Determination of iron oxide and titania in clay refractories. W. RAYMOND KERR AND EDGAR B. READ. Mellon Inst. *J. Am. Ceram. Soc.* 11, 845-50(1928).—The usual detn. of Fe_2O_3 and TiO_2 from ignited R_2O_3 ppt. requires considerable time. Direct titration of fusions with Na_2CO_3 is impossible because of gelatinous SiO_2 . Direct titration of fusions with KHSO_4 is accurate with clays low in SiO_2 and unfired clays. By treating with HF and H_2SO_4 and dissolving with dil. HCl and pptg. the R_2O_3 by NH_4OH and then fusing with KHSO_4 , the Fe_2O_3 and TiO_2 can be titrated accurately. Details are given. C. H. KERR

Increase in refractoriness in ceramic bodies in interrupted heat treatment. H. B. HENDERSON AND J. H. CALDWELL. *J. Am. Ceram. Soc.* 11, 795-802(1928).—The study was undertaken to overcome the tendency of pyrometric cones to set (or freeze) in prolonged heat treatment, when the temp. is fluctuating. Conclusions are: (1) Fired natural bodies, as a rule, and many synthetic bodies are more refractory than the raw bodies. (2) The probable cause is the development and segregation of aluminous silicates such as mullite. (3) This development seems to be from kaolinite and not from feldspar, porphyry, etc. (4) Feldspar and possibly other aluminous minerals such as porphyry dissolve mullite, etc., and thus prevent freezing. (5) Freezing appears to be a function of the ratio of feldspathic material to the other aluminous minerals in the mixt. and not to the constitution of any one mineral. C. H. KERR

The production of magnesia and silica crucibles in the induction furnace. C. N. SCHUERTE. *Bur. Mines, Repts. of Investigations* No. 2896, 6 pp.(1928).—Magnesia crucibles are made in graphite molds, using 60-mesh periclase, a fused elec. furnace product contg. 95.1% MgO . Silica crucibles are made of 20-30 mesh crushed silica from old crucibles and of 20-30 mesh Ottawa standard sand. W. H. BOYNTON

High ratings—no erosion in boiler-furnace tests at carborundum plant. ANON. *Power* 68, 839-41(1928).—A furnace burning pulverized coal and lined with *carbofrax*, SiC refractory, stood up without erosion with a boiler rating of 500% and combustion rates as high as 50,000 B. t. u. per cu. ft. D. B. DILL

The insulator molding room and the molding of porcelain insulators. C. DORNEDINGER. *Sprechsaal* 61, 523-5, 541-4, 559-61 579-81, 597-9, 617-20(1928). R. A. H.

A test for the adhesiveness of vitreous enamels to metal. W. N. HARRISON AND G. T. THALER. *Bur. of Standards. J. Am. Ceram. Soc.* 11, 803-11(1928).—Test specimens are prepd. by clamping together 2 strips of enameled metal while they are still in the furnace and allowing them to cool slowly in another furnace from a temp.

of 500°. The test consists of detg. the force necessary to pull the pieces apart when treated as a continuous strip of metal under tensile stress. An estimate is also made of the % of contact area on each specimen within which failure occurred in the bond. A Co enamel gave a stronger bond than one without Co. The test is sufficiently reproducible to permit positive distinction where the difference is commercially considerable. C. H. KERR

The application of the cone softening point method for the determination of the relative fluidity of enamel frits. F. DEURVORST. *Tech. Hochschule, Karlsruhe Sprechsaal* 61, 561-4(1928).—A series of 12 normal enamels for sheet iron are itemized, of which the melting periods are given, using 1250° for an approx. const. working purification temp. The time of deformation of the series of 12 cones of frits with an approx. const. rate of heating is also included, which gives both the temp. at which deformation started and complete fusion of the cone. The calcd. time for reaching fusion is compared with observed time. These values are also compared with calcd. values using the so-called "refractory factors" obtained by Staley (cf. *C. A.* 20, 2901-2). R. A. HEINDL

Terra cotta in modern building (GILARDONI) 20. Iron content of special red lead (SPRINGER) 18. Removing gas from molten substances (U. S. pat. 1,691,458) 13.

Artificial glass. KUNSTHARZFABRIK F. POLLAK G.M.B.H. Fr. 637,318, May 1, 1927. A compressible powder is made by pptg. from dil. solns., either by an electrolyte or by an albumin pptg. agent, an amorphous, flocculent deposit of the condensate products of carbonic acid amides or their derivs. with formaldehyde. The powder is washed, dried and heated to 120-130° under high pressure to obtain homogeneous, transparent or translucent materials resembling glass.

Sheets of glass. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE SAINT-GOBAIN, CHAUNY-ET CIREY. Fr. 637,622, Nov. 15, 1926. In the manuf. of glass in sheets by flowing and rolling the gathering zone of the furnace is kept at a temp. above the critical point of devitrification, and the temp. of the flow of glass from the furnace is rapidly cooled to a convenient degree for rolling.

Plate glass manufacture. NAAMLooZE VENNOOTSCHAP MIJ. TOT BEHEER EN EXPLOIT. VAN OCTROOIEN. Brit. 287,111, March 15, 1927. Mech. features.

Light-diffusing glass. PATENT-TREUHAND-GES. FÜR ELEKTRISCHE GLÜHLAMPEN (to General Electric Co., Ltd.). Brit. 287,545, March 24, 1927. Clear glass is pulverized and then fused together to form a viscous mass which is blown to the desired state and forms a turbid or opalescent product. Coloring or opacifying agents may be added.

Revolving tank for molten glass. MEYER M. EPPSTEIN (to Owens Bottle Co.). U. S. 1,690,777, Nov. 6. A compartment is provided from which charges are gathered and a compartment surrounding this serves to receive portions of glass severed from the charges gathered in the inner compartment. The app. is arranged for reheating and transfer of the chilled portions from the outer to the inner compartment.

Apparatus for supplying molten glass to molds. LEONARD D. SOUBIER (to Owens Bottle Co.). U. S. 1,690,998, Nov. 6.

Apparatus for making blown glass bottles. H. HILLMANN. Brit. 287,067, Mar. 10, 1927.

Apparatus for melting off waste portion of blown glass bulbs, etc. NAAMLooZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 287,131, March 16, 1927.

Bricks from clay. G. H. HADFIELD. Brit. 286,772, Dec. 7, 1926. Clay is mixed with clinker, from boiler ash, house refuse, destructor ash or the like which has been substantially freed from carbonaceous materials.

Ornamenting and cold-glazing tiles, etc. M. POLLAK-STEGE. Brit. 286,566, May 9, 1927. In a continuous process, the roughened surface of a tile or the like is treated with a slimy mass in approx. the design to be produced and the material is then distributed on the surface by vibration to form a marbled design or other pattern and the surface is then pressed or cross-rolled and planed or scraped. Hygroscopic material may be thinly applied to absorb moisture during the rolling. The scrapings may be used for surfacing other tiles of different character.

Fuel-charging apparatus for brick kilns, etc. K. RUETZ. Brit. 286,626, March 6, 1927.

Material for furnace linings, etc. P. E. J. J. COURTURAUD (to Laboratoire de perfectionnements thermiques). Brit. 287,556, March 24, 1927. Walls or other parts

of furnaces exposed to the injurious action of slag, clinker or the like are protected by a coating having a graphite base preferably mixed with Na silicate or other sol. silicate.

Refractory materials. A. WAGEMANN. Brit. 286,677, March 8, 1927. The strength of refractory materials such as those of clay-bound quartz, sand, chamotte and similar siliceous materials is increased by adding 10% or less of artificial silicates contg. Al_2O_3 such as slag, in a very fine or colloidal state.

Heating refractory and other materials. MARCEL FOURMENT. Fr. 638,843, Dec. 21, 1926. An app. for heating refractory, insulating and abrasive materials by induction currents at high frequency is described.

Ceramics. KUNSTSTEIN-INDUSTRIE W. HENKER & Co. G.M.B.H. Ger. 466,254, Jan. 16, 1927. Light colored objects are made by pouring S mixed with gypsum or powd. marble into molds. A thin layer of the mixt. is poured in and a thicker layer of a different colored non-cracking mixt. added.

Ceramic articles. DONALD W. ROSS and JAMES M. LAMBIE. U. S. 1,690,208, Nov. 6. Grog grains of assorted sizes, deflocculatable clay to bond the grog, a deflocculating agent and water are mixed together as a paste *in vacuo* and molded to form tank blocks for use with molten glass or other articles. An app. is described.

Casting pottery. JOHN D. WIGGIN and MATHIAS M. REMMES (to H. B. Wiggin's Sons Co.) U. S. 1,690,708, Nov. 6. Articles which are afterward removed from the mold and fired are cast in a mold, using a slip contg. a sol. carbonate and a mold material comprising plaster of Paris and a substance such as $BaCl_2$, $CaCl_2$ or $MgSO_4$ which prevents reaction between the carbonate of the slip and the $CaSO_4$ of the mold.

Kiln or oven for firing pottery, etc. F. BENNION, H. J. PLANT and J. B. CLARKE. Brit. 287,693, Nov. 22, 1927.

Continuous furnace for baking porcelain. NGUYEN-BA-CHINH. Fr. 32,908, Dec. 21, 1926. Addn. to 595,009. The furnaces have 8 or 10 rectangular compartments joined to one another with a partition of refractory material between.

Fused silica. QUARTZ ET SILICE. Brit. 287,522, March 23, 1927. In making transparent fused silica from quartzites as described in Brit. 190,477 (C. A. 17, 2942), as large blocks as possible of the quartzite are melted without deformation by packing the blocks into an elec. resistance furnace with a filling of pure sand. After fusion, the cooled ingot is cut up and the flawless portions are sepd. and used for optical purposes. Other portions may be further treated.

Fused silica. QUARTZ ET SILICA. Fr. 639,016, Jan. 6, 1927. See Brit. 283,148 (C. A. 22, 3969).

Silica and other gels. E. B. MILLER (to Silica Gel Corp.). Brit. 287,066, March 12, 1927. Hard, tough, low-density gels of silica, tungstic acid, alumina, Ti oxide or their mixts. are prepd. by submitting the hydrogel to a heat treatment before drying. The hydrogel may be slowly heated to 80-160° under conditions which prevent dehydration, and slowly cooled. Heated gas or vapor satd. with H_2O may be used in the treatment. Cf. C. A. 22, 2644.

Abrasive wheels with side plates bonded to the abrasive after firing by use of vulcanized rubber. J. R. GAMMETER. Brit. 286,683, March 9, 1927. The thickness of the layer of rubber used is "comparable" with the grain size of the wheel.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

New England's only cement mill. C. H. SONNTAG. *Chem. Met. Eng.* 35, 623-6 (1928).—A description of the Thomaston, Maine, plant of the Lawrence Portland Cement Company.

RAYMOND WILSON

Volume stability of cement. A. DAHLGREN. *Rev. matériaux construction trav. publies* 1928, 331-2.—A discussion of the role of CaO in causing unsoundness in cement.

F. O. A.

The shrinkage of cements. J. COCAGNE and MME. Y. MATRAS. *Rev. matériaux construction trav. publies* 1928, 321-30; cf. C. A. 22, 4219.—Specimens were stored at const. temp. and practically const. humidity for one year, after which very little change occurred. The shrinkage varied with the cement, with the amount of mixing water, with the amt. and nature of the aggregate and with the amt. of admixtures. Angular aggregates are preferred. $CaCl_2$, Na_2CO_3 and water glass increased the shrink-

The concrete should be applied as dry as possible and after it has set it should be kept wet for a while.

F. O. A.

A new method of burning cement in a shaft kiln of high yield; the system of Andrees. KARL BIEHL. *Rev. materiaux construction trav. publics* 1928, 339-41; cf. *C. A.* 22, 3029. F. O. A.

Graphical mixing of raw cement mixtures. RICHARD GRUEN AND GUENTHER KUNZE. *Pit and Quarry* 16, No. 13, 64-70(1928); cf. *C. A.* 22, 4754. R. W.

Gypsum and anhydrite in the manufacture of portland cement. RICHARD K. MEADE. *Rock Products* 31, No. 24, 55-8, No. 25, 40-5(1928).—Gypsum and anhydrite-gypsum mixts. are equally effective as retarders and have the same effect on the strength of cement if compared on the basis of their SO_3 contents. Anhydrite alone also retards the set, if finely ground (cf. *C. A.* 22, 1836). RAYMOND WILSON

The effect of retarders on portland cement clinkers. ERNEST E. BERGER. Bur. of Mines. *Rock Products* 31, No. 25, 50-1(1928).—Anhydrite alone is less effective as a retarder for portland cement, per unit of SO_3 , than gypsum or plaster of Paris. In mixts. with gypsum or plaster it is as effective as any other form of CaSO_4 . RAYMOND WILSON

The manufacture of supercement. N. C. KYBIAOU. *Rev. materiaux construction trav. publics* 1928, 341-5.—A cement of the compn.: 20.5 0.7% SiO_2 , 3.0-0.6% Al_2O_3 , 8.0-0.5% Fe_2O_3 and 66-7% CaO has given two-day strengths greater than 380 and 36 kg./sq. cm. The logical way to build waste-heat boilers is along an extension of the axis of the rotary kiln, allowing the attainment of much higher steam pressures. F. O. A.

Aluminous cement. TRAVERS. Inst. chim., Nancy. *Ciment* 33, 363-5, 406-10(1928).—A general discussion. F. O. A.

Aluminous cement. J. KONARZEWSKI. *Przemysl Chem.* 11, 309-12(1927).—This is a review of the properties of aluminous cement. Its manuf. in Poland would be at a disadvantage because of the high cost and unavailability of domestic bauxite. A. C. ZACHLIN

Unsoundness and its control. P. FERON. *Rev. travaux construction trav. publics* 1928, 361-4.—A general discussion. Cements contg. 3 to 5% MgO showed no vol. change on boiling 3 hours but after a second 3 hrs. expansion of several mm. was noted which had reached as much as 160 mm. after 18 hrs.' boiling. F. O. A.

Design of pavement by the water-cement ratio. F. H. JACKSON. U. S. Bur. Public Roads. *Roads and Streets* 68, 479-82(1928). L. B. MILLER

Modulus of elasticity of cores from concrete roads. A. N. JOHNSON. Univ. of Md. *Public Roads* 8, 164-8(1928).—J. discusses the accuracy of various types of extensometers used for elasticity measurement of concrete cores under compression. The results on various rock cores and concrete cores are given. L. B. MILLER

Terra cotta in modern building. HENRI GILARDONI. *Ciment* 33, 342-9(1928). F. O. A.

Methods of making structures impermeable, especially by means of waterproofers. LOUIS VIENNOT. *Ciment* 33, 355-9, 389-94(1928).—In spite of a few really good waterproofers most are apt to give variable results and should be used with caution. If a cement could be developed free from shrinkage, the problem of waterproofing would be eliminated. F. O. A.

Industrial results of the experimental works for silicate materials. N. N. SMIRNOV, A. S. GRYAZNOV AND N. K. LAKHTIN. *Trans. State Exptl. Inst. Silicates* (Moscow) 1927, No. 24, 5-39.—The authors give a description of the geology, mineralogy and chem. compn. of the lime deposits and other raw building materials at Podolsk, the methods of working over these materials for the building industry, such as plaster, cement and binding sand. J. S. JOFFE

Constitution and properties of plaster of Paris. ALEXANDER PELLAT. *Rev. materiaux construction trav. publics* 1928, 335 7.—When the resistance of gypsum products to atm. conditions and to fire have been established by sufficiently profound research; when the manuf. of the plaster is carried out with sufficient technical control; and when adequate care is used in its application, then this material will occupy the chief place in modern construction. F. O. A.

The diffusion of water-soluble preservatives in wood. ROBERT NOWOTNY. *Z. angew. Chem.* 41, 46-9(1928); cf. *C. A.* 21, 4043.—In the Cobra process a paste of NaF and dinitrophenol is injected into wood by means of hollow needles (cf. *C. A.* 20, 3069). The diffusion of these salts, 1 yr. after introduction into the wood by needle injection, was studied in spruce and pine telegraph poles. Cross sections of the poles at intervals of a few cm. were made and the diffusion patterns measured to obtain longitudinal, radial and lateral penetration. The longitudinal diffusion is by far the greatest (20 to 40 cm.), sidewise spreading along the annular rings much less (1 to 2

cm.) and radial diffusion very slight. The rate of diffusion is greatly influenced by the moisture content of the wood. The diffusion therefore is considerably greater underground than above the ground line in poles. Pine shows more diffusion than spruce. The NaF is more diffusible than the dinitrophenol. From such data puncture distribution patterns can be developed. While the incisions may be a considerable distance apart longitudinally, they must be close together laterally and should be staggered in alternate rows in order to obtain a penetration ring of uniform depth. The depth of penetration will be practically equal to the length of the needle, 3 to 4 cm. in practice.

ALFRED L. KAMMERER

Testing cements [for oil wells] (ALEKSANDROV) 22. Oxidized petroleum wax products [for use in proofing brick, stone or concrete] (Brit. pat. 287,514) 22. Cement. OTTO LELLEP. Ger. 466,298, Apr. 3, 1927. The crude powder, heated by waste furnace gases, is roasted with clinker in a rotating oven.

Rotary cement kiln and cooler construction. O. BOUZIN. Brit. 288,114, Dec. 8, 1927.

Treating concrete surfaces. NATHAN C. JOHNSON. U. S. 1,691,721, Nov. 13. Flexible sheet material such as paper or cloth has one side covered with selected concrete aggregate such as colored pebbles secured to the sheet by an adhesive which includes a substance such as $AlCl_3$, $MgCl_2$ and Mg saccharate which inhibits normal setting of the concrete to a limited depth when applied to the surface. This material is secured to the inside of the forms in which concrete is cast.

Supplying water to concrete during setting. MARVIN S. WEAVER. U. S. 1,690,467, Nov. 6. A perforated water-supply pipe is placed in the interior of a mass of concrete next placed for setting and water is supplied through the pipe under pressure in excess of the gravity pressure due to the head of the water.

Asphalt concrete. NAAMLOOZE VENNOOTSCHAP KONINKLIJKE STEARINE KAARSEN-FABRIEK GOUDA. Brit. 286,552, Aug. 2, 1927. A bituminous emulsion (which may be formed of asphalt, resin, NaOH and water) to which protein material may be added is mixed with coarse stone separately and fine stone or the like is then added with or without previous admixt. with emulsion.

Asphalt. HERMANN PLAUSON. Ger. 466,567, Nov. 18, 1925. An artificial asphalt for roads is made by subjecting factice contg. oil either alone or in combination with tar, pitch, etc., to a partial sulfonation. Filling materials may be added and the mass is ground if necessary and emulsified.

Asphalt paving. WEST PROCESS PAVEMENT CO. Brit. 287,799, Oct. 5, 1927. A paving compn. which will not set into a coherent mass during storage or transit but requires to be heated and blended before laying is prepd. by heating a mixt. of mineral aggregate and a powd. hard asphalt to a temp. below that at which the hard asphalt can blend with a soft or semi-liquid asphalt or asphaltic flux (the latter being separately heated and then blended with the other materials). An example with proportions is given.

Paving composition. F. MORTON. Brit. 286,949, July 5, 1927. Coal-tar pitch or like material with a "twisting point" between 40° and 65° 5-20% is used with granite chippings, slag or the like in sizes of 0.25-0.75 in.

Porous artificial stone or other porous solid materials. BERNARD GRANVILLE. U. S. 1,691,280, Nov. 13. Cement mixts. or other wet gas-contg. material which has the property of setting and hardening is subjected to a sub-atm. pressure to maintain the material in expanded condition during setting. An app. is described.

Apparatus for preparing bitumen emulsions for use on roads, etc. H. E. WARSOP. Brit. 287,257, Jan. 1, 1927.

Cast sulfur masses of marble-like appearance. KUNSTSTEIN-INDUSTRIE W. HENKER & CO. G. M. B. H. Ger. 466,922, Feb. 16, 1927. The mass before casting is sprinkled with readily fusible dyes, or with a finely ground mixt. of dyes and S. The drops of dye run together during the casting to produce a grained product.

Plastic product from Jerusalem artichoke. EDWIN K. O'BRIEN. U. S. 1,690,648,

Nov. 6. Parts of the Jerusalem artichoke plant such as the stems or stalks are mixed with other substances such as lime and preservatives which render the product resistant to deteriorating effects of ordinary heat and moisture. The product is suitable for use in *building construction*.

Moisture-indicating instrument for testing wood or like materials. MATTHEW E. DUNLAP (to the Government and People of the United States). U. S. 1,690,672, Nov. 6.

Floor construction. W. MICHAELIS. Brit. 288,093, Sept. 21, 1927. A concrete or brickwork base carries slabs or plates of porous burnt clay, ashes, cork or peat, with straw or peat in intermediate spaces and cement ribs between the slabs.

Sectional wood piling. EUGENE F. CONSIDINE. U. S. 1,691,704, Nov. 13. A sectional wood pile comprises an upper section which has been treated with a preservative and a lower section adapted to be completely below water level and which is not treated with preservative.

Drying, dyeing or fireproofing wood. C. GOODALL. Brit. 286,833, May 18, 1927. Mech. features of supplying treating fluids to a balk of timber supported in a cylinder.

Fireproofing and preserving wood, etc. F. S. VIVAS (to International Fireproof Products Corp.). Brit. 286,725, March 11, 1927. Wood or other material is fireproofed and preserved from decay by treatment successively with solns. of chlorides and H_3BO_3 (such as a soln. formed of $CaCl_2$, NH_4Cl , H_3BO_3 and water) and of metallic sulfates such as sulfates of Zn and Al, to ppt. insol. sulfates in the material. $NaOH$ may be used to saponify the resins of wood treated which may be recovered as a by-product.

Composition for preserving wood. CHARLES WILLIAMS and FERDINAND FRANÇOIS (one-third to Eddy Bozonier). U. S. 1,690,390, Nov. 6. A mixt. suitable for use on submerged wooden structures is formed from paraffin oil 2, naphthalene 2, benzene 3, light creosote 2.5, oil of tar 5, heavy creosote 2.5 gals., cement 5 lbs., hydrated lime 5 lbs., S 5 lbs. and Paris green 20 oz.

Preserving wood, etc. G. GUNN. Brit. 286,892, March 25, 1927. Wood or other material to be preserved, after treatment with an aq. soln. of a dichromate and a sol. Cu salt acidified with $HOAc$ as described in Brit. 273,007 (C. A. 22, 1838) and after running off the treating soln., is subjected to the direct action of steam (suitably satd. steam at atm. pressure) to form a deposit in the wood of basic Cu chromate.

A. C. FIELDNER

Pulverized fuel at the Calumet Power Station, Chicago. F. H. ROSENCRANTZ. *Engineering* 126, 389-91, 398(1928).—An installation of 2 boilers erected in 1926 to burn powd. coal contg. $14\frac{1}{2}\%$ moisture and 18% ash is described. These furnaces were first of the bin-and-feeder type, but they are now being changed to the unit or direct-fired system. The efficiency of these boilers is $86\frac{1}{2}\%$ as contrasted with 78% for the stoker-fired boilers, partly due to the fact that only 20% excess air is required as against 40% for the former installation. The final temp. of the products of combustion is $250^\circ F$. The boiler can be started from the cold in 30 min. as against 1-1 $\frac{1}{2}$ hrs. for the stoker-fired boiler. The boiler is designed to supply 200,000 lb. of steam per hr. at 375 lb. per sq. in. at $700^\circ F$.

W. O. E.

The relation between carbon dioxide and excess air. A. A. POTTER AND H. L. SOLBERG. Purdue Univ. *Power* 68, 837-9(1928).—The max. $\% CO_2$ in products of combustion can be calcd. by the formula, $(CO_2)_{max.} = \frac{8.81}{0.421 + ((H - O/8)/(C + 0.375))}$

the symbols H, O and C representing $\%$ by wt. in the fuel. Since $(CO_2)_{max.}$ can be detd. when the analysis of the fuel is known, the actual $\% CO_2$ in the products of combustion can be used as a measure of the $\%$ excess air supplied for combustion, provided combustion is complete.
D. B. DILL

Recovery of waste heat from internal-combustion engines. CONSTANTIN REDZICH. *Gas u. Wasserfach* 71, 1071-2(1928).—Heat may be recovered from the cooling water used in the jacket of internal combustion engines or the waste gases may be circulated through waste heat (fire tube) boilers. In this way 1 kg. of steam at 2 atm. pressure can be secured per kw. hr. and this will develop 10% additional power in a steam turbine. Care should be taken to avoid cooling the gases to the condensing point as excessive corrosion results. The power developed can be increased from 22% of the theory to 32% or if the steam is used in chemical processes the utilization of heat totals about 70% of the theory.

R. W. RYAN

Experiences and results with the continuous vertical retort plant at Salzburg. HANS DERINGER. *Städt. Gas- u. Wasserwerke, Salzburg. Monatsbull. Schweiz. Ver. Gas u. Wasserfach* 8, 219-24, 247-50, 274-9(1928).—The equipment and operation of a Koppers plant and its performance, during the two years of its existence, are described and discussed. The high gas-thermal yield peculiar to this system is attributed to protection, against pyrogenic decompn., of the rich distn. gases through prompt diln. and removal by the water gas simultaneously produced. Other special features are the ready adaptation to variation of output; the long life of the furnaces, due to reduction of mechanical requirements by the continuous movement of the charge and to the absence of very large temp. variations in the walls; the comparatively little underfiring; the possibility of increasing the yield of coke, available for sale, by about 20% by heating the retorts with their own gas; and the small power consumption. In selecting the coal, a low gas yield of high calorific value is considered preferable to the reverse.

F. S. GRANGER

Desirable fusion temperatures of coal ash and influence of sulfur. A. BEMENT. *Power* 68, 683-4(1928).—There appears to be only a slight increase in fusion temp. of ash as the S content of coal decreases. Since an efficient furnace temp. softens the ash of any coal the emphasis should be placed on the proper disposal of a fused ash rather than on avoiding fusion.

D. B. DILL

Pneumatic coal transport at the Gablonz municipal gas works. WILLY GAESSLER. *Gas u. Wasserfach* 71, 1073-5(1928).

R. W. RYAN

The fractionation of coal with solvents, and the influence of the soluble portion upon the agglutinating power of coal. HUGO NOVAK AND J. HUBAČEK. *Paliva a Topeni* 10, 9, 22-8, 28-33, 41-51(1928).—Two brown, one bituminous, and one sub-bituminous, coal from Bohemia were extd. with tetrahydronaphthalene at 18 atm. and elevated temp. Brown coals yielded 26 and 24% sol. material. The bituminous coals were further extd. with pyridine, yielding a total of 44 and 39% bituminous substances, which are considered as the portions which have the property of becoming liquid, plastic, or semisolid at elevated temp. Further extn. was carried out in petroleum ether, EtOH and C_6H_6 . The fraction extd. by petroleum ether consisted of hydrocarbons in large amts. of resinous matter. This fraction and the EtOH fraction have an av. temp. of 100°; these exts. reveal properties of fossil resins and constitute the chief sol. fraction of brown coal. Bituminous coal extracts consist chiefly of 3 fractions: (1) sol. in C_6H_6 , m. 180°, (2) insol. in C_6H_6 , m. 300°, (3) sol. in pyridine. Tables of coal comps. and ultimate analyses are given. The coking mechanism, significance of caking curves, and improper testing methods are discussed. The influence of the diff. coal constituents must be considered as well as the grinding, blending and heating of coal. Brown coal lacks caking ability; it is high in extractable matter. All substances in brown coal which can be melted show binding power when heated with inert matter. Therefore the amt. of fixed C left behind by the extd. fractions after carbonization (cementing residuum) is the first factor detg. the coking power of coal. Bituminous coals yielded 20% of cementing residuum constituting $\frac{1}{3}$ of the total coke formed, brown coals yielded 5% cementing residuum. A fraction from a coking bituminous coal (sol. in tetrahydronaphthalene, insol. in benzene) yielded 60% cementing residuum; this is considered the real binding matter in coal. Thermal stability (the range of temp. during which the binding materials remain molten) is also necessary. Both bituminous coals contained the same amt. of cementing residuum; one (a coking variety) had a thermal stability of 120°; the non-coking variety 30°. The hydrocarbons and resinous fractions act favorably or adversely upon the agglutinating power of coke formation depending upon the thermal stability. The binding power is impaired by the destructive distillation of the resinous fraction. An English translation accompanies the article.

FRANK MARESH

The determination of the specific heat of brown coal. G. BURCKHARDT AND A.

FRITZSCHE. *Braunkohlenarch.* 1927, No. 17, 20-33; *Chem. Zentr.* 1927, II, 1641.—B. and F. worked out a method in which a bomb calorimeter having certain modifications was employed. In order to det. the exact initial temp. of the coal, which is impossible, when the coal has to be transferred from the thermostat to the calorimeter, the coal was put in a basket of wire gauze attached to the stirrer, and heated in the calorimeter, by an elec. heating resistance. Thus the coal was examd. in a chemically and physically unchanged state; it was easily moistened, and therefore quick exchange of the heat was caused. The initial temp. can be measured with exactness, and the simple method accommodates serial tests in a short time. The tests made on almost all German brown coals gave for water-free coal values between 0.322 and 0.4678. The sp. heats for raw and dry coal of the samples examd., and the water, ash, and tar content are compiled in tables. It was impossible to calc. the sp. heat by Kopp's law. The figures obtained have to be regarded as av. values between 0° and 100°.

G. SCHWOCH

Low-temperature distillation of lignite. MAX TOLTZ. *Power* 68, 853(1928).—By low-temp. distn. the max. yield of liquid by-products is obtained. The *semi-coke* or char can be briquetted by the addn. of 6% by-product tar as a binder. Lignite deposits amounting to 9 billion tons in S. D., N. D., and Montana, may become available by such treatment.

D. B. DILL

Transformations of the methoxyl group during the distillation of lignite. KAREL HRDLICKA. *Pulva a Topeni* 9, 185-7(1927).—The yields of MeOH (0.25%) and AcOH (0.32%) even during careful and gradual distn. are insignificant in comparison to wood, which contains 6% MeO but yields 1.5-2% MeOH. The lignite used came from Dubnany; it contains 6.12% MeO (based on org. matter present). The coke contained no MeO; 6.9% MeO was located in the tar and 5.8% in the light oils, making 0.53% of the org. matter in lignite. During the distn. of lignite, even under careful control, the destruction is more complete than when wood is distilled, and the yield of MeOH and AcOH is insignificant.

FRANK MARESH

New methods of benzene purification. R. KATTWINKEL. *Teer u. Bitumen* 26, 536(1928).—After a brief discussion of the H₂SO₄ process, the Rostin and Stegemann processes are cited as improvements. In the former, the H₂S in the crude benzene is utilized, through the action of Cu-Al contact agents, as a source of nascent H to hydrogenate the unsatd. compds., which are thus utilized instead of lost. In one of the two Stegemann processes, HF, used to polymerize the unsatd. compds., is easily recovered by distn., leaving a marketable pitch, whereas the H₂SO₄ regeneration residue is worthless. In the other, dehydrogenation, by heating with 1% S, strangely enough, reduces the Br absorption no. 90% with very little material loss, leaving also a marketable pitch.

F. S. GRANGER

Air excess required in gas heating. HEINRICH MÜLLER. *Gas u. Wasserfach* 71, 971-5, 995-1000, 1017-20, 1042-6(1928).—Ordinary gas oven burners are adjusted in such a way as to have a very large surplus of air, as much as 10-fold when the flame is turned low. Theoretical and practical studies of the problem have indicated that satisfactory operation (with respect to CO formation) can be attained with 1.4 times the theoretical amt. of air. The air excess can be maintained const. by suitable "throttling" means operated by the gas valve, etc.

R. W. RYAN

The simultaneous elimination of ammonia and sulfur from gas. HANS BAHR. *J. usines gaz* 52, 429-35(1928).—See C. A. 22, 1841.

F. S. GRANGER

Direct firing of boilers with producer gas. WILLIAM B. CHAPMAN. *Power* 68, 733-4(1928).—The development is predicted of an underfeed, mechanically operated, gas producer designed to go directly beneath a boiler and burn low-grade fuels, such as coke breeze or slack coal, with high efficiency.

D. B. DILL

The purification of coal gas. CHARLES COOPER. *Gas World* 89, 451-4(1928).—See C. A. 22, 4772.

F. S. GRANGER

Reinforced concrete in (oxide) purifier installations (for coal gas.) ZIMPEL AND FRANK. *Augsburg. Gas u. Wasserfach* 71, 952 4(1928).—Spent purifying material in contact with reinforced concrete pillars caused rusting of the iron reinforcing material and softening and embrittling of the concrete itself, due to the presence of thiocyanates. Oxygen and moisture aided in the action of the thiocyanates on the iron. The outside of the columns was roughened and a specially dense concrete surface prepnd., which was then waterproofed with an asphalt prepnd. The purifier boxes were cleaned inside with wire brushes and coated with a tar product, closing the pores and keeping moisture from attacking the reinforcing.

R. W. RYAN

Temperature of welding flames. WEHRMANN. *Duisburg. Gas u. Wasserfach* 71, 950-2(1928).—The theoretical flame temp. of mixts. of acetylene or illuminating gas

with various vols. of oxygen and air was calcd. and the flame temps. actually obtainable were measured by means of Seger cones for low temps. and by the melting point of zirconium oxide (2750°) and thorium oxide (3000°). It is believed that the use of such materials gives a much closer approximation to the true flame temps. than the use of wires. The temps. thus detd. are shown on a drawing of the flames. Identical temps. were obtained for the usable part of the acetylene and the illuminating gas flames, when the proper burner was used in each case. On a $\frac{1}{2}$ -meter weld on 1.5-mm. material the two burners were of equal value. The superiority of the oxy-acetylene burner over the oxy-gas burner on large work appeared to be due to the greater quantity of heat supplied, 6670 kg.-cal. in the first case and 5400 kg.-cal. in the second. It is important that oxy-gas burners should be constructed so that excess oxygen is not required.

R. W. RYAN

Primary tar oils. R. WEISSGERBER. Gesellschaft f. Teerverwertung m.b.H., Duisburg-Meiderich. *Ber.* 61B, 2111-9(1928).—R. had found (C. A. 18, 3705) that the unsatd. components of the 180-235° fractions of the neutral part of primary tar oil consist in great part of homologous coumarones and indenenes but that there are also present substances less sensitive to H_2SO_4 which can be removed by the usual methods with this acid only gradually and after repeated treatment. The primary object of this work was the elucidation of the constitution of these substances. By means of H_2SO_4 under definite conditions of concn. and temp., W. has been able to show that they consist, in great part at least, of aliphatic olefins with a terminal double bond, and definitely to characterize 1 of them, undecylene. One l. of a 193-201° fraction, obtained from a 199-207° tech. primary tar oil washed with concd. H_2SO_4 and distd. to remove easily resinifiable coumarones and indenenes was vigorously stirred 0.5 hr. at 15-20° with 500 g. of 90% H_2SO_4 . Two layers were formed. The lower, deep brown red, acid layer contained about 10% of the original material in soln. and on diln. with H_2O yielded an oil (I) smelling strongly of ketones. The upper, likewise deep, dark red, oily layer (II), which contained the olefins in the form of alkylsulfuric acids, was washed with small quantities of H_2O , the dild. aq. ext. cautiously neutralized with NaOH and shaken with Et_2O and the remaining clear aq. soln. of the Na alkyl sulfates decompd. in the usual way by acidification and distn. with steam, yielding the secondary alcs. (III) (1.5-2% of the original oil). The washed II on attempted distn. *in vacuo* evolved much SO_2 and deposited large quantities of resin, because of the presence of neutral alkyl sulfates. The decompn. can be prevented by distg. with steam at 150° instead of *in vacuo*; the colorless distillate (66% of the original oil) now shows all the properties of a "washed," i. e., tech. pure hydrocarbon mixt. from which no appreciable quantities of ketone-contg. oils or olefins can be removed on further treatment with 90% H_2SO_4 , and the residue (25%) with $PhNH_2$ at 170° splits off H_2SO_4 , the quantity of which, however, corresponds to only 0.9% of olefins in the original material. This residue undoubtedly consists chiefly of polymerized olefins, which thus escape quant. detection; the presence of a small quantity of polymeric coumarones was also established. From the III, purified through the benzoates, was isolated methylchanylcarbinol, b. 234-6°, d_{20} 0.8304, identified through the semicarbazone and oxime of the ketone obtained with CrO_3 . The total yield of olefins, calcd. from that of the neutral and acid alkyl sulfates, is about 3% but the true content in the original material is undoubtedly many times that. Their presence explains why it is so difficult to purify primary tar oils, as compared with coking tar oils, by the usual tech. methods, especially that of washing with H_2SO_4 . Of I (5-7% of the original material), about $\frac{1}{2}$ consists of ketones; after removal of the latter as the hydrazones there remains an oil of nitrile-like odor sol. in 90% H_2SO_4 and unstable toward $KMnO_4$; on long boiling with concd. KOH a part dissolves and acids ppt. from the soln. a mixt. of low melting and oily CO_2H acids from which was isolated a small quantity of *o*- $MeC_6H_4C_6H_5$. The oil sol. in 90% H_2SO_4 remaining after removal of the ketones and nitriles yielded a product (IV) (0.76% of the original material), b. 190-200°, d. 0.950, having an intense, unpleasant odor and contg. 16.4-18.9% S, insol. in and unchanged by alkalis and giving none of the reactions for sulfide S. It could only be concluded that the S was aromatically bound, i. e., that the product consisted of homologous thiophenes. A systematic study (with CHR. SEIDLER) indicated that it was chiefly tetramethylthiophene. Attempts to prep. a $HgCl_2$ deriv. failed; oxidizing agents reacted with it vigorously but split off the S as H_2SO_4 ; halogens gave only uninviting substitution and addition products. With H at 650-75°, however, it gave thiophene, *o*-thiophene, 2,3-thioxene and a fraction b. 158-65° whose $HgCl_2$ compd., m. 160-1°, contained 9.03% S (calcd. for that of trimethylthiophene, 8.87%). Attempts to synthesize a tetramethylthiophene failed, but by acetylating 1,4-thioxene, reducing by

Clemmensen's method and again acetylating and reducing the resulting ethyldimethylthiophene there was obtained *dimethyldiethylthiophene*, an oil of peculiar, not unpleasant odor, d_4 0.9573, b. 214–7°, sol. without change in 80% H_2SO_4 and behaving entirely like IV towards oxidizing agents, Br and isatin- H_2SO_4 . Since coking tar results from the higher heating of the primary tar formed first at lower temp. it was of interest to det. what changes occur during this higher heating, and accordingly a fraction of coking tar oil, b. 180–200°, was put through the same process as above. Below are the yields of the different classes of substances obtained from the primary and the coking tar oil, resp.: coumarones and indenenes 33, 66; alcs. from the alkyl sulfates 1.3, 0.06; ketones from the hydrazones, 0.4, 0.13; thiophenes, 0.31, 0.01; saponifiable nitriles, 0.19, 1.59%. These values, although, of course, they do not give the true content of these substances in the original materials, show clearly that the character of the tar changes at the coking temp. The olefins, ketones and thiophenes practically disappear; the apparently considerable increase in coumarones, indenenes and nitriles is probably due to the stability of these compds. at the coking temp. The chem. group-characteristics of both tars, however, are identical; it is the quant. distribution of these groups (especially the absence of the cryst. constituents and the predominance of the homologs) which imparts to the primary tar properties materially different from those of coking tar.

C. A. R.

Coke breeze firing (in boilers). FR. ALBACH AND FR. REUTER. Berlin Municipal Gas Works. *Gas u. Wasserfach* 71, 937–43 (1928).—Progress in the development of grates for successfully burning coke breeze is reviewed and illustrations are given. Breeze can be fired successfully with at least one modern grate and appropriate design of the boiler setting.

R. W. RYAN

Disintegration of CaC_2 in air (SCHERUHN) 6. Solvents from natural gas (GARLICK) 13. Application of gas to the textile industry (DORCHESTER) 25. Density and porosity of limestone and coke (SMOLENSKI, REICHER) 18. Some effects of coal ash on refractories (McVAY, HURSH) 19. New ways of using gases for soldering and welding (BRONN) 9. Filter for liquid fuels (Brit. pat. 287,932) 22. Centrifugal apparatus for separating coal and slime water (Brit. pat. 287,442) 1. Dewatering colloids, particularly peat (Ger. pat. 466,856) 13. Purifying gases [fuel] (Brit. pat. 286,633) 13. Apparatus for separating and classifying coal (Brit. pat. 287,262) 1. Rotary drum mill for pulverizing coal (U. S. pat. 1,690,712) 1. Purifying gases (U. S. pat. 1,690,437–8) 13. Charging means for shaft retorts, especially for gas producers (Ger. pat. 466,963) 1.

Combustion of fuels. RICHARD H. ANDREWS. Fr. 638,942, Dec. 31, 1926. A mixt. of air and powd. coal or a liquid or gaseous fuel is injected into the furnace with a gyratory movement.

Burning liquid hydrocarbon fuels. JOHN M. KELLEY (to Protane Corp. (1926)). U. S. 1,690,119, Nov. 6. A liquid hydrocarbon fuel (such as a product from casing-head gas) having a dry end point not in excess of 65° and an initial b. p. of about 7° or lower and which will develop a pressure of over 50 lb. per sq. in. at a temp. of 37° is expanded into a chamber and further expanded after its discharge from the chamber and sufficient heat is applied at its point of escape from the chamber to prevent congealing of moisture at the escape aperture; the expanded fluid is mixed with air and the mixt. is burned as required. An app. is described.

Use of gaseous and liquid fuels in aircraft. J. I. BRONN and CONCORDIA BERGBAU A.-G. Brit. 287,082, March 14, 1927. In order to maintain the buoyancy substantially const., liquid and gaseous fuels are used either in mixt. together in the same engines, or in different engines. The gaseous fuel may be CH_4 or a mixt. of hydrocarbons obtained by cooling distn. gases of coal, and the gas, alone or mixed with air, may be passed in contact with liquid fuel maintained at a const. temp. or at different temps. according to the proportion of the liquid fuel which it is desired shall be taken up.

Motor fuel. RÜTGERSWERKE-AKT.-GES. and LEOPOLD KAHL. Ger. 866,573, May 29, 1926. See Fr. 632,193 (C. A. 22, 3517).

Motor fuels. SAMUEL P. MARLEY and WM. A. GRUSE (to Gulf Refining Co.). U. S. 1,690,988, Nov. 6. Gasoline or similar fuel is mixed with a plurality of detonation-preventive substances, each having a soly. in gasoline of not more than about 0.5%. Among the substances which may be used, in various mixts., are β -naphthoquinone, *p*-anisidine, phthalimide, toluylene diamine, *m*- or *p*-phenylenediamine, azobenzene, dinitro-*p*-toluidine, dimethylhydroresorcin, aminoazobenzene, formanilide, capronitrile, $(CH_3)_3N$, *p*-iodoaniline and blending solvents such as C_6H_6 .

Destructive hydrogenation. I. G. FARBENIND. A.-G. Brit. 286,578, Sept. 10,

1925. In destructive hydrogenation of coal, tars, mineral oils and the like at pressures of 50 atm. or higher to produce light hydrocarbons, a catalyst is used contg. an oxide or carbonate of Li, Mg or Zn, with or without metals or compds. of the metals of the 8th group of the periodic system. Brit. 286,679 specifies a catalyst contg. a compd. of Cd, Pb, Bi or Sn, with or without more difficultly reducible metal oxides (or carbonates forming such oxides), and with or without metals or compds. of metals of the 8th group of the periodic system. Fe and carbonates of Mg, Li, Mn, V, Zn and U may be used, and an example is given of the passage of fuel oil with H and N under 200 atm. pressure and at a temp. of 500° over porous material impregnated with Pb nitrate. Brit. 286,680 specifies a catalyst contg. U oxide or carbonate, with or without metals of the 8th group of the periodic system or their compds. Brit. 286,681 specifies a catalyst contg. Mn oxide or carbonate, with or without 8th group metals or compds. Cf. *C. A.* 23, 264.

Destructive hydrogenation of carbonaceous materials. I. G. FARBERIND. A.-G. Brit. 288,148, March 31, 1927. Residues remaining after destructive hydrogenation of coals, tars, and like materials, are heated to recover oil constituents, *e. g.*, by passing hot gases or steam through the residues in a shaft or rotary furnace, in a low-temp. producer, in a metal bath, or in a closed pipe through which the materials are conveyed by a worm, or by atomizing the residues into a heated chamber. The sepd. oils may be mixed with carbonaceous materials to form a pasty mixt. for further destructive hydrogenation, or the oils may be heated to effect cracking and production of light hydrocarbons such as "benzines" and olefins which can be further converted into alcs., "solvents," lubricating oils, etc. The solid residues still remaining after sepn. of the oils may be gasified in a producer or may be used for the production of active C.

Destructive hydrogenation of coal, oils, etc. I. G. FARBERIND. A.-G. Brit. 287,855, March 26, 1927. The temp. of the reaction is regulated partly directly by the temp. of the hydrogenating gas introduced into the reaction chamber and partly indirectly by indirect heat exchange. Various details are described.

Distilling solid carbonaceous materials with by-product recovery. H. NIELSEN and B. LAING. Brit. 287,381, Dec. 4, 1926. The time factor and temp. gradient during the distn. period are so controlled, that a temp. difference exceeding 150° is avoided between the temps. at the center and periphery of a suitably arranged fuel bed. A solid fuel, easily powd., free from deposited graphitic C and contg. 4-15% of volatiles is obtained. Numerous details are given.

Distilling coal or like carbonaceous materials. H. NIELSEN and B. LAING. Brit. 287,637, Dec. 4, 1926. In distn. with by-product recovery, by direct heating with a gas such as water gas, producer gas or combustion gas which is passed in counter-flow to the materials, the vol. of gas used is such as to lower the vapor tension of the volatiles to enable the oil vapor to be liberated at temps. not exceeding 450-500° and so that the gaseous mixt. may be cooled to 80-100° without causing the highest b. p. fraction to condense. Coking coals may be subjected to a preliminary heat treatment with gases contg. O 2-8% to reduce their coking properties, and O may be added to the heating gases to assist in polymerization of resinous substances. Lubricating oil may be obtained by treating the primary oil with NaOH to remove tar acids, refining the residue with H₂SO₄, distg. off 25% of the refined oil and passing the remainder through a filter press at -5° to sep. paraffin. Various other details are given.

Distilling powdered fuel. KOHLENVEREDLUNG A.-G. Brit. 287,627, Dec. 22, 1926. Carbonaceous or bituminous materials are carried through a retort in suspension in a stream of heating gas, suitably at a temp. of about 800°, for a time sufficiently short to effect only low-temp. distn. Cf. *C. A.* 23, 264.

Apparatus (with superposed annular carbonizing chambers) for low-temperature distillation of fuels. J. PLASSMANN. Brit. 287,313, March 9, 1927.

Coal distillation. KARL PRINZ. Ger. 466,571, Jan. 13, 1926. In a distn. plant for coal, etc., of the type in which the coal is spread in a thin layer on and removed from a rotating disk, the disk floats on a metal bath above the furnace.

Distilling coal and similar materials. LOW TEMPERATURE CARBONISATION, LTD., and C. H. PARKER. Brit. 287,586, Sept. 25, 1926. The material is distd. by being charged into receptacles which are rolled on inclined tracks through an externally heated retort. Numerous details of the app. used are described. Brit. 287,587 relates to a similar process applied to coal distn. and in which the receptacles are dried by being caused to traverse a chamber through which hot waste gases pass.

Distillation of coal, etc. JOHN H. ANDERSON. Fr. 638,755, Aug. 2, 1927. Carbonaceous material is distd. at low temp. in a rotating retort over the heating furnace. Metallic bodies which can move freely are placed in the material.

Distillation of coal, etc. GIUSEPPE SCAVIA. Fr. 637,782, July 19, 1927. In low-temp. distn. of coal, etc., the coal in small pieces is heated to 600–725° in a layer of 6–18 mm. thickness, and without movement of the coal. The heating lasts for approx. 5 min.

Distillation of coal in two stages. LOW TEMPERATURE CARBONISATION, LTD., and C. H. PARKER. Brit. 287,585, Sept. 25, 1926. In operation of an app. in which the charge from a retort in the first stage is transferred to a second retort of large vol. so that the second stage is of longer duration than the first and effects cooling of the charge, water is passed into the retort of the second stage or into a cooling receptacle adjacent to the retort.

Apparatus (with shaft-like heating or distilling chambers) for distilling coal, lignite, peat, wood or other carbonaceous materials. OTTO HUBMANN. U. S. 1,690,933-4, Nov. 6. U. S. 1,690,934 is assigned to Metalbank und Metallurgische Ges. A.-G. as is also U. S. 1,690,935 which specifies continuous distn. of high-ash solid carbonaceous materials such as oil shale or slaty coal by passing a charge of the material downwardly and in continuous flow successively through a distn. zone, a reaction zone, and a residue-cooling zone, introducing O-free gases such as combustible gases into a cooling zone and thereby heating them, introducing O-contg. gases such as air into the reaction zone to sustain reaction or combustion with the distd. material which still contains combustible material, drawing off and mixing the hot gases from both zones and passing them into the distn. zone. This pat. also describes app.

Apparatus for removing the slag from the combustion space of furnaces using coal dust. KARL HUFSCHMIDT. Fr. 637,331, June 21, 1927.

Apparatus for regulated and proportionate supply of air and powdered coal or other fuel to furnaces. ASKANIA-WERKE A.-G. VORM. CENTRALWERKSTATT DESSAU AND C. BAMBERG-FRIEDENAU. Brit. 287,132, March 16, 1927.

Unsaturated hydrocarbons. I. G. FARBENIND. A.-G. Brit. 286,825, Jan. 3, 1927. Unsatd. hydrocarbons such as C_2H_2 are obtained by subjecting coal, tars, mineral oils or the like, in vaporized or finely divided condition, to the action of an elec. arc either in the presence of water vapor or gases contg. it or, when tars and mineral oils are treated, in the presence of H_2 , N , CO_2 , CO or gas mixts. contg. these. Only 33–50% (or less) the quantity of water vapor is used as would be necessary to produce water gas. The materials are preferably preheated.

Charcoal fuel. JACK GELÉ DE FRANCONY. Fr. 637,296, Nov. 8, 1926. A fuel is made by mixing finely divided charcoal with the tar coming from the carbonization of the wood and 20–200% of coal or petroleum tar. An agglutinant such as wood gum, xylose or other product obtained by the treatment of wood or straw with caustic soda is added.

Coal briquets. HENRI LIESENS. Fr. 637,396, July 9, 1927. Coal briquets which do not smell or smoke and are non-friable are made from an intimate mixt. of coal dust, flour of manioc 3, bitumen tar 2, and chalk 1 1/5.

Peat fuel in the form of united hollow cylinders. RAYMOND E. OBER. U. S. 1,691,734, Nov. 13.

Pressure-feed apparatus for producing hard homogeneous fuel, etc., from peat, peat moss, lignite or similar materials. BOHUMIL JIROTKA (to the Firm of Dr. Otto Sprenger Patentverwertung Jirotka m. b. H.). U. S. 1,691,196, Nov. 13.

Montan wax. WILHELM PUNGS and MICHAEL JAHNSTORFER (to I. G. Farbenind. A.-G.). U. S. 1,690,876, Nov. 6. The properties of montan wax are improved by treating it with chromic acid in the presence of glacial $HOAc$ and small quantities of an acid substance such as H_2SO_4 or acid salts or polybasic acids.

Bleaching montan wax. A. RIEBECK'SCHE MONTANWERKE A.-G. Fr. 637,777, July 16, 1927. Crude montan wax is bleached by oxidizing agents such as $Na_2Cr_2O_7$ in the presence of H_2SO_4 .

Drying damp fuels. I. G. FARBENIND. A.-G. Fr. 637,838, July 18, 1927. See Brit. 274,858 (C. A. 22, 2259).

Recovering phenol from waste liquors. F. RASCHIG. Brit. 287,226, Dec. 15, 1926. Waste water of gas works or the like is treated with a hydrocarbon such as benzene in a vessel filled with Raschig rings of 15 mm. diam. and corresponding axial length. The phenol and benzene are sepd. by distn. and the waste water is heated by being utilized for condensing the benzene vapor. After distg. off the benzene, impure phenol contg. a small proportion of C_6H_6 , pyridine and pyrrole is obtained which can be purified in the usual manner.

Transforming heavy into light oils. HENRI MONY. Fr. 638,833, Dec. 20, 1926. Heavy oils from coal, etc., are heated in the presence of one or more solid or liquid

substances under atm. pressure to produce light oils. Suitable substances include metallic sulfides such as FeS , AcOK and Na_2SO_4 .

Mill adapted for grinding heavy portions of fuel oils or other oils. ROBERT C. HOPKINS. U. S. 1,690,168, Nov. 6.

Coal-tar oils. HERBERT WITTEK. Ger. 466,264, Aug. 13, 1925. Crude coal-tar oils are purified by dilg. with aliphatic hydrocarbon oils and distg. The fraction b. $100-200^\circ$ is dissolved in an equal quantity of paraffin and shaken with 2% by wt. concd. H_2SO_4 . The fraction b. $30-150^\circ$ is dissolved with an equal quantity of petroleum-benzene and shaken with 1% by wt. concd. H_2SO_4 .

Apparatus for extracting benzene from coal gas wash-oils. CHRISTIAN BUNTE and FRIEDRICH GOSSLER. Ger. 466,814, July 18, 1925. The app. comprises a distn. column, a reflux cooler and an intermediate container for sepg. the oil and water, the container having a vol. equal to that of the cooler.

Container for charging acetylene generators. AUTOGENWERK SIRIUS G.M.B.H. Ger. 466,832, May 6, 1927. The container has a displaceable bottom and is filled with carbide and inserted as a whole into the generator; the bottom is then displaced from outside the generator.

Drying fuel gases. D. M. HENSHAW, C. COOPER and W. C. HOLMES & Co., LTD. Brit. 287,678, Feb. 5, 1927. Gas is dried in 2 stages, first at about atm. temp. and then with a cooled hygroscopic liquid.

Coal or coke-oven gas. S. P. MILLER (to Barrett Co.). Brit. 287,900, March 29, 1927. Hot coal gases from a battery of coke ovens or retorts are cooled and freed from tarry impurities by spraying them with oil as they pass through the collector mains. Oils may be used which are obtained in the condensers of the carbonizing plant or the process may be used for the distn. and purification of dirty oils which are vaporized by contact with the hot gases and afterward recovered by condensation (impurities such as tar and pitch being pptd. in the collector main and washed out by the undistd. oil). An app. is described.

Controlling calorific value of coal gas. W. M. CARR. Brit. 286,758, Nov. 13, 1926. A device for controlling the supply of an admixt. of diluent gas is controlled by the flame temp. of a burner in which the mixed gases are burned.

Purifying coke oven gases or similar gases. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ETUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE). Brit. 287,558, March 25, 1927. N oxides present as impurities in gases which are subsequently to be sepd. by liquefaction are sepd. by hydrogenation in the presence of a catalyst such as reduced Cu or Fe, at a low temp. and under atm. or higher pressure. C_2H_2 present is hydrogenated at the same time. C_2H_4 remains practically unaffected and may be converted into alc. An Al sulfate soln. at high temp. also may be used for removing the oxides.

Oil gas. J. HANSFORD and J. S. HUGHES. Brit. 287,213, Dec. 13, 1926. Gas production from oil or other liquid or powd. fuel is effected in the presence of iron shavings or the like at such a temp. that the Fe is consumed. Steam may be supplied to increase the H content of the gas formed. An app. is described.

Purifying exhaust gases from internal-combustion engines. DEUTSCHE GAS-GESELLSCHAFT-AUER GES. Brit. 287,106, March 15, 1927. Exhaust gases are first passed through a layer of absorbing material such as active C or silica gel and then over an oxidizing agent such as heated Pt wire or Cu oxide.

Automatic oil control for carburetted water-gas plants. M. PARSONS (to Humphreys & Glasgow, Ltd.). Brit. 287,870, March 28, 1927. A calorimeter measures the calorific value of the carburetted water gas produced and a galvanometer system responsive to the calorimeter and balanced at the standard calorific value of the gas (but unbalanced and operative at departure from the standard calorific value) serves to vary the oil supply to the carburetter. Numerous structural details are described.

Burning gas. W. C. HOLMES & Co., LIMITED. Fr. 637,733, July 15, 1927. Corrosion of gas mains by S or CN compds. is prevented by thoroughly drying the gas by CaCl_2 which is continually regenerated.

Producer for water gas. ARTHUR BRANCART. Fr. 637,207, July 7, 1927. The fuel is emptied onto step-like plates in the masonry and water pipes are arranged above the highest for sprinkling the fuel.

Gas producer. JACQUES G. SCHULZ. Fr. 638,926, Dec. 30, 1926. Part of the waste gases from the engine are directed back into the combustion zone of the gas producer to lower the temp. thereof.

Gas producer and retort setting. R. W. BROADHEAD. Brit. 286,835, Jan. 17, 1927. The producer of a retort setting is placed externally to and independently of the setting and the space in the setting which it would otherwise occupy is devoted to

an extension of the regenerator which is arranged to preheat both the producer gas and the secondary air (or either of them).

Apparatus for washing and cooling producer gas. EDMOND WARNANT. Ger. 466,694, Aug. 26, 1926. The end of the washing column stands in water, up through which the gas bubbles, and the water which travels in a closed cycle may be drawn off at this level for cooling.

Retort and associated construction for two-stage distillation in gas production. LOW TEMPERATURE CARBONISATION, LTD. and C. H. PARKER. Brit. 287,830, Sept. 25, 1926.

Vertical gas retorts (cast in multiple). LOW TEMPERATURE CARBONISATION, LTD., and C. H. PARKER. Brit. 287,584, Sept. 25, 1926. Structural features.

Apparatus for operating the doors of gas retorts. FIRMA H. KOPPERS. Ger. 466,673, Oct. 2, 1925.

Eddy-stream gas burner. DEUTSCHE WÄRME AUSNUTZUNG G.M.B.H. "DEWAG." Ger. 466,831, Oct. 25, 1927. Constructional details are given.

Gas purification plant. SIEMENS-SCHUCKERTWERKE A.-G. (Hans Hoßler, inventor). Ger. 466,437, Feb. 4, 1926. A device for guiding and equally dividing gas currents in an elec. gas purification chamber is described.

Gas production plant. METALLBANK UND METALLURGISCHE GES. (Ernst Hüter, inventor). Ger. 466,436, Dec. 7, 1926. A method of detecting the existence of high-tension currents in the plant is described.

Gas production plant. ASKANIA-WERKE A.-G. and CARL BAMBERG. Ger. 466,465, Apr. 10, 1925. A steady input is maintained by a rotary regulating device in the exhaust chamber. The device widens the outlet in proportion to the exhaust pressure.

Hydrogenizing tar oil. RUDOLF BERNHARD and WALTER DEMANN. U. S. 1,691,221, Nov. 13. The oil is heated to near the b. p. and treated in the presence of a colloidal Ni catalyst with the dry gas resulting from the manuf. of coke, under the normal pressure prevailing in the coke oven. The catalyst is prepd. by reduction at 310° with that part of the oil which b. 375-390°.

Dehydrating tar. S. P. MILLER (to Barrett Co.). Brit. 287,084, March 14, 1927. Tar is dehydrated by direct contact with the hot gases produced in coal distn. ovens or retorts. The gases may be used at such a temp. as to effect partial distn. of the tar and light oils thus distd. may be condensed and remixed with the dehydrated tar. An app. is described.

Treating low-temperature tars, etc. F. C. BUNGE. Brit. 287,471, March 21, 1927. Low-temp. tars or their fractions are freed from acid constituents by use of H_3PO_4 or other suitable acid, preferably in the presence of a neutral diluent such as the purified oil. Water formed may be removed by evapn. or use of P_2O_5 . The acid constituents form stable aq. emulsions and may be used as disinfectants or flotation agents.

Coking apparatus. OTTO H. HERTEL. Ger. 466,996, June 21, 1925. In app. of the type comprising an externally heated retort enclosing a spiral conveyer traversed by an internally heated tube, the internal heating is effected with a no. of independent groups of burners arranged at intervals along the length of the tube.

Coke-oven construction (designed to provide unobstructed outlet for distillation products). DR. C. OTTO & CO. GES. Brit. 287,885, March 28, 1927.

Regenerative coke-oven construction. GUSTAV O. WOLTERS. U. S. 1,690,805, Nov. 6.

Coke oven and regenerator construction. FOUNDATION OVEN CORP. Brit. 286,776, Dec. 8, 1926.

Combined coking retort and gas generator construction. ALBERT BREISIG. U. S. 1,691,636, Nov. 13.

Continuous vertical distillation retort furnace. J. PIETERS. Brit. 287,934, March 30, 1927.

Vertical coking-retort construction. J. PIETERS. Brit. 287,935, March 30, 1927.

Charging truck for coke-oven chambers. C. OTTO & CO. G.M.B.H. Ger. 466,939, July 23, 1926. Constructional details are given.

Metallurgical semi-coke. KURT JAHNKE. Ger. 466,940, May 3, 1924. The subdivided fuel is mixed with $FeCO_3$ or other unstable compds. and with bituminous substances and the mixt. subjected to low-temp. coking.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

Petroleum and the filtering earths. P. G. NUTTING. *J. Wash. Acad. Sci.* 18, 409-14(1928).—Filtering materials are effective because of the open oxygen and silicon bonds. These are produced by removal of water from terminal hydroxyl radicals. They act by attacking certain less firmly bound radicals of the hydrocarbons. The result may be mere adhesion but is in many cases a surface reaction in which a film of org. silicate is formed over the surface of the filter grains. Many of the org. silicates so formed are insol. in any single known solvent. Clays of the kaolin type do not filter because they contain no hydroxyl water to be driven off leaving open bonds. Clays of the bentonite type make only poor filters even after acid treatment because they contain only a little alkali replaceable by hydroxyl. Good filters are (1) those well supplied with hydroxyl water removable by moderate heating and (2) those having originally had terminal alkali radicals subsequently converted to hydroxyl by acid treatment. The selective action of filters is readily accounted for by the varying activity of open bonds toward organic radicals retained by bonds of varying strength.

D. F. BROWN

Cracking of Boryslaw gas oil. SZAYNA. *Ann. office nat. comb. liquides* 2, 917-25 (1927).—Boryslaw gas oil of d. 0.8554 with 9.3% distg. below 225° is cracked in a flask with dephlegmator in the presence of 15% of AlCl_3 . A yield of 36.2% by vol. of colorless gasoline with 150° end point and d_{15} 0.702 is obtained. The cracking of this gas oil at atm. pressure in electrically heated tubes (cf. Gault, *C. A.* 21, 1882) of SiO_2 , Cu and Fe gives max. yields of about 28% by vol. of gasoline (225° end point with d_{15} 0.790-0.799) at 610°, 540° and 600°, resp. These gasolines are all yellow and with the exception of that produced in the Fe tube, they darken with age and deposit resins or tars. Berginization of the gas oil for 3 hrs. at a mean temp. of 480° and at a pressure of 60 to 245 atms. produces 29% by vol. of 150° end point gasoline with d. 0.7045. The total yield of 225° end point gasoline amts. to 46% by vol., has a sp. gr. of 0.7466 and contains 4% of olefins, 14.5% of aromatics and 81.5% of satd. hydrocarbons.

R. E. SCHAAD

The composition of heavy Sakhalin crude oils and their working up. A. N. SAKHANOV. *Neftyanoye Khozyaistvo*, 15, 53-4(1928).—A sample of Okhinskii crude (Sakhalin) had the following characteristics: Sp. gr. 0.931, E_{10} 3.14, excise resins 36%, f. p. below -20°, H_2O 0.3%. Distn. with a "Glinskii" dephlegmator: Below 200° 3.03%, sp. gr. 0.804; 200-220° 3.26%, 0.832; 220-240° 4.38%, 0.894; 240-260° 4.00%, 0.863; 260-270° 2.78%, 0.871; 270-280° 2.88%, 0.877; 280-300° 6.45%, 0.885. Mazout: Sp. gr. 0.964, flash (Mart.-Pens.) 149°. Cold test -18°, E_{10} 17.4, excise resins 49%. Results of vacuum distn. of this mazout are given. Three fractions between 200° and 330° are transparent when frozen and no paraffin is sepd. The residue obtained from mazout 26% had sp. gr. 1.02, m. p. (Kremer-Sarnow) 41°, penetration at 25° 20, elongation at 25° over 100. The content of lubricating oils is very high, contrary to Nametkin's investigations (cf. *C. A.* 22, 2458); it has 18.5% of machine oil distillates with sp. gr. 0.947 and 16.5% of cylinder stocks with sp. gr. 0.964. These distillates are only obtainable with a high vacuum. They must be treated with fuller's earth, since H_2SO_4 causes a loss of 30-40%. The residue left after this distn. is an asphalt of high quality, suitable for roads. The mazout cracked at 425°, 10 atm., 1 hr. or 450°, 20 atm., 10 min. gave gasoline up to 200-210° 14.9%, sp. gr. 0.727; kerosene 200-300° 15.8%, sp. gr. 0.864; bottoms 60.5%, sp. gr. 1.027, E_{10} about 30; traces of coke are present; gas and loss 7.7%. The cracking residue mixed with cracked kerosene gives a fuel oil of E_{10} about 10 and sp. gr. 0.990. A more complete cracking gives a higher yield in gasoline but also a high % of coke. The crude oil when cracked at 425°, for 2 hrs. 38 min., at 10 atm. or 450°, 30 atm. and 26 min. gives gasoline fractions up to 200-210° 25.8%, kerosene 200-300° 26.7%, residue 33.6%, gases and loss (including the distn.) 14%. The gasoline has a sp. gr. of 0.759, the kerosene 0.876 and the residue 1.1, containing about 10% coke of a high viscosity. On cracking the above kerosene and gas oil the following final yields from the Okhinskii crude oil are obtained: Gasoline 44.5%, residue 40.0% sp. gr. about 1.0, gases, loss and coke 15.5%. The residue is an inferior fuel oil. The crude oil can be worked up in three different ways, depending on the marketing conditions: (1) for kerosene and lubricating oil, yielding refined kerosene 16.5%, gas-oil unrefined 16.5%, solar oil 15.0%, machine

oil refined 12%, cylinder stock refined, E_{100} 3.0, 13%, asphalt residue 18%, loss (not including fuel for distn.) 9%; (2) for kerosene and gasoline yielding refined kerosene 23%, cracked benzine 11%, fuel oil 50%, gases and loss (not including fuel for distn.); (3) for gasoline (by complete cracking), yielding cracked gasoline 44.5%, fuel oil 40%, gases and loss 15.5%.

A. A. BOEHLINGK

Sludge formation on the addition of new to used transformer oil. H. v. D. HEYDEN AND K. TYPKE. A. E. G. Transformatorenfabrik, Berlin-Oberschöneweide. *Erdöl u. Teer* 28, 493-4 (1928).—Highly refined oil showed a greater sludge-pptg. propensity than less refined oil, and paraffin-base than naphthene-base. The proportions also were a factor. Non-sludging oil does not retain its sludge-pptg. power after oxidation.

F. S. GRANGER

Testing cements [for oil wells]. I. A. ALEKSANDROV. *Neftyanoye Khozyaistvo*, 15, 17-20 (1928); cf. *C. A.* 22, 1452.—Various methods for testing cement are discussed and special attention is paid to the expansion in the process of setting. A. recommends using the methods of Le Chatelier and Michelis, these, while not quite in accordance with the conditions existing in oil wells, are the best methods so far known.

Petroleum or bitumen from rocks, etc. PAUL VÉROLA. Fr. 637,619, Nov. 13, 1926. Petroleum or bitumen is ext'd. from rocks, sand, etc., by a liquid heavier than the petroleum but lighter than the rocks, and having a b. p. higher than the temp. at which the petroleum becomes fluid. Water, contg. CaCl_2 to raise its b. p., may be used.

Cracking oils. STANDARD DEVELOPMENT CO. Brit. 286,017, May 2, 1927. The cracking zone comprises a series of converters through which the oil is slowly passed without distn. while maintaining the temp. and pressure and which are arranged so that any chamber may be cut out without disturbing the continuity of the process. Various details of app. and operation are described.

Distilling and cracking oils. H. MAGNUS. Brit. 287,525, March 23, 1927. Mineral oils and tars are dist'd. under pressure and the products are sepd. in a condensation plant into fractions of higher and lower b. p. than gasoline; the fraction of higher b. p.

is then further treated at higher temp. and pressure in a cracking app. Two or more pressure vessels are connected in series in a closed circuit and the raw materials are distd. in the first vessel while the residues remaining after the fractionation of the lighter constituents are cracked in the following vessels. Turbines driven by the expansion of the cracked vapors serve to circulate the materials.

Cracking hydrocarbon oils. WM. C. PARRISH (to Texas Co.). U. S. 1,690,243, Nov. 6. A body of oil is maintained at a cracking temp. to cause the formation of lighter hydrocarbons and C and is agitated by a power-actuated agitating device; the power required for the operation of the agitator is measured and the cracking run is stopped when the accumulation of C is indicated to be excessive by the increasing power required for this operation. An app. is described.

Agitating and cracking hydrocarbon oils. ALFRED SCHWARZ (to Petroleum Sand Products Corp.). U. S. 1,691,085, Nov. 13. A heavy oil and the vapor produced from it while being heated to a cracking temp. are agitated by an agitator rotating at a speed of about 400–600 r. p. m. to form a vapor-oil emulsion. An app. is described.

Cracking liquid hydrocarbons. OWEN D. LUCAS and ERNEST L. LOMAX (to V. L. Oil Processes, Ltd.). U. S. 1,690,416, Nov. 6. Heavy oils are heated rapidly to a cracking temp. in a tube still and then passed to a conversion chamber in which they are maintained in bulk at the cracking temp. and under a pressure of 600–1000 lb. per sq. in.; lighter oils are drawn off in vapor form into a vapor-pressure or refluxing chamber open directly to and forming an extension of the conversion chamber and under the same pressure as the latter, and the refluxing chamber is maintained at a temp. substantially lower than that of the conversion chamber but sufficiently high to prevent (under the prevailing pressure) condensation of any oils below a predetd. density; heavier oils are condensed in the refluxing chamber and the condensed oils are passed without reheating and below the cracking temp. through a branch passage directly back into the conversion chamber for further treatment; liquid oils are simultaneously drawn off from the conversion chamber and released through a pressure-reducing valve into a lower-pressure chamber and vapor of the lighter oils is removed from the lower-pressure chamber. Various details of app. are described.

Apparatus for cracking oils. CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,690,997, Nov. 6. Substantially straight vertical heating pipes extend through heating flues in a furnace and are connected to a supply tank. A pump is provided in the connections for forcing oil from the supply tank to the heater.

Decolorizing hydrocarbon oils. THOMAS G. DELBRIDGE and HENRY F. DURE (to Atlantic Refining Co.). U. S. 1,690,772, Nov. 6. After acid treatment and sepn. of sludge, air is passed into the acid-treated oil while heated and without neutralization, to condition the oil for subsequent clay treatment, finely divided clay is added and the mixt. of oil and clay is aerated at a temp. below 100°. An app. is described.

Purifying hydrocarbon oils. LYLE CALDWELL (to Celite Co.). U. S. 1,691,266, Nov. 13. Oils such as "sour" gasoline are brought into contact with a pulverulent treating agent obtained by chlorinating the product of reaction between diatomaceous silica and an alk. earth hydroxide and the treating agent is then sepd. from the oil. This treatment serves to "sweeten" sour oils.

Rectifying hydrocarbons. IRA B. FUNK (to Union Oil Co. of Calif.). U. S. 1,691,238, Nov. 13. Liquid hydrocarbon material is distd. with steam and the vapors are passed through a rectifying column in which certain fractions are progressively condensed together with the steam; the fractions and condensed steam are removed at a plurality of selected points and the oil fractions are then returned to the column. An app. is described.

Obtaining light hydrocarbons from distillation of solid carbonaceous materials. ZULEY PROCESSES CORP. Brit. 287,999, Feb. 14, 1927. Material such as coal is coated or impregnated with a substance such as NaCl which will break up on heating to about 1375° and which has a catalytic effect on the distn. and gasification process and production of light hydrocarbons such as C₂H₄. An app. is described.

Oxidizing hydrocarbons. ARTHUR W. BURWELL (to Alox Chemical Corp.). U. S. 1,690,768, Nov. 6. A normally liquid hydrocarbon material contg. aliphatic compds. such as a spindle oil petroleum distillate is treated, in liquid phase, with an oxidizing gas such as air at a temp. of at least 100° (it may suitably be about 120–130°) and under a pressure of about 100–320 lb. per sq. in. An app. is described. The process results in the formation of simple and hydroxy org. acids. U. S. 1,690,769 specifies contacting an oxidizing gas such as air with a normally liquid petroleum hydrocarbon mixt. such as a 42° B₄ distillate from Pennsylvania petroleum under similar conditions of temp. and pressure, to produce oxidation products including

water-insol. org. acids of solid or semisolid character which are insol. in the hydrocarbon mixt.; these insol. acids are sepd. and aq. liquid is sepd. during the further treatment of the hydrocarbon mixt. with oxidizing gas. An app. is described. Mn stearate or other catalyst may be used.

Metallic towers and electrical connections for protecting petroleum tanks, etc., from lightning. * WEST DODD. U. S. 1,691,340, Nov. 13.

Trap and pipe system for separating gas from oil at wells. FORD W. HARRIS. U. S. 1,691,350, Nov. 13.

Liquid fuel for internal-combustion engines. BRITISH DYESTUFFS CORP., LTD., and S. CORREY. Brit. 287,192, Oct. 25, 1926. Knocking of the usual hydrocarbon fuels is reduced by adding to the liquid or to the gases in the combustion chamber a heavy metal deriv. of a β -diketone such as the Fe, Ni, Co, Cr, Th, Cu, Mn, Mo, V, W, Ce, Hg, Ag, other noble metals, Al and Zn compds. of acetylacetone, benzoylacetone and their alkyl, aralkyl or aryl homologs, *e. g.*, 0.1–1.0% of ferric methylacetylacetone may be added to "petrol" or a blended fuel.

Producing gasoline from heavier hydrocarbon oils. BERNARD ORMONT (to Bernard Ormont Associates). U. S. 1,691,300, Nov. 13. Oil such as gas oil is heated to a temp. sufficient to vaporize only lighter fractions of the oil and water is independently heated to produce a region of nascent steam. The proportion of oil to water is so regulated that the product of the latent heat of vaporization of the oil and the wt. of the oil shall substantially equal the product of the latent heat of vaporization of the water and the wt. of the water, and the unvaporized oil is conveyed to the region of nascent steam, and the resulting mixt. of oil vapors and steam is then subjected to further heating. An app. is described.

Chlorinating gasoline. F. S. VIVAS (to International Fireproof Products Corp.). Brit. 286,726, March 11, 1927. An app. is described in which gasoline after treatment to remove heavy oils is brought into contact with Cl in the presence of a catalyst. NaOH may be used as a purifying agent and the purified gasoline then introduced into a vessel with perchloromethane, aq. NH_3 and a metallic chloride such as AlCl_3 or FeCl_3 acting as a catalyst and Cl then introduced. Heavy oil sapon. products are recovered; they may be used as *lubricants*.

Purifying "petrol." W. M. KNOWLING and M. KOSTEVITCH. Brit. 287,141, March 16, 1927. "Petrol" is filtered through activated charcoal which may be admixed with silica gel. A filter contg. these substances may be placed between the fuel tank and the carburetor of an automobile.

Oxidized petroleum wax products. A. W. BURWELL (to Alox Chemical Corp.). Brit. 287,514, March 23, 1927. Emulsions suitable for use in *sizing paper, dressing fabrics*, and "*proofing*" permeable materials such as *strawboard, asbestos, brick, stone or concrete*, are made from oxidized petroleum wax which may be prepd. by supplying the wax to an oxidizing cylinder having a steam coil and a pipe for admitting compressed air and effecting oxidation under pressure at 100–155° in the presence of a catalyst such as Mn oleate or other suitable Mn, Cu or Fe compd. until about 30% of the material is oxidized to acids. Numerous details are given for prepg. the coating and sizing compns., etc., from the oxidized wax derivs.

Separation of paraffin and like compounds from oil. AKTIEBOLAGET SEPARATOR-NOBEL. Fr. 637,229, July 8, 1927. See Brit. 276,658 (*C. A.* 22, 2462).

Cylindrical apparatus with superposed compartments for sweating paraffin, etc. H. L. ALLAN and J. MOORE (Burmah Oil Co., Ltd.). Brit. 287,714, March 26, 1927.

Dipolymer from pine oil. IRVIN W. HUMPHREY (to Hercules Powder Co.). U. S. 1,691,573, Nov. 13. Vapors of pine oil are passed in contact with a catalyst such as fuller's earth for such a time and at such a temp. (suitably about 8 hrs. at 160–170°) as will effect dehydration and polymerization of a substantial part of the vapors to form "dipolymer."

"Dipolymer" from pine oil. IRVIN W. HUMPHREY (to Hercules Powder Co.). U. S. 1,691,065, Nov. 13. A "dipolymer" is obtained by heating pine oil (suitably at a temp. of about 145–225°) with a neutral catalyst such as fuller's earth to effect dehydration and finally polymerization of a substantial proportion of the oil. U. S. 1,691,066 specifies the production of a "turpentine substitute" by dehydrating pine oil with a halogen, *e. g.*, by treating the pine oil with I and then distg. with steam. U. S. 1,691,067 specifies producing a "dipolymer" by vaporizing dipentene and passing the vapors in intimate contact with a catalyst such as fuller's earth, Al_2O_3 or chlorides of Zn, Sn, Al or Fe for a time and temp. (suitably about 400°) to effect substantial polymerization. U. S. 1,691,068 specifies heating dipentene with a metallic chloride such as SnCl_4 to effect production of di- and higher polymers. U. S. 1,691,069 specifies

heating pine oil with SnCl_4 or other suitable metallic chloride to effect dehydration and formation of dipentene and subsequent polymerization of the dipentene.

Thickening mineral lubricating oils. ROBERT W. HENRY and ELFORD D. STREETER (to Gulf Refining Co.). U. S. 1,691,882, Nov. 13. A thickener for "mineral castor" oils is prepd. by making a basic Al soap and a less basic Al soap, and mixing these in accord with the desired ratio of Al to fatty acid content.

Device for atomizing lubricating oil, etc., into a stream of air or other gas. E. PLAYER and PARC ENGINEERING Co., LTD. Brit. 286,812, Dec. 23, 1926.

"Mineral castor oil" for lubricating. ROBERT W. HENRY and ELFORD D. STREETER (to Gulf Refining Co.). U. S. 1,691,654, Nov. 13. An aq. soap soln. is mixed with a soln. of an Al salt, in the presence of an alkali, thus pptg. a basic Al soap and the Al soap is mixed with mineral oil.

Filter for lubricating oils, liquid fuels, etc. G. CATTANEO. Brit. 287,932, March 30, 1927.

Filter for oil in lubricating systems. ABRAHAM M. BABITCH (to A. C. Spark Plug Co.). U. S. 1,690,358, Nov. 6.

Bituminous emulsions. L. KIRSCHBRAUN. Brit. 286,844, Jan. 31, 1927. Asphalt or similar material (suitably at a temp. of about $160-175^\circ$) is added to a suspension of colloidal clay at about 65° and the materials are agitated together to effect emulsification. The process may be made continuous.

Emulsions or dispersions of pitchy substances. LESTER KIRSCHBRAUN and HAROLD L. LEVIN (Levin to Flintkote Co.). U. S. 1,691,766, Nov. 13. In producing an aq. dispersion of a pitchy substance in an aq. vehicle, the p_H of the system after dispersion is adjusted to a predetd. value (suitably about 6.0-6.5 with various asphalts and clays). U. S. 1,691,767 relates to maintaining the p_H at a definite value while forming the dispersion.

Dispersions of pitchy substances. LESTER KIRSCHBRAUN. U. S. 1,691,768, Nov. 13. In forming dispersions of pitchy substances, in an aq. vehicle, the p_H is adjusted by combining with the materials a second dispersing agent which will produce a modified dispersion medium of the desired p_H .

Agglomerating wood charcoal. SOC. O. MONNET ET CIE. Brit. 288,167, April 2, 1927. Pulverized wood charcoal is made into a homogeneous paste with a binder such as 20-40% of blood and molded under pressure at a temp. sufficient to effect coagulating without carbonizing.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Researches on cellulose acetate and its solution. III. Stabilizer for cellulose acetate. Y. TANAKA AND K. ATSUKI. *J. Soc. Chem. Ind. (Japan)* 31, 416-20; Suppl. Binding 97B(1928).—See C. A. 22, 2473. Y. TOMODA

Commercial production of viscose. EARLE H. MORSE. *Rayon J.* 3, No. 2, 13-6, 39(1928).—The prepn. of the alkali cellulose is described. CHAS. E. MULLIN

Coördinating a paper-mill's demands for steam and power. J. C. HAYES AND O. C. CALLOW. *Power* 68, 664-6(1928).—Power and light are supplied by a semi-automatic water-turbine unit with a steam-turbine generator in reserve. Pulverized-coal fired boilers supply steam to this unit when required and to digesters and paper-machine engines. Exhaust steam at 25 lb. and live steam generated from wood refuse supplies the process demand. D. B. DILL

Composition for fireproofing paper (U. S. pat. 1,691,726) 18. **Size** [for use in the manufacture of paper] (Fr. pat. 637,476) 18. **Oxidized petroleum wax products** [for use in sizing paper and waterproofing strawboard] (Brit. pat. 287,514) 22. **Apparatus for determining the moisture content of paper webs** (U. S. pat. 1,690,155) 1. **Apparatus for evaporating cellulose waste lye** (Brit. pat. 286,982) 1.

Cellulose. HERMINGHAUS & Co. (Hermann Rathert, inventor). Ger. 466,383, Mar. 6, 1926. Cellulose is washed on the spools by equally distributing the washing fluid by capillary tubes and porous bodies.

Cellulose. LEON LILIENFELD. Ger. 467,003, May 20, 1924. See Brit. 231,801 (C. A. 19, 3592) and 231,806 (C. A. 19, 3593).

Cellulose. SIEMENS-SCHUCKERTWERKE A.-G. (Friedrich Schiebuhr, inventor). Ger. 466,384, May 21, 1926. A method of and app. for simultaneously spinning and twisting artificial silk filaments by rotating nozzles and rotating coagulating fluid are described.

Cellulose. SIEMENS-SCHUCKERTWERKE A.-G. (Hans Schultz, inventor). Ger. 466,386, May 8, 1927. Artificial silk spinning devices have exchangeable bottom plates for the inserted spinning heads.

Cellulose. SPINNSTOFFWERKE GLAUCHAU A.-G. and HEINRICH VOSS. Ger. 466,385, Nov. 13, 1925. The filaments are washed on the spools by forcing or sucking the washing fluid with air, gas or steam, through the layers.

Cellulose from sugar cane bagasse. E. C. H. VALET. Brit. 287,516, March 23, 1927. In a process such as that described in Brit. 277,163 (C. A. 22, 2465) the entire treatment is carried out within a single container. Numerous details are given.

Laminated fabric of cellulosic materials. ARNOLD PRINT WORKS. Brit. 287,669, Jan. 21, 1927. Two or more layers of cellulosic fabric are treated with caustic alkali and then with cuprammonium soln. and are held together during the treatment. An app. is described.

Digesting cellulosic material. EDMONDSON SPENCER. U. S. 1,690,954, Nov. 6. In prep. paper pulp, digesters are charged with cellulosic material such as bamboo, wood, reeds or grasses and digesting liquor such as caustic-sulfide liquor is introduced into one of the digesters to dissolve at least a portion of the sol. substances from the material, the resulting liquor is removed and liquor of greater concn. and higher temp. and under greater steam pressure is introduced into the digester and the process is similarly continued in successive stages and by use of the liquor in sequence in a series of digesters on the countercurrent principle. An app. is described.

Alkali cellulose. L. C. P. JARDIN. Brit. 286,619, March 4, 1927. Sheets of wood pulp or similar material, which are treated with a detd. porportion of caustic alkali soln. or the like are treated in such a manner that at the end of the operation the desired quantity of soln. remains in the sheets and they need not be subjected to pressing. An app. is described in which the sheets may be suspended on a weighing device and immersed in and sprayed with the treating soln. until they have absorbed the desired quantity of the soln. Brit. 286,620 describes an app. in which wood pulp sheets or rags or other materials may be disintegrated and moistened with a spray of caustic alkali soln. to effect the desired transformation.

Cellulose esters. HANS T. CLARKE and CARL J. MALM (to Eastman Kodak Co.) U. S. 1,690,620, Nov. 6. Esters are formed contg. a crotonate, cinnamate or other acyl group of a monocarboxylic acid having an ethylenic bond, *e. g.*, by treating cellulose (*e. g.*, tissue paper) with specified esterifying agents. Esters of this character are suitable for making highly flexible films. U. S. 1,690,621 specifies mixed esters contg. nitro groups and a halogen-substituted acyl group such as dibromobutyryl which are suitable for making films.

Cellulose ester composition for films, molded articles, etc. HARRY M. WEBER (to Ellis-Foster Co.). U. S. 1,690,515, Nov. 6. A cellulose ester such as cellulose nitrate is used together with a reaction product of a vegetable oil such as corn oil, China wood oil or blown rapeseed oil, an org. acid such as fatty acids from castor or soya bean and a polyhydric alc. such as glycerol and phthalic anhydride.

Cellulose esters of organic acids. H. T. CLARKE, C. J. MALM and R. L. STINCHFIELD (to Kodak, Ltd.). Brit. 287,880, March 28, 1927. Cellulose or a suitable cellulose conversion product or deriv. is treated with an org. acid and the corresponding anhydride, preferably in the presence of a solvent for both the acid and anhydride such as halogen acetic acid. Processes are described particularly suitable for the manuf. of mixed esters contg. acyl groups derived from aliphatic acids contg. 2, 3 or 4 C atoms and also acyl groups derived from aliphatic acids contg. more than 8 C atoms. The starting material may be undegraded cellulose, hydrocellulose, reverted cellulose and lower nitrates, acetates, formates or ethers. By use of the appropriate org. acid together with $Mg(ClO_4)_2$ the following esters may be obtained: propionates, butyrates, isobutyrate, valerates, isovalerates, caproates, heptylates, caprylates, pelargonates, caprates, laurates, myristates, palmitates, stearates, crotonates, cyclohexanecarboxylates, benzoates, *o*-methoxybenzoates, *o*-chlorobenzoates, acetylsalicylates,

phenylacetates, hydrocinnamates, cinnamates and mixed esters derived from stearic and acetic acids and from *o*-methoxybenzoic and acetic acids. Numerous details and examples are given.

Cellulose ester and ether solutions. I. G. FARBENIND. A.-G. Brit. 280,789, Dec. 10, 1926. Cellulose esters and ethers are dissolved in aq. solns. of compds. of the acetal type of polyhydric alcs., and other solvents, plastifying agents, dyes, etc., may be added. *E. g.*, cellulose acetate is dissolved in a mixt. of water 30 and glycerol monoformal 60 parts or water 20 and glycol formal 70 parts. The solns. may be used for making films, for printing or impregnating or as lacquers.

Esterification of cellulose. HENRI L. BARTHÉLEMY. Fr. 638,897, Dec. 28, 1926. Cellulose is pre-treated with warm AcOH vapors to soften the cellulose and then esterified with successive addns. in convenient quantities of the esterifying agent.

Esterification of cellulose. HENRI L. BARTHÉLEMY. Fr. 638,902, Dec. 28, 1926. Cellulose is esterified by org. acid anhydrides, particularly Ac_2O , in the presence of known catalysts such as H_2SO_4 and a compd. capable of liberating O, such as peracids or peroxides. Examples are given in which $\text{Na}_2\text{Cr}_2\text{O}_7$ and KMnO_4 are used. Fr. 638,903 describes a process of esterification in which the cellulose is previously treated with oxidizing agents such as peroxides or H_2O_2 in aq. alk. soln. Carbonates, silicates or soaps may be added to avoid the formation of alkali cellulose.

Apparatus for acetylating cellulose. HENRI L. BARTHÉLEMY. Fr. 638,900, Dec. 28, 1926. Cellulose is acetylated in a rotating vessel which presents discontinuous surfaces of contact such as a cube or parallelepiped or cylinder turning about an axis inclined to the axis of symmetry.

Cellulose acetate. HARRY LEB. GRAY and CYRIL J. STAUD (to Eastman Kodak Co.). U. S. 1,690,632, Nov. 6. Cotton or other suitable esterifiable cellulose material 100 is mixed with an esterifying catalyst such as H_2SO_4 and H_3PO_4 and with less than 250 parts of liquid Ac_2O (using at least the quantity theoretically required for fully esterifying the material) contg. less than 15% of solvent diluent, and a temp. of reaction is employed which is below the soln. point of cellulose acetate in the mixt.; the reaction is continued until the material is fully converted into CHCl_3 -sol. cellulose acetate in the undissolved state.

Apparatus for making sheets or films of cellulose acetate or similar materials. SPICERS, LTD., AND H. J. HANDS. Brit. 287,635, Dec. 23, 1926.

Cellulose ether compositions. I. G. FARBENIND. A.-G. Brit. 288,143, March 31, 1927. In working up compns. by heating, solvents are used which dissolve the cellulose ether used only when heated. On cooling, the soln. gelatinizes, or the ether seps. as flakes or grains, the hot soln. can be purified by filtering. Solvents which may be used for the higher ethyl cellulose ethers comprise benzene, ligroin and aromatic substances such as hydrotoluene or hydronaphthalenes or their mixts.

Treating (waste) sulfite cellulose liquor. BRITISH DYESTUFFS CORP., LTD., AND A. J. HAILWOOD. Brit. 286,808, Dec. 21, 1926. "Sulfite cellulose pitch" is subjected to heating under pressure with NH_3 soln. and the products obtained may be subjected to alk. reduction, as by use of NaOH and Zn . The products may be used as dispersing agents and protective colloids in making dye pastes which are to be dried to powder form and may be used also as tanning agents.

Charging pulp digesters, etc. PER A. FRESK. U. S. 1,690,192, Nov. 6. Mech. features.

Horizontal press for treating boards of alkali cellulose (used in the manufacture of artificial silk) or similar materials. WILHELM DÜTZMANN. U. S. 1,690,894, Nov. 6.

Artificial silk. B. BORZYKOWSKI (to Borvisk Syndicate, Ltd.). Brit. 287,073, March 12, 1927. In order to improve the strength and flexibility of artificial silk, the latter, after washing and while still on the winding bobbins, is treated with oil, oil emulsion, soap soln. or the like, *e. g.*, with a soln. of a "textile oil". This treatment enables the material better to withstand twisting, re-winding and similar operations without breakage of individual filaments.

Artificial silk. ERICH HEYMANN. Fr. 637,300, April 16, 1927. Artificial silk having a brilliant mat surface is made by incorporating in the spinning solns. of viscose, cuprammonia, or nitrocellulose, non-volatile or difficultly volatile substances such as mineral, animal or vegetable oils, fats or waxes, aniline, tetralin or nitrobenzene as fine emulsions or colloids, or solid substances insol. or only slightly sol. in the solns. may be used, such as oxide of Th, Mg soaps or Ca naphthenate. The added substances may be partly removed by solvents or by evapn. in vacuum.

Artificial silk. FABRIEK VAN CHEMISCHE PRODUCTEN. Brit. 287,540, March 24, 1927. In prep. cellulose esters such as the formate, acetate, propionate or aceto-

formate, the cellulose is first subjected to a partial formylizing with strong formic acid and ZnCl_2 or a salt of similar action. This treatment may be repeated and formylizing may be completed in the presence of HCl , sulfonyl chloride or P oxychloride. Ac_2O is used in making acetic or mixed esters. Various details are given.

Artificial silk, films, etc. HENRI L. BARTHÉLEMY. Fr. 638,896, Dec. 28, 1926. The coagulating liquid for cellulose ethers or esters is composed of either (1) hydrocarbons boiling higher than 80° such as toluene, xylene or the terpenes, (2) hydroaromatic compds. such as cyclohexane or tetrahydronaphthalene, (3) alcs such as EtOH , PrOH , glycol, glycerol or cyclohexanol, (4) fatty acids such as oleic or ricinoleic acid, (5) esters such as oleates, palmitates or stearates, (6) halogen compds. such as trichloroethylene pentachloroethane, or chlorotoluene, (7) nitriles such as benzonitrile or xylonitriles, (8) nitro compds. such as PhNO_2 , (9) mixts. of the above. Fr. 638,899 describes a process in which a coagulant having emulsifying properties is used, such as an ammoniacal soln. of an alkali salt of a fatty acid or sulfonated fatty acid. A hydrocarbon, mineral or vegetable oil or alc. may be added.

Artificial silk from the cellulose of sugar cane bagasse. E. C. H. VALET and O. FUNK. Brit. 287,461, March 19, 1927. Cellulose such as that obtained by the process described in Brit. 277,163 (*C. A.* 22, 2465) is used for making nitrates, acetates or xanthates or soln. in alkalies or ammoniacal Cu solns. for artificial silk manuf.

Viscose and artificial silk. I. G. FARBENIND. A.-G. Brit. 287,492, March 21, 1927. Cellulose xanthate is purified by treating with an alc. such as MeOH , dild. with a quantity of water insufficient to cause swelling of the xanthate. The treatment is rapidly effected at a low temp. and the sepd. purified material is suitable for artificial silk manuf.

Apparatus for making artificial silk. I. G. FARBENIND. A.-G. Brit. 286,603, March 5, 1927.

Apparatus for making filaments of artificial silk. H. KINDERMANN. Brit. 287,602, Nov. 23, 1926.

Apparatus suitable for making filaments of artificial silk of small "total titre." I. G. FARBENIND. A.-G. Brit. 287,862, March 24, 1927. In producing artificial silk of 120 deniers or less a pinning box is used of greater than usual diam. (over 160 mm.) and the speed of the box is adjusted in accord with its diam. so as to produce the desired twist on the thread. Various other details of operation are described.

Vertical cell construction for manufacture of artificial silk by the downward dry-spinning method. ACETA Ges. Brit. 286,608, March 3, 1927.

Apparatus for spinning artificial silk. I. G. FARBENIND. A.-G. Brit. 288,153, April 1, 1927. In producing fine threads the output of the app. is increased by providing 2 nozzles separately supplied with soln., at each spinning place. Various details of construction are described.

Centrifugal apparatus for spinning artificial silk. A. H. RAILING and H. J. ELEY. Brit. 286,927, Dec. 15, 1926.

Apparatus for spinning artificial silk by the box or "pot" spinning system. J. BRANDWOOD and T. W. HOLT. Brit. 287,183, Sept. 13, 1926.

Spinning artificial silk. RAYMOND A. J. TUÉNOZ. Fr. 638,993, Jan. 4, 1927. Between the spinning nozzles and the receiver for the finished thread are placed 2 rollers easily displaceable to be brought in contact with the thread at 2 points variable at the wish of the operator and capable of rotating in both directions. Fr. 638,994 describes rotating spinning nozzles having capillary channels for the cellulose ester or ether so inclined as to give to the threads an inclination approx. equal to that caused by rotation of the nozzles.

Apparatus for drying filaments formed from viscose or similar materials. SAMUEL A. NEIDICH. U. S. 1,691,165, Nov. 13.

Gear wheel pump for distributing viscose in artificial silk plants. ARMAND C. FREY. U. S. 1,691,713, Nov. 13.

Wood pulp. CARL B. THORNE. U. S. 1,691,682, Nov. 13. A preheated liquor such as a sulfite liquor is injected into wood chips in a digester against a substantially const. pressure derived from an external gas such as SO_2 , and circulation of the liquor in the digester is effected by pressure of the gas. An app. is described.

"Chemical pulp" manufacture. JOHN S. BATES. U. S. 1,691,511, Nov. 13. After settling kraft green liquor, the supernatant clear liquor is sepd. from the underlying dregs, and the clear liquor is causticized.

Drying device for paper or wood pulp. JOHN E. ALEXANDER. Ger. 466,409, Feb. 5, 1924. A device for drying paper or wood pulp in sheets is described.

Paper pulp. REX WM. HOVEY. Fr. 637,326, June 14, 1927. The charge in the

digester is kept at a const. temp. by continuously circulating the liquor, so that the lower sugars and part of the lignin are dissolved while almost all the cellulose and part of the lignins, the pentosans and complex sugars are preserved.

Apparatus for straining paper pulp. D. RUSSELL and J. R. HAPPER. Brit. 286,814, Dec. 28, 1926.

Beater for treating paper pulp. AMOS C. BONTELL. U. S. 1,690,661, Nov. 6.

Beater for paper stock. CHARLES R. SEABORNE. U. S. 1,691,308, Nov. 13.

Treating paper stock before compacting it. AGASOTE MILLBOARD CO. Brit. 286,948, July 2, 1927. Paper stock or like fibrous material is treated with water, tannic acid and a metallic soap (which may be prepd. from linseed oil, China wood oil or rosin) which may be formed *in situ* after beating the material, by the action of Al sulfate.

Paper. MASCHINENFABRIK A.-G. VORM. WAGNER & CO. AND EDUARD BÖHME & CO. Ger. 466,407, Mar. 15, 1927. Toothed rollers for a pulverizing and tearing machine are described.

Recovery of zinc chloride in paper making. I. G. FARBENIND. A.-G. (Udo Ehrhardt, inventor). Ger. 466,559, Sep. 16, 1926. $ZnCl_2$ is recovered from the waste liquor in the making of paper pulp by the addn. of Zn hydroxide and Cl in such a way that the liquor is alk. and the Fe is oxidized and removed. More Cl is then added to form $Zn(OCl)_2$ and finally an excess of Cl is added whereby $Zn(ClO)_2$ is formed. During the evapn. the org. compds. become oxidized.

Paper-making apparatus. JOHN C. CORCORAN (to Argy Preheating Corp.). U. S. 1,690,402, Nov. 6.

Paper-making apparatus. NICKOLAS J. NICKS. U. S. 1,690,203, Nov. 6.

Machine for making elastic paper. WM. A. LORENZ. U. S. 1,690,172, Nov. 6.

Increasing the elasticity and shrinkability of paper. DAVID GENESE (one-half to Wm. H. Orem). U. S. 1,690,631, Nov. 6. Paper is moistened with a soln. of H_2BO_3 and dried under heat and pressure.

Apparatus for washing paper after parchementizing, etc. P. ERKENS. Brit. 286,506, May 9, 1927.

"Art paper." SIEBENHIRTNER CHEM. INDUSTRIE-WERK GES. Brit. 287,559, March 24, 1927. A paper of high gloss and pure white color is obtained by adding to the pulp a paste consisting of sapond. stearin to which is added a heavy metal salt such as $ZnSO_4$. K or Na silicates also may be added.

Waterproof paper board. EDMUND BACHE (to Waldorf Paper Products Co.). U. S. 1,691,752, Nov. 13. A quantity of bitumen emulsion is prepd. in which the emulsoid particles carry an electronegative charge, paper pulp is prepd. carrying an electropositive charge on the fibers, and the emulsion and pulp are intimately mixed uniformly to distribute the bitumen upon the surfaces of the paper fibers.

Drying paper in folio. EUGEN A. ALBRECHT. Ger. 466,786, Sept. 25, 1924. The paper is carried through a drying chamber by an arrangement of bands and rollers.

Paper formed by use of kelp. A. L. KENNEDY (to Plastic, Inc.). Brit. 287,538, March 25, 1927. See Can. 280,789 (C. A. 22, 3045).

Extraction of fibers from plants. CARL LEYST-KÜCHENMEISTER. Ger. 466,276, Oct. 4, 1925. Straw, esparto grass, maize straw and similar substances are split, roasted and steamed under pressure. They are then treated with hot sulfite- or sulfate-contg. liquor and dried.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

A new permissible explosive. B. L. STROOPS. *Chem. Met. Eng.* 35, 676(1928).—As high explosives were first offered for use in mining coal they were so coned. as to shatter the coal. To overcome this, bulky matter such as balsa dust or sugar-cane pulp were introduced but they were so absorbent for the nitroglycerin as to render the product insensitive to detonation. By soaking the sawdust in a soln. of NH_4NO_3 and drying, the salt crystallized on the surface of the dust and prevented the absorption of the nitroglycerin, but the drying of this nitro-soaked dust is tedious and dangerous. Success has been reached by mixing 20 pts. of $Mg(NO_3)_2 \cdot 6H_2O$ with 80 pts. NH_4NO_3 , heating so that both salts are dissolved in the water of crystn., incorporating the balsa sawdust in the melt and allowing the whole to cool, when a bulky dry mass is at once obtained which forms an admirable dope for a coal-mining explosive, and such a compn. has passed to Permissibility. Where for the older powder there were but 370 cartridges in 100 pounds, for this new permissible there are 500 or more. C. E. M.

The gaseous explosive reaction at constant pressure. The effect of inert gases. F. W. STEVENS. *J. Am. Chem. Soc.* 50, 3244-58(1928).—See C. A. 22, 2058. E. H.

The decomposition of powders and explosives and the theory of stabilizers. HENRI MURAUOUR. Ingénieur en chef des Poudres. *Chimie et industrie* 20, 610-7(1928).—The deterioration of powders and explosives is apparently due to a slow hydrolysis, taking place at atm. temp., of the nitric esters under the action of traces of HNO_3 formed in the course of manuf., the rate of the phenomenon being gradually accelerated by autocatalysis. This reaction is unaccompanied by evolution of gases, and is therefore essentially different from the decompn. reaction observed when nitric esters are raised to a high temp. as in the usual stability tests. The thermal decompn. reaction does not seem to be involved in the decompn. which takes place at atm. temp. The chief function of stabilizers is to form neutral compds. with the traces of oxygenated N compds. formed during manuf. A. PAPINEAU-COUTURE

Guncotton from cellulose. G. PANDELE. *Notiz. chim.-ind.* 3, 631-2(1928).—Because of the shortage of cotton in Italy, during the war a guncotton was produced from cellulose by using 67.2% H_2SO_4 , 24.3% HNO_3 , 8.5% H_2O and allowing nitration to proceed 90 min. It contained 12.1-12.2% N, whereas the product from cotton shows 13.36% N. A. W. CONTIERI

The origin of gunpowder. ALBERT HAUSENSTEIN. *Z. ges. Schiess-Sprengstoffw.* 23, 229-33, 276-9(1928).—A discussion of the early history of black powder and its use in warfare and in mining in various countries. Evidence is presented that Berthold Schwarz was the first to use black powder as a propellant in fire arms, in the year 1313 in Freiburg, Germany. C. G. STORM

Pentaerythritol tetranitrate-nitroglycerin mixture as a shell and detonator explosive of highest brisance. ALFRED STETTBACHES. *Z. ges. Schiess-Sprengstoffw.* 23, 345-8(1928); cf. C. A. 22, 2991.—The tendency, especially of the very fine crystals of pentaerythritol tetranitrate, to explode on pressing to high densities, is thought to be due to adiabatic compression of air held in the mass of fine crystals. This tendency is overcome by admixt. of 20-30% of nitroglycerin. Such mixts. reach their max. d. of 1.69-1.70 at 600 atm. pressure. Tests on iron plates up to 8 mm. in thickness showed that such mixts. have higher brisance, as indicated by perforations of the plates, than nitroglycerin, guhr dynamite, picric acid or TNT. Detonating fuse made with a granular mixt. of pentaerythritol tetranitrate and nitroglycerin detonates at a rate of 7000 to 8000 m./sec. C. G. STORM

Standard methods of analyses of mercury fulminate, 5 pages; Standard methods of examination of ammonium nitrate 8 pages; of trotyl (TNT), 6 pages; of amatol, 5 pages and of picric acid, 6 pages. A. E. SLEIGHTON. *Australian Dept. of Defence, Munitions Supply Board*, May, 1926.—Each of these pamphlets sets forth in minute detail the analytical and other tests which the particular explosive treated of must pass to conform with the Governmental specifications. CHARLES E. MUNROE

Photographic study of detonation in solid explosives. I. Development of a photographic method for measuring rates of detonation. ELWYN JONES. *Proc. Roy. Soc. (London)* A 120, 603-20(1928).—Photographic records give the rate of movement of the detonation zone along the surface of an explosive cartridge and differences existing between the "surface" and "axial" rates of detonation are considered. Under certain conditions, the disturbance set up in the surrounding medium may cause distortion of the photographic records of the detonation phenomenon. A method of overcoming this is described. Under certain circumstances the disturbance set up outside an explosive cartridge placed in a gaseous medium travels faster than the detonation phenomenon in the cartridge. The contour of the disturbed region surrounding a particular cartridge of explosive was approx. detd. at definite intervals from the instant at which the disturbance was first initiated. Photographic detns. of velocities of detonation agree with those obtained by the Dautriche method. Some results are tabulated to illustrate the two stable velocities of detonation peculiar to the gelatinous explosives and the effect of the nitroglycerin content of a powdered explosive on its velocity of detonation. A method is given for detg. the approx. duration of the detonation phenomenon over a transverse section of a cartridge. The stable form assumed by the detonation front inside a 7.6-cm.-diam. cartridge of a certain explosive was detd. G. CALINGAERT

The dependence of detonation velocity on initial impulse. H. HENKEL. *Z. ges. Schiess-Sprengstoffw.* 23, 354-5(1928).—A discussion of the manner of functioning of detonators, and of the influence of such factors as d., granulation, H_2O content, etc., of the detonator charge, on its efficiency. The Pb plate test for detonators is unreliable because the effect on the plate is increased if the detonator is not in direct contact

with the plate. A detonator in which the charge has the form of a cone is advocated to increase the initial impulse imparted to the explosive to be detonated. C. G. S.

Are flame safety lamps suitable for detecting petroleum vapors? A. B. HOOKER, W. P. YANT AND D. H. ZELLERS. Bur. of Mines. *Information Circular* 6083, 6 p. (1928).—The changes in the flames of safety lamps so vary with circumstances, are so slow to react and are so difficult to observe, that the flame safety lamp is deemed unsuitable for testing for small percentages of inflammable gases and vapors in and about petroleum tanks.

CHARLES E. MUNROE

Fire in the powder factory at Hasloch a. M., July 14, 1928. J. BODEWIG. *Z. ges. Schiess-Sprengstoffw.* 23, 348-50(1928).—The fire, of unknown origin, started in a dry-house of the smokeless sporting powder factory, destroyed this building and two other dryhouses, in spite of fire-walls and barricades, and then spread to numerous other factory buildings. Static electricity is suggested as a possible cause of ignition of the powder. Two men inside and 2 outside of the dryhouse where the fire originated, were killed. No others were in the immediate vicinity. This factory has suffered 2 previous fires within the 2 preceding years.

C. G. STORM

The velocity of flames in complex gaseous mixtures of low inflammability in a closed vessel. KIYOHICO YUMOTO. *Bull. Inst. Phys. Chem. Research (Tokyo)* 7, 957-73(1928); *English Ed.* 1, 93.—The flame velocity in complex gaseous mixts. of low inflammability was studied kinematographically by the Schlieren method. The expts. were carried out in a closed cylindrical vessel of 6.9 cm. diam. and 5 cm. length. For mixts. of H and air contg. an excess air, the speed of flame propagation is never const. In mixts. of CO and air with an excess of air, the speed of the flame is approx. uniform within a certain travel. Various mixts. of H and air and of CO and air had nearly the same av. speed. The mean velocity of mixts. of CO, H and air was appreciably higher.

A. L. HENNE

Lessons of the last explosions in blast-furnace plants. ALFONS WAGNER. *Stahl u. Eisen* 48, 1153-9, 1200-8(1928).—The explosion of a blast furnace at Völklingen is described in detail and the opinion of a great no. of blast-furnace experts is given as to the possible cause of the explosion. All seem to agree that it was a coal-dust explosion, probably caused by the sudden endothermic reaction between fine pyrophoric C, formed according to the equation $2\text{CO} \rightleftharpoons \text{CO}_2 + \text{C}$, and the downrushing oxidic ores, falling from a scaffold in the upper part of the shaft. A scaffold in the upper part of the shaft of a blast furnace is very dangerous. Various methods are advanced and discussed for the prevention of scaffolding and for the increase of the resistance to explosion of the shaft. The explosion of the cold-blast main at Oberhausen was caused by the presence of explosive gas mixt. in the main, during the reversal of the hot stoves, when the valve of the blast main was not closed properly. This explosion danger is eliminated if the mixed blast main is led into the hot blast main, so that the same valve will close both hot and cold blasts. Various possible installations are shown. A discussion of the paper is given.

J. A. SZILARD

Explosive charges for projectiles. O. MATTER. *Brit.* 287,906, March 29, 1927. Bullets for destroying barbed wire or other obstacles (for use with rifles or machine guns) have a thin-walled casing which is filled with high explosive such as trinitrotoluene and are provided with a detonator compn. such as Hg fulminate at the front of the projectile.

Nitroglycerin dynamite. THOMAS O'HERN (to Arthur T. O'Hern). U. S. 1,690,872, Nov. 6. A 60% nitroglycerin dynamite comprises NaNO_3 64, infusorial earth 30, wood flour 20, KNO_3 3, ground MgCO_3 3 and nitroglycerin 180 parts.

Use of lead trinitroresorcinate in priming compositions for explosives. J. E. BURNS (to Remington Arms Co.). *Brit.* 287,517, March 23, 1927. Various mixts. are described which are stated to produce no corrosion of the gun barrel.

25— DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Early documentary references on the use of dyestuffs in America. C. A. BROWNE. Bureau of Chemistry, Washington. *Am. Dyestuff Rept.* 17, 696-700, 712, 739-40(1928).—An interesting account, including quotations from Governor Winthrop's note book, is given of the prepn. and application of indigo, cochineal, galls, madder, redwood and lute as used from 1630 to 1700. During the following century black was obtained from *Alea spicata*, *Acer rubrum*, *Rumex acetosella* and logwood, copperas or alum being used

as mordants; blue from indigo; red from *Sanguinaria canadensis*, *Rhus glabra* and *Rubia tinctorum*; yellow from saffron, birch bark, apple bark, barberry and many other plants; orange from sassafras; brown from the barks of butternut, walnut, white oak and other trees; scarlet and purple from *Phytolacca decandra*. Interesting formulas for dyes as used in the first half of the 19th century are quoted. L. W. RIGGS

The choosing of dyestuffs. C. WESTGATE. *Dyer, Calico Printer* 60, 118-8, 138-9, 182-3(1928).—General. Suggestions are given for a classification of dyes with regard to light fastness, for decreasing the cost of production and for the simplification of dye nomenclature. RUBY K. WORNER

Testing the fastness properties of dyestuffs—methods adopted. J. STEPHEN HEUTHWAITE. *Textile Colorist* 50, 311-5(1928).—Fastness to laundering and to weather are considered. Methods are given. RUBY K. WORNER

Fading of dyestuffs on textile fabrics. J. J. HEDGES. *J. Soc. Dyers Colourists* 44, 341-6(1928); cf. *C. A.* 21, 3746; 22, 1478.—The results given in this and previous papers show the abs. necessity for control of humidity in the testing of all textile fabrics for fastness to light. Unless tests are carried out with some form of fading lamp in which conditions are under control, as in the Fugitometer, the results may be misleading. Temp. must be considered equally with humidity in fastness tests. With most of the lamps used for testing light-fastness of colored fabrics the exposed patterns become very hot. This alone would increase the rate of fading, but in addn. the regain is lowered and tends to decrease the rate. Accordingly in the efficient fadeometer both humidity and temp. must be under control. The exptl. data treated mathematically yield an equation connecting fading, time and regain for a given dyeing, and from this equation it is possible to calc. the amt. of fading that would take place at other regains and for other times of exposure. L. W. RIGGS

Textiles and dyes abroad. CHAS. E. MULLIN. *Clemson Coll. Proc. Am. Assoc. Textile Chem. Colorists* 1928, 253-7; *Am. Dyestuff Rept.* 17, 719-23.—An account is given of textile research abroad. The need of greater attention to textile research in America is emphasized. L. W. RIGGS

A red dye from West African Guinea corn. C. D. MELL. *Textile Colorist* 50, 268(1928).—The bright red dye, used extensively by the natives for dyeing leather, is obtained from *Sorghum guineense*, variety robustum. It is held chiefly in the leaf-sheaths, which are tinged with a deep red-purple color. RUBY K. WORNER

The ancient Kendal Green. DAVID PATERSON. *Dyer, Calico Printer* 60, 159, 184-6(1928).—This article is "the result of a little research into its history and method of dyeing." RUBY K. WORNER

Influence of the anions of the mordant on the shade of alizarin red lake. P. P. VIKTOROV. *J. Soc. Dyers Colourists* 44, 336-41(1928).—The influence of the anions of the mordants is due to a combination of varied effects, including the reducing action of the mordant itself, the reducing action resulting from the interaction of the mordant and the thickening during steaming, the rapidity of the hydrolysis of the mordant, etc. Additions, such as basic Al chloride, As_2O_3 , etc., intended to increase the brightness of the shade, owe their action to a variety of causes. They behave as reducing agents, they increase the reducing properties of thickening agents and regulate the rapidity of the hydrolysis of the mordants. Thiocyanates prevent the introduction of Fe salts into the printing paste, but if the Fe is already present, they are unable to exert any compensating action. L. W. RIGGS

Piece-dyeing machines. ANON. *Textile Colorist* 50, 333-4(1928).—An illustrated description is given of the new Monel-metal dye beck built by the Klauder-Weldon Dyeing Machine Division of H. W. Butterworth & Sons Co., Philadelphia. R. K. W.

New piece-dyeing process. THEODORE J. BACHOFEN. *Rayon* 7, No. 8, 52-3(1928).—A new type of machine on which the cloth is wound on a reel for dyeing is described. CHAS. E. MULLIN

Studies on mordanting and dyeing processes. VI. EGON ELÖD, E. PIEPER AND E. SILVA. *Z. angew. Chem.* 41, 14-6(1928); cf. *C. A.* 21, 1887.—Silk treated with $SnCl_4$ and then H_2O takes up 9-43% SnO_2 , depending on concns. The various combinations give x-ray spectrograms of both SnO_2 and silk, but no other spectrograms, indicating the absence of any cryst. compd. of Sn with protein. In combinations contg. 30% or more SnO_2 the spectrogram of the SnO_2 masks that of the silk. The treatment of unweighted silk with a ripened SnO_2 sol results in a fixation of SnO_2 , the spectrograms obtained being the same as in the foregoing cases. The SnO_2 is not removed by dil. HCl, which condition the authors attribute to the impossibility of diffusion of the large particles of SnO_2 through silk filaments, such a theory being supported by the fact that SnO_2 sols of similar dispersity are not absorbed. $Cr(OH)_3$ is fixed to silk in a similar manner.

The formation of SnO_2 occurs by 2 processes, first, by shifting of the hydrolytic equil. of SnCl_4 soln. by the protein chloride formation, and, second, by further pptn. due to hydrolysis during washing. $\text{Cr}(\text{OH})_3$ is fixed mainly according to the first step, as Cr salts are less susceptible to hydrolysis. VII. EGON ELÖD AND E. PIEPER. *Ibid.* 16-9; cf. C. A. 20, 3574; 21, 4073.—Wool and silk, being amphoteric, tend to reach their isoelec. points when warmed in alk. or acid solns. Thus, the presence of basic or acid dyes does not affect the final p_H . With wool the basic dye taken up increases with increase of p_H up to 10; above this there is a decrease due to an increase (observed ultramicroscopically) in the size of dye particles, without influencing the nature of the change in p_H value. With an acid dye the max. dye is taken up at a p_H of 2, above which there is a decrease due to increase in size of dye particles. The curve showing the relation between dye absorbed and final p_H value is continuous, there being no break at the isoelec. point; this indicates that the taking up of dye by wool or silk is due not entirely to the formation of protein salts, but also to adsorption. Weighted silk behaves similarly to unweighted silk with respect to the taking up of dye, but its isoelec. point is lower. Deaminated silk takes up more basic and less acid dye than silk, and also has a lower isoelec. point.

FREDERICK C. HAHN

Studies of mordanting and dyeing phenomena. VIII. E. ELÖD AND E. SILVA. *Z. physik. Chem. Abt. A*, 137, 142-75(1928).—E. and S. consider single-bath chrome tanning of hides, tin weighting of silk, mineral mordanting of wool and the acid dyestuff dyeing of animal fibers to be very similar phenomena. In the systems investigated the conditions were found to be suitable for existence of Donnan membrane equil. The acid-binding power of hide and wool with varying p_H values agrees with Procter and Wilson's work and with Loeb's data for swelling of gelatin. The action of acid dyestuffs on hide substance and wool depends on the taking up of dyestuff anions, which is influenced by the p_H of the bath, added electrolytes and dyestuff concn. The conditions for max. uptake of dyestuff from soln. are calcd. and agree with expt. Single-bath chrome tanning is due to the hydrolysis of the Cr salt and agrees exactly with the Donnan theory. In mineral mordanting of wool and tin weighting of silk there is a hydrolysis accelerated and increased by the membrane action of the org. materials.

CHAS. E. MULLIN

The effect of printing, discharging and stripping agents on muslin. I. Rongalit groups and Decroline. H. UDAKA. *J. Soc. Chem. Ind. (Japan)* 31, 374-81; Suppl. Binding, 87-8B(1928).—The actions of Rongalit groups and of Decroline on muslin were investigated. The tensile strength and the elongation of muslin decreased with the increase of the concn. of Rongalit C and ZnO and of the time of steaming. ZnO promoted the lowering of the elongation of muslin and seemed to prevent the depression of the tensile strength. Distinct differences were observed between the effect of fresh Rongalit CW and that of an old one that had been kept for 1 year, i. e., the former showed little effect on the tensile strength and elongation of muslin, whereas the latter showed a serious effect. Decroline in AcOH soln. did not lower the tensile strength and elongation, but it did in the aq. soln. Rongalit C and Zn powder had less effect than Rongalit C and ZnO . II. Blankit, hyposulfite, sodium bisulfite and steaming pressure. *Ibid.*

382-6; Suppl. Binding, 88B.—Blankit and ZnO, hyposulfite and ZnO decreased the tensile strength and the elongation of muslin greatly, but NaHSO₃ and Zn powder had little effect. The steaming pressure of printing affected more or less the tensile strength and the elongation of muslin that had been treated with those reagents above mentioned. **III. The aging test.** *Ibid* 386-8; Suppl. Binding, 88B.—Aging damaged slightly the muslin treated with the stable hyposulfite groups, *i. e.*, Rongalit C, CW, CL and Decroline, but scarcely those treated with the unstable hyposulfite groups, *i. e.*, Blankit, hyposulfite, etc. The elongation of the treated muslin increased generally with aging. Notes on the action of tans on silk. FRED. GROVE-PALMER. *Textile Colorist* 50, 242-4(1928).—A series of expts with all the different kinds of tannin readily obtainable shows that a full velvety black is best given by a combination of two tan exts., chestnut (Best French) and divi divi. Two tables are given, one listing the tans used and describing the colors obtained, the other showing the amount of weighting put on at differ-

ent temps. with chestnut and divi divi alone and in combinations. The behavior of different varieties of silk is an important consideration. RUBY K. WORNER

Tenacity and elongation of artificial silks. P. E. KING AND E. N. JOHNSON. Leeds Univ. *J. Soc. Dyers Colourists* 44, 346-50(1928).—The corrected tenacities, both dry and wet, viscose silk vary considerably, but with the finer counts the wet tenacity is higher than with coarser counts. This is desirable as in any case the gross strength of the coarser counts is greater than that of the finer ones. With the fine filament cuprammonium silk the elongation both dry and wet is about half that of viscose silk, whereas the tenacity is somewhat greater. With cellulose acetate silk the tenacity, although less than that of viscose silk when dry, is practically the same as that of wet viscose silk. The tenacities are const. for both high and low counts. The elongation is higher than for viscose silk. The elongation of Chardonnet silk is of the same order of magnitude as that of the cuprammonium variety. L. W. RIGGS

Physical properties of rayon. CHARLES S. FOWLER. *Rayon* 7, No. 7, 7-8, 16, 33 4(1928).—A general discussion stressing the importance of research. C. E. M.

Effect of oil on rayon. HENRY W. NICHOLS. Bradford Durfee Textile School. *Rayon J.* 3, No. 4, 26, 40(1928).—As it is common practice to oil rayon in the mills, expts. were conducted to det. the effect of the oil upon the strength and stretch of the rayon. Four tables are given comparing the (I) "yield break" or load in lbs., at which the stretch becomes excessive, (II) % stretch at the yield point, (III) "rupture break" or tensile strength in lbs. and (IV) percentage stretch at rupture, of 7 diff. 150-denier rayon yarns at 39% relative humidity and 21°C. with 0.62, 1.47, 2.70, 3.60, and 4.95% of added oil in the yarns, as well as without added oil. While conclusions may be drawn from these tables, "it is unfortunate that there does not appear to be any general law that can be derived from these results with the exception perhaps in the case of table I." With only one exception, the "yield break" was greatest when 0.62% oil was present. These yield breaks were also in every case greater than those obtained with non-oiled samples. Most of the samples showed a greater % of stretch when oiled with 0.62% oil than in any other condition. In one case the % stretch was slightly less with 0.62% oil than without oil. In 2 cases the max. stretch was obtained with 1.47% oil. In table III, "rupture break," less favorable results were obtained with 3.6% of oil on 4 samples than with any other amt. One gave best results with 4.95% oil. Results varied widely and no law can be stated. Table IV gives even more variable results as to the % of stretch at the break, the variations extending over the entire range with the exception of 0.62% of oil, which did not give the optimum result in any case. In this table 5 samples gave the best results when oiled. CHAS. E. MULLIN

Boiling-out and bleaching rayons. THOMAS F. HUGHES. *Rayon* 7, No. 6, 12, 14(1928), cf. *C. A.* 22, 1891.—Scouring and bleaching goods containing rayon and colored yarns are discussed. CHAS. E. MULLIN

Wool oils and their removal or the scouring of wool piece goods. CHAS. E. MULLIN. Clemson College Textile School. *Textile Colorist* 50, 451-6(1928).—A discussion of the scouring properties of wool oils, the scouring of woollen and worsted pieces, the effects of soap and soda in the scour, the temp. and pH effects, solvent scouring agents, the "break" in continuous scouring, the pH and cond. of scouring soles. at the break, and the theory of detergent action. CHAS. E. MULLIN

The effect of heat on cotton. Initial changes in tensile strength of unproofed fabric. A. H. TILTMAN AND B. D. PORRITT. *India Rubber J.* 76, 245-8(1928).—There is a serious lack of published data on the effect of heat on cotton in the presence of air and moisture, and yet cotton fabrics are as important as rubber in the construction of automobile tires. For this reason expts. were begun to det. the effect of temps. comparable with those during vulcanization on the structure, strength and durability of cotton fabrics. In these initial expts., cotton fabric of a construction suitable for precise testing was heated in air and *in vacuo* at different temps. up to 240° and afterward was exposed for some hrs. to air of a humidity close enough to the original humidity to make the tests comparable on this basis. After equil. was reached, the stretch and strength (*i. e.*, the stress-strain curves) of the samples were detd. Permanent weakening of the fabric was roughly proportional to the time of heating. The effect of heating became manifest at 115-20°, and loss of strength increased with increase of temp. until complete loss of strength occurred around 240° after 4 hrs. of heating. Heating in air was far more injurious than heating *in vacuo*; *e. g.*, the losses of strength after 4 hrs. at 160° were around 17% and 7% in air and *in vacuo*, resp. Preliminary removal of air prior to vulcanization might therefore increase the durability of fabric in vulcanized rubber products. Heating did not influence materially the elastic properties of the fabric, but only its breaking strength. C. C. DAVIS

Modern methods in boiling out cotton piece goods. RICHARD CAMERON. *Textile Colorist* 50, 326-7(1928).—Descriptive. RUBY K. WORNER

A study of the boiling and bleaching of cotton. V. KACZKOWSKI AND N. KROL. Polytechn. School of Warsaw. *Tiba* 6, 1255-61(1928).—From biol. considerations, the presence of fats and waxes in raw cotton is thought to be due to contamination by the oil of the seed rather than to be due to their direct elaboration in the fibers by the plant. The other non-cellulosic so-called impurities of raw cotton consist of pectic compds. constituting intermediate stages in the elaboration of cellulose. It has been found that cotton can be subjected to the action of very strong alk. (16-60% NaOH) or acid (up to 60% H₂SO₄) solns. without impairing its strength, provided the treatment is carried out in such a way as to prevent all contact with O. With weaker alkali (below 16% NaOH) there is tendency for the cotton to dissolve and the strength is impaired. In the bleaching process as usually carried out, the acidification which generally follows treatment with an oxidizing agent is generally considered to act by liberation of HOCl, but the amt. of the latter is so small that its action is practically undetectable; on the other hand, it has repeatedly been observed that the color is improved by prolonging the acid treatment, which K. and K. attribute to more complete hydrolysis and soln. of the last traces of fats, etc., by the acid. Equiv. results are more difficult to obtain with strong NaOH solns. because it forms a slimy film on the fibers, which makes it difficult to obtain proper and uniform wetting and penetration of the goods. It is suggested that washing with soap after the acid treatment, which is not used in practice (except in the Mohr process), could be used to advantage, as in lab. tests it has always given excellent results. A. PAPINEAU-COUTURE

The control of the bleaching of cotton. S. R. TROTMAN. *Textile Recorder* 45, No. 540, 65, 67; No. 541, 57, 59; 46, No. 542, 67; No. 543, 61, 63; No. 545, 64(1928).—The methods given in the literature for detg. copper number, methylene blue number and viscosity are critically reviewed and the relation of these properties to degree of oxidation is discussed. RUBY K. WORNER

Shrinkage of cotton woven materials. GEORGE H. JOHNSON. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 259-65; *Am. Dyestuff Rept.* 17, 725-31.—The amt. of shrinkage varies with the material. Moisture is the controlling factor in shrinkage, without it there is no shrinkage. An increase in the washing temp. has little effect on the rates of shrinkage, and the presence of soap, Na₂CO₃, NaOH or NaCl has no effect on the shrinkage. The warp shrinkage is generally, but not always, greater than the filling shrinkage. Varying amts. of agitation have no effect on the shrinkage of woven cotton goods. Approx. the same shrinkage occurs during 2 20-min. as during 2 55-min. washings. About 85% of the warp shrinkage occurs during the first washing regardless of the washing method used. From 65 to 85% of the shrinkage obtained is due to the moisture or soaking factor alone. The presence of sizing lowers this percentage. Pressing with a hand iron tends to stretch the fabric slightly, but will never overcome excessive warp or filling shrinkages. Any fabric that is tailored to fit should be previously shrunk. A gain in yardage during finishing means a corresponding shrinkage during washing. If a cotton fabric is going to shrink, nothing can be done during laundering to prevent it. L. W. RIGGS

The Launder-ometer. HUGH CHRISTISON. *Proc. Am. Assoc. Textile Chem.*

Colorists 1928, 265-8; *Am. Dyestuff Rept.* 17, 731-4.—The Launder-ometer is a machine for making standard laundry tests. Its construction and uses are described. L. W. R.

Dyes. I. G. FARBENIND. A.-G. Brit. 286,602, Dec. 14, 1925. Halo- or methyl-dibenzanthrones are obtained by treating with alk. condensing agents Bzl, Bzl'-dibenzanthronyls contg. halogen or methyl groups but not substituted in the 2- and 2'-positions. The reaction may be effected with alc. potash at temps. slightly over 100°. Examples are given of the production of intermediates as well as the final products.

Dyes. I. G. FARBENIND. A.-G. Brit. 286,669, March 8, 1927. Vat dyes of the anthanthrone series are made by condensing a halogenated anthanthrone with an aminoanthraquinone (or a deriv. or substitution product) in the presence of an acid-binding substance and a catalyst such as Cu or a Cu compd. Examples are given for producing dyes giving on cotton from the hyposulfite vat various shades of gray, blue and brown.

Dyes. I. G. FARBENIND. A.-G. Brit. 286,717, March 10, 1927. Substantive azo dyes are made by coupling tetrazotized 4,4'-diaminobiphenyl-3,3'-dicarboxylic acid or a deriv. with an aryl naphthylaminosulfonic acid or a deriv. and with another coupling component contg. a sulfo, carboxy, OH, NH₂ or ketomethylene group which gives soly. in water. The couplings may be in different sequences and in the presence of pyridine. The dyeings may be rendered faster by after-treatment with metal salts such as those of Cu. Several examples of blue and reddish violet and green dyeings are given.

Dyes. I. G. FARBENIND. A.-G. Fr. 638,269, May 25, 1927. New vat dyes are produced by reacting the halogen or other negatively substituted derivs. of *allo-ms*-naphthodianthrones, *ms*-anthradianthrones, *ms*-benzodianthrones, *ms*-naphthodianthrones, dibenzanthrones or isodibenzanthrones with N compds. contg. at least one H atom attached to the N capable of reacting, preferably in the presence of solvents or diluents, and with or without catalysts or acid-binding agents. The N compds. belong preferably, and with the *ms*-naphthodianthrones exclusively, to the anthraquinone series. New vat dyes are also obtained by replacing some or all of the halogen atoms in polyhalopyranthrones by N radicals contg. a H atom attached to the N capable of reacting. In examples, tetrabromo-*allo-ms*-naphthodianthrone is boiled with α -aminoanthraquinone in the presence of PhNO₂ and NaOAc, giving a compd. which dyes cotton a fast blue-marine from the vat. Tribromopyranthrone is boiled with α -aminoanthraquinone in the presence of PhNO₂ and NaOAc; the product gives dark violet shades on cotton from the vat. Similarly dichlorodibenzanthrone is heated with 1,4-aminomethoxyanthraquinone with the addn. of CuCO₃, giving gray-blue to blue-black shades of great fastness on cotton. Several other examples are given.

Dyes. I. G. FARBENIND. A.-G. Fr. 638,772, Aug. 3, 1927. Very fast dyes giving violet red to violet-blue shades on wool are obtained by the action of compds. yielding Cr on α -hydroxyazo dyes from diazotized 4-chloro-2-aminophenol and naphtholmono-sulfonic acids. Valuable complex Cr compds. are also obtained from α -hydroxydiazo compds. and 2,4-dihydroxyquinoline, giving brown-red to red or violet shades. Instead of the α -hydroxyazo compds. themselves the derivs. contg. alkyloxy groups instead of OH groups may be used under such conditions that the alkyl group is eliminated. In examples, the dye from diazotized 4-chloro-2-aminophenol and 2,6-naphtholsulfonic acid is heated in aq. soln. with a paste of Cr₂O₃ and HCOOH. The dye from diazotized 4-chloro-2-aminophenol-6-sulfonic acid and 2,4-dihydroxyquinoline is similarly treated.

The dye from diazotized *o*-phenetidine and 1,5-naphtholsulfonic acid when similarly treated gives the same product as from *o*-aminophenol and 1,5-naphtholsulfonic acid but in a purer state. Other examples are given.

Dyes (halogen derivatives of anthanthrone). L. CASSELLA & Co., Ges. Brit. 287,020, Nov. 3, 1926. The process described in Brit. 260,998 (C. A. 21, 3467) is modified by carrying out the halogenation with an excess of liquid halogen or halogenating agent as diluent, or by using the halogenating agent in gaseous form without a diluent, or by employing successive chlorination and bromination or *vice versa*, or by use of sulfonyl chloride as a chlorinating agent (suitably in PhNO_2 in the presence of I or FeCl_3). Various examples are given.

Dyes. SOC. ANON. POUR L'INDUSTRIE CHIMIQUE À BAËLE. Ger. 466,535, May 23, 1923. Addn. to 453,087. Indigoid dyes are prepd by condensing 2,1-naphthohydroxythiophene with the anil or halide of cyclic ketones, except β -naphthisatin chloride and halogenating the product. In examples, 2,1-naphthohydroxythiophene is condensed with (1) the *p*-dimethylamino-2-anil of benzothiofuran-1,2-dione; the product dyes cotton a Bordeaux shade. By treating with Br a redder dye is obtained. With (2) the 2-dibromide of benzothiofuran-1,2-dione, the product dyes cotton a Bordeaux shade.

Dyes. RAYMOND VIDAL. Fr. 639,034, Jan. 8, 1927. See Brit. 283,468 (C. A. 22, 4257).

Azo dyes. I. G. FARBERIND. A.-G. Brit. 287,479, March 21, 1927. Azo dyes fast to kier-boiling, to Cl and to light are produced by coupling a diazotized dihalo-*m*-toluidine with a component capable of being taken up by the fiber such as an arylide of 2,3-hydroxynaphthoic acid or of a β -ketocarboxylic acid. Numerous examples are given.

Azo dyes. I. G. FARBERIND. A.-G. Brit. 287,651, Jan. 5, 1927. The process for dyeing cellulose acetate described in Brit. 262,537 (C. A. 21, 3751), by treating with a mixt. of a diazotizable amine, coupling component and nitrite and, after wringing, developing the dye in an acid bath, is applied to the dyeing of pelts, hairs, feathers or similar materials. In a modification of the process (applicable also to cellulose acetate) the dye is developed in the original bath by addition of acid. Numerous examples and further modifications are described.

Azo dyes. I. G. FARBERIND. A.-G. Fr. 637,383, July 9, 1927. Azo dyes are prepd. by coupling 2,5-dimethyl-4-halo-1-diazobenzene, in which either the 3- or 6-position H is substituted by a halo, with an arylamine of β -ketocarboxylic acid or of 2-hydroxynaphthalene-3-carboxylic acid. The fastness to boiling of these dyes is greater than that of any other of this class. In an example cotton fiber is treated in a bath of the 2-methyl-4-chloro-1-anilide of 2-hydroxynaphthalene-3-carboxylic acid, and the dye is developed with 2,5-dimethyl-4,6-dichloro-1-aniline. A bright red fast to Cl and boiling is obtained. Other examples of dyes giving a reddish blue and alizarin shades are given.

Azo dyes. WALTER DUISBERG, WINFRID HENTRICH and LUDWIG ZEH (to Grasselli Dyestuff Corp.). U. S. 1,690,774, Nov. 6. Diazotized *o*-aminobenzaldehyde is coupled with a component such as 2-phenylamino-8-naphthol-6-sulfonic acid, 1-ethylamino-8-naphthol-3,6-disulfonic acid, methyl-4-sulfophenylpyrazolone, 5,5'-dihydroxy-7,7'-disulfo-2,2'-dinaphthylamine or 5,5'-dihydroxy-2,2'-dinaphthylurea-7,7'-disulfonic acid and the product further coupled with hydroxylamine. The dyes produced give different colors and are suitable for treatment with Cu salts.

Azo dyes. KARL HOLZACH and RICHARD METZGER (to Grasselli Dyestuff Corp.). U. S. 1,690,900, Nov. 6. Dyes suitable for dyeing cellulose acetate are made by coupling 1,3-dihydroxyquinoline, 3-methyl-1-phenyl-5-pyrazolone or other unsulfonated compd. selected from the group consisting of hydroxyquinolines and pyrazolones with a diazo compd. of *m*-aminobenzaldehyde or other suitable unsulfonated aromatic amine contg. at least 1 aldehyde group. The dyes thus obtained give yellow shades fast to light.

Azo dyes. J. R. GEIGY A.-G. Ger. 466,381, Jan. 29, 1926. An azo dye for use with a mordant is prepd. by diazotizing the diarylmethane deriv., described in Ger. 454,460, which contains in one nucleus an amino group and in another an *o*-hydroxycarboxylic acid group, and coupling it with an azo dye component.

Azo dyes and intermediates. SOC. ANON. POUR L'INDUSTRIE CHIMIQUE À BAËLE. Ger. 466,961, Oct. 1, 1925. Azo dyes or intermediates with readily displaceable H. atoms are treated with cyanurictricarboxylic halides. Examples are given describing (1) treatment of aminoazobenzene-*p*-sulfonic acid with cyanurictricarboxylic acid trichloride; (2) treatment of toluylenediamine with cyanuric tricarboxylic acid trichloride, the condensation product being then diazotized and coupled with the Na salt of 2,5-aminonaphthol-7-sulfonic acid; (3) treatment of the Na salt of 1,4-phenylenediamine-3-

sulfonic acid with cyanurictricarboxylic acid trichloride, the condensation product being diazotized and coupled as in (2); (4) treatment of the Na salt of 2,5-aminonaphthol-7-sulfonic acid with cyanurictricarboxylic acid trichloride, the condensation product being coupled with diazobenzene. Reference is made to the use of 1,8-aminonaphthol-3,6-disulfonic acid instead of 2,5-aminonaphthol-7-sulfonic acid.

Complex copper-ammine azo dyes. WINFRIED HENTRICH and MAX HARDTMANN (to Grasselli Dyestuff Corp.). U. S. 1,690,782, Nov. 6. Diazotized *o*-aminobenzoic acid is coupled with the mono-azo dye obtained from diazotized 3-aminobenzaldehyde and 5,5'-dihydroxy-2,2'-dinaphthylurea-7,7'-disulfonic acid and the materials are simultaneously reacted on with tetrammine-cupric sulfate in the presence of Na_2CO_3 . The product dyes cotton fast brick-red shades. Similar complex Cu-ammine azo dyes may be obtained from various other similar specified starting materials.

Monoazo dye. KARL HEUSNER and MAX SIMON (to Grasselli Dyestuff Corp.). U. S. 1,690,783, Nov. 6. Dyes giving an orange color on wool are formed from *p*- or *m*-sulfanilic acid and β -naphthylsulfamic acid compds. Cf. C. A. 22, 3304.

Monoazo dyes. I. G. FARBENIND. A.-G. Brit. 287,908, March 29, 1927. Monoazo dyes dyeing fast to kier-boiling and to light are produced in substance or on the fiber by coupling diazotized 2,3- or 2,5-dichloro-4-aminotoluene with an arylide of 2,3-hydroxynaphthoic acid. Several examples are given of dyes dyeing in various shades of red.

Trisazo dyes. I. G. FARBENIND. A.-G. Brit. 287,232, Dec. 16, 1926. The process described in Brit. 248,230 (C. A. 21, 654) is further applied to the manuf. of trisazo dyes contg. 1,2-aminonaphthol ether as well as its sulfonic acid as third component and any deriv. of 2-amino-5-naphthol-7-sulfonic acid as end component. Several examples are given of dyes which give greenish blue on cotton.

Benzanthrone dyes. BRITISH DYESTUFFS CORPORATION, LTD., ARNOLD SHEPHERDSON and SIDNEY THORNLEY. Fr. 637,847, July 18, 1927. Benzanthrone and its unsulfonated derivs., except dibenzanthrones, are condensed with hydroxylamine or its salts and the products are fused with alkali. They dye cotton from the vat in gray to black shades. Examples are given of the condensation of benzanthrone and the methyl-benzanthrone from β -methylantraquinone in the presence of H_2SO_4 and FeSO_4 , the products being fused with NaOH at 240° .

Dyes. I. G. FARBENIND. A.-G. Brit. 287,050, March 12, 1927. Vat dyes which are probably 4,5,8,9-dibenzopyrene-3,10-quinones are obtained by treating 2-arylbenzanthrones with a condensing agent such as AlCl_3 , with or without use of a diluent or air or O . Several examples are given, one of which is of a dye giving intense yellowish red dyeings on cotton from the vat.

Benzanthrone dyes. I. G. FARBENIND. A.-G. Brit. 287,845, March 26, 1927. The 4,5,8,9-dibenzopyrene-3,10-quinones described in Brit. 287,050 (preceding abstract) are converted into new vat dyes by halogenation. By introducing Cl into the original dye brighter tints are obtained, while brominating gives darker tints. Examples are given.

Lissamine green. V. (Color Index No. 735.) BRITISH DYESTUFFS CORP., LTD., and T. A. SIMMONS. Brit. 287,995, Feb. 5, 1927. In the manuf. of this compd. from 4,4'-tetraethyldiaminobenzohydrol and 2,7-naphthalenedisulfonic acid, the hydrol is isolated in the form of its 2,7-naphthalenedisulfonate and to prepare the dye the naphthalene disulfonate is washed and dissolved with H_2SO_4 . The leuco dye obtained by heating and pouring into water is then oxidized with PbO_2 . Various details are given.

Anthraquinone dyes. I. G. FARBENIND. A.-G. Fr. 637,512, July 12, 1927. Vat dyes of the anthraquinone series are prepd. by condensing aminobenzamidoanthraquinones with benzamidoalkoxyanthraquinones contg. halogens or by combining benzamidoalkoxyanthraquinones contg. halogen with anthraquinone derivs. which have at least one amino or benzamido group free and alkylating the condensation products thus obtained, or by combining among themselves aminohydroxybenzamidoanthraquinones or halogenated benzamidoalkoxyanthraquinones and alkylating. In examples (1) 1-benzamido-4-hydroxy-5-chloroanthraquinone and 1-benzoylamino-4-aminoanthraquinone are heated in the presence of AcONa . The dye obtained gives a Bordeaux red on cotton, which is sensitive to alkalies on account of the OH group. Other examples are given.

Anthraquinone vat dye. WALTER MIEG (to Grasselli Dyestuff Corp.). U. S. 1,690,306, Nov. 6. 4-Benzoylamino-1,1'-dianthraquinonylamine is treated with anhyd. AlCl_3 in the presence of pyridine. The resulting dye gives fast brown shades on vegetable fibers from cold or hot vats. U. S. 1,690,307 specifies treating the dianthraquinonylamine deriv. obtained by condensing 4-bromo-1,9-anthraquinonemethylpyridone

with 1-aminoanthraquinone, with anhyd. AlCl_3 in the presence of pyridine. A dye is thus formed which gives brownish orange dyeings on cotton from a cold or a hot vat.

Vat dyes. WILHELM ECKERT (to Grasselli Dyestuff Corp.). U. S. 1,690,775, Nov. 6. The dianhydride of 1,4,5,8-naphthalenetetracarboxylic acid (or the acid itself or a substitution product) is condensed with an *o*-nitroamino compd. such as 3-nitro-4-amino-1-phenetole or 3-nitro-4-amino-1-anisole, and the condensation products thus obtained are then reduced to effect ring closure and formation of corresponding imidazole derivs. The dyes obtained (of which several examples are given) produce brown, red or reddish brown tints on cotton after exposure to the air in dyeing from the vat.

Vat dyes. ALBERT JOB (to Grasselli Dyestuff Corp.). U. S. 1,690,786, Nov. 6. By causing a benzoylamino-dipthaloylacridone to be acted upon by hydrazine, preferably in the presence of an org. solvent such as pyridine or toluene, and at an elevated temp. (suitably 90–100°), vat dyes are obtained which dye cotton from the vat fast green shades. Examples and details are given.

Vat dyes. WALTER MIEG (to Grasselli Dyestuff Corp.). U. S. 1,690,236, Nov. 6. Vat dyes are formed by reaction of anhyd. AlCl_3 upon a 1,2'-dianthraquinonylamine or other suitable anthraquinone deriv. of the general formula R-NH-R' , in which R stands for an anthraquinonyl residue and R' for H or an anthraquinonyl residue, in the presence of pyridine, quinoline or similar cyclic compd. contg. a tertiary N atom different from the anthraquinone deriv. reacted upon. The products dye various yellow and brown shades.

Vat dyes. OSKAR UNGER and GEORG BÖHNER (to Grasselli Dyestuff Corp.). U. S. 1,690,913, Nov. 6. Vat dyes of the anthraquinone series are made by heating a 1-chloroanthraquinone-2-carboxylic acid and an arylamine such as β -naphthylamine or *p*-chloroaniline in PhNO_2 or other inert org. solvent (suitably at a temp. of boiling).

Vat dye. I. G. FARBENIND. A.-G. (Paul Nawiasky, inventor). Ger. 466,990, July 12, 1923. Addn. to 398,485. The parent case describes the manuf. of a blue-green dye by ethylating oxidized dibenzanthrone with the ethyl ester of toluenesulfonic acid, the product being different from that obtained by Fr. 543,910, in which the ethylating agent is Et_2SO_4 . It is now found that the product of the parent case can be obtained by using Et_2SO_4 if the reaction is conducted in an org. medium free from NO_2 groups but contg. halogen substituents, or alternatively if the reaction is conducted in an org. medium contg. NO_2 groups and the desired product is sepd., suitably with solvents such as trichlorobenzene, from the other dye which accompanies it. Examples are given.

Vat dyes. I. G. FARBENIND. A.-G. (Paul Nawiasky, inventor). Ger. 466,585, Jan. 13, 1926. Gray to black vat dyes are prepd. by treating aminodibenzanthrone with Me esters of H_2SO_4 in the absence of agents which combine with acids. In examples pure aminodibenzanthrone is heated with MeOH and H_2SO_4 , or Me_2SO_4 and H_2SO_4 , or Me_2SO_4 . A smaller yield of dye is obtained with crude aminodibenzanthrone.

Solid preparations of vat dyestuffs. SOC. ANON POUR L'INDUSTRIE CHIMIQUE À BAËLE. Ger. 466,938, Jan. 26, 1926. The dyes are intimately mixed with a non-caustic alkali, such as Na_2CO_3 , $\text{Na}_2\text{B}_4\text{O}_7$ or Na_2HPO_4 , and with a hyposulfite; a dispersing agent such as Turkey red oil may be added if required. *E. g.*, the dye may be mixed with the dispersing agent, the alkali added, and the mixt. evapd. to dryness, the hyposulfite being incorporated after the product has been finely ground. Detailed examples are given.

Vat dyes of the 2,2'-indolethionaphthene-indigo series. CARL KRAUSS (to Grasselli Dyestuff Corp.). U. S. 1,691,660, Nov. 13. Dibromomethyl-2,2'-indolethionaphthene-indigos which dye animal and vegetable fibers from a yellow vat clear fast violet shades are produced by brominating 7-methyl-2,2'-indolethionaphthene-indigo or similar compds. by a method which is described in detail.

Aminoanthraquinone derivatives. SOC. ANON POUR L'INDUSTRIE CHIMIQUE À BAËLE. Fr. 638,732, Aug. 2, 1927. See Brit. 282,853 (*C. A.* 22, 3996).

Anthraquinone condensation products. I. G. FARBENIND. A.-G. Fr. 638,966, Aug. 4, 1927. Amino compds. of the anthraquinone series are treated with halohydrins in the presence of acid-binding agents with or without condensing agents. The products are sol. in org. solvents and dye cellulose esters in red, red-violet and blue shades and most of them dye wool from an acid bath. In examples, compds. are prepd. from: (1) 1-aminoanthraquinone and ethylene chlorohydrin in presence of Na_2CO_3 ; (2) 1-aminoanthraquinone and glycerol α -monochlorohydrin in presence of 1,2-dichlorobenzene and Na_2CO_3 ; (3) 1-amino-4-hydroxyanthraquinone and ethylene chlorohydrin in presence of disodium phosphate; (4) 1,4 or 1,5-diaminoanthraquinone and ethylene chlorohydrin in the presence of NaOAc or MgO . The compds. of (1) and (2) are 1- β -hydroxy-ethylaminoanthraquinone and 1- β - γ -dihydroxypropylaminoanthraquinone, resp.

Sulfurized derivatives of phenols. EMIL KRAUS (to Fabrick van chemische Pro-

ducten). U. S. 1,690,640, Nov. 6. Phenol, cresol or other phenol is treated with a quantity of NaOH or other suitable alkali sufficient to convert more than about 25% of the phenol into alkali phenolate but insufficient to effect such conversion of all the phenol, the mixt. is heated until free from water, 1-2 at. proportions of S is added for each mol. proportion of the total phenol present, and the mixt. is heated for a sufficient time at a reacting temp. above 100° and below the temp. which would decomp. the desired product (suitably about 160-180°) until a product is obtained whose soln. in an alkali is capable of fixing basic colors on cotton.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 287,858, March 24, 1927. Halobenzenesulfonic acids and their homologs are converted into the corresponding sulfonylchlorides by treatment with chlorosulfonic acid at temps. below 100°. On reduction of the sulfonylchloride, mercaptans are produced and by condensing the mercaptans with chloroacetic acid thioglycolic acids are obtained. Several examples are given.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 286,694, March 9, 1927. 2 Amino (and substituted amino)-6-nitro-1-benzoic acids are made from a 2-chloro-6-nitro 1-benzoic acid by treatment with NH_3 or the corresponding alkyl, aralkyl or arylamine, in the presence of a catalyst such as Cu powder.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 287,178, March 18, 1927. Trihalobenzenesulfonylchlorides or their homologs are produced by treating a trihalo-benzene or a homolog with chlorosulfonic acid. By reduction, the product yields the corresponding mercaptan which, by condensation with chloroacetic acid, gives the trihaloarylthioglycolic acid. Examples are given.

Dyes and intermediates. RAYMOND VIDAL. Fr. 639,033, Jan. 8, 1927. See Brit. 283,467 (C. A. 22, 4257).

Dyeing. CHARLES CALLEBAU AND JULIEN DE BLICQUY. Ger. 466,349. Feb. 27, 1926. Textile goods such as hose and gloves are rotated with the dye liquor in closed vats by air pressure.

Dyeing. I. G. FARBENIND. A.-G. (Paul Nawiasky and Fritz Helwert, inventors). Ger. 466,810, Dec. 8, 1926. Fast yellow shades are produced on animal, vegetable or artificial fibers by treatment in feebly alk. vats with the product obtained by fusing 1-hydroxyanthraquinone with caustic alkali.

Dyeing. I. G. FARBENIND. A.-G. (Otto Siebert und Max Raeck, inventors). Ger. 467,036, Jan. 1, 1926. A dye for cellulose ethers and esters is formed by coupling non-sulfonated aromatic diazo compds. with 2-4-diaminophenylmethanesulfonic acid. Thus, aminoazobenzene gives a straw-yellow, 4-nitroso-1-aminoazobenzene a Corinth, and 1-aminoazobenzophthalene an orange.

Dyeing. I. G. FARBENIND. A.-G. (Hermann Wagner, Heinz Eichwede und Erich Fischer, inventors.) Ger. 467,037, Mar. 23, 1926. A pyrazolone dye contg. one or more alkyl, aryl, aryloxy or aralkyloxy groups is used for dyeing mixed wool and silk. Thus, a dye bath contg. *o*-aminoanisole-1-(4'-sulfophenyl)-3-methyl-5-pyrazolone was used. Other examples are given. Cf. C. A. 22, 2536.

Dyeing. I. G. FARBENIND. A.-G. (Winfried Hentrich, Rudolf Knoche und Max Hardtmann, inventors.) Ger. 467,038, Sept. 23, 1926. A dye for acylated cellulose, cellulose esters and their transformation products is formed from the diazo compds. aminomonosulfonic acid aminomonocarboxylic acid, and their substitution products coupled with α,β -diketohydrindene and its derivs. Thus, the NH_4 salt of aniline-4-sulfonic acid-azo- α,β -diketohydrindene dyes acetate silk a fast yellow.

Dyeing. I. G. FARBENIND. A.-G. (Heinrich Clingstein and Harry Grimm, inventors.) Ger. 467,059, Aug. 20, 1926. Dyes which are insol. in water are prepd. by coupling diazo compds. with compds. formed by coupling non-sulfonated amino-fluorones with an insol. azo dye. Thus, cotton yarn immersed in a bath of 2,3-hydroxynaphthoic acid anilide, NaOH and Turkey red oil, wrung out and immersed in a diazo soln. neutralized with acetate and contg. monoaminofluorenone receives a fast red color. When 2,3-hydroxynaphthoic acid aniside is used, a red-brown dye is obtained; β -naphthol gives a red; 2,7-diaminofluorenone and 2,3-hydroxynaphthoic acid anilide give a violet. Other examples are given.

Dyeing. IWAN KOSTIN. Ger. 466,624, April 15, 1924. In an app. for dyeing, particularly with vat dyes, the cloth is led into a tank contg. the dye liquor under vapor pressure and free of air, the cloth passing several times from the liquor to the vapor and back.

Dyeing. SOCIÉTÉ PAUL NAVARRE, E. CHEREAU & CIE. Fr. 638,935, Dec. 31, 1926. Coarse fibers such as vegetable fiber, raffia or coconut fiber are dyed black by impregnation with a soln. of a Pb salt, and treatment with H_2S in the cold.

Dyeing cellulose esters and ethers. H. DREYFUS. Brit. 286,761, Dec. 3, 1926.

Material formed of or contg. cellulose acetate or other cellulose ester or ether, in mordant dyeing, is treated with a mordant metal in the form of a metal salt soln. of at least 15% concn. (suitably 20-40% or even 60% or more). As mordant salts there may be used Al sulfate, alums, Cr chloride, Cr fluoride, Cr bisulfite and SnCl_2 and assistant substances such as cream of tartar or oxalic acid may be added. A temp. of 60° or higher may be used for the mordant bath. Various examples are given. Cf. C. A. 23, 288.

Dyeing regenerated cellulose materials. BRITISH DYESTUFFS CORP., LTD., AND J. BADDILEY. Brit. 287,609, Dec. 10, 1926. Dyeing in level shades is effected with secondary disazo dyes (other than those used according to Brit. 283,319 (C. A. 22, 3997)) obtained by coupling the diazo compd. of a sulfonated or carboxylated *p*-nitro-arylamine with a usual middle component, rediazotizing, and coupling with an aminonaphtholsulfonic acid or a N deriv. (other than 2,8-aminonaphtholsulfonic acids and their derivs.). Corresponding dyes in which the nitro group has been reduced to the amino group may also be used with diazotization on the fiber and development with usual developers if desired. Several examples are given.

Dyeing regenerated cellulose "silk." BRITISH DYESTUFFS CORP., LTD., AND J. BADDILEY. Brit. 287,214, Dec. 13, 1926. Secondary disazo dyes are used which are made by coupling a diazotized nitroarylamine or a homolog or deriv. free from sulfo or carboxy groups with a middle component, rediazotizing and coupling in alk. soln. with a 1,8-aminonaphtholsulfonic acid or a N-substituted deriv. The nitro group may or may not be reduced. Several examples are given.

Dyeing cellulose acetate. GEORGE H. ELLIS and WM. O. GOLDTHORPE (to Celanese Corp. of America). U. S. 1,690,481, Nov. 6. 3-(5, 7-Dibromoindole)-2'-thionaphthen-indigo or other substances for coloring cellulose acetate, which are relatively insol in water, are solubilized by pretreating them with a solubilizing agent comprising a substance of oily or fatty characteristics such as Na sulforicinate and with at least one auxiliary solvent such as $\text{C}_2\text{H}_2\text{Cl}_4$.

Dyeing cellulose acetate and similar materials. ARMIN GOESCHKE (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,691,517, Nov. 13. Blue to green shades fast to light and storing are produced on "acetate silk" or other cellulose esters and ethers of like character by use of indophenols such as may be produced by simultaneous oxidation of a halogenated *p*-aminophenol and an aromatic amine having a free *p*-position or by condensation of a halogenated *p*-nitrosophenol with an aromatic amine with a free *p*-position, or by simultaneous oxidation of a suitable *p*-diamine with a halogenated phenol with free *p*-position. Preferably, a dispersing agent is used such as sulfite waste liquor, condensation products from naphthalenesulfonic acids with CH_2O , salts of lignin-sulfonic acids, Turkey red oil, etc.

Dyeing artificial silk. BRITISH DYESTUFFS CORP., LTD., J. BADDILEY, P. CHORLEY and R. BRIGHTMAN. Brit. 287,010, Sept. 8, 1926. Materials such as "viscose silk" are dyed in level shades by use of secondary disazo dyes formed by coupling diazo compds. with N-substituted derivs. of 2 amino-8-naphtholsulfonic acids. A large no. of examples are given.

Dyeing cotton and artificial silk. LOUIS LIBMANN. Fr. 637,833, July 18, 1927. Cotton or artificial silk to be dyed with indigosol or its derivs. is mordanted with peroxide of Mn, Pb or other analogous metal, rinsed and dyed in an acid bath of indigosol, etc. Discharge effects may be produced by the application of reducing agents to parts of the cloth before dyeing.

Dyeing wool and silk. CECIL SHAW. U. S. 1,691,500, Nov. 13. Dyestuffs of water-sol. 1,4-dihydroxy-2,5-dihalobenzoquinones are applied from an acid bath.

Dyeing yarn. EDWIN I. CARLSON and LAWRENCE A. STEAD. U. S. 1,691,701, Nov. 13. An app. is described. U. S. 1,691,702 also specifies a yarn-plaiting app. for prepg. warp yarn for dyeing.

Mordant dyeing of cellulose acetate and similar materials. H. DREYFUS. Brit. 287,204, Dec. 3, 1926. In the mordant dyeing of yarns, fabrics and other materials made of or contg. cellulose acetates or other org. esters of cellulose or cellulose ethers, the mordant metal is applied in the form of a salt of an aliphatic acid, suitably a hydroxy aliphatic acid. Among the salts which may be used are: basic Cr lactate, Al lactate, Na Al lactate, basic Al NH_4 citrate, ferric citrates, basic Al glycolate, basic Cr glycolate and the acetates of Al, Cr, Fe and Cu, and also salts contg. other acid radicals such as Al sulfate-acetate, Al nitrate-acetate and Al chloride-acetate and the corresponding Cr salts. The mordanting bath may be heated and if temps. are used in excess of 75-80° there should be added to the bath, to prevent delustering, protective agents such as those referred to in Brit. 246,879 (C. A. 21, 502) and Brit. 200,312 (C. A. 21, 3471).

The mordant may be applied before dyeing or simultaneously with or after application of the dye.

Apparatus and liquid-circulating system for scalding or dyeing cotton in bundles. J. ANNICQ. Brit. 287,011, Oct. 27, 1927.

Dye baths. I. G. FARBENIND. A.-G. (Joseph Nusslein, inventor). Ger. 466,420, June 3, 1925. In employing soap or Turkey red oil in acid baths which also contain K and Mg salts, a substance which prevents the sepn. of fatty acids or insol. salts thereof is added. Thus, in a color bath which for 100 kg. of woolen goods contains 0.5% aniline yellow G, 0.25% superamine red B, 0.2% anthraquinone blue SR, 2 g. soap and 2 g. disopropyl naphthalenesulfonic acid, 3% H_2SO_4 is added. Instead of the above named or similar sulfo acid, 5 g. purified and thickened sulfite pulp waste liquor can be used. Other examples are given.

Dyeing apparatus. CURT FÖRSTER. Ger. 466,619, Mar. 18, 1927. In a dyeing app., particularly for hose, the holder which enters the dye liquor in piston-like manner has a perforated bottom and top and is of smaller cross-section at the top than at the bottom.

Dyeing machines. SOCIÉTÉ F. & L. CONSTANT. Ger. 466,350, Jan. 9, 1926. The vat swings on a fixed axle with stirring fins.

Hardened colloid films for dye imbibition processes, etc. J. F. KIENNINGER (to Technicolor Motion Picture Corp.). Brit. 288,146, April 1, 1927. A gelatin compn. or the like while still in liquid form is treated with a potential hardening agent such as a dichromate together with an activating agent such as an alkali sulfite and a restrainer such as NH_4OH and the restrainer is afterward rendered inactive as by its removal, in whole or in part, to permit hardening to proceed.

Treatment of textiles. OSCAR KOHORN & CO. AND ALFRED PERL. Fr. 637,779, July 16, 1927. An app. is described for the uniform wet treatment of skeins of textiles particularly artificial silk, whereby tangling is prevented.

Restoring textile fabrics. ALFRED KARSTEN-SALMONY. Ger. 467,116, April 26, 1927. Old clothing and like textile materials are restored to their original appearance by treating them with an aq. soln. of mucilage mixed with formaldehyde and alkali carbonates.

Treating vegetable fibers. JEAN JULES LAMBRECHT. Fr. 637,772, July 16, 1927. Vegetable fibers are rendered imputrescible by heating them in a bath contg. a vegetable or animal fatty substance such as oleic acid, soda lye and a mineral fatty substance such as oil of vaseline, and agitated to secure sapon. of the fatty substance.

Treatment of cotton fibers. PAUL KARRER. Ger. 466,937, Dec. 16, 1925. See Brit. 263,169.

Sizing textile fibers. COMPAGNIE FRANÇAISE DE PRODUITS CHIMIQUES ET MATIÈRES COLORANTES DE SAINT-CLAIR-DU-RHÔNE. Fr. 638,891, Dec. 28, 1926. Emulsions for sizing fibers are made in hydrocarbons or their derivs. especially in chloro derivs. In an example boiled linseed oil is dissolved in *p* dichlorobenzene and NaOH soln. is added and the mixt. is emulsified with boiling water.

Sizing threads. ÉDOUARD PINEL. Fr. 637,654, Nov. 18, 1926. Threads of wool, cotton or other textile are sized in a bath contg. carob gum with or without glycerol and then in a bath contg. starch, dextrin and wax.

Tank (with a perforated false bottom) for washing fibrous materials wound on bobbins. W. ALTHOFF. Brit. 286,512, May 16, 1927.

Apparatus for drying and stretching fabrics. M. R. JAHR MASCHINENFABRIK. Brit. 287,163, March 17, 1927.

Apparatus for calendering fabrics. C. SCHLATTER (to Slater & Sons). Brit. 287,139, March 16, 1927.

Apparatus for tentering fabrics. R. C. MATHER and MATHER & PLATT, LTD. Brit. 286,487, April 7, 1927.

Apparatus for fulling and milling fabrics. T. CROWTHER and J. A. CROWTHER. Brit. 286,839, Jan. 24, 1927. Cloth in rope form is continuously worked or compressed and opened out as it is passed through a trough by temporarily obstructing its passage by rollers the rotation of which is intermittently checked.

Bleaching textile materials. C. TAYLOR. Brit. 286,567, Oct. 12, 1927. Cotton, linen, artificial silk or other vegetable material is satd. with a liquid contg. about 1% Na_2CO_3 and about 4.4% $NaOCl$, bleaching powder or Cl_2 , the material is stored for about 12 hrs. and is then washed. The process may be repeated and the goods then soured. Temps. of about 22° are suitable and small quantities of borax or NH_3 may be added to the satg. liquid.

Apparatus for bleaching fabrics in lengths. C. TAYLOR. Brit. 287,419, Oct. 12, 1927.

Coating pervious materials. NORMAN E. OLIVER (to Hermetite Corp.). U. S. 1,690,426, Nov. 6. Pervious material such as woven fabric is first subjected to mech. treatment, e. g., by calendering under high pressure, to reduce the size of the openings or interstices, flatten the fibers and give a smoother surface, and a coating compn. is then applied such as a cellulosic deriv. or celluloid lacquer or varnish having a high degree of pliability when dried and forming on the outer surface of the treated material only one layer which does not permeate and embed the fibers. U. S. 1,690,427 relates to a similar process in which one side only may be given the preliminary treatment.

Use of compressed air from nozzles for moistening warps on looms, etc. T. WINSTANLEY and A. WINSTANLEY. Brit. 287,311, March 9, 1927. Mech. features.

Zig-zag roller apparatus for treating fabrics with liquids. J. BAILEY and W. H. WADSWORTH. Brit. 287,233, Dec. 17, 1926.

Apparatus for dressing, drying and beaming yarns in warp form. A. SUCKER. Brit. 287,345, April 30, 1927.

Apparatus for dressing textile threads with wax, oil, etc. MASCHINENFABRIK SCHWEITER A.-G. Brit. 287,923, March 30, 1927.

Delustering acetate silk. SOCIÉTÉ POUR LA FABRICATION DE LA SOIE "RHODIASÉTA." Fr. 638,795, Aug. 3, 1927. Acetate silk is delustered without being weakened by plunging the silk into an aq. soln. of CaCl_2 , LiCl or MgCl_2 of 10–30% concn. at ordinary temp. and then into a bath of boiling aq. acid not over 0.1 N strength. Naphthalene sulfonic acid gives a mat crepe effect. BzOH or salicylic acid gives a very white mat without much of the crepe effect. H_3BO_3 gives a clear pearly mat. Other acids give different effects.

Apparatus for treating skeins of artificial silk with liquids. J. BRANDWOOD. Brit. 287,731, April 19, 1927.

Apparatus for pressing artificial silk into flat cakes for washing, desulfurizing, bleaching, dyeing, etc. F. KÜTTNER A.-G. Brit. 287,097, March 14, 1927.

Viscose silk. S. TODA. Brit. 287,807, April 22, 1927. Yarns made from a viscose soln. are loosely twisted, then starched, and are woven or knitted without previous desulfurization and the resulting fabric is afterward desulfurized and bleached.

Linen-like effects on cotton. HULDRICH EGLI (to A.-G. Seeriet). U. S. 1,690,572, Nov. 6. Cotton yarns or webs the fineness of the threads of which does not exceed English yarn No. 60 are subjected to the action of 49–50.5° Bé. H_2SO_4 for not less than about 4 min. and then subjected under tension to treatment with caustic alkali of about 15° Bé. at ordinary temps.

Treating cotton cloth. LÉON LILIENFELD. Fr. 637,826, July 16, 1927. A wool-like cotton fabric is produced by treating cotton in an unstretched condition with alkali lye, or by a treatment with a mixt. or emulsion of CS_2 and alkali lye. The CS_2 may be dild. with benzine.

Apparatus for the carbonization of wool. EMILE MOLINGHEN and JULES GAVE. Ger. 466,623, Dec. 31, 1925. The wool is fed between radial arms, on a rotating drum, which dip into a half-cylinder acid container on the same axis.

Balloon fabric. WM. J. KELLY (to Goodyear Tire & Rubber Co.). U. S. 1,691,764, Nov. 13. The fabric is coated with a soln. of cellulose xanthate contg. acidified Na_2SO_4 and the cellulose is regenerated on the fabric.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

New decorative finish and how to use it. F. B. ROOR. *Ind. Finishing* 4, 110, 112, 117 (1928).—A general description and directions for use of a new baking finish. The compn. is not given.

Chalking of paints. HANS WOLFF. *Farbe u. Lack* 1928, 472–3.—The degree of chalking of a paint film was measured by drawing a dark cloth across its surface and comparing the spot produced with a standard. By this test a paint contg. white lead and lamp black chalked least; one contg. ZnO and sublimed lead was next; and one contg. lithopone, ZnO and CaSO_4 chalked most. The last lost less wt. than the others. This may be explained by the fact that chalking is a surface phenomenon while loss in wt. may also take place along the pores of the film.

Zinc lithopones and calcium lithopones. VON STEINAU. *Chem.-Ztg.* 52, 785–6

(1928).—The physical properties of these lithopones are discussed and photomicrographs are shown. Reference made to previous papers shows the relative resistance of each to light.

RICHARD KATZ, JR.

Microscopic examination of lithopone and of zinc whites. V. ALLARD. *Société des Couleurs Zincique. Ann. fals.* 21, 445-9(1928).—Under the microscope, with ordinary light, true (or "molecular") lithopone appears as dark, agglomerated, amorphous grains; lithopone prep'd. by mixing ZnS and ground heavy spar appears as amorphous agglomerates interspersed with brilliant, translucent crystals of BaSO₄. With polarized light, pure "mol." lithopone appears as agglomerated amorphous grains on a red background, heavy spar and gypsum appear as angular, cryst. beautifully colored grains, the color changing as the Nicol prism is rotated; CaCO₃ appears as small, greenish yellow crystals, which undergo but little change in color; ZnO appears like lithopone. The detection of natural BaSO₄ can be rendered more sensitive by examg. the HCl-insol. residue.

A. PAPINEAU-COUTURE

The effect of zinc white and lime on the permanency of coal-tar dyes. GUSTAV ARNOLD. *Chem.-Ztg.* 52, 815(1928).—The permanency of several coal-tar dyes as alizarin and indanthrene is affected by ZnO when dispersed in linseed oil after 12 months' exposure to light and the elements. When dispersed in casein soln. CaO affects them similarly. In mixts. of these colors dispersed in linseed oil with white lead, lithopone and BaSO₄ their permanency was unchanged.

RICHARD KATZ, JR.

Specific gravity of linseed oil at higher temperatures. FELIX FRITZ. *Farbe u. Lack* 1928, 474.—The temp. coeffs. of the sp. gr. of linseed oil between 22.8° and 170°, 226° and 243° were 0.0006707, 0.0006857 and 0.0006877, resp.; of tung oil between 22.26 and 200°, 0.000678 and of linseed fatty acids between 23° and 160°, 0.0006806. Comparison with older data in the literature is made.

G. G. SWARD

Heat polymerization of tung oil and ethyl ester of eleostearic acid. T. MAZUME AND S. NAGAO. *J. Soc. Chem. Ind. (Japan)* 31, 473-6; Suppl. Binding 114-5B(1928).—When tung oil was heated at 200-300°, its mol. wt. was doubled, but its I value did not decrease much; therefore it was considered that the change was an extramol. polymerization. With the Et ester of eleostearic acid, the change was similar, except that it did not solidify as the tung oil did.

Y. TOMODA

Oxidation and polymerization of ethyl esters from linseed acids. G. PETROV AND N. SOKOLOV. *Masloboina Zhiravoe Delo (Oil & Fat Ind. (Russia))* 1928, No. 2, 106.—Linseed oil was split with "Kontakt," washed with water, dried with CO₂ and obtained according to Wolf. Vacuum distn. of these ethers caused decomn., but steam distn. gave satisfactory results. The 210-230° fraction had acid no. 14.0, I no. 194.7, sapon. no. 188.44 and sp. gr. 0.8921. Comparative drying expts. were made with linseed oil (a), fatty acids (b) and the steam-distd. Et ester fraction (c) from linseed fatty acids. After 100-110 hrs (a) had gained in wt. 7.8%, (b) 16.24%, (c) 24.91%. After 13 days the weight was const., but after 26 days (c) lost 3.65%. (a) Had a hard skin, (b) becoming viscous very slowly did not have any skin; (c) did not have a skin but was semisolid. With a drier such as Co linoleate (c) is oxidized in thin layers, containing a high amount of O without producing a linoxyn skin; only a thickening takes place similar to that of (b). By blowing air (c) is easily oxidized and gives a viscous oxidized oil, apparently more rapidly than does linseed oil. The formation of a linoxyn skin is due to the presence of glycerol and unsatd. acids. On heating to 180-200° (c) becomes polymerized, at reduced pressure, nearly to the same extent as (a).

A. A. BOEHLINGK

Short contribution to the history of abietic acid. PAUL LEVY. *Tech. Hochschule, Aachen. Z. angew. Chem.* 41, 233-4(1928).—Criticism on an article of H. Wislicenus (*C. A.* 22, 1070).

G. SCHWOCH

Answer to the remarks of P. Levy concerning the "history of abietic acid." H. WISLICIENUS. *Z. angew. Chem.* 41, 234-5(1928); cf. preceding abstr.

G. S.

Insulating varnishes: classification, selection and use. A. R. DUNTON AND A. W. MUIR. *Electrician* 101, 607-8(1928).—A review.

C. G. F.

Composition and properties of Albertol resins. J. H. FRYDLENDER. *Rev. prod. chim.* 31, 461-5(1928); cf. *C. A.* 18, 2611; 19, 408; 22, 3999.—The compn., uses and comparison of these products are made with other varnishes.

P. THOMASSET

Euphorbia verrucosa Jacq (GILLOT) 27. *Euphorbia paralias* L. (GILLOT) 17. Rusting and protection of iron (SCHULZ-KIRCHMÖSER) 9. Iron content of special red lead (SPRINGER) 18. Process for the treatment of ilmenite for the recovery of electrolytic iron and TiO₂ concentrate for pigment, etc. (TRAILL, McCLELLAND) 4. Fatty substances soluble in water [for cleaning paint, varnishes, etc.] (Fr. pat. 637,274) 27.

Modifying the physical properties of "isocolloids" [use in the manufacture of lacquers] (Brit. pat. 287,943) 18. Cellulose ester and ether solutions [for use as lacquers] (Brit. pat. 286,789) 23. Apparatus for separating and classifying pigments (Brit. pat. 287,262) 1. Chromium compounds [for anti-rust paints] (Fr. pat. 638,718) 18.

Aqueous emulsion paints. LESTER KIRSCHBRAUN. U. S. 1,691,765, Nov. 13. A paint base such as a pitch compn. is dispersed in an aq. medium by means of a finely divided pigment such as chrome green in an aq. paste form adjusted to a predetd. H-ion concn. (suitably p_H of about 6.5-7.0 with chrome green); the pigment chosen is of such a character as to impart a distinct color to the final product.

Compositions for paints, plasters, etc. ARCHIBALD M. SARGINT. Fr. 637,370, July 9, 1927. A compn. suitable for paints, plasters, putty, cements, etc., consists of ZnO and for MgO, a sol. silicate and a powd. metal, such as brass, bronze, Cu, Ni, Sn, Al or Zn. A basic Pb compd., e. g., a mixt. of litharge and white lead, is added to accelerate setting. The sol. silicate is preferably a Na_2SiO_3 contg. Na_2O and SiO_2 in the ratio of 1:3 and of sp. gr. of 1.29. A typical compn. is 4 kg. of Sn, 255 g. of ZnO, 28 g. of litharge and white lead mixt. (3:1), and sufficient Na_2SiO_3 to give the desired consistency.

Lithopone. FRANK G. BREYER and CLAYTON W. FARBER (to N. J. Zinc Co.). U. S. 1,690,099, Nov. 6. Solns. of ZnSO_4 and ZnCl_2 are separately prepd. and purified and crude lithopone is pptd. by mixing these purified solns. with Ba sulfide soln.; at the end point of the pptg. step there is established in the crude pulp a predetd. sulphhydrate excess, the crude pulp is dild. with water promptly after the pptn. and the crude lithopone is washed until the Cl content of the liquor in which the lithopone is suspended does not exceed 0.5 g. per l. After the washing a definite hydrate content is established in the liquor equiv. to 2.5-7.0 cc. of 0.25 N HCl per 250 cc. of filtrate, and the crude lithopone is charged into a calcining app. with an av. moisture content of about 5-8% and is calcined at 650-725°.

Coating metal or other surfaces with paints, lacquers, etc. E. I. DU PONT DE NEMOURS & Co. Brit. 287,940, March 30, 1927. A preliminary coating is first applied which is preferably formed of glycerol, phthalic acid, linseed oil acids, china wood oil acids and rosin acid or of ethylene glycol, phthalic anhydride and linseed oil, to which pigments also may be added. After this coat has dried top coats are applied which may be of the drying oil type or may be compns. of cellulose esters or ethers.

Roller mill for grinding and mixing paints, inks, etc. J. BAXENDALE and HUGHES & TRELEAVEN, LTD. Brit. 287,658, Jan. 11, 1927.

Device for testing the spread of ink. MILTON O. SCHUR (to Brown Co.). U. S. 1,691,739, Nov. 13.

Paint- and varnish-remover. BORIS N. LOUGOVY (to Chadeloid Chemical Co.). U. S. 1,691,771, Nov. 13. Alc., acetone and paraffin or ceresin wax are used together with sufficient Na lauroate (the latter being partly in pptd. condition) to serve as a thickener.

Varnishes. I. G. FARBENIND. A.-G. Brit. 287,115, Nov. 9, 1925. Varnishes of the oil resin type (such as those prepd. from linseed oil and copal resin) contain "benzine" obtained by the destructive hydrogenation of carbonaceous materials or conversion products of such a "benzine." Brit. 287,116 specifies cellulose ester lacquers contg. such a "benzine" and which also may contain various other solvents and auxiliary ingredients such as urea- CH_2O resin, blown castor oil and isobutyl alc.

Nitrocellulose varnishes. I. G. FARBENIND. A.-G. Brit. 287,137, March 16, 1927. Nitrocellulose varnishes contain oxyns such as linoxyn, with or without plasticizers, resins, dyestuffs or coloring substances, etc. and solvents such as alc., benzene, acetone, AmOAc or BuOAc .

Lacquers. F. S. VIVAS (to International Fireproof Products Corp.). Brit. 206,724, March 11, 1927. A non-inflammable chlorinated hydrocarbon such as perchloromethane is incorporated with sep. solns. of gum (e. g., gum dammar) and of "soluble cotton" and vegetable oil and the solns. are mixed. H_3BO_3 also may be used and various solvents are specified.

Grinding mill, for colors to be mixed with "cellulose lacquers," etc. L. M. FRASER. Brit. 287,318, March 12, 1927.

Waterproof and adhesive composition. CARROLL A. CRAWFORD (to Western Electric Co.). U. S. 1,691,543, Nov. 13. A compn. suitable for use on elec. coils subject to heating is formed of paracoumarone resin 50, carnauba wax 40 and raw linseed oil 20 parts.

Composition for polishing surfaces composed of cellulose ester compositions.

JOSEPH E. HIRSH AND ARTHUR D. ROBSON (to Standard Varnish Works). U. S. 1,690,680, Nov. 6. EtOAc, BuOAc or other suitable cellulose ester softening agent is mixed with an inert diluent of lubricant such as an oil and wax and with pumice, tripoli or other abrasive material.

Product containing sulfur and sulfurized xylene resin. CARLETON ELLIS. U. S. 1,690,335, Nov. 6. A material suitable for making molded articles by hot pressing comprises S and sulfurized xylene resin and may be prep'd. by reacting on raw material contg. cresol and xylene with S chloride, deodorizing and incorporating with molten S.

Artificial resin. SCHIEFERWERKE AUSDAUER A.-G. Brit. 286,731, March 10, 1927. A viscous condensation product is made by heating to boiling a mixt. of PhOH, *p*-dichlorobenzene and CH₂O in the presence of a catalyst such as NaCl and NH₄Cl and (CH₂)₆N₄. The product may be hardened by further heating at about 80° and may be used with fillers, etc. Brit. 286,732 specifies forming sheets and articles of insulating material by cold pressing under very high pressure condensation products similarly produced.

Resinous composition. CARLETON ELLIS. U. S. 1,690,160, Nov. 6. A deodorized fusible resin free from H₂S and free from other sol. sulfides is formed by heating a phenolic comp'd. such as PhOH with at least 1.6 times its wt. of S in the presence of an alk. catalyst, such as K₂CO₃.

Synthetic resinous material. CARLETON ELLIS. U. S. 1,691,271, Nov. 13. A crude xylene and a Mg formaldehyde jelly are caused to react by agitation together at room temp., and water is sep'd. The product is suitable for use in making molded articles, etc.

Condensation products of alcohols and ketones with urea. I. G. FARBERNIND. A.-G. Brit. 287,095, March 14, 1927. Examples are given of the condensation of acetylurea, diacetin and benzylamine; urea, butylene glycol and acetanilide; urea, methylcyclohexanol and toluenesulfonamide; and of urea, cyclohexanone, acetanilide and toluenesulfonamide. Oily products are obtained which on prolonged heating are transformed into resinous materials which may be used as softening agents for cellulose esters. Cf. C. A. 22, 3056.

Dicyandiamide-aldehyde condensation products. K. RIPPER. Brit. 287,177, March 18, 1927. Dicyandiamide is condensed with CH₂O with or without the presence of other substances capable of combining with CH₂O to give resins, to form hydrophobe products which are converted by cold water into fine powders which can be molded and pressed. Various details and examples are given.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

High-pressure hot-water equipment in the fat industry. EGON BOHM. *Chem. App.* 15, 193-5, 219-20 (1928).—Description of app., exclusive of steam supply and condensers, accompanied by notes based on 20 yrs.' experience. J. H. MOORE

Splitting fats. G. PETROV AND N. SOKOLOV. *Masloboino Zhirovoe, Delo* (Oil & Fat Ind. (Russia)) 1928, No. 1, 28-30.—Linseed oil, sunflower oil, animal fat and hydrogenated vegetable fat ("Salolin") were treated and agitated with steam in the presence of H₂SO₄, ZnSO₄, Al₂(SO₄)₃, Na₂SO₄. H₂SO₄ (5%) was used to the amt. of 25% of the total fat, sulfates 10% of the wt. of H₂SO₄. The fats were then sapon'd. with 2% of "Kontakt" and only 0.2% of H₂SO₄. The emulsions were broken up by adding 0.2 to 0.5% of CaSO₄ and agitating with steam for 10-15 min. (method of Russ. pat. 12,441). For linseed a preliminary treatment with dil. H₂SO₄ as well as with a mixt. of sulfates and dil. H₂SO₄ does not improve the color of the oil, but makes it transparent. The oil thus treated shows no improvement in color on sapon. Emulsions are formed when over 2.5% of Na₂SO₄ or any amount of other sulfates is present; they are broken up by adding 0.5% of CaSO₄. For sunflower oil washing with a 5% H₂SO₄ makes the oil transparent but does not improve the color. Oil treated with a 5% H₂SO₄ is not improved in color. Oil treated with a 5% H₂SO₄ does not have an improved color after sapon.; but the color is improved after sapon. when the oil is treated previously with a mixt. of 5% H₂SO₄ and Na₂SO₄. The emulsions could not be broken up with lead acetate. For animal fat (acid value of 1.46 mg. KOH) and "Salolin" (acid value of 10.18 mg. KOH) treatment with mixts. of 5% H₂SO₄ and Na₂SO₄ and ZnSO₄ improved the color. On sapon. fats washed previously with H₂SO₄ and Na₂SO₄ gave brighter fatty acids than if only H₂SO₄ was used. A. A. BOEHLINGK

Rapid determination of water in fats and glycerol. V. CHERNUISHEV. *Masloboino*

Zhirovoe, Delo (Oil & Fat Ind. (Russia)) 1928, No. 1, 17-8.—A weighed amount of water-contg. fat is pressed on a weighed filter paper either with a spatula or by rubbing it between two layers of filter paper. The water is thus absorbed by the paper and is evapd. by drying the sample and paper in a beaker at 105°. Only 20 min. is required for the whole operation instead of the customary 4-10 hrs. Glycerol is poured on to a weighed filter paper, dried at 80°, powdered Na_2SO_4 is added, the whole is placed in a thimble and extd. with dry acetone. By this method losses in glycerol due to evapn. are avoided and the drying procedure is accelerated. A. A. BOEHLINGK

The action of narcotics on the saponification of fatty acids. M. CHIO AND N. PIRAS. *Boll. soc. ital. biol. sper.* 3, 359-62(1928).—The effect of CHCl_3 , EtOH , Et_2O , and chloral hydrate on the sapon. of olive oil and oleic acid by alkalis was studied. The 4 substances had the property in common of accelerating the reaction between NaOH or Na_2CO_3 and free fatty acids. PETER MASUCCI

Hydrogenation of fatty oils. VII. Formation of isooleic acid by the hydrogenation of soy-bean oil. T. MAZUME. *J. Soc. Chem. Ind. (Japan)* 31, 467-9; Suppl. Binding, 111-2B(1928).—Formation of the isooleic acid was less when the temp. of hydrogenation was low. The greater the amt. of the catalyzer used, the greater was the formation of isooleic acid. When the Ni catalyzer contained a small quantity (0.3%) of Cu, the formation of isooleic acid was very great, but when its Cu content was large (4%), the formation of isooleic acid was very small. The Ni catalyzer which had been exposed to air at a low temp. after its reduction gave more isooleic acid than that which had been exposed to air at high temp. **VIII. Hydrogenation of the methyl ester of oleic and linolic acid.** *Ibid* 470-2; Suppl. Binding, 112-3B.—During the hydrogenation of the Me ester of oleic acid, a large amt. of isooleic acid was formed at the initial period of the hydrogenation, and the isooleic acid so formed was gradually transformed into oleic acid by further hydrogenation. When the Me ester of linolic acid was hydrogenated, the following transformation of linolic acid was observed: Linolic acid \rightarrow oleic acid \rightarrow isooleic acid \rightarrow stearic acid. Y. TOMODA

Olive oil and its substitutes. CHARLES H. LA WALL. Phila. Coll. of Pharmacy and Sci. *Am. J. Pharm.* 100, 616-25(1928).—A sp. list of the different brands and detailed description of the manner of labeling illustrating misbranding by the substitution of cottonseed oil, or other edible oil, for olive oil. W. G. GAESSLER

Emulsification of sulfonated oils. D. WOODROFFE AND F. N. CRANE. *J. Intern. Soc. Leather Trades Chem.* 12, 419-23(1928).—Samples of (1) a very acid sulfonated vegetable oil and (2) several specimens of sulfonated cod oil, giving emulsions of $p_H = 5.8-9.0$ and contg. mineral oil in unstated amt., were shaken with buffer solns. of $p_H = 1.0-12.0$ and the stabilities of the emulsions noted. Sample (1) gave stable emulsions at $p_H = 2.2-10.0$. The various specimens of (2) gave stable emulsions only at $p_H = 7.8-12.0$. Dilm. of emulsions with H_2O had little effect. Most emulsions were unstable in the presence of more than 3% NaCl . H. B. MERRILL

Flaxseed. FRANK T. SHUTT. Dept. Agr. Canada. *Rept. Dominion Chemist, Year Ending March 31, 1927*, pp. 40-1(1928).—The Argentine, Novelty, Crown and Linota varieties of flaxseed, grown in Manitoba, had the following compps., resp.: H_2O 6.57, 5.77, 6.16, 6.09; protein 25.86, 26.04, 24.54, 25.44; fat 36.91, 38.33, 38.37, 33.61; carbohydrates 20.80, 20.47, 21.16, 23.81; fiber 6.54, 6.20, 6.43, 7.26; ash 3.32, 3.19, 3.34, 3.76%. K. D. JACOB

Coloring matter of cottonseed hulls. AUGUSTUS H. GILL AND H. W. GREENUP. *Oil and Fat Ind.* 5, 288-94(1928).—The coloring matter is not extd. from cottonseed soap stock or foats by any common solvent which will not dissolve the soap stock. The extracts of cottonseed hulls were made with ether, CS_2 , alc., acetone and benzene. When the exts. were analyzed by the absorption method they failed to show carotin, xanthophyll or closely related pigments. The result was checked by the spectroscopic examn. and agreed with the work done by Gill on color tests for oils. The cottonseed-hull exts. made with the above solvents when combined showed very small amounts of gossypol as identified by the aniline and acetyl derivs. Less than a g. was found in 15 lb. of hulls; this would have little or no toxic effect. The H_2O ext. of cottonseed hulls gave a substance contg. 38.1% C, 5.4% H and 56.5% O. This substance was reddish brown and could not be decolorized by animal charcoal. It gave no class reactions and was inactive toward most reagents. It gave a compd. with $\text{Cu}(\text{NO}_3)_2$ and with NaOH gave a black tarry mass. Mol. wt. detns. by the f. p. method were not successful. The mol. wts. calcd. from the combustion and from the detn. of Cu in the $\text{Cu}(\text{NO}_3)_2$ compd. were 597 and 612, resp. E. SCHERUBEL

Euphorbia paralias L. PAUL GILLOT. *Mat. grasses* 20, 8307-8(1928).—The seeds contain water 7.08, fats 38.05, proteins 22.43, sugars 2.58, ash 5.39, cellulose 24.47%.

The expressed oil has d_{44}^{20} .9368, n_D^{20} 1.4819, n_D^{15} 1.4815, Crismer no. 62°, solidifying point -25° , free acids = 1.69 oleic acid per 100 g., sol. acids = 3.3 cc. 0.1 N KOH for 150 cc., insol. acids + unsapond. = 96.17%. Sol. volatile acids = 2.5 cc. 0.1 N KOH; insol. 0.5 cc. 0.1 N KOH, sapon. no. 194, I no. 196.3, acetyl no. (Andre) 10, unsapond. 1.55%, Hehner's no. 43.60%, oxidation 19.12%, elaidin test, Bellier aldehyde test, Halphen CS_2 test, Villavecchia and Fabris test, Blarez test and Bellier test (arachidic acid), all negative. Halphen Br test, immediate ppt.; resorcinol test, oil deep violet and acid yellow. Total acids have n_D^{20} 1.4727, I no. 203.8, neutralization value 198.2. The oil extd. with petroleum ether possesses practically the same consts., the only marked differences being an increase in the proportion of the free acids and a greater proportion of unsaponifiable matter. This oil is strongly drying.

P. THOMASSET

Halphen reaction. J. PIERAERTS AND EMILE SIMAR. *Mat. grasses* 20, 8312-6 (1928); cf. C. A. 22, 3546.—From tabulated results obtained in presence of various hydrocarbons, furfural and other substances and on different oils, it is concluded that: (a) No increase in sensitivity is obtained by dilg. the product under test; (b) pure furfural has no effect on the reaction; (c) pyridine increases the speed and sensitivity of the reaction; (d) contrary to Gastaldi, very pure amyl alc. does not give the same coloration with Halphen reaction.

P. THOMASSET

Apparatus for reducing the nickel catalyst. E. VOLPSON. *Masloboino Zhirovoe Delo (Oil & Fat Ind. (Russia))* 1928, No. 2, 8-11.—For his app. for the reduction of the Ni catalyst V. claims the advantages of mechanical charge and discharge, abs. tightness during the complete operation, a very good contact between the H_2 and the catalyst, the possibility of drawing samples during the process without cooling the apparatus, and the possibility of discharging the catalyst when hot.

A. A. BOEHTLINGK

The physicochemical evaluation of the "Physiol" soaps. A. BEYRODT AND L. ZAKARIAS. Prague. *Seifenforsch.* 1, 1-10(1928).—Some data are given on H_2O retention and lathering power of soaps which contain an addition of "Physiol" (a gum of the tragacanth class).

P. ESCHER

The bleaching of soaps. E. W. ALBRECHT. *Seifensieder-Ztg.* 55, 359(1928).—It is more economical to bleach the original fats than the finished soaps.

P. ESCHER

The p_H and detergent value of soap solutions. CHAS. E. MULLIN. Clemson College Textile School. *Textile Recorder* 46, No. 543, 65-6; No. 544, 59-61(1928).—The theory of detergents and the effect of p_H upon the cleansing action of detergent solns. are discussed. The surface tension of detergent solns. decreases with increasing p_H but the emulsifying action of the soln. has an optimum point, beyond which the emulsion of oil or dust is not as stable as at the optimum. There is no relation between the p_H of an alk. soap soln. and the remaining detergent power of the soln. These points are discussed in connection with wool scouring.

CHAS. E. MULLIN

The influence of certain narcotics on the equilibrium between soaps and alkalies and alkaline earths. M. CHIO. *Boll. soc. ital. biol. sper.* 3, 370-1(1928).— Et_2O , $EtOH$, $CHCl_3$ and chloral hydrate increase markedly the assocn. of Ca oleate mols.

PETER MASUCCI

The influence of certain narcotics on the dissociation of sodium oleate. R. SANNA-RANDACCIO. *Boll. soc. ital. biol. sper.* 3, 363-6(1928).—The effect of $CHCl_3$, $EtOH$, Et_2O and chloral hydrate on the dissocn. of sodium oleate was investigated. A 0.5% soln. of the soap was used. The turbidity formed on mixing the soap with the various reagents was detd. by means of a nephelometer and this turbidity was taken as a measure of the dissocn. or hydrolysis. The 4 substances acted as follows: (a) and (b) with and without the addn. of HCl all the reagents seem to accelerate the hydrolysis of Na oleate; (c) in the presence of CO_2 the 4 substances inhibit hydrolysis; (d) in the presence of $NaCl$, $EtOH$ and Et_2O inhibit hydrolysis, while $CHCl_3$ and chloral hydrate accelerate hydrolysis. However, if the soap soln. is dild. with distd. H_2O , $EtOH$ and Et_2O increase the turbidity. This increase is attributed to the assocn. of soap mols., which decreases dispersion, and not to increased hydrolysis. Similarly, in (a) and (b) the apparent increase of hydrolysis is due to the assocn. of the complex soap-fatty acid mol.

PETER MASUCCI

The precipitating action of chloroform on soaps. M. CHIO AND S. PORCU. *Boll. soc. ital. biol. sper.* 3, 367-9(1928).— $CHCl_3$ does not modify the dispersion of highly hydrolyzed soaps; it does decrease the dispersion of slightly hydrolyzed soaps with the formation of a coagulum. The coagulum is dehydrated by $CHCl_3$.

P. M.

for oils (Brit. pat. 286,753) 1. Heat-exchange apparatus suitable for use with oil (U. S. pat. 1,890,108) 1.

Aralkylated fats and aliphatic acids. I. G. FARBENIND. A.-G. Brit. 286,796, Dec. 13, 1926. Oleic acid or fats or other aliphatic acids are aralkylated by treating the materials, of unsatd. character, with benzyl chloride or other aralkyl halide, preferably in the presence of a catalyst such as Fe powder, ZnCl_2 or AlCl_3 . The products, when sulfonated, yield substances suitable for use as *wetting agents in dyeing* and as *substitutes for Turkey red oil*. A temp. of 150° is suitable for the aralkylation.

Extracting fats from waste liquors. CARL VAN OVERSTRAETEN. Fr. 638,739, Aug. 2, 1927. Fatty substances are recovered from the residues obtained in purifying wash waters such as wool by washing the residues in tepid water and boiling to dryness in the presence of Na_2CO_3 and afterwards heating under pressure to allow the impurities to ppt. to the bottom, then decanting and again boiling in water.

Fatty substances soluble in water. RAYMOND VIDAL. Fr. 637,274, Nov. 5, 1926. Fatty acids, such as oleic acid, acids from copra oil, peanut oil, etc., animal fats and oils, or mixts. of fatty acids and mineral oils, such as mazout, vaseline oils or paraffins, are made sol. in water by a treatment with alkali hypochlorites alone. The products find application in the *textile industry* for purifying raw fibers and for *cleaning paint, varnishes, etc.*

Bleaching fatty substances. I. G. FARBENIND. A.-G. Brit. 286,794, Dec. 11, 1926. Oils or fatty substances of vegetable or animal origin are bleached by the conjoint use of inorg. oxidizing agents such as permanganate, chlorate or hypochlorite, and inorg. substances acting by reduction or adsorption such as nascent H or bleaching earths. The material may be preliminarily treated with concd. H_2SO_4 or made into an emulsion with soap and during the bleaching an amt. of acid at least equiv. to the alkali in the oxidizing agent used is added. After bleaching, the material may be converted into soap and bleached with hypochlorite. Several examples are given.

Sulfonating fatty substances, etc. CHEMISCHE FABRIK MILCH A.-G. (to Oranienburger Chemische Fabrik A.-G.). Brit. 288,126, April 1, 1927. Mixts. of fatty substances (such as castor oil or wool olein) with mineral oils, lactones, alcs., ketones, aliphatic or aromatic acids, hydroxy acids, keto acids, acid anhydrides or acid chlorides are sulfonated by use of strong sulfonating agents such as chlorosulfonic acid to obtain products which may be used as emulsifying agents, wetting or fatting agents or in cleaning or dyeing paper, textile fabrics, leather, etc., or bleaching, mercerizing, carbonizing or finishing operations. Cf. C. A. 22, 2284.

Sulfonating aliphatic acids, etc. I. G. FARBENIND. A.-G. Brit. 288,127, April 1, 1927. Castor oil or other unsatd. aliphatic acid material or anhydrides or esters of unsatd. aliphatic acids are sulfonated by use of a mixt. of a low aliphatic acid or its anhydride (such as glacial HOAc or Ac_2O) and fuming sulfuric acid. The products obtained may be used like Turkey red oil.

Treating oils and fats. METALLBANK UND METALLURGISCHE GESELLSCHAFT AKTIENGESELLSCHAFT. Fr. 638,606, Aug. 1, 1927. See Brit. 275,536 (C. A. 22, 2284).

Recovering oil from aqueous emulsions. AMERICAN SHEET AND TIN PLATE CO. Brit. 287,438, Sept. 13, 1926. A heated aq. emulsion such as that of palm oil is agitated with steam and treated with an acid such as H_2SO_4 or other suitable acid or salt to break down the emulsion so that gravity sepn. of the oil may then be effected. An app. is described. Cf. C. A. 22, 4266.

Sulfonated oils, fats or their acids. H. TH. BÖHME A.-G. CHEMISCHE FABRIK. Fr. 637,338, July 8, 1927. Polymerized oils, fats or their acids are sulfonated by H_2SO_4 in the presence of anhyd. acids, their anhydrides, or chlorides, such as AcOH , Ac_2O or AcCl . An example is given of the sulfonation of "Floricin" (obtained by heating dry castor oil). Products with better properties than Turkey red oil are obtained. Cf. C. A. 22, 4265.

Sulfonated oils. CARL DREYFUS. Fr. 637,335, June 24, 1927. Sulfonated oils, contg. 6% or more of H_2SO_4 in org. combination are used in the treating liquids in the *textile industry*, as they are not decompd. in baths having a high content of acid, lye or salts. They can be used alone or along with hydrocarbons, alcs., esters, ketones, or chlorohydrocarbons.

Apparatus for continuous decantation of olive oil. SOCIÉTÉ CÉLESTIN COQ ET CIE. Fr. 638,881, Dec. 24, 1926.

Apparatus for extracting oil or fat from seeds, offal, fish or other vegetable material by use of solvents. J. R. STERLING. Brit. 286,752, Nov. 8, 1926.

Degreasing wool. I. G. FARBENIND. A.-G. Brit. 287,230, Dec. 16, 1926. Cyclo-

hexanone or a homolog is used for decreasing raw wool or other textile materials which may be wet or dry and may have been washed with water to ext. K salts. Cf. C. A. 22, 3789.

Centrifugal apparatus for recovering wax from honey-combs, etc. C. BOESCH. Brit. 287,094, March 14, 1927.

Soaps. I. G. FARBENIND. A.-G. Brit. 287,114, Nov. 9, 1925. Soaps suitable for cleaning textile materials contain "benzine" obtained by destructive hydrogenation of carbonaceous materials or a conversion product of such a "benzine." Other substances such as EtOH, oleic acid and benzene may also be added to soaps such as Marseilles soap.

Jacketed cauldron and soap-mixing apparatus. L. H. NELLES. Brit. 287,198, Nov. 16, 1926.

Soap-molding apparatus with an endless chain of molds. LEWIS A. PALEY. U. S. 1,691,899, Nov. 13.

Detergents. AXEL VIGGO BLOM. Ger. 466,301, Feb. 12, 1924. Alkali soaps and similar substances are treated with ethylene chlorhydrin to increase their adsorptiveness towards org. solvents and to decrease their sensitiveness toward Ca and Mg compds. Thus 40 parts of fatty acid is dissolved in 15 parts of BuOH and neutralized with concd. KOH. After cooling, 33 parts ethylene chlorhydrin is stirred in. The addn. of CCl_4 further increases the fat-dissolving action of the product.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Current problems in sugar plants. FRANT. NOSEK. *Listy Cukrovar.* 47, 37-9 (1928).—A discussion (non-technical). FRANK MARESH

Central Tarlac—greatest of Philippine mills. ANON. *Facts About Sugar* 23, 1112-5, 1121(1928).—This is a detailed qualitative description without engineering details. M. J. PROFFITT

The Indian sugar bowl and agricultural research in connection therewith. T. S. VENKATRAMAN. *Agr. J. India* 23, 166-76(1928).—An address dealing with the Indian sugar industry. K. D. JACOB

Production of refined sugar from gur in India in 1926-27. WYNNE SAYER. *Agr. J. India* 23, 213-6(1928).—In 1926-27, 21 factories in India produced 121,028 tons sugar as compared with 91,499 tons produced by 19 factories in 1925-26. K. D. JACOB

Some suggestions to improve the refining quality of the raw sugar. SEGUNDO D. LABAYEN. *Sugar News* 9, 464-7(1928).—To improve the refining quality of Philippine sugars, which in the 1926-27 season gave poor filtration rate, L. makes the following suggestions based upon his data obtained in Binalbagan Estate: (1) liming the cold mixed juice to 7.6-8.0 pH, (2) use of ample settling-tank capacity, preferably of the continuous type, (3) screening of the clarified juice through 100-150 mesh before sending to evaporators, (4) filtration of the sirup through some cloth (like fiji cloth), (5) making of good B massecuite and (6) using the "combination system" of sugar boiling. V. G. LAVA

Impurities of raw sugar. J. HAMOUS. *Listy Cukrovar.* 47, 90(1928).—H. concludes that in order to obtain the largest grains of sugar with a max. yield, the amt. of sirup must be at a min. This is effected by centrifuging the sugar as dry as possible. FRANK MARESH

Influence of the method of filtration of sugar solutions upon polarization. J. J. WEISS. *Listy Cukrovar.* 47, 49-50(1928).—The commission for standard methods has adopted a filtering app. which permits filtration in covered flasks. Details are lacking. FRANK MARESH

Unknown losses of sugar during saturation. L. O. ŠNAJDMAN. *Nauchnuie Zapiski* 5, 322-8; *Listy Cukrovar. Rozhledy* 47, 3(1928); cf. C. A. 22, 2286.—An aq. soln. of sugar was made alk. with CaO and some CaCl_2 was added. A Na_2CO_3 soln. was added until only a small quantity of free CaCl_2 remained in soln. The cloudy liquid was divided into 2 portions; one was filtered immediately, the second after the pptd. CaCO_3 originally amorphous became cryst. The first filtrate showed a lower alky. and polarization than the second because amorphous CaCO_3 is adsorbed more strongly than the cryst. form, which has a smaller surface, and some adsorbed products return into soln. FRANK MARESH

Losses encountered in diffusion batteries. JOSEF JASKÓLSKI. *Listy Cukrovar.*

47, 104-5(1928).—A description of an automatic device for preventing losses of diffusing liquors. FRANK MARESH

Colloids in their relation to clarification. J. J. SEIP. *Sugar News* 9, 81-6(1928); cf. C. A. 22, 2678.—The presence of colloids increases the viscosity of the soln. and this retards heat diffusion with its consequent effect on the rates of pan boiling and crystn. and on purging and centrifuging. Cane-juice defecation as now practiced, consists, essentially, in eliminating by flocculation about 15-25% of the colloids present. The elimination of colloids may be effected by elec. neutralization, by dehydration (e. g., by the use of strong alc.) or by adsorption (e. g., by use of Norit, Suchar, etc.). The use of the Gilchrist process of coagulating and clarifying sugar juices together with the Gilchrist settler is suggested. No data are given. V. G. LAVA

Elimination of the filter press in the sugar house and the possibility of obtaining granular muds. F. BERGÉ. *Sucr. Belge* 47, 444-51(1928).—B. points out the advantage to be gained by centrifuging juices through cloth. In this way a cake is obtained, the water content of which is 20% compared to the 60% water content of the regular filter press-cake. Thus sugar losses may be reduced. E. A. FIEGER

The danger of inversion in sugar-house products. O. SPENGLER AND F. TÖDT. *Z. Ver. deut. Zuckerind.* 78, 393-405(1928).—A simple method has been worked out for detg. the risk of inversion in all cases occurring in factory practice. The max. possible theoretical loss from inversion may be immediately detd. from temp.- p_H curves. These curves are based on the fact that inversion is influenced in a simple manner only by temp. and p_H . Hitherto, because of the irregular effects of salts, and because of the other inversion phenomena apparently contradictory to the law of mass action, the prevalent belief has been that inversion was a catalytic process which could not be governed by any readily derived law. The practical possibilities of the application of this direct method of detg. the danger of inversion are discussed. E. A. FIEGER

The sulfide stain method for determining small quantities of "volatile sulfur" in sugar. J. M. BRYAN. *Analyst* 53, 589-90(1928).—An app. similar to that used for the Gutzeit test is recommended. The test papers are prepd. by soaking filter paper in 25% neutral $Pb(OAc)_2$ soln. and are kept moist by placing them in a desiccator contg. wet pumice. 25 g. of Zn pellets and 50 cc. of 6 N HCl are used in the test. For the standard stains sat. air-free distd. water with SO_2 , dil. to a convenient strength and add 10 g. of sucrose per 100 cc. of soln. Prep. standards corresponding to 0.005, 0.010, 0.015, 0.020 and 0.025 mg. of SO_2 . W. T. H.

Methods of determining p_H with special reference to the quinhydrone electrode. V. G. LAVA AND A. S. HIZON. *Sugar News* 9, 16-26(1928).—The colorimetric method, the H-electrode method and the quinhydrone electrode method of detg. p_H are compared. Data on crusher juice, clarified juice and solns. of centrifugal sugar and molasses, are given, to show that the quinhydrone electrode can be used for measuring p_H of these solns. especially in the crusher juice and in solns. of molasses, where neither the H-electrode nor the color method will give satisfactory results. In solns. of centrifugal sugar the difference between the p_H detd. by the quinhydrone electrode and that detd. by the H electrode is less than 0.2 up to p_H 9, if care is taken that the quinhydrone reading is made within 2 min. after the quinhydrone powder is placed in the soln. Instead of using the calomel electrode for a half-cell, 0.01 N HCl buffered with 0.09 N KCl is suggested. V. G. L.

Gumming disease (of sugar cane). E. F. S. SHEPHERD. *Rev. agr. Maurice* 5, 173-6(1928).—Amplifying an article by Edwards (C. A. 22, 1491), S. describes in detail the symptoms of this disease and recommends various control measures. Some cane varieties are more resistant than others. Hot-water treatment of seed cane is being tried. F. W. ZERBAN

Leaf scald (of sugar cane). E. F. S. SHEPHERD. *Rev. agr. Maurice* 5, 176-8(1928).—This disease is present in Mauritius. It is similar to gumming disease caused by *B. vascularum*; the differences in the symptoms are described. The same control measures are recommended as for gumming disease (cf. preceding abstr.). F. W. Z.

The quality of milling cane: field trash. W. K. ORTH. *Facts About Sugar* 23, 1097, 1103(1928).—On the basis of direct estimates of the quantity of trash shipped in with cane at the Ewa, Hawaii, factory, 5 graphs are shown indicating an increase of trash with increase of rainfall; and with increase of trash a decrease of milling capacity, an increase of moisture in the bagasse, the ratio of bagasse to cane and sugar loss in the bagasse. It was not found that trash effected the purities deleteriously, but every effort should be made to exclude trash from the cane. M. J. PROFFITT

A summation of the comparative yields from cane variety tests conducted by the Philippine Sugar Association. H. ATHERTON LEE. *Sugar News* 9, 163-9(1928).—L.

compiled the results of variety tests in Negros and in Luzon with and without the use of fertilizers. Out of 14 expts. of 10 replications each in Negros, Badila was found to give better yields than Negros Purple in 8 instances, poorer yields in 3 instances, and results with no significant differences in 3. Out of 3 tests, H-109 was found to outyield Negros Purple in 2 and to be outyielded in 1. Badila is resistant to Fiji disease, mosaic disease and smut; it ratoons better than Negros Purple. From other data L. concludes that Cebu Purple will give greater yields than Pampanga Red and Luzon White, and be a more profitable cane to grow in Central Luzon, although H-109, M-1900 and Badila have some promise of being even more profitable. V. G. LAVA

The growth of beets in 1928. JAROSLAV SOUČEK. *Listy Cukrovar.* 47, 99-104 (1928).—A statistical study giving the yield of sugar beets in Czechoslovakia for 1928 as 61,376,800 kg.; the yield of sugar was 10,698,300 kg. FRANK MARESH

Ecology of sprouting beets with reference to disease. V. STEHLIK AND F. NEUWIRTH. *Listy Cukrovar.* 47, 77-90(1928).—A chapter for a monograph which is being prepd. FRANK MARESH

The protection of plants and culture of beets along the Rhine. F. NEUWIRTH. *Listy Cukrovar.* 47, 39-40(1928).—N. gives a survey of the work carried on by the Inst. of Plant Pathology at Bonn and describes the beet culture in the neighborhood. FRANK MARESH

The effect of removing the tops of sugar beets upon the sugar content. JAROSLAV SOUČEK. *Listy Cukrovar.* 47, 41-9(1928).—A statistical study. Exptl. plots were established throughout Czechoslovakia. About $\frac{1}{2}$ of the tops of each beet were broken off in certain rows during Aug. 15-20, and in others during Sept. 15-20. The remaining rows served as controls. Only the analyses (weights, yields, etc.) of the middle row of each plot of 3 rows are considered. Detailed instructions for collecting representative samples were given. In 1926 removal of the tops in Aug. decreased the yield of beets 17 quintals (q.) per hectare (ha.) and the sugar content 0.20%. The removal of tops in Sept. decreased the yield of beets 13 q. per ha.; the sugar content decreased 0.64%. Early removal of tops decreased the total yield; the later removal affected the sugar content. The results are not considered reliable, for the no. of plots was small, climate abnormal and distribution unrepresentative. In 1927 the control yielded 376 q. per ha. of beets. The Aug. removal of tops decreased the yield of beets 32 q./ha., the yield of tops (at harvest) 65 q./ha., the sugar content 0.38% and the yield of sugar 7.1 q./ha. The removal of tops in Sept. decreased the yield of beets 15 q./ha., tops 93 q./ha., sugar content 0.45%, yield of sugars 4.5 q./ha. The percentage of pressed juices remained the same in all cases. The effect of a late removal of tops is increased as the harvest is delayed. The decrease of sugar is not offset economically by the total growth of tops. FRANK MARESH

Increasing the capacity of the evaporator station in the beet sugar factory. M. MAXANT. *Sucr. Belge* 47, 382-91, 405-13(1928).—The Prache and Bouillon pre-evaporator-autocondenser is described in detail. The app. functions on live steam. It is autocondensing since no excess vapors but only incondensable gases and condensate water leave the app.; in this way all the energy of the live steam is utilized. The equipment facilitates the work of the evaporators by removing the incondensable gases to a large extent as well as by pptn. of various materials from the juice, this being done without fouling the app. The app. can handle 5-10-15% of the juice going to the effects, giving 3 lb. water evapn. per lb. steam in single effect. Examples are given showing where economies in juice heating and evapn. may be effected by means of the Thermo-Compressor. This is a basic part of the pre-evaporator. The vapors produced by evapn. of the juice are partly drawn off by a live-steam nozzle which forces them back into the steam chest of the pre-evaporator. This is the principle of the Thermo-Compressor. Another part of the vapors from the pre-evaporator is used for preliminary juice heating. An inclined evaporator is also described which serves to utilize part of the vapors from the vacuum pans. This evaporator resembles a juice heater, heated by vapors robbed from the pans. The juice section of the heater is in full connection with the vapor pipe going to the condenser. Full details of the principle and practice are given. E. A. FIEGER

Determination of lime salts in the beet sugar factory. O. SPENGLER AND C. BRENDL. *Z. Ver. deut. Zuckerind.* 78, 175-89(1928).—Full details of methods of prepn. of soap solns. are reviewed. Manipulation and procedure for all factory cases are described. Exptl. proof is given to show that equiv. quantities of $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ and CaO require the same amt. of soap soln. The soln. is so standardized that for 0.04358 g. $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$, 10 cc. of soap soln. are required. As the cc. of soap soln. are not exactly proportional to the lime content a table of the relation between cc. of soap

soln. and lime content is given. The table checks the table of Faisst and Knauss (*Chem. Pharm. Centralbl.* 1852:513). Mg salts do not use the same amt. of soap soln. as the equiv. amt. of Ca salts. A mixt. of Ca and Mg salts requires very little more soap soln. than that required for the Ca salts alone. Again Mg may be changed by the $\text{Ca}(\text{OH})_2$ to the insol. $\text{Mg}(\text{OH})_2$ and so removed from the reaction. Where high-Mg lime is used for liming, the soap test gives lime contents that are too high. In this case the tedious oxalate method must be used. The oxalate method is reviewed and may be used for checking. High-Mg limes will be discussed later. E. A. FIEGER

Answer to the remarks of J. J. Willaman concerning our article: "Degree of sweetness of fructose as compared with sucrose." O. SPENGLER AND A. TRÄGEL. *Z. Ver. deut. Zucker-Ind.* 1927, 367-9; *Chem. Zentr.* 1927, II, 988; cf. *C. A.* 22, 1784.—The expts. of S. and T. deal with the relative sweetness of fructose and sucrose, while W. always (with 1 exception) refers to the relative sweetness of fructose and glucose. Thus a discussion on the degree of sweetness of fructose (108 according to S. and T., 173 according to W.) is superfluous. As far as W.'s criticism of the method used by S. and T. is concerned, S. and T. discuss it and decline it. G. SCHWOCH

Analysis of starch sugar degradation products by selective fermentation. THOMAS McLACHLAN. *Analyst* 53, 583 9(1928).—To control the manuf. of products such as malt extract or glucose, the following, fairly accurate method is suggested. Take 8 tubes, each contg. 50 cc. of 10% soln. of the substance under examn. and sterilize in the steam sterilizer for 3 successive days, heating rapidly on the first day to destroy any diastase. Inoculate 2 tubes with *S. exiguus*, 2 with *S. froberg*, 2 with *S. saaz* and keep 2 blank. Incubate the whole set at 26° for 14 days. On the 4-5th day, rotate the tubes to distribute the yeast and to introduce a fresh air supply. After the fermentation, empty out one tube from each set into a sep. 150-cc. beaker, rinse it out carefully and evap. to about 15 cc. Cool, make up to 50 cc. and det. the d. *Dextrose and levulose*. The difference in the total solids of the blank and the soln. fermented by *S. exiguus* represents the dextrose and levulose. These can be detd. approx. if desired, by the diff. in optical rotation. *Maltose*.—The difference in the total solids between *S. exiguus* and *S. froberg* is maltose. *Other fermentable sugars*.—The difference in the total solids of the *S. froberg* and *S. saaz* solns. indicates other fermentable sugars. *Dextrins*.—The optical rotation is detd. and calcd. for the 100% product. Then dextrins = $[\alpha]_D \times 100, 180\%$. W. T. H.

The newer knowledge of pressure digesters. V. SÁVAZSKÝ. *Listy Cukrovar.* 47, 115-20(1928).—A discussion. FRANK MARESH

Formulas for computing the liquid contents of horizontal tanks. R. FREUND. *Listy Cukrovar.* 47, 50-2(1928).—Derivations, formulas and tables for use in the plant are given. FRANK MARESH

Fire extinguishers in sugar refineries. JOZEF KADLEC. *Listy Cukrovar* 47, 120-2(1928).—A description of the equipment "Minimax"; it contains Na_2CO_3 and HCl . FRANK MARESH

Boilers, furnaces and control equipment. GEORGE W. CONNOR. *Facts About Sugar* 23, 1046-50(1928).—C. describes two recent installations of boiler plants for cane sugar factories, one with regenerative air preheaters, and cites recent trends in the automatic control of firing with oil burners and bagasse burners, the increasing use of tuyères placed in the side and back walls of the furnaces, flat suspended furnace arches and certain operating devices. M. J. PROFFITT

A laboratory apparatus with a conductometric indicator for studying saturation and filtration (STANĚK, SANDERA) 1. An interpretation of the results of fertilizer experiments carried out in N. W. Dec. Artificial silk from the cellulose of sugar-cane bagasse (Brit. pat. 287,461) 23.

Sugar. RAFFINERIE TIRLEMONTAISE SOC. ANON. Brit. 286,599, March 5, 1927. Centrifugal sepn. of mother liquor from sugar crystals is effected so as to avoid the circulating of extraneous air through the crystal layer; a centrifuge drum with an air-tight cover may be used. Cf. *C. A.* 22, 3005.

Corn sugar. CHARLES N. BROWN and HUBERT E. NELSON. U. S. 1,690,350, Nov. 6. In producing glucose and corn sugar from corn grits, which have been prepd

by cracking, degerminating and dehulling, the grits are treated with a dil. inorg. acid (such as 0.03% HCl soln.) of a concn. just sufficient to solubilize basic salts contained in the grits and are washed prior to further treatment.

Purifying sugar. CORN PRODUCTS REFINING COMPANY. Fr. 638,958, Aug. 4, 1927. Fatty materials, proteins, cellulose and metal compds. are eliminated from glucose solns. obtained by the conversion of starch by passing an elec. current through the soln. in which a diaphragm such as porous porcelain is placed, which is permeable to the impurities but not to the glucose.

Refining sugar. C. G. PERRÉ. Brit. 287,590, Oct. 18, 1926. The viscosity of massecuite is reduced by heating immediately prior to its delivery to centrifuges or by the addn. of hot molasses while passing to the centrifuges so that it may be charged while the app. is in rotation. An app. is described.

Purifying sugar juice. AKTIEBOLAGET SEPARATOR. Brit. 287,526, March 23, 1927. Sugar juice is settled after liming and then centrifuged to remove suspended impurities. A centrifuge is used which has a non-perforated bowl from which the deposits are periodically removed while the centrifuge is at rest.

Purifying sugar juices. J. POHLMANN and R. F. RASSERS. Brit. 287,119, March 15, 1927. Albuminous substances are removed from an acid or neutral saccharine juice by addn. of tannin, tannin compds. or derivs., MeOH, picric acid, phosphotungstic acid or phosphomolybdic acid. The treatment may be effected at normal temp. and Ca(OH)₂ is added to remove excess tannin. A second crystn. may be obtained or the molasses may be concd. for the production of treacle.

Apparatus (with an endless belt traveling in a fluid-tight conduit) for counter-current extraction of beet slices, etc. SOC. ANON. DES ÉTABLISSEMENTS A. OLIER. Brit. 286,668, March 8, 1927.

Recovering nitrogen and acetone, etc., from molasses or vinasses. NOUVELLES INDUSTRIES CHIMIQUES SOC. ANON. Brit. 287,829, June 23, 1927. In the process of recovering N and acetone from molasses or vinasses as described in Brit. 277,932 (cf. J. 22, 2636), an alk. earth carbonate such as CaCO₃ or residues from a previous distn. or a hygroscopic substance such as sawdust is added to the mixt. of molasses or the like and lime to be distd.

Crystallization of glucose. CORN PRODUCTS REFINING COMPANY. Fr. 638,955, Aug. 4, 1927. Pure dextrose crystals are obtained from a soln. contg. isomers of glucose of high purity by maintaining a state of supersatn. and such a temp. that only 1 isomer crystallizes to the exclusion of the others. Thus, under vacuum at a temp. of 49–55° the anhyd. α -glucose is obtained.

Glucose from starch. CORN PRODUCTS REFINING CO. Fr. 638,956, Aug. 4, 1927. Glucose is prepd. from starch in successive stages; the second stage being carried out in the absence of substances forming polysaccharides. Between the first and second stages, the liquor is given 2 successive neutralizing and filtering treatments. The vessels used have walls inert to the hydrolyzing acid. Fr. 638,957 describes the conversion of starch into glucose in the absence of catalysts which tend to polymerize the glucose by converting the starch in the presence of absorbents such as animal or vegetable charcoal, fuller's earth or silica gel and using vessels chemically inert to the hydrolyzing acid.

Starch and glucose. CHARLES R. BROWN and HUBERT E. NELSON. U. S. 1,690,360, Nov. 6. In order to remove Fe salts from starchy materials such as in starch or glucose manuf., they are treated with a suitable dil. acid such as dil. HCl and the solubilized Fe salts and acid are washed out.

29—LEATHER AND GLUE

ALLEN ROGERS

Materials for protecting and preserving leather. EWALD ALTMANN. *Chem.-tech.* Ind. 29, 305–6, 321–2(1928).—A discussion of waterproofing materials for work or sport shoes. For the soles, mixts. of drying oils with waxes and resins are employed. For the uppers, mixts. of mineral oil with non-drying animal or vegetable oils and limited amts. of waxes are recommended. Numerous recipes are given. H. B. MERRILL

Determination and nature of water-solubles in leather tanned with wattle-bark extract. R. O. PAGE. Woolston Tanneries, Christchurch, New Zealand. *J. Am. Leather Chem. Assoc.* 23, 495–523(1928).—Leather from the butt of a cowhide tanned 6 weeks in wattle-bark ext. was very lightly oiled, dried and prepd. for analysis by shav-

ing. From the H_2O content of leather on removal from the last liquor and concn. of sol. matter in that liquor the % of sol. matter occluded by the leather was calcd. Ten-g. samples of leather were extd. with variable amts. of distd. H_2O flowing at 600 cc. per hr. in Wilson-Kern extractors. H_2O -sol. matter was detd. (1) by weighing the dried leather after extn., and (2) by analyzing the dried leather to get the ratio between hide substance and combined vegetable materials. Both methods gave the same % H_2O -sol. matter up to extn. with 25 l. H_2O . On further extn., % H_2O -sol. matter as detd. by the wt. of residue continued to increase up to extn. with 150 l., while the % H_2O -sol. matter as detd. by analysis of the residue did not increase, indicating that the ratio of hide substance to tannin became const. after extn. with 25 l. but that the residue was slowly hydrolyzed with the loss of both tannin and hide substance. To follow the extn. process in greater detail, 10-g. samples of leather were treated repeatedly with 100 cc. of H_2O or other soln. at 25° and at 50° until equil. between leather and liquor was established (8-24 hrs.). The liquor was filtered and sol. matter detd. in an aliquot. Fresh soln. was added to bring the vol. up to 100 cc. This process was repeated 65 times with H_2O at 25°, 54 times with H_2O at 50°, and 48 times with 0.001 N H_2SO_4 at 25°. The no. g. sol. matter in each ext. was plotted against the no. of extns. The resulting curves all consisted of 4 parts: (1) a smooth curve asymptotic to the vertical axis and to a line parallel to the horizontal axis, (extns. 1 to 10 with H_2O at 25°); (2) a short horizontal portion (extns. 11-20), representing the removal of material at a const. rate of about 0.04 g. per extn.; (3) a second horizontal portion following a sharp break, representing uniform extn. at a slower rate (about 0.025 g. per extn.), (extns. 20-39); and (4) a final horizontal portion following another break, representing uniform extn. at a still slower rate (about 0.012 g. per extn.), (extn. 39 till the expt. was discontinued). With H_2O at 50° the breaks were reached sooner. The principal effect of raising the temp. or varying the p_H value of the extn. medium is to change the shape of the curve before the first break is reached. The total amt. of material extd. up to the second break agrees very well with the amt. extd. by continuous washing with 25 l. H_2O , and is independent of temp. or p_H value within limits. This is the total quantity of material that can be removed without causing the leather to hydrolyze. The exts. obtained after the second break in the curve all contained dissolved hide substance. Conclusion: Total H_2O -sol. matter is best detd. by extn. of 10 g. leather with 25 l. H_2O flowing at a rate of 600 cc. per hr. The total matter extractable by H_2O may be divided into fixed and free. The exts. obtained after the curve first becomes linear all gave the gelatin-salt test for tannin. Analysis of combined exts. 10 to 20 for tannin by A. L. C. A. and by Wilson-Kern methods showed that much of the material dissolved is tannin that can be irreversibly fixed by hide substance. Hide, therefore, combines with a certain amount of tannin to form a compd. that is very resistant to washing, but it can also combine with more tannin to form a compd. that is broken down by washing. Free H_2O -sol. matter is the material deposited in the skin by evapn. of the last tan liquor carried out of the liquor by the skin. The wt. of H_2O -sol. matter found in the first ext. agrees closely with the wt. calcd. from the vol. and concn. of the liquor occluded by the skin. This was confirmed with several leathers tanned in final liquors of varying concn. Conclusion.—Det. free H_2O -sol. matter by digesting 10 g. leather with 100 cc. H_2O for 24 hrs. Det. sol. matter in an aliquot of the filtered soln. and calc. the quantity of material dissolved in the whole soln., including H_2O in the leather when weighed for analysis. Take the difference between total and free H_2O -sol. matter as combined H_2O -sol. matter. The effect of tanning conditions on % tannin, % combined H_2O -sol. matter and % free H_2O -sol. matter was studied. Increasing the concn. of wattle liquor from 20 to 150 g. tannin per l. in the last liquor increased the free H_2O -sol. matter, and had no effect on fixed tans or combined H_2O -sol. matter. Increasing time of tonnage from 6 weeks to 6 months had no effect on any constituent. Fixed tannin and combined H_2O -sol. matter were uniform throughout the cross section of the skin, but free H_2O -sol. matter was much higher near the surfaces. Pretreatment of skin with $CaCl_2$, $Ca(OH)_2$ and $NaOH$ increases combined H_2O -sol. matter at the expense of fixed tannin. Unhairing with NH_3 instead of $Ca(OH)_2$ increases fixed tannin at the expense of combined H_2O -sol. matter. Pretannage with 37% basic $Cr(OH)SO_4$ increases fixed tannin and decreases combined H_2O -sol. matter. The p_H value of the tan liquor is without effect on either fixed tannin or combined H_2O -sol. matter over the range p_H = 4-8. Decreasing the p_H value below 4 increases both fixed tannin and combined H_2O -sol. matter. Increasing the p_H value above 8 increases fixed tannin but decreases combined H_2O -sol. matter.

H. B. MERRILL

An improved tintometer [for tanning materials]. J. GORDON PARKER. London

Leather Industries Lab., London, Eng. *J. Intern. Soc. Leather Trades Chem.* 12, 417-8(1928).—Attention is called to a modified Lovibond tintometer adapted to the detn. of the color of vegetable tanning materials. Advantages claimed over the old form are saving of time and better agreement between different observers' results. H. B. M.

The tizrah sumach from Morocco. C. D. MELL. *Textile Colorist* 50, 395(1928).—Tizrah, tezera, tisrah, or five-leaved sumach (*Rhus pentaphylla*) is used chiefly for tanning hides, dyeing skins and fabrics and making inks. The roots constitute the best grade and may contain as much as 35% tannin. RUBY K. WORNER

Mordanting and dyeing phenomena (ELÖD, SILVA) 25. A red dye [for leather] from West African Guinea corn (MELL) 25. Emulsification of sulfonated oils (WOODROFFE, CRANE) 27. Modern tannin chemistry (DEKKER) 10. Vulcanization of rubber joined to leather (Fr. pat. 637,487) 30. Treating sulfite cellulose liquor [for use as tanning agent] (Brit. pat. 286,808) 23. Sulfurized derivatives of naphthols [for use in tanning] (U. S. pat. 1,690,641) 10. Composition for filling shoe bottoms (Brit. pat. 287,206) 30. Chromium compounds [for tanning] (Fr. pat. 638,718) 18.

Treating dried hides and skins. HARRY DODGE. U. S. 1,690,969, Nov. 6. Dried hides and skins are treated with a bath formed of CH_2O , KNO_3 , NaHCO_3 and water, in order to prep. them for tanning. Cf. C. A. 22, 2855.

Treating leather to prevent mildew, etc. BRITISH DYESTUFFS CORP., LTD., T. H. FAIRBROTHER and A. RENSHAW. Brit. 287,222, Dec. 14, 1926. A small proportion of an alkali salt of a polyhalogenated phenol such as 2,4,6-trichlorophenol is added to a leather dressing compn.

Tanning. CARL DREYFUS. Fr. 637,441, June 28, 1927. Sulfonated oils or fatty acids contg. more than 6% combined H_2SO_4 are used for tanning and prepg. skins, particularly in chrome tanning, along with org. acids such as H.COOH , AcOH , PrOH , BuOH , lactic acid or oxalic acid.

Tanning. F. G. STIASNY and B. JALOWZER. Brit. 287,221, Dec. 14, 1926. Complex ferri sulfite compds. are used or substances which will form them in the bath or on the hide itself. These compds. may be formed from FeCl_3 , $\text{Fe}_2(\text{SO}_4)_3$ or ferrous salts with subsequent oxidation by reaction with alkali sulfites, bisulfites or metabisulfites or compds. of SO_2 and org. substances such as aldehydes, ketones and acids and their salts, glucose or other carbohydrates. These compds. may be used with other tanning substances such as sulfite cellulose liquors and the hides may be successively treated with the reactive reagents to form the ferri-sulfites in the hide substance itself.

Tanning fish skins. S. STRAMSKY. Brit. 287,981, March 29, 1927. Fish skins such as those from ray fish, after liming, are fastened together in pairs with their flesh side opposed and tanned in this position to avoid curling.

Dyeing leather. BARTHOLOMAËUS VOSSEN (to Grasselli Dyestuff Corp.). U. S. 1,690,518, Nov. 6. Full even brown shades are produced on leather with acid azo dyes formed with 2 end components derived from a diazotizable aromatic amine such as peramic acid and *p*-nitroaniline and middle components, one of which is a non-sulfonated resorcinol or substitution product and the other of which is an aminonaphthol mono- or di-sulfonic acid.

Gelatin. L'ULTRA-FILTRE D. M. S. Fr. 638,871, Dec. 23, 1926. Gelatin from the hydrolysis of N compds. such as ossein is clarified by passing it through an ultra-filtr made of nitrocellulose, denitrated or not, or cellulose acetate or viscose.

Apparatus for obtaining glue or gelatin in solid pellets. C. GREINER. Brit. 287,866, March 28, 1927. Drops of liquid material are allowed to fall onto a cooled impeller conveyor band formed of metal.

Glue. STOCKHOLMS BENJÖLSFABRIKS AKTIEBOLAG. Brit. 287,128, March 16, 1927. Small pieces of glue in a "glutinous" condition are introduced into or sprinkled with a powder to form a coating on them. Cf. C. A. 22, 4870.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Dispersoidological investigation of latex. P. P. VON VEIMARN. *Kolloid-Z.* 46, 23(1928).—See C. A. 22, 4872. E. H.

Investigation on rubber prepared from primary and tertiary latex cream according to the Itermark patent. W. SPOON. *Arch. Rubberkultur* 12, 596-603(1928). (Sum-

marized in English 604.)—The prepn. and drying of crepe from ammoniated primary and tertiary latex cream were investigated. The tertiary cream was obtained by centrifuging the primary cream twice, each time after diln. with water. Samples of crepe were prepd. in Holland from the primary and from the tertiary cream to det. the changes which they might undergo during a sea voyage. Rubber from primary and tertiary cream dried very slowly, while the chem. compn. of the former indicated a low proportion of non-rubber components and the chem. compn. of the latter a still purer rubber. The rate of vulcanization of these rubbers was abnormally slow, especially with tertiary rubber, while the quality after vulcanization was abnormally poor. Centrifuging the primary cream twice purified the rubber to some extent but did not improve the phys. quality. C. C. DAVIS

Investigations on Utermark cream and on rubber prepared therefrom. Comparison with some other rubber types. W. SPOON. *Arch. Rubbercultuur* 12, 576-93(1928). (Summarized in English 594-5.)—*Hevea* latex concd. while fresh by the Utermark method (cf. British pat. 218,635) gave cream which contained 54-5 g. of dry rubber per 100 cc. of cream. Crepe rubber prepd. from fresh cream and from cream preserved with NH_3 was compared with crepe prepd. by ordinary methods from fresh latex and from latex preserved with NH_3 and with crepe from fresh underlatex. Crepe from cream was nearly white; that from underlatex was yellow. Crepe from cream preserved with NH_3 required twice as long to dry as crepe from normal latex preserved with NH_3 (cf. Stevens, *C. A.* 21, 2077). Rubber from cream contains a very low content of serum substances, whereas rubber from underlatex contains a considerable content. The phys. and chem. properties of crepe from underlatex resemble those of rubber prepd. by partial coagulation (cf. de Vries, *C. A.* 11, 2625), and the properties of crepe from cream resemble those of crepe from the residual liquid. Aging tests were carried out by heating at 70° in air, the change in wt. and in acetone ext. being detd. Rubber from cream was inferior in its aging properties to rubber prepd. in the ordinary way, which agrees with similar expts. by Stevens. Cured with S alone, rubber from cream vulcanized more slowly than did rubber prepd. in the ordinary way. Rubber from cream had a smaller capacity for water absorption than ordinary rubber. C. C. DAVIS

Determination of the specific gravity of rubber mixtures. ST. REINER. *Gummi Ztg.* 43, 135(1928).—A method is recommended which involves cutting out a small sample, measuring its dimensions and wt. and thence calcg. the d. C. C. DAVIS

Determination of the specific gravity of rubber mixtures. L. STOLL. *Gummi Ztg.* 43, 252(1928).—The methods for detg. d. as described by Reiner (cf. preceding abstr.) are impractical. It is best to follow standard methods, such as weighing in air and then in water, or the Mohr procedure. C. C. DAVIS

The absorption of the vapors of liquids by rubber. STEPHAN REINER. *Kautschuk* 4, 210-5(1928).—The possibility that rubber might be used in place of active powders as an absorptive agent for the recovery of volatile solvents led to expts. to det. at what rate and to what extent rubber absorbs such vapors at room temp. The app. and technic devised, which are described and illustrated in detail, allowed the measurement of the absorption of any vapor by rubber at const. temp. The rubber was purified by soln. in C_6H_6 and reprecipn. with EtOH , and was finely divided to present a large surface area, and was then exposed to the vapor under the very carefully controlled conditions described. Data are tabulated for the continuous absorption of C_6H_6 vapor at 25° by rubber over a period of 700 hrs. These results show a rate of absorption which is relatively slow and progressive, no approach to equil. being evident even after 700 hrs. This is shown by the following values drawn from the results, the data giving the hrs. of exposure and the % C_6H_6 absorbed: 1, 0.2; 5, 0.37; 25, 1.07; 50, 1.80; 75, 2.62; 100, 3.24; 200, 5.46; 300, 7.10; 400, 9.30; 500, 12.10; 600, 13.50; 700, 16.10. At the end of 700 hrs., the rubber was sticky and swollen and with all indications that absorption would have continued progressively. C. C. DAVIS

Color reactions of rubber and gutta-percha. F. KIRCHHOFF. *Kautschuk* 4, 190-2(1928).—A crit. review and discussion of a paper by Pauly (cf. *C. A.* 22, 1703), with the inclusion of new data. Like concd. H_2SO_4 , $\text{Cl}_3\text{CCO}_2\text{H}$ isomerizes rubber (cf. *C. A.* 23, 307), and since moreover $\text{Cl}_3\text{CCO}_2\text{H}$ gives characteristic color reactions with other unsatd. cyclic hydrocarbons, the Chugaev-Godoletz and allied reactions probably involve a transitory addn. of $\text{Cl}_3\text{CCOC}_2\text{H}$ (or H_2SO_4) with formation of cyclorubber, which as a result of the colloidal state shows an intense coloration. By dissolving the product in water, the rubber isomer seps. in flocculent form. The appearance of these colors is not, therefore, a proof of the original existence of a ring structure in the rubber hydrocarbon (cf. Pauly, *loc. cit.*), but only of cyclization or rearrangements within the rubber mol. The comparatively great tendency of the rubber hydrocarbon toward

cyclization is accordingly responsible for the color changes. Much more characteristic and significant is the color reaction of rubber dibromide noted by Weber (cf. *Ber.* 33, 791(1900)). Since phenolic ethers do not react with rubber dibromide, it was concluded by W. that the H atom of the OH group, and not the *p*-H of the Ph group, reacts with the Br, but this was disproved by Fisher, Gray and McCollm (cf. *C. A.* 20, 1987). It is therefore probable that hydroxyphenyl derivs. of hydorrubber of the constitution:

are formed (cf. Geiger, *C. A.* 21, 4093), which will also explain their soly. in alkalis. In the absence of catalysts, blue or red-violet fusion mixts. are formed which are stable for several days, but which change color when dissolved in org. solvents. The violet color of fusion mixts. of rubber or gutta-percha dibromide is a typical dispersive color reaction which depends upon the particle size, while the latter depends in turn upon the concn., temp. and occurrence of secondary reactions. Natural impurities in rubber therefore play a part and alter the color obtained with pure reagents. The Weber reaction can be utilized for the detection or identification of rubber or gutta-percha. Ext. a few centigrams of finely divided sample with acetone, swell or dissolve in CCl_4 , brominate in this soln., suspend a few mg. of bromide in 2-3 cc. of CCl_4 , add 1-2 cc. of very concd. PhOH (or the corresponding quantity of cryst. PhOH), warm to eliminate CCl_4 and heat until the PhOH begins to boil. If rubber or gutta-percha is present, the characteristic blue or red-violet color appears. For further identification, dissolve a few drops of the fusion mixt. in an org. solvent (CHCl_3 , Et_2O or Ac_2O) and note the color. About 6 mg. of gutta-percha bromide (from Tjipetir gutta-percha), i. e., about 2 mg. of gutta-percha hydrocarbon, in 10 cc. of CHCl_3 gave a distinct blue-violet color, so even 0.2 mg. of rubber hydrocarbon can be detd. by this method. The reaction is applicable to hot- and cold-vulcanized rubber. With hexahydrophenol and phenetole there is no definite color reaction. The following data give the color of the dibromides, of the PhOH fusion mixts. and of their solns. in CHCl_3 , CCl_4 , Ac_2O and Et_2O , resp.: pure rubber (crepe), yellowish white, blue-violet, blue-violet, blue-violet, reddish yellow, yellow, pure gutta-percha (Tjipetir), white, blue, blue, blue-violet, reddish yellow, yellow, oxidized gutta-percha, yellowish white, carmine, carmine, carmine, reddish yellow, yellow; synthetic rubber II, yellowish white, cherry-red, cherry-red, cherry-red, —, yellow, sulfolycorubber, yellow-brown, carmine, cherry-red, cherry-red, —, yellow; $\text{Cl}(\text{CO}_2\text{H})$ rubber, light yellow, reddish brown, reddish brown, reddish brown, —, yellow; rosin oil, light brown, reddish brown, reddish yellow, reddish yellow, —, brown; rosin, light brown, reddish yellow, reddish yellow, reddish yellow, —, brown. Heated with pyrogallol, rubber dibromide gives a cherry-red color, and with resorcinol a dark orange-red color. Like the PhOH mixts, these fusion mixts. give with alc. alkalis, intense yellow brown solns. (alkali salts of the corresponding hydroxyphenylhydorrubbers). None of these fusion mixts. exhibits such a characteristic color as the PhOH products of rubber, gutta-percha and balata dibromides.

C. C. DAVIS

The direct agglomeration of waste soft rubber and the manufacture of soles.

L. GRAFFE. *Caoutchouc & gutta-percha* 25, 14186-7(1928).—As ordinarily encountered, the tendency of fresh surfaces of unvulcanized rubber to adhere and the lack of such tendency in vulcanized rubber depends upon the temp. and pressure, vulcanization merely changing the limits between which adhesion may be obtained. It is possible by the use of sufficiently high pressures and suitable elevated temps. to bind finely divided vulcanized waste rubber together into a compact mass, and thus obtain useful products directly, such as soles (cf. French patents 338,945(1903); 361,300(1905); English patents 12,454(1906); 28,267(1907)). The process may be made continuous, the ground material passing to heated hydraulic presses. Soling made in this way has shown tensile strengths of 0.35-0.40 kg. per sq. mm. and elongations of 150-250%, with good resistance to abrasion.

C. C. DAVIS

The resistance of rubber to compression. RAFFAELE ARIANO. *Nuovo Cimento*, [N. S. V.] 3, 77-107(1928); cf. *C. A.* 20, 3362; 22, 2081.—A. has explored mathematically the compression curves of rubber of different degrees of vulcanization, and the relation

between variation in vol. and the Joule effect and Poisson's coeff. The Poisson coeff. for stretching is never greater than 0.5, but for compression varies from 0.5 to infinity. The expression for work of deformation has a logarithmic form. L. T. FAIRHALL

Jelutong. C. D. V. GEORGI. *Malayan Agr. J.* 16, 204-11(1928).—There are several reasons which may account for the tendency of jelutong from certain sources to oxidize to a brittle resin (cf. C. A. 22, 2078), among which are contamination with harmful metallic salts or alkalies. Expts. were therefore undertaken to det. whether the addn. of salts to jelutong latex would result in oxidation and resinification. FeSO_4 , FeCl_3 , CuSO_4 , MnSO_4 , and MnCl_2 were added in sep. expts. to latex and the latter was then coagulated with AcOH . In control tests, latex was coagulated without the addn. of a salt. The coagula were then treated in the usual way and examd. after 6 months. Fe and Cu salts induced oxidation, whereas Mn salts only favored the growth of molds. With 0.01-0.02 g. of Fe per 100 cc. of latex, the jelutong oxidized considerably during 3 months of storage. Mn compds. have consequently a far different effect on jelutong than their effect on rubber. In further expts. fresh coagulum was extd. with boiling water, was then soaked in 1% aq. FeSO_4 , FeCl_3 , CuSO_4 , $\text{Cu}(\text{OAc})_2$, MnSO_4 , MnCl_2 , NaOH and KOH and finally was pressed into blocks, dried and stored for 6 months. Under these conditions the metallic compds. had little or no effect. Jelutong latex from Kedah differs in compn. from latex from the local forest reserves of Malay, expts. with the former showing no tendency to oxidize whether or not the jelutong had been extd. with boiling water, and whether or not it had been coagulated with AcOH , HCO_2H , H_2SO_4 , K alum or Na_2SiF_6 . Addn. of FeCl_3 to the latex, however, resulted in rapid oxidation. Addn. of NaCl (0.1 g. per 100 cc. of latex) had no influence on the aging. Kedah latex coagulated with alc. gave a product with no tendency to oxidize, but when the jelutong was creped and then blocked, oxidation ensued. C. C. DAVIS

The valuation of jelutong. C. D. V. GEORGI. *Malayan Agr. J.* 16, 220-33(1928); cf. preceding abstr.—Definite standards should be established for the manner of sampling, examn. and testing jelutong. Present methods for detg. the moisture content are unsatisfactory, since the water present in a block is unevenly distributed. A crit. survey of present methods of detg. water, with expts. on the development of a better method, shows that good results can be obtained by weighing the whole block, cutting into pieces, creping the latter, drying the crepes superficially, weighing, removing a part of each sample, repeating the process of creping, drying and removing a proportionate part, creping finely, drying for 10 hrs. at 40° , cooling, weighing, removing an aliquot part and drying to const. wt. Jelutong has a tendency to gain weight when heated more than 6 hrs. at 100° . It darkens considerably, acquires an odor suggesting decompn., and probably both absorption of O and decompn. take place simultaneously, the former more rapidly than the latter. Data on moisture detns. of jelutong from various sources are given. C. C. DAVIS

Factors in the evaluation of vulcanized rubber mixtures. WERNER ESCH. *Kautschuk* 4, 215-22(1928).—A general discussion dealing with modern methods of compounding, with the object of showing the phys. quality obtained with different types of rubber mixts. The argument is supported by quant. data on the phys. quality obtained with various formulas, phys. tests before and after aging being given to show that it is impracticable to judge the phys. quality of rubber mixts. by the content of rubber and other ingredients. C. C. DAVIS

Is vulcanization a chemical phenomenon? PAUL BARY. *Rev. gén. caoutchouc* 5, No. 45, 3-7(1928).—A crit. review and discussion of recent work by Bacon (cf. C. A. 22, 3804). The expts. do not disprove the existence of "giant" mols., for the swelling of lyophilic colloids, particularly rubber, involves depolymerization and solvation (cf. Bary, C. A. 21, 670, 1911) with formation of mols. small enough to peptize. No explanation of vulcanization with very small proportions of S in the presence of an ultra-accelerator is offered. Difficulties in explaining the degree of polymerization of raw and of vulcanized rubber and the continuity in the variation of the phys. properties of compds. of the compn. $(\text{C}_6\text{H}_8)_n$ and $(\text{C}_6\text{H}_8)_n\text{S}$ are removed by assuming that raw rubber is a complex system of mols. of various degrees of polymerization (cf. Bary, C. A. 21, 670) and that the coeff. of polymerization n is only a mean value. Two types of polymers may be present, α and β , with widely different n values and transformable into each other by changes of temp., elongation, soln., light, etc. Since the higher the temp. the lower the mean degree of polymerization, vulcanization at low temps. requires less S than vulcanization at higher temps., e. g., $140-5^\circ$. Satn. of the available double bonds at vulcanizing temps. does not assure the formation of a rubber resistant to heat or to repeated mech. work, and if the temp. is raised above that of vulcanization, renewed depolymerization occurs and the rubber is again undercured. The

expts. of Bacon do not take into account the more recent theories involving colloidal properties, though there is no evidence offered which is at variance with any of the latter.

C. C. DAVIS

Specific gravity of various kinds of carbon black (ESCH) 18. A new electrical instrument for marking various objects, notably of rubber, and its application to vulcanization (GRAND) 1. Spraying of rubber [trees] (ASHPLANT) 15. The effect of heat on cotton. Initial changes in tensile strength of unproofed fabric (TILTMAN, PORRITT) 25. Principles of patent law involved in the Weiss patent litigation (DELLER) 13. Dental plate of rubber coated with metal (U. S. pat. 1,691,755) 18. Bolter for C black or other pulverulent materials (U. S. pat. 1,691,572) 18. Unsaturated aliphatic hydrocarbons [for use in the production of rubber] (Fr. pat. 637,410) 10. Modifying the physical properties of "isocolloids" [use as rubber substitutes] (Brit. pat. 287,943) 18.

Treating latex. WM. B. WESCOTT (to Rubber Latex Research Corp.). U. S. 1,690,150, Nov. 6. A reaction is effected between ZnO and hemoglobin in soln. in latex to obtain a material which may be subsequently coagulated for various purposes.

Rubber compositions. L. B. SEBRELL (to Goodyear Tire & Rubber Co.). Brit. 287,445, March 19, 1927. Reaction products of crotonaldehyde and amines such as toluidines, xylydines or naphthylamines are used as "antiagers" for rubber.

Rubber composition for sealing containers, etc. ARTHUR BIDDLE (to United Products Corp. of America). U. S. 1,691,460, Nov. 13. A compn. of adhesive properties comprises an aq. dispersion of chicle, a hydrophilic colloid such as casein, an oil solvent for the chicle such as linseed oil, rubber in dispersed phase and an alkali such as NH₃ and borax.

Composition of rubber and fibers. THE DUNLOP RUBBER CO., LTD. Fr. 637,211, July 7, 1927. Objects are made by molding and vulcanizing a material contg. 75% or more of waste tires and tubes, or other waste from the manuf. of tires, and if desired, filling materials. In an example, 29 parts of waste auto covers ground small, 28 of cloth scraps or waste cord, 28 of old rubber tires, 10 of S, 2 of mineral oil, 2 of brown substitution product, and 1 of stearic acid are mixed and vulcanized under pressure.

Deposition of rubber. WM. A. WILLIAMS. Fr. 638,630, June 22, 1927. In the electrophoretic deposition of rubber an exterior source of current is dispensed with by adding to the latex, vulcanized or not, an electrolyte such as NH₄Cl which acts as an auto-excitant, and connecting the electrodes of Zn and C directly outside the electrolyte. If the latex of commerce is used its alky. is first reduced.

Forming rubber tubes from solutions or dispersions. DUNLOP RUBBER CO., LTD., D. F. TWISS AND E. A. MURPHY. Brit. 287,592, Oct. 21, 1926. Mech. features.

Forming tires in metal molds. WALLACE H. CAMPBELL (to Goodyear Tire and Rubber Co.). U. S. 1,691,756, Nov. 13. A tire is supported in a metallic mold blank in spaced relation to the blank, the intervening space is packed with a casein compn. and the materials are subjected to heat and pressure to harden the compn. and form a tread mold for tire manuf.

Molded rubber articles formed by dipping. DUNLOP RUBBER CO., LTD., G. W. TROUBRIDGE AND E. A. MURPHY. Brit. 287,946, Oct. 20, 1926. The mold is treated, on the side which is to take the deposit, with materials which facilitate the agglomeration of the rubber from latex or other aq. dispersions, e. g., with CaCl₂, with or without fillers, S, accelerators, etc. The pressure on the inside of the mold may be reduced or that on the outside increased, or the mold may be partially glazed so that a thinner deposit is formed on the glazed than on the unglazed portions.

Utilizing waste rubber for belting, etc. I. BONTEMS. Brit. 286,652, March 7, 1927. Articles such as driving, conveyor or elevator belts are made from old tire casings (from which the beads or flanges are removed) which are partly devulcanized and then revulcanized in stretched-out position.

Composition for filling shoe bottoms. H. BROOMFIELD AND SHOE INVENTIONS, LTD. Brit. 287,206, Dec. 7, 1926. Various materials are used together, of which an example comprises ground vulcanized rubber 56, leather or cork dust 16, cotton, leather or wool fiber 2, a soln. of bitumen in light hydrocarbon with or without collodion 24, raw rubber soln. 48, S 2 and accelerator 1 part.

Molding ebonite. A. FRASER AND RISSIK, FRASER & CO., LTD. Brit. 286,915, Nov. 2, 1926. In subjecting ebonite dust to pressure and heat, molds are used, the inner surfaces of which are composed of materials such as Sn, brass, duralumin or other Al alloy, rustless steel contg. no Ni or an alloy such as described in Brit. 250,721 (C. A.

21, 1247), to which the ebonite dust does not stick and with which it does not react. Cf. *C. A.* 22, 2082.

Molded ebonite articles. HAROLD GRAY (to B. F. Goodrich Co.). U. S. 1,691,347, Nov. 13. Rubber is mixed with a vulcanizing agent such as S and accelerator and with sufficient clay, whiting, C or other suitable pigment to stiffen the compn. after momentary vulcanization, the material is partially vulcanized in a mold, then removed from the mold and subjected to further vulcanization.

Vulcanization of rubber joined to leather. LÉON B. CONANT. Fr. 637,487, July 12, 1927. See *Brit.* 275,194 (*C. A.* 22, 2292).

Vulcanized rubber. BRITISH DYESTUFFS CORP., LTD., CECIL J. T. CRONSHAW and WM. J. S. NAUNTON. Fr. 637,849, July 18, 1927. A material giving good aging properties to rubber is produced by condensing equal parts of α - and β -naphthylamine with AcH in the presence of an acid. An example of a good aging rubber is 45 parts smoked sheets, 30 floating reclaim, 3 mineral rubber, 10 ZnO, 10 gas black, 2 S, 0.3 diphenylguanidine, and 1.2 of the above described compd., vulcanized for 45 min. at 141°.

CHEMICAL ABSTRACTS

Vol. 23.

FEBRUARY 10, 1929

No. 3

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

A new microburet. ERIK M. P. WIDMARK AND SÖREN L. ÖRSKOV. *Med.-Chem. Inst., Lund. Biochem. Z.* 201, 15-21(1928).—Description of a buret graduated in cu. mm. S. MORGULIS

A new attachment for bottles used for the storage of standard solutions. A. G. LIPSCOMB. *Analyst* 53, 645(1928).—The device recommended provides for the escape of air from the container when the temp. rises and prevents contamination by CO₂ and concn. changes. In the rubber stopper is inserted a tube which runs upward into an outer glass jacket. Through the top of this jacket is introduced and sealed to the jacket, a tube which is expanded into 3 bulbs. Air drawn into the stock bottle is made to bubble through the same soln. that is contained in the stock bottle and air from the bottle is made to pass through the soln. in the opposite direction. W. T. H.

A sensitive vacuum-tube voltmeter. CHARLES B. AIKEN. *J. Optical Soc. Am.* 17, 440-50(1928). F. H.

Illuminator for Stammer's colorimeter. V. SÁZAVSKÝ. *Listy Cukrovarnické* 47, 137(1928).—S. describes a simple arrangement which allows the use of a Stammer colorimeter with artificial light at const. intensity and distance. A moving curtain removes gray shadows and permits reliable results. FRANK MARESH

Addition to the paper: A new simple automatic cryostat. A. SIMON WITH O. FISCHER, R. GLAUNER AND L. EHLING. *Tech. Hochschule, Stuttgart. Ber.* 61B, 2173-4(1928).—A new arrangement of the device described previously (cf. *C. A.* 21, 1905) permits a more convenient regulation of the pressure. A. L. HENNE

The separation of solids from liquids. A review of modern plant and appliances. ANON. *Chemistry & Industry* 47, No. 48; *Chem. Eng. Trade Literature Suppl.*, 32 pp. (1928). F. J. C.

A new rapid extrusive type of plastometer. P. M. GIESY AND S. ARZOOMANIAN. *Fifth Colloid Symposium Monograph* 1928, 253-8.—Pressure is produced by Hg in a buret, connected by canvas-lined rubber pressure tubing to a chain of ordinary cast-iron pipe fittings seriated as follows: reducing coupling, nipple, street elbow, cap. The cap is pierced to allow the insertion of a capillary into a rubber stopper, which is held in by the cap. A stopcock and side outlet tee of glass are interposed between the pressure tube and the reducing coupling. If desired, a const.-temp. bath may be used. JEROME ALEXANDER

The falling-sphere viscometer and plasticity measurements. H. E. PHIPPS. *Fifth Colloid Symposium Monograph* 1928, 259-66.—The falling-sphere viscometer may be used as a plastometer, its use being limited to the lower portion of a normal plasticity curve. JEROME ALEXANDER

New hydraulic press. HANS KLEINMANN. *Univ. Berlin. Pharm. Ztg.* 73, 1498-9(1928).—A detailed description is given in connection with an illustration, of a new micropress for small quantities of material. W. O. E.

Temperature regulator for Carius furnace. G. B. HEISIG. *Univ. of Minnesota. J. Am. Chem. Soc.* 50, 3388(1928).—Suggests the use of a thermostat used to control the temp. of ovens on gas stoves. C. J. WEST

A new type of thermostat. V. CUPR. *Masaryk Univ. Z. Elektrochem.* 34, 679-82 (1928).—The thermostat described may be used between wide temp. limits (most advantageously from -40° to +20°) with an accuracy of $\pm 0.02^\circ$, the danger of overheating being eliminated. Its temp. is kept const. by allowing some of the soln. to flow from or into a test tube. The soln. in the test tube is cooled (when used below room temps.) by immersion in a freezing mixt., or heated (for above room temps.) by surrounding with an elec. heating unit. The flow of the soln. is controlled by an elec. interrupting device and a vacuum pump, relays and strong sparking being eliminated.

Gasometric determination of H_2O_2 , nitrogenous compounds and of fermentative CO_2 by means of Paechtner's ponderovolumeter (Luy) 11B.

Scientific Instruments. London: Adam Hilger, Ltd. Reviewed in *Glass Ind.* 9, 223(1928).

Grinder for laboratory use. ETIENNE JOUKOWSKY. Swiss 126,456, May 2, 1927. Constructional details.

Pyrometers. SIEMENS & HALSKE AKT.-GES. (Alfred Schack and Mathias Wenzl, inventors). Ger. 467,953, July 9, 1926. In a pyrometer for measuring the temp. of a flowing gas, the hot junction is surrounded by substances, such as tubes of refractory material, offering a large heating surface to the gas and having high coeffs. of heat transmission.

Recording optical pyrometer. OSWALD H. BLACKWOOD. U. S. 1,692,923, Nov. 27. Wet- and dry-bulb hygrometer. SOC. ANON. DES ETABLISSEMENTS NEU. Brit. 288,604, April 13, 1927. A device suitable for use with humidity-regulating app. comprises a hygrometer the wet bulb of which is moistened with an aq. soln. having a vapor tension that is a constant determined fraction of that of pure water at all temps. Solns. of glycerol, NaCl, $NaNO_3$, and $CaCl_2$ are suitable. Various structural details are described.

Portable electrical thermometer. JÖRGEN U. A. OHLSEN. Swiss 126,229, Mar. 1, 1927. Constructional details.

Thermometer for measuring temperatures of electrical apparatus. E. D. T. NORRIS and FERRANTI, LTD. Brit. 288,735, Jan. 17, 1927.

Thermometer with dial and pointer. BLAINE H. HARRIS (to Brown & Bigelow). U. S. 1,692,551, Nov. 20. Structural features.

Thermometer stem with inner and outer tubular portions. HARRY Y. NORWOOD (to Taylor Instrument Companies). U. S. 1,692,381, Nov. 20. Structural features.

Temperature regulator. FABRIK ELEKTR. APPARATE FR. SAUTER A.-G. Swiss 126,490, June 14, 1927. Constructional improvements are described in app. of the type in which the linear expansion of an expansible body acts on an elec. contact so constructed that at a predetd. min. or max. temp. a control circuit is completed.

Automatic temperature regulator. WM. DÉRIAZ. Swiss 126,605, April 4, 1927. An elec. device is described.

Temperature-indicating devices for use on automobile radiators. JOHN W. ANDERSON. U. S. 1,694,902-3-4-5-6-7-8, Dec. 11.

Temperature indicator adapted for use on automobile radiators. CLAYTON A. DUNHAM (to C. A. Dunham Co.). U. S. 1,693,225, Nov. 27.

Temperature indicator for use with internal-combustion radiators. LOUIS M. SPENCER and JOSEPH ZUBATY (to A. C. Spark Plug Co.). U. S. 1,694,871, Dec. 11.

Thermometric device with a distance indicator operated by a rotatable shaft. WILLIAM R. HESLEWOOD (one-half to Fred A. Dana). U. S. 1,692,301, Nov. 20.

Filter. ALFRED GRONNING. Fr. 639,836, Aug. 20, 1927. A filter for liquid is described in which filtering takes place in spaces provided between the surfaces of plates or disks piled on one another or placed side by side.

Air filter. WM. M. REED and CHESTER P. HEGAN (to Reed Air Filter Co.). U. S. 1,693,585, Nov. 27. Structural features.

Filter for air or other gases. EDWARD L. JOSEPH. U. S. 1,695,237, Dec. 11. Structural features.

Apparatus for cooling and filtering milk or other liquids. ANGEL F. ORTIZ. U. S. 1,692,760, Nov. 20.

Leaf filter for wine or other liquids. J. CUENOUD. Brit. 288,920, Nov. 8, 1927. Structural features.

Apparatus for filtering and bottling effervescent liquids or other liquids under pressure. GOTTLIEB STRIFFLER. U. S. 1,692,393, Nov. 20.

Arrangement of filter cloths in a filter press. HARRY L. WALKER (to Standard Oil Co. of Ind.). U. S. 1,694,956, Dec. 11. Mech. features.

Filtration apparatus with a rotary filtering drum and compression rolls. ARTHUR WRIGHT and FRANK W. YOUNG. U. S. 1,691,950, Nov. 20.

Baffle device for separating dust from air or other gases. HARRY A. EDGAR. U. S. 1,693,479, Nov. 27.

Apparatus (with plates coated with oil) for separating dust from air, etc. G. S. DAUPHINEE (to General Air Filter Corp.). Brit. 288,992, April 18, 1927.

Apparatus for separating dust from gases by centrifugal action. E. PRAT. Brit. 288,190, April 1, 1927.

Device for removing impurities from gases by centrifugal action and entrainment in a moving liquid film. HAGAN CORP. (J. Gordon & Co., Ltd.). Brit. 289,192, Feb. 9, 1927.

Apparatus with rotating screens for separating suspended matter from gases. FRED F. PEASE (to F. F. Pease, Inc.). U. S. 1,694,666, Dec. 11.

Apparatus for separating liquids from gases or vapors by baffling and gravity. J. T. H. WARD. Brit. 288,740, Jan. 21, 1927.

Centrifuges. ÉLISÉE C. DUHAMEL and COMPAGNIE GÉNÉRALE DES INDUSTRIES TEXTILES. Fr. 636,661, Oct. 21, 1926. Improved construction to facilitate cleaning and dismantling.

Apparatus for condensing vapor in air or gas by cooling. MATHIAS FRÄNKEL. Fr. 636,707, June 21, 1927.

Atomizer for liquids with adjustable orifices. ALFRED LANSER. Fr. 636,590, June 25, 1927.

Atomizing nozzles for aerating liquids, etc. H. G. L. DE WHALLEY. Brit. 288,349, Oct. 8, 1926. Structural features.

Nozzle for mixing liquids with vapor or gases. ELEKTROWERKE A.-G. (Karl Ilgen, inventor). Ger. 468,306, Sept. 18, 1927. The nozzle has inwardly bent slits.

Evaporators. AKT.-GES. BROWN, BOVERI & CO. Ger. 467,232, Feb. 13, 1925. Lye at a certain concn. is intermittently discharged from an evaporator by an automatic valve governed by the elec. cond. of the lye at the desired concn.

Evaporation apparatus. NIRO A./S. SWISS 126,187, Mar. 30, 1927. The app. comprises a container with an atomizer in the center of the top cover, a hot-air-admission tube arranged tangentially in the upper part of the container, and an air-outlet tube centrally arranged at the bottom of the container, the inner end of this tube extending into the container.

Absorption apparatus. SIEMENS-SCHUCKERTWERKE A.-G. (Edmund Altenkirch inventor). Ger. 468,138, Aug. 13, 1926. Addn. to Ger. 453,847. The gas is introduced into the app. between an absorber and an evaporator, the latter contg. a heavier neutral gas than the former.

Gas analysis apparatus. REPUBLIC FLOW METERS CO. (Electroflo Meters Co., Ltd.). Brit. 288,510, Dec. 5, 1927. Various structural details are described, of an app. comprising measuring and absorption vessels, etc.

Electrical control for gas valves. SAMUEL G. CRANE (to F. H. Ohrmund). U. S. 1,693,070, Nov. 27.

Device for controlling the flow of gas to burners. JAMES QUINLAN. U. S. 1,692,467, Nov. 20.

Micromanometer for the continuous measurement and recording of gaseous density. UNION APPARATEBAUGESELLSCHAFT G. m. b. H. Ger. 467,755, Nov. 11, 1923.

Cell for measuring the thermal conductivity of gases. R. H. KRUEGER (to C. Engblard, Inc.). Brit. 288,908, Aug. 27, 1927. Structural features.

Apparatus for exothermic catalytic reactions of gases under pressure. A. T. LARSON (to Soc. l'air liquide, Soc. anon. pour l'étude et l'exploitation des procédés G. Claude). Brit. 288,577, April 12, 1927. An outer pressure-resisting chamber is associated with an inner chamber contg. the catalyst. Fresh entering gases pass through a space between the 2 chambers and after being mixed with recirculating gases pass into the catalyst space. A heat-exchanger may be placed within the inner chamber. Cf. C. A. 22, 3744.

Containers for compressed gases. HERMAN E. STÜRCKE. U. S. 1,692,521, Nov. 20. Containers for compressed gases are formed of comparatively soft steel substantially free from heat and mech. stresses, annealed, subjected to internal pressure corresponding to the ultimate test pressure, and the mech. stresses thus set up are then removed, e. g., by heating to 100–425°.

Tower for washing gases. H. A. BRASSERT (to H. A. Brassert & Co., Ltd.). Brit. 289,118, Dec. 24, 1926. Structural features.

Gas burner construction. MAX NUSS. U. S. 1,692,382, Nov. 20.

Determining gaseous carbon dioxide. HANS SCHMICK (to Siemens & Halske A.-G.). U. S. 1,695,031, Dec. 11. An app. is specified including a quartz filter and a holder for the gas through which rays from an elec. heated coil may act on bolometric devices.

X-ray target. JOHN W. MARDEN (to the Canadian Westinghouse Co., Ltd.). Can. 285,347, Dec. 4, 1928. X-ray targets are manufd. by heating W to about 2200° in a vacuum and bringing into contact with the W the vapor of a U compd.

Vacuum-tube filament. FREDERICK S. McCULLOUGH (to Radio Tubes, Ltd.). Can. 284,421, Oct. 30, 1928. An electron-emitting body for cathode structures is formed by applying a coating of Th oxide to a W rod having associated therewith a reducing agent, then sintering the rod in a non-oxidizing atm. and reducing a portion of the oxide coating, the reduced metal and the sintered W alloying and permanently fusing the unreduced oxide on to the core.

Discharge tubes. C. H. F. MÜLLER A.-G. (Wilhelm Daumann und Kurt Knoth, inventors). Ger. 467,293, Mar. 7, 1926. An arrangement for regulating the electron discharge by a movable electrode is described.

Electron discharge tubes. COMPAGNIE FRANCAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 639,106, Aug. 5, 1927. The electrode connections are constructed to take current up to 100 amps.

Electric discharge tubes. J. R. ROBERTSON. Brit. 289,326, Jan. 22, 1927. Various structural features are specified relating to compound vacuum tubes for converting elec. oscillations into light oscillations as in sound recording and for *therapeutic purposes*. The tubes have expansion chambers and contain N, or Ne, or both, mixed with H (the H passing through the electrodes as soon as its pressure in one tube falls below that in the other tube).

Electric discharge devices. SIEMENS & HALSKE A.-G. Brit. 289,381, April 25, 1927. A thermionic cathode such as that of a gas discharge rectifier comprises a W core with a surface of an alloy of the metal of the core with a high proportion of an electron-emitting metal such as Th or U. This alloy may be formed by coating the core with Th azide or hydride and heating, or a coating of Th nitrate with a material such as Mg or C may be applied. A filling of rare gas or low-pressure Hg vapor may be used.

Funnel with a measuring and recording discharge device. DANIEL G. MILLIGAN. U. S. 1,695,053, Dec. 11.

Thermionic valves. J. R. SINCLAIR. Brit. 289,509, Jan. 24, 1927. A filament is coated with electron-emitting material by the combined action of cataphoresis and electrolysis obtained by immersing the filament in a bath contg. the coating materials in suspension or in a colloidal state and connecting the filament to the pos. and the bath to the neg. terminal, and continuously moving the filament. A suspension of BaO₂ in alc. with which a 1% soln. of Ba(OH)₂ in water or C₂H₂Cl₄ is mixed may be used as may also various other similar admixtures which are described. An app. is also described.

Supports for thermionic valves or electron tubes. REDFERN'S RUBBER WORKS, LTD. Fr. 639,338, Aug. 11, 1927.

Device for detecting oxygen in hydrogen. GAYLOR W. PENNEY (to The Can Westinghouse Co.). Can. 283,911, Oct. 9, 1928.

Furnace. JULIUS HAACK. Ger. 467,933, Mar. 8, 1923. In a furnace burning coal dust the cross-sectional area of the furnace varies with the vol. of gaseous products.

Furnaces. KARL KOLLER. Ger. 468,196, Nov. 2, 1926. Oil and gas furnaces for industrial use have the flue gases kept at const. high pressure.

Annealing furnace. AKT.-GES. BROWN, BOVERI & CIE. Ger. 468,081, July 14, 1927. The chamber covers are operated by filling or emptying chambers with water by means of a pump.

Regenerative furnace. MARCEL FOURMENT and JEAN J. LADURÉE. Fr. 639,747, Jan. 29, 1927. The conduits to and from the combustion chamber are made adjustable, so that a conduit when functioning for the arrival of gas can be made as large as possible and when for the evacuation of the products of combustion is reduced in size.

Regenerative-furnace construction. HEINRICH BANGERT and GUSTAV HÜHN. U. S. 1,691,913, Nov. 20.

Rotary drum furnace for lime burning, ore roasting or coking. ÉTABLISSEMENTS POLIET & CHAUSSON. Ger. 468,288, May 4, 1926. Detail of construction.

Inclined furnace suitable for heating unit pieces such as poppet valves. RICHARD F. BISSEL (to Thompson Products, Inc.). U. S. 1,692,614, Nov. 20.

Charging means for furnaces. ANTONIN CHMELICEK. Swiss 126,370, Jan. 31, 1927. Constructional details.

Furnace grate moved on endless chain. DEUTSCHE BABCOCK & WILCOX DAMPF-KESSEL-WERKE AKT.-GES. Ger. 467,802, April 9, 1927.

Electromagnetic safety device for gas furnaces. COMPAGNIE DES FORGES DE CHATILLON-COMMENTRY ET NEUVES-MAISONS. Fr. 639,456, Aug. 12, 1927.

Gas burner. PAUL BEAUDEQUIN. Fr. 639,438, Jan. 24, 1927. The gas and air are led in parallel tubes so arranged that they do not mix till the point of combustion is reached.

Gas burners. LOUIS NECCHI. Fr. 639,540, Aug. 16, 1927. The diam. of the gas holes is approx. equal to the thickness of the walls of the burner at that point.

Gas burner. LE GAZ BLEU. Fr. 639,765, Feb. 1, 1927. The tube in which the gas and air mix is bent so that the direction of flow of the mixt. is changed sharply.

Annular tunnel kiln. JULIUS KERSTEN. Ger. 468,136, Mar. 27, 1925. The kiln is particularly suitable for the decompn. of $MgCl_2$ and has a rotary plate and side chambers for steam or generator gas.

Burner for mazout for bakery furnaces. MAURICE GASSE. Fr. 637,095, July 5, 1927.

Burner using mazout for heating bakery ovens. HENRI J. AUBRESPIN. Fr. 636,767, June 28, 1927.

Heat exchangers for fluids not in contact. COMPAGNIE DES SURCHAUFFEURS. Fr. 639,511, Aug. 13, 1927.

Heat-exchange apparatus. E. MENZEL and MENZEL A.-G. Brit. 289,677, July 14, 1927.

Heat-exchange apparatus for effecting catalytic reactions. M. CASALE-SACCHI. Brit. 289,661, June 7, 1927. Structural features.

Apparatus for heat-interchange between liquids. CHARLES L. BURDICK. U. S. 1,694,370, Dec. 11.

Bunsen burner for use with polarimeters and other optical instruments. W. Y. BUCHANAN. Brit. 289,548, Jan. 29, 1927. Finely powd. chem. salts are supplied to the gas and thence to the flame to give a desired color to the latter. Various structural details are described.

Heat recorder. WALTER SIEGNER. Ger. 468,035, Aug. 19, 1926. A heat recorder has the thermometer adjustable to allow for difference in sp. gr. of the liquid.

Acetylene generator. E. MENZ. Brit. 288,185, March 31, 1927. A device is provided for indicating the quantity of carbide remaining in the generating chamber. Various structural features are described.

Acetylene generator. BERNHARD GREIFZU. Ger. 467,352, Nov. 5, 1926. Constructional improvements are described in a generator of the type in which water is displaced from the carbide container when gas is not required.

Working acetylene generators. MESSER & Co., G. m. b. H. Ger. 467,353, June 29, 1926. Access of air to the generator during charging or removal of sludge is avoided by means of an auxiliary generator adapted to supply gas to the main generator when required.

Pressure regulator of the water-seal type for acetylene generators. BERNHARD GREIFZU. Ger. 467,351, Nov. 5, 1926. Constructional details.

Apparatus for emulsifying oils or other liquids. GEORGE L. FISH (to Raymond Salisbury, trustee). U. S. 1,694,589, Dec. 11.

Apparatus for feeding materials to emulsifiers at a constant head. A. W. EMPSON. Brit. 289,186, Feb. 1, 1927.

Apparatus for extracting oil from oil-containing materials. FREID. KRUPP GRUENWERK AKT.-GES. Ger. 467,801, Dec. 10, 1925.

Apparatus for distillation of solid and liquid materials in a closed circuit of superheated steam and gas. H. DUPUY. Brit. 289,425, April 27, 1927. The suction chamber of a steam injector is connected with the distn. chamber and is connected by a by pass with a heat economizer and condenser for the distillates. Various other structural features are specified also.

Apparatus for storing compressed air or other fluids under pressure. LOUIS J. LEMESURIER. U. S. 1,692,670, Nov. 20.

Extraction press for treating fish products or other materials. P. VOLDNES. Brit. 288,472, Aug. 18, 1927.

Apparatus (with a submerged flame burner) for evaporating ammonium chloride solutions or other liquids. C. F. HAMMOND and W. SHACKLETON. Brit. 289,159, Jan. 22, 1927.

Injectors and associated apparatus for producing foam by reacting chemicals. EXCELSIOR FEUERLÖSCHGERÄTE A.-G. Brit. 289,444, April 27, 1927.

Rubber-lined tumbling-barrel for cleaning and polishing silver articles, etc. H. C. BECKETT. Brit. 288,819, April 22, 1927. The lining is seamless and may be applied electrically or electrochemically or in a plastic state.

Casting chilled metal pipes, conveyor chutes or other articles with abrasion-resisting inserts. RALPH S. EDMONDSON and EUGENE HAHN (to American Abrasive Metals Co.). U. S. 1,692,725, Nov. 20. Mech. features.

Apparatus for heat-treatment of coils of wire for annealing, etc. GOTTLIEB KELLER (to A. G. Brown, Boveri & Cie). U. S. 1,693,388, Nov. 27. Structural features.

Apparatus for separating dredged muds or other solid materials from liquids. SAMUEL R. PURYEAR. U. S. 1,695,021, Dec. 11.

Wire helix conveyor device for feeding regulated small quantities of powdered substances. NAAMLOOZE VENNOOTSCHAP INTERNATIONALE OXYGENIUM MAATSCHAPPIJ NOVADÉL. Brit. 289,275, May 13, 1927. A small wire helix is driven by a sprocket and the helix may be formed of steel, bronze, Al, chrome Ni steel, Monel metal, or "V2A" steel, and may be coated with Sn, lacquer, varnish, etc.

Automatic reversing arrangement for the alternate filling and emptying of measuring vessels filled under pressure. PAUL BREITSCHUH. Swiss 126,384, April 21, 1927. Constructional details.

"Wear down" testing apparatus for typewriter ribbons, carbon paper and the like. WINFIELD P. PEMBROKE (to Kee Lox Mfg. Co.). U. S. 1,693,494, Nov. 27.

Rotating and dipping drums for soaking, rinsing and drying materials. GOTT-FRIED BUCHERT. Ger. 467,911, Sept. 29, 1927.

Apparatus for drying fabrics and paper in endless webs. AUBIN LAMBRETTE. U. S. 1,692,129, Nov. 20.

Thermostats. ALBERTO ALBERT. Swiss 126,690, April 6, 1927. The variation in length of metal rods due to temp. changes makes or breaks an elec. contact.

Thermostatic device for control of electric circuits. HERBERT E. RIDER (to Beaver Machine & Tool Co.). U. S. 1,694,928, Dec. 11.

Thermostatic device for control of electric circuits. OLIVER C. TRAVER (to General Electric Co.). U. S. 1,692,474, Nov. 20.

Thermostatic electric switch for controlling heater circuits. WILFORD J. WINNINGHOFF (to Cooper Hewitt Electric Co.). U. S. 1,695,261, Dec. 11.

Thermostatic electric switch. ARLEY U. HOOK. U. S. 1,695,103, Dec. 11.

Thermostatically operated electric switch. ERNEST L. BENSON. U. S. 1,692,540, Nov. 20.

Thermostatic device for control of dampers, etc. IRA E. SMITH. U. S. 1,693,060, Nov. 27.

Thermostatic valve. HARPY C. TABLER (to American Heater Corp.). U. S. 1,694,492, Dec. 11.

Thermostatic control for ovens heated by gas, etc. EMIL L. CLAUS and WALTER E. CLAUS (to Claus Mfg. Co.). U. S. 1,694,682, Dec. 11.

Device controlled by steam pressure and a thermostat for regulating atomizing burners used to heat steam boilers. LEE S. CHADWICK (to Perfection Stove Co.). U. S. 1,694,501, Dec. 11.

2—GENERAL AND PHYSICAL CHEMISTRY

Covalency, the paramagnetism of oxygen and stereochemistry. H. F. BIGGS. Oxford Univ. *Phil. Mag.* [7], 6, 659-64(1928).—Discussion and speculation of London's theory of the non-polar bond (cf. *C. A.* 22, 1531). GEORGE GLOCKLER

The metastability of elements and compounds as a result of enantiotropy or monotropy. XI. The physical-chemical constants of silver iodide. I. ERNST COHEN AND W. J. D. VAN DOBBENBURGH. Univ. of Utrecht. *Z. physik. Chem. Abt. A*, 137, 289-334 (1928).—The phys. consts. of many solid substances have been erroneously reported in the past because they were detd. for metastable mixts. of 2 or more modifications of the solid. C. and D. describe here the prepn. of "physically and chemically" pure AgI in its α - and β -forms and the detn. of the vol. change accompanying the transition from 1 form to the other. AgI was prepd. by adding a 1% soln. of KI, or NH_4I , to a soln. of AgNO_3 . After being thoroughly washed, the ppt. is no longer discolored by ordinary light. It consists, however, of both modifications of the solid. The stabilization at ordinary temps. takes place very slowly, but can be hastened either by boiling the ppt. with a CaCl_2 soln. or by melting the solid. When once obtained, the α -form is stable below the transition pt. and has d_{40}^{30} 5.683. The d . at the transition pt., 145.80° , as detd. by using a pycnometer filled with paraffin oil, was found to be unchanged with the rise in temp. The α -form is converted into the β -form on being heated above the transition pt. The $d_{46.80}^{145.80}$ of the β -form is 6.009. The change in sp. vol., -0.00948 cc., accompanying the transition from β to α was verified by direct measurement. The value obtained corresponds to the value calcd. from other data with the Clapeyron equation. H. F. JOHNSTONE

Evidence of boron in the sun. SETH B. NICHOLSON AND NICOLAS PERRAKIS. *Astrophys. J.* 68, 327-34(1928). E. H.

Crystal structure of calcium. C. D. NIVEN. Univ. of Toronto. *Phil. Mag.* [7], 6, 665-6(1928).—Some of the crystals of Ca grown by distn. definitely showed that Ca has a cubic structure. GEORGE GLOCKLER

The crystal structure of mercury, copper and copper amalgam. HENRY TERREY AND CYRIL M. WRIGHT. Univ. College London. *Phil. Mag.* [7], 6, 1055-69(1928).—The work on Hg was carried out at approx. -150° . The rhombohedral structure assigned by McKeehan and Cioffi (*C. A.* 17, 2068) was fully confirmed. For the plane spacings of Cu they obtain 3.603 A. U. In the case of amalgams they find that they are mech. mixts. of the two metals, as in every case the diffraction pattern of Cu was obtained on the film, and the intensity of the lines decreased with increasing Hg content. The appearance of a weak amalgam pattern in the freshly prepd. amalgams contg. 40 and 49% of Cu is probably due to the fact that these amalgams hardened in 3-4 hrs., and the time of exposure was also of this order. In the hardened amalgams a definite compd. is found contg. 27-40% Cu. This pattern is masked in the amalgams of high Cu content by the Cu pattern. GEORGE GLOCKLER

Crystal structure and linear coefficient of thermal expansion of tungsten carbides. K. BECKER. Osram-Konzern, Berlin. *Z. Physik* 51, 481-9(1928).—X-ray analysis and comparison of W, WC, α - W_2C and β - W_2C . GEORGE GLOCKLER

Slip in a crystal and rupture in a solid due to shear. A. T. STARR. *Proc. Cambridge Phil. Soc.* 24, Pt. 4, 489-500(1928). E. H.

Lattice constant of gypsum. J. NAGY. *Z. Physik* 51, 410-2(1928).—The distance between at. planes in gypsum crystals is not const. but differences up to 2.5 per mille are found. From the viewpoint of x-ray spectroscopy it is essential to assume a standard value for x-ray wave length rather than for the lattice const. of NaCl. GEORGE GLOCKLER

Observations on the higher fatty acids. X-ray measurements. GILBERT T. MORGAN AND EUSEBIUS HOLMES. Chem. Research Lab. Teddington, England. *J. Soc. Chem. Ind.* 47, 309-11T(1928).—X-ray pictures of a number of the fatty acids have been taken by the methods originated by Müller (cf. *C. A.* 17, 3833). The diffraction pattern of cluytinic acid gave a main spacing identical with that of the highest fraction of the satd. arachis oil acids, indicating by comparison with Müller's results that the acid was really hexacosic acid (C_{26}); later work on the higher fatty acids shows that it is probably a mixt. of the C_{24} and C_{26} acids and not a C_{21} acid as originally believed. Acids obtained by hydrogenating whale oil give main spacings agreeing with those of acids of established compn., but less concordant results were obtained with the arachis oil acids. In purifying these acids, the superiority of distn. over recrystn. as a means of sepn. of the different individuals was demonstrated. Following is a list of the main interplanar spacings observed for a number of fatty acids. Margaric (C_{17}) 36.9 A. U., stearic (C_{18}) 39.0 A. U., eicosic (C_{20}) 44.3 A. U., heneicosic (C_{21}) 45.0 A. U., cluytinic (C_{21} ?) 54.5 A. U., behenic (C_{22}) 48.3 A. U., tricosic (C_{23}) 50.3 A. U., hexacosic (C_{26}) 56.6 A. U. It is noted that all the values given for the arachis oil acids (58-54 A. U.) are much higher than are warranted by the sapon. figures, which indicate C_{20} to C_{24} acids. This may be due to the selective influence on the x-ray pattern of relatively small amts. of higher acids present. Expts. with eicosic and behenic acids showed little difference resulting from pressing the sample on to the mount instead of melting it. A. W. KENNEY

The question of liquid crystals. L. S. ORNSTEIN. Univ. Utrecht. *Physik. Z.* 29, 668-70(1928).—A further explanation of the work of O. (*C. A.* 18, 2827). There are 2 questions to be distinguished in the study of liquid crystals. The first deals with the macroscopic properties of the cloudy liquid crystal form, i. e., a discussion of their extinction, the influence of a magnetic field on the extinction and on the dielec. const., etc. The 2nd more essential question deals with mol. properties, which form the basis of the optical and chem. properties of the liquid crystals—thus the properties of the pseudo-isotropic form and the explanation of the differences between the macroscopic properties in turbid melts and in the pseudo-isotropic form in the same temp. range. In a discussion of liquid crystals both questions must be kept in mind. M. F.

The equation of state of a perfect gas. R. D. KLEEMAN. *Phil. Mag.* [7], 6, 743-4 (1928).—Mathematical. An improved form is given of proof of the equation of a perfect gas showing $PV = MRTx$, where $x = f(V)$ and other symbols have their usual meaning. GEORGE GLOCKLER

Gas flow through packed columns. S. P. BURKE AND W. B. PLUMMER. Combustion Utilities Corp., Linden, N. J. *Ind. Eng. Chem.* 20, 1196-1200(1928).—Results are reported for numerous tests on the pressure drop for air flowing at various rates through systems packed with spheres. The general expression for gas (or other fluid) flow through packed spaces is $p/l = C\rho V^2S/f^3$, where p is the pressure drop, l the length of packing, C the const. or friction factor, ρ the d., V the velocity, S surface of packing per unit of packed volume, f the packing factor or fractional free space. The variable coeff. is a function of, and is plotted against $\mu S/\rho V$, where μ is the viscosity in centipoises. L. A. PRIDGEON

Suspension of macroscopic particles in a turbulent gas stream. S. P. BURKE AND W. B. PLUMMER. Combustion Utilities Corp., Linden, N. J. *Ind. Eng. Chem.* 20, 1200-4(1928).—The const. of the equation ($R = k\rho V^2r^3$) for the resistance acting between a macroscopic spherical particle and turbulent gas stream moving past it has been detd. as $k = 0.00084$. R = grams, ρ the density of the gas, V the velocity, r the radius of the sphere, all in c. g. s. units. For irregular particles the value of k is slightly higher. The method of detg. the value of k is described. L. A. PRIDGEON

The molecular state of liquid substances. VL. KISTYAKOVSKII. *Z. physik. Chem.* Abt. A, 137, 383-92(1928).—On the basis of their phys., chem. and elec. properties, K. has classified liquids in 7 groups according to their degree of mol. assocn. The existence of the completed shell of 8 electrons is shown to be unfavorable to assocn. as well as to chem. action. For this reason the rare gases, with the exception of He, are placed along with a few satd. hydrocarbons, in Group I contg. substances which show no assocn. That liquid He shows a slight assocn. is explained by the fact that the 2 electrons in the shell are not stable enough to prevent the approach of other atoms of He. For the same reason, compds. contg. H joined either to O or N are often highly assocd. in the liquid state. The assocn. of liquid mols. is supplementary to the instability of the electronic shell. The assocn. of the elements in the liquid state is clearly periodic and agrees with the Mendelyev system. H. F. JOHNSTONE

Measurement of flow by means of orifice meters. L. ZIPPERER. *Gas. Wasser-*

fact 71, 1033-5(1928).—The derivation of the formula for flow of liquid through orifices is given, together with charts for orifice size, and calcs. for gases of given analyses.

R. W. RYAN

An exact determination of the coefficient of internal friction of fused salts. R. S. DANTUMA. *Z. anorg. allgem. Chem.* 175, 1-42(1928).—The detn. was carried out by the method of the "oscillating body." A steel ball suspended from a wire on which a mirror was fastened was allowed to move in the salt melt by the action of torsion. The movements were registered by a beam of light reflected from the mirror upon a rotating drum covered with light-sensitive paper. The internal friction of fused KNO_3 , NaNO_3 , LiNO_3 and NaCl was detd. at different temps.

EMIL KLARMANN

Jaeger's method as applied to the determination of the surface tension of mercury. R. C. BROWN. Univ. College London. *Phil. Mag.* [7], 6, 1044-55(1928).—Difficulties similar to those mentioned by Bircumshaw (*C. A.* 22, 4025) were encountered.

G. G.

The molecular nature of the adsorption of gases on glass and charcoal. HEINO ZEISE. Univ. Berlin. *Z. physik. Chem.* 136, 385-418(1928).—Adsorption of CH_4 , N , O and H on thin glass plates was measured at 90° abs. and at pressures between 2×10^{-4} and 7×10^{-2} mm., by the const.-vol. method. The total glass surface area was 12,590 sq. cm. The measurements with CH_4 , N and O were extended to 306 mm. with 3810 sq. cm. of glass surface. The isotherms obtained were studied mathematically. The Freundlich exponential equation fits the data only as a first approximation.

The data are represented quant. by the equation $a = \sqrt{(k_1 k_2 P)/(l + k_2 P)}$, where k_1 and k_2 are consts., P is the pressure and a the moles gas adsorbed per sq. cm. This equation is interpreted to show that the adsorption is monomol. There was no polymol adsorption indicated, even at the highest pressure studied. The Langmuir adsorption isotherm equation (cf. *C. A.* 12, 2152) was found to fit satisfactorily the earlier adsorption data of Tittoff, Homfray and Richardson on wood charcoal.

R. L. DODGE

Colloid types. EUGENE C. BINGHAM. *Fifth Colloid Symposium Monograph* 1928, pp. 219-28.—From the standpoint of plastic flow, colloids show 3 types: *Non-polar*, e. g., a suspension of a finely divided solid in a very viscous medium; *emulsions*, e. g., fats and greases, which when molten, behave as viscous liquids, but become plastic as solidification begins; *polar*, e. g., gelatin in water, where the increase of concn. of the dispersed phase is more marked than with the first type. The so-called "solubility" of polar colloids has long been roughly measured by the apparent viscosity of the soln. in diff. "solvents." This method is of course open to various objections, for these are not true solns. nor true viscosities, and it is not apparent that one would be an exact measure of the other. With a single crystal since the flow takes place along slip planes, it differs from the foregoing. With ordinary cryst. mixts., the situation is more complicated.

JEROME ALEXANDER

Interferometric measurements of ultramicroscopic particles. U. GERHARDT. *Ann. Physik* 87, 130-44(1928).—By means of special shields for the microscope objective, it is possible to make such particles appear as 2 sep. points of light, so that the Michelson methods for measurement of fixed and twin stars may apply. The influence of these shields and the light coherence is believed to nullify these methods for particles of less than 270 μ . A minimum of total brightness discussed by Bechmann was not observed.

GREGG M. EVANS

Study of chemical reactions in gelatin gels. S. M. KUZMENKO. *Ukrainskii Khim. Zhurnal* 3, No. 2, Pt. sci. 231-5(1928).—K. has studied the pptn. of sulfides from binary solns. of metallic sulfates in a 5% gelatin gel, spread on a glass plate, by a drop of concd. soln. of Na_2S . In 0.001 *N* solns. of $\text{Co} + \text{Mn}$; $\text{Zn} + \text{Ni}$; $\text{Co} + \text{Ni}$; $\text{Co} + \text{Zn}$; $\text{Ni} + \text{Mn}$ the less sol. sulfide is pptd. mainly. In the soln. $\text{Fe}^{++} + \text{Mn}$ the more sol. sulfide is pptd. In solns. contg. $\text{Zn} + \text{Mn}$; $\text{Zn} + \text{Ni}$; $\text{Co} + \text{Ni}$; $\text{Co} + \text{Zn}$, $\text{Ni} + \text{Mn}$, both metals are simultaneously pptd. as sulfides.

G. B. K.

Ebullioscopic determination of double and complex salts in aqueous solution. F. BOURION AND E. ROUYER. *Ann. chim.* 10, 182-262(1928).—The term ebullioscopic deviation is used to denote the difference between the observed b. p. elevation for a pair of salts in soln. and the elevation calcd. by a rule of mixts. Algebraic relations are established between the magnitude of the deviations and the compn. and dissoen. consts. of complex salts which may be formed. Two similar app. of the Beckmann type, one contg. the soln. under investigation and the other contg. pure water were used at the same time in order to eliminate corrections for the variation of atm. pressure. The following complex salts were found between CdCl_2 and KCl , NaCl and NH_4Cl , with the given dissoen. consts. $\text{K}_2(\text{CdCl}_4)$, $k = 0.625$; $\text{Na}_2(\text{CdCl}_4)$, $k = 1.12$; $2\text{Cd} \cdot 3\text{NH}_4\text{Cl}$, k not detd. CdI_2 and KI form the complex $\text{K}_2(\text{CdI}_4)$ with $k = 6.0 \times 10^{-3}$.

E. R. SMITH

The rate of solution of cadmium in hydrochloric acid. M. TZENTNERSHVER. Lettland Univ., Riga. *Z. physik. Chem. Abt. A*, 137, 352-60(1928).—When the concn. of the acid is not less than 6 *N*, Cd dissolves in HCl solns. in a manner similar to the solution of Zn and Al. A period of induction first exists during which the rate of attack steadily increases. If the metal has previously been dipped in strong acid, the induction period is eliminated. The increased action of the metal is not lost if the surface is kept covered with H₂O. Stirring the acid does not increase the velocity of the action except for the higher concns. The temp. coeff. of the velocity is about 2 for each 10° rise for the higher concns. but decreases with the concn. These results show that at the lower concns. of acid, the rate of solution of the metal depends almost entirely upon the chem. action at the surface and only slightly upon the rate of diffusion, while at the higher concns. this relation is reversed.

H. F. JOHNSTONE
The expression of free acid and alkaline ion concentration. ALB. J. J. VANDEVELDE. Inst. Supérieur des Fermentations de Gand. *Bull. assoc. élèves inst. sup. fermentations Gand* 29, 395-402(1928).—A brief crit. discussion of the various systems which have been proposed, with a table giving the equivalence of the various methods of notation varying from *N* acid to *N* alkali. V. considers that the expression C_H and C_{OH} are the simplest because they constitute an elementary translation of what is learned by experimentation without requiring any new conventional notion. Also in *Natuurw. Tijdschrift* 10, 145-51(1928).

A. PAPINEAU-COUTURE
Theory of electrical migration of ions. J. N. MUKHERJEE. Univ. College of Science, Calcutta. *Nature* 122, 608(1928).—According to Mukherjee, the theory of moving boundaries as developed by Kohlrausch and Weber overlooks the unequal transfer of the common ion at the boundary and consequently rests on a misconception of the conditions on the "indicator" side of the boundary. Consider a boundary between solns. of two salts AR and BR. When current passes there will not be any mixing of the ions A and B. However, more R ions leave the boundary on one side than enter it from the other, thus tending to violate the condition of elec. neutrality. This ion excess causes a drag and an adjustment of the potential gradient which for the steady state requires an equal no. of R ions entering and leaving the layer in the same time. A paper contg. a fuller treatment is to appear.

E. R. SMITH
Supplement to our paper, "The dielectric constants of electrolytic solutions." H. HELLMANN AND H. ZAHN. *Ann. Physik* 87, 716(1928); cf. *C. A.* 22, 4347-8.

MALCOLM DOLE
Chemical interactions corresponding to the constant of mass action being a function of the volume and masses of the constituents as well as of the temperature and catalytic action. R. D. KLERMAN. *Phil. Mag.* [7], 6, 648-59(1928).—K. has investigated (*C. A.* 22, 4040) some of the conditions under which the const. of mass action is a function of the vol. of the gaseous interacting mixt. and the masses of the constituents, as well as of the temp. This paper is a continuation of the investigation.

G. G.
Free energy of formation of fused salts. I. Cuprous and thalious halides and mercuric iodide. GIOVANNI DEVOTO. Reale Univ. Milano. *Gazz. chim. ital.* 58, 359-71(1928).—The present paper gives the initial results of expts. to establish an electrochem. series of the elements in fused salts. The method chosen as most promising was that of polarization (cf. Lorenz, *Elektrochemie geschmolzener Salze*, III (1906); Cambi and Devoto, *C. A.* 21, 2837). Polarization tensions of CuCl, CuBr, CuI, ThCl, ThBr, ThI and HgI₂ at different temps. are tabulated. With CuCl, depolarization through formation of CuCl₂ at lower temps. (i) results in the *E/t* curve remaining horizontal to approx. 520°, above which temp. the voltage diminishes fairly regularly with increase of temp. Changes in the *E* values of CuBr with changes in current strength show approx. the logarithmic relation of Jahn (cf. *Z. physik. Chem.* 34, 529 (1900)). As a result of the formation of yellow thalious thallic chloride, TiCl shows considerable depolarization, which diminishes with increase of temp. With CuBr, CuI, TlBr and TlI there is no depolarization because of the slight stability of the higher halides. The polarization tension of HgI₂ has an abnormally high temp. coeff. Calcn. in an approx. way of *F* at the abs. m. ps. gave CuCl, $F_{700} = 22,220 = 0.965$ v.; CuBr, $F_{700} = 16,750 = 0.779$ v.; CuI, $F_{800} = 9675 = 0.460$ v.; TiCl, $F_{600} = 37,880 = 1.64$ v.; TlBr, $F_{700} = 32,300 = 1.40$ v.; TlI, $F_{700} = 25,255 = 1.095$ v.; HgI₂, $F_{600} = 19,100 = 0.515$ v. Differences between the observed and calcd. values are approx. 0.05 v.

C. C. DAVIS
The resistance of cesium, cobalt and chromium at low temperatures. J. C. McLENNAN, C. D. NIVEN AND J. O. WILHELM. Univ. of Toronto. *Phil. Mag.* [7], 6, 672-7(1928).—Tables and curves show the elec. resistance of Cs, Co and Cr as a function of temp.

GEORGE GLOCKLER
Application of an electromagnetic force to the "thermobalance." ZEN-ICHI

SHIBATA AND MASAJI FUKUSHIMA. *Tech. Repts. Tôhoku Imp. Univ.* 7, 201-8 (1928).—See *C. A.* 22, 3086. E. J. C.

Electrical conductivity of arsenic and antimony at low temperatures. J. C. McLENNAN, C. D. NIVEN AND J. O. WILHELM. Univ. Toronto. *Phil. Mag.* [7], 6, 666-72 (1928).—Tables and curves show the variation of resistance of As and Sb with temp.

Molecular cohesion. G. A. TOMLINSON. *Phil. Mag.* [7], 6, 695-712 (1928).—Cohesion between quartz fibers and glass spheres is studied. From the study elec. moments of mols. of the right order of magnitude are obtained. An inverse-fourth-power law for mol. attraction is favored.

GEORGE GLOCKLER

The effect of cadmium as an impurity in lead on the conductivity of lead. J. C. McLENNAN, C. D. NIVEN AND J. O. WILHELM. Univ. of Toronto. *Phil. Mag.* [7], 6, 678-85 (1928).—The alloys show supercond. as does Pb. An aging effect was noticed.

GEORGE GLOCKLER

The electrical conductivity of metals as a function of pressure according to the Sommerfeld electron theory. A. T. WATERMAN. Yale Univ. *Phil. Mag.* [7], 6, 965-70 (1928).—For the effect of hydrostatic pressure upon the elec. cond. of metals, Houston (*Z. Physik* 48, 449 (1928)) has given an approx. formula, and has briefly pointed out that its application is qual. correct. When subjected to quant. calcn., this formula is found only to give the right order of magnitude for the pressure coeff. of resistance. The accuracy of known data for the pressure coeff. of metals, however, warrants a more exact formula, which is deduced. The agreement is fair.

GEORGE GLOCKLER

The application of the Debye dipole theory to binary liquid mixtures. JOHN W. WILLIAMS. Univ. Leipzig. *Physik. Z.* 29, 683-8 (1928); cf. *C. A.* 22, 1897.—The elec. moments of 33 mols. calcd. from the dielec. consts. and the d. of their solns. in C_6H_6 at 25° , are collected in a table and the significance of these values in reference to the structure of the mols. is sought. The mols. are divided into C_6H_6 derivs., compds. of the type Ca , biphenyl and its derivs., and inorg. mols. Every atom or every group substituted in a C_6H_6 nucleus is characterized by a larger or smaller definite moment which can be considered as a vector and has a definite bearing. When 2 or more atoms are substituted in the C_6H_6 nucleus, their reciprocal effect can in general not be neglected. A probable structure for C_6H_6 is one in which all the C atoms lie in a plane. It is not possible to express the structure of biphenyl and its derivs. by a simple spatial arrangement. No clear relation exists between the structure of the dissolved mols. and that of the crystals.

MARIE FARNSWORTH

Capillary-electric phenomena of amalgams. I. Thallium amalgam. A. FRUMKIN AND A. GORODETZKII. Karpov Inst. Moscow. *Z. physik. Chem.* 136, 451-72 (1928).—Electrocapillary curves on Tl amalgams were measured in a variety of solns. with a capillary electrometer (cf. *C. A.* 10, 3017). The max. of the curves of the Tl amalgams was displaced from the max. for Hg in the direction of stronger cathodic polarization. The displacement for a 41.5% amalgam in normal Na_2SO_4 soln. was 0.45 v. The curves for the amalgams were affected in the same way as the Hg curves, by the concn. of the electrolyte and by the presence of pyrogallol, thiourea or amyl alc. in the electrolyte. Application of Gibbs' equation to the adsorption of Tl at the soln.-amalgam interface indicated that the quantity of adsorbed Tl was a function of the potential difference between soln. and amalgam.

R. L. DODGE

The refractometric relations and state of dissolved ammonium salts and of strong acids. K. FAJANS. Akad. Wissenschaften, München. *Z. physik. Chem. Abt. A*, 137, 361-82 (1928).—The change in the refractivity of a salt soln. which accompanies an increase in the concn. has been explained by the formation of undissocd. particles and the mutual deforming action of the ions in direct contact with each other (cf. *C. A.* 21, 3539; 22, 4037). In solns. of NH_4 salts and in those of HCl the distorting action of the Cl on the NH_4 and OH ions, resp., is greater than that of the same anion on the alkali cations because of the disturbance of 1 of the H atoms in the nuclei. For these solns., therefore, the decrease in refractivity with increase in concn. is much greater than might have been expected from the similarity in the structure of these cations to that of the alkali cations. F. also shows that the change in the refractivity with increasing concn. for a series of Na salts of different acids, agrees in sign and in magnitude with the change in refractivity of the acids alone in passing from infinitely dil. solns. to the homogeneous undissocd. acids. He regards this as further proof for his explanation of the effect of concn. on refractivity.

H. F. JOHNSTONE

Magnetic hysteresis at high frequency. W. NEUMANN. Univ. Königsberg. *Z. Physik* 51, 355-73 (1928).—The magnetization of 2 samples of Fe was found smaller at higher frequencies.

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

An upper limit of energy density. G. I. POKROVSKII. Univ. Moscow. *Z. Physik* 51, 730-6(1928).—The assumption is made that the greatest possible density of energy cannot be greater than the density of matter (considered as energy) in the heaviest atoms. As a consequence temp. and frequency also have upper limits. The max. temp. is 3×10^{12} degrees and the max. frequency is 10^{23} ($= 3 \times 10^{-15}$ A. U.). G. G.

Corpuscular theory of interference and diffraction. G. WATAGHIN. Univ. Turin. *Z. Physik* 51, 593-604(1928).—The density of quanta in a light-beam corresponds at each point to the energy density of the electromagnetic field of classical theory. The velocity of the light quanta is parallel to the Poynting vector. Mathematical. G. G.

The evolution of the quantum theory. E. PERSICO. *Scientia* [2], 44, 373-86(1928).

F. H.

Quantum theory and molecule-formation. H. LESSHEIM. Univ. Breslau. *Z. Physik* 51, 838-41(1928).—See *C. A.* 22, 3821.

GEORGE GLOCKLER

Group theory and the mutual interactions of atoms. W. HEITLER. Univ. Göttingen. *Z. Physik* 51, 805-16(1928).—Mathematical. The problem of valency is studied as a problem of modern quantum-theory. The mathematical methods of group-theory are applied.

GEORGE GLOCKLER

An interpretation of the wave-equation of a material particle. T. TAKEUCHI. *Z. Physik* 51, 887-8(1928).—The mathematical similarity of the Schroedinger wave-equation and the equation of Brownian movement leads T. to interpret the former in terms of the latter.

GEORGE GLOCKLER

Molecular spectra of diatomic molecules in modern quantum-mechanics. E. WIGNER AND E. E. WITMER. *Z. Physik* 51, 859-86(1928).—The structure of mol. spectra is studied by the math. methods of group theory. First approximations of the proper *eigenfunctionen* are derived and the selection and intensity rules and the energy-level scheme of rotational bands are given. Similarly the mode of formation of a scheme of electron energy levels of a mol. is given and this term system is thought built up out of the union of 2 atoms.

GEORGE GLOCKLER

Spectrum characteristics in the quantum mechanics of the spinning electron. J. V. NEUMANN AND E. WIGNER. Berlin and Göttingen. *Z. Physik* 51, 844-58(1928); cf. *C. A.* 22, 3584.—Starting with the math. soln. of the Schroedinger equation of an atom not having spinning electrons, a first approximation for *eigenfunctionen* with spin is derived. Results are: the Landé-equation (Zeeman-effect) and the Burgers-Dorgelo sum rule of spectral intensity.

GEORGE GLOCKLER

The spectrum of aluminum in the extreme ultra-violet. ERIK EKEFORS. Univ. Upsala. *Z. Physik* 51, 471-80(1928).—The extreme ultra-violet spectrum of Al is investigated by means of a one-meter vacuum spectrograph. The instrument is described. A few lines of Al II and Al III in the region γ 480 to 1300 Å. U. are identified and several term values for Al III are detd.

GEORGE GLOCKLER

The vector-system of atoms in the newer quantum theory. E. FUES. Univ. Stuttgart. *Z. Physik* 51, 817-27(1928).—Impulse-vectors were used in the older quantum theory to describe the state of an atom. Certain addn. laws which these vectors obeyed are translated into the newer mechanics.

GEORGE GLOCKLER

Calculation of grating energies of simple salts on the basis of the new wave mechanics. H. BRUCK. Univ. Munchen. *Z. Physik* 51, 707-27(1928).—The repulsive forces in crystals as calcd. by Born and Landé are now considered on the basis of the new quantum mechanics. The grating energies, ionic radii and compressibilities of a few salts are calcd. and discussed and good agreement is found with expts. G. G.

The decomposition constant of actinium. STEFAN MEYER. Radium Inst., Wien. *Sitzb. Akad. Wiss. Wien Abt. IIa*, 137, 235-9(1928).—The half life of Ac is found to be 13.4 years, detd. from the rise and decay of Ac activity.

M. F.

Range of atomic disintegration-products. W. BOTHE. Reichsanstalt, Charlottenburg. *Z. Physik* 51, 613-7(1928).—In the case where the α -particle causing the disintegration is captured by the disintegrated atom, is it possible to derive simple relations of energy and momentum. These relations give certain definite information concerning the range of H particles as dependent on the range of the α -particle causing the disintegration. These deductions seem to apply to the case of N, as studied by Blackett (*ibid.* 1, 19, 1657).

GEORGE GLOCKLER

Yield of atomic disintegration experiments. G. KIRSCH AND H. PETTERSSON. *Z. Physik* 51, 669-95(1928).—The factors affecting the yield in expts. on at. disintegration are noted and the differences between the values of Bothe and Franz (with the Geiger counter) and the Vienna results (with various methods) are discussed. The difference is ascribed to the failure of the Geiger counter to register H particles quantitatively. Further differences are taken up and the earlier Vienna expts. are thought to have been correctly carried out and interpreted.

GEORGE GLOCKLER

The decomposition of carbon. III. HANS PETTERSSON. Radium Inst., Wien. *Sitzb. Akad. Wiss. Wien Abt. IIa*, 137, 1-6(1928); cf. *C. A.* 22, 1271.—Expts. on the decomposability of C with the α -particles of Po of artificially degraded range are described. The no. of scintillations from α -rayed graphite observed by the retrograde method show a very appreciable decrease when the range of the α -particles falls from 3 to 2.4 cm. When the α -particles have a range of 2 cm. the no. of at. fragments is the same with or without a source of rays. The same minimal energy is required to comp. both C and Al.

MARIE FARNSWORTH

A method for the preparation of a highly concentrated polonium preparation. ELISABETH RONA AND EWALD A. W. SCHMIDT. Radium Inst., Wien. *Sitzb. Akad. Wiss. Wien Abt. IIa*, 137, 103-15(1928); cf. C. A. 22, 3827.—The method of distn. is used to prep. a highly concd. Po prep. Systematic expts. are made for obtaining a good yield. The preps. have high surface d. and the advantage that they can be strengthened at any time. Expts. to det. how the preps. are suited to expts. on at. decompn. gave satisfactory results. Further expts. concerning the importance of the metal holding the Po and the influence of a gaseous Po compd. are planned.

MARIE FARNSWORTH

The preparation of polonium from radium compounds and active lead salts. ELISABETH RONA. Radium Inst., Wien. *Sitzb. Akad. Wiss. Wien Abt. IIa*, 137, 227-34 (1928); cf. C. A. 22, 3827.—It is possible to sep. pure Ra D and Po from a strong Ra prepn. (1207 mg. Ra) by pptg. with H_2S . The Po can be concd. from the active Pb salt by shaking the soln. with Ag foil.

MARIE FARNSWORTH

Separation and purification of radium D, E and F. O. ERBACHER AND K. PHILIPP. K. W. Inst. Berlin, Dahlem. *Z. Physik* 51, 309-20(1928).—A new method for purification of Ra D by electrolysis is described. Po is pptd. on Ag foil and Ra E on Ni foil.

GEORGE GLOCKLER

Volatilization curves of radium B and radium C which are precipitated on gold by single and by double recoil. ERNA BUSSECKER. Radium Inst., Wien. *Sitzb. Akad. Wiss. Wien Abt. IIa*, 137, 117-26(1928).—The possibility of an alloy between active deposit and its substratum is studied. Ra B and Ra C are hammered into Au foil, once by a single recoil and the other time by a double recoil. The volatilization curves are studied in both cases. The Ra B and Ra C product produced by 2 recoils, which favors alloy formation, in general volatilized more readily.

MARIE FARNSWORTH

Simultaneous action of impact and radiation. O. OLDENBERG. Univ. Göttingen. *Z. Physik* 51, 605-12(1928).—From the study of a continuous spectrum of Hg with He in the discharge tube, it can be concluded that radiation and kinetic energy together can, in one elementary act, cause the excitation of an atom. More generally the simultaneous action of 2 sorts of energy in 1 excitation act is discussed. From the Smekal-Raman effect it is concluded that 2 light quanta can possibly act together and cause the excitation of one atom.

GEORGE GLOCKLER

Transparency of rare gases for slow electrons. F. KORROESY. *Z. Physik* 51, 420-8(1928).—A very slow electron will not be acted upon by a mol. for the latter will appear to be a spherical condenser (neg. shell outside of the pos. kernel) with no elec. forces acting toward the outside. Such a slow electron will therefore pass easily through a gas of such mols. An outside electron passing the mol. with a velocity comparable with the velocities of the outer electrons of the mol. will, however, be acted upon by strong elec. forces and the collision area of the mols. will appear to be large. A very much faster electron will, however, be only a very short time under the influence of the mol. fields and it will pass easily through the gas. Thus on the old Bohr model K. attempts to explain the phenomenon of transparency of the rare gases for slow electrons. (Cf. C. A. 20, 3383, and Faxén and Holtsmark, C. A. 22, 1273).

GEORGE GLOCKLER

Photoelectricity. WILLIAM BRAGG. *Sci. Monthly* 1928, 522-9; cf. C. A. 22, 4055.—An address.

E. H.

Influence of gases upon photoelectric sensitivity of carbon. O. v. AUWERS. *Z. Physik* 51, 618-37(1928).—The presence of gases has a great influence upon photoelec. sensitivity of C. However, the kind of gas (H_2 , O_2 , air) has not a marked influence. It is assumed that the active location of the photoelec. phenomenon is to be sought in gas layers within the pores of the material.

GEORGE GLOCKLER

The sudden discharge-voltage of the Geiger counter. OTTO KLEMPERER. Univ. Kiel. *Z. Physik* 51, 341-9(1928).—Independent of the dimensions of the counter, the gas pressure and the kinds of gas used, the voltage at which the current through the counter suddenly increases from about 10^{-13} to 10^{-10} amp. depends only on 2 factors: the no. of pos. ions needed to liberate another electron and the range of the electron. Deviations are found only with extremely high ion velocities. H_2 , air and CO_2 were studied.

GEORGE GLOCKLER

Sparking potential at pressures less than one atmosphere. FR. KLINGELFUSS. *Z. Physik* 52, 126-40(1920).—The sparking potential at const. electrode distance is studied as a function of pressure. The pressure-distance product ($p \times d$) is translated into equiv. wave length and the expression of the sparking potential is given in terms of this wave length.

GEORGE GLOCKLER

Optical experiments with electrons. II. L. H. GERMER. Bell Tel. Lab., N. Y. *J. Chem. Education* 5, 1255-71(1928); cf. C. A. 22, 4361.—Since electrons have a

wave length of h/mv , intensity of reflected beam is plotted vs. reciprocal of wave length. Maxima of electron reflection fall to the left of corresponding x-ray reflections, with the displacement decreasing toward the higher orders. By assuming that the displacement from x-ray positions indicates a refraction different from unity, 6 different values are obtained, corresponding to 6 electron wave lengths. These values plotted vs. reciprocal wave lengths give the dispersion curve of Ni crystal for electron waves. The break in the continuity of this curve is not understood. The loops suggest double refraction. Miller indices can now be assigned to each of the electron beams. The 54-v. diffraction beam is shown. This is a (331)—x-ray terminology. Figures for (662), (422), (844), (551), (553), (442) and (773) reflections are shown. Application is made of electron waves to the study of crystal structure. Electron waves are scattered more efficiently by the atoms of a crystal than are x-rays, and do not penetrate as deep. These waves should provide a new and useful means of studying crystal surfaces. L. D. R.

Diffraction of an electron beam on a grating. E. RUPP. A. E. G., Berlin. *Z. Physik* 52, 8-15(1928).—A metal grating having 1300 lines per cm. was used to produce spectra of 3 orders of electron beams of 70, 150 and 310-v. velocity. The method of glancing incidence used for x-rays was used here. The de Broglie relation $\lambda = h/(mv)$, λ = equiv. wave length, m = mass of electron, v = velocity of electron, is checked satisfactorily to an accuracy of $\pm 2\%$. GEORGE GLOCKLER

Wiedemann—Franz—Lorenz—law. E. GRÜNEISEN. *Z. Physik* 51, 652-68 (1928).—In order to explain certain deviations from the above law, G. assumes that in a metal there exist 2 types of electron motion, only one of which, however, can partake in thermal conduction. (Cf. C. A. 21, 3776.) GEORGE GLOCKLER

Alternating-current arcs in liquids. A. v. ENGEL. *Z. Physik* 52, 145-9(1928).—The high potential noted by Bodforss and Frölich (C. A. 16, 3593) is caused by interruption of the current and is not to be confused with the normal drop across the arc. This was shown in the case of measurements with uninterrupted arc current. G. G.

The magnetic moment of the electron. C. G. DARWIN. *Proc. Roy. Soc. (London)* A120, 621-31(1928).—By starting from the wave equations for an electron and the associated elec. density and current, it is shown how the electromagnetic fields of a moving electron can be attributed partly to the convection of electricity and partly to an intrinsic magnetization. A geometrical construction shows the relation between the wave const. and the magnetization. The formulas, first worked out for slow motion, are easily generalized by relativity for high speeds, and in this case there are elec. as well as magnetic moments, and various invariant properties are given. A comparison is made between an electron wave and a light wave, and the resemblance may be loosely expressed by saying that a light quantum is an electron without charge or mass. G. CALINGAERT

Diffraction of the magnetic electron. C. G. DARWIN. *Proc. Roy. Soc. (London)* A120, 631-42(1928).—The problem is solved of the diffraction of an electron wave by a line-grating exerting periodic elec. or magnetic forces; this represents the essential features of diffraction by a crystal. The incident wave is supposed to be magnetized in a definite direction, and it is shown that when the grating exerts only elec. forces, the effect is to rotate the direction of magnetization through a definite angle about an axis perpendicular to the incident and diffracted rays, and no polarization can be produced by the diffraction. For some magnetic forces a similar rotation occurs, but in general the simultaneous action of elec. and magnetic forces may produce a partial polarization, though the case is too remote from expt. to be worth treating in detail. G. CALINGAERT

Polarization of characteristic x radiation. H. MARK AND K. WOLF. *Z. Physik* 52, 1-7(1928).—By a photographic method it is found that the degree of polarization of the characteristic K radiation of Cu is within the limits of error of 1%. G. G.

Insulation for radiation and the economical production of light. F. SKAUPY. *Z. Physik* 51, 388-94(1928).—The amt. of energy required to overcome the radiation losses of an incandescent object can be greatly reduced if the body be surrounded by certain covers or mantles placed at distances calcd. from the laws of radiation (Stefan-Boltzman law). These mantles must be transparent to the visible but impervious to the infra-red. The proper placing and choice of these mantles would result in an economical light production. GEORGE GLOCKLER

The propagation of light through fields of force. F. J. WISNIEWSKI. *Z. Physik* 51, 443-50(1928).—The fact that the velocity of light in material media is not c (3×10^{10} cm./sec.) is explained on the assumption that electromagnetic fields exist inside of the material media. GEORGE GLOCKLER

Dispersion in air and carbon dioxide in the interval from 600 to 60 meters. M.

FORRO. Univ. Budapest. *Z. Physik* 51, 374-7(1928).—The change in dielec. const. in air and CO_2 was measured and a slight increase with decreasing wave length was found.

GEORGE GLOCKLER

Derivation of Plank's radiation law. K. SHAPOSHNIKOV. *Z. Physik* 51, 895-900 (1928).—It is assumed that black-body radiation consists of wave groups or wave packets each of energy $ih\nu$, where i = a whole no. and $h\nu$ = energy of 1 quantum. On further geometrical considerations Plank's Law is derived.

GEORGE GLOCKLER

The interpretation of the green auroral line on the basis of the Zeeman effect. L. A. SOMMER. *Z. Physik* 51, 451-70(1928).—On the basis of interferometer measurements of the Zeeman effect of the oxygen line $\lambda = 5577.350$ A. U. obtained in a discharge tube contg. A and O_2 this line is identified as the famous auroral green line with the term designation $2pD_2 - 2pS_0$. This transition violates both the selection principles for azimuthal and inner quantum no.

GEORGE GLOCKLER

Light absorption in crystals with traces of impurities. I. MASLAKOWEZ. Univ. Göttingen. *Z. Physik* 51, 696-706(1928).—The ions NO_3^- and NO_2^- can be incorporated in an alkali-halide crystal and can be identified therein by means of their ultra-violet and infra-red absorption spectra. Addn. of NO_3^- ion brings also NO_2^- absorption and *vice versa*. A sort of equil. is established. Carbonates and sulfates cannot be incorporated into alkali halide crystal without causing considerable disturbance.

GEORGE GLOCKLER

Broadening of spectral lines through self-reversal. H. C. BURGER AND P. H. VAN CITTERT. Univ. Utrecht. *Z. Physik* 51, 638-51(1928).—The broadening of spectral lines due to absorption is calcd. By the use of a Fabry-Perot interferometer the absorption coeff. is measured for the red He-line $2^1P - 3^1D$ and is found to be large as theoretically expected. With triplet-lines the measurement is more difficult on account of the multiple structure. By means of working with liquid air it has been possible to study this multiple structure.

GEORGE GLOCKLER

Molecular spectrum of hydrogen. W. FINKELNBURG. Univ. Bonn. *Z. Physik* 52, 27-118(1928).—In the region $\lambda = 4861$ (H β) to $\lambda = 3314$ there are found 3667 lines belonging to the mol. spectrum of H_2 . These were taken with the great Rowland concave grating with a dispersion of 1.98 A. U. per mm. The calcd. probable error is ± 0.0035 A. U. for the more intense lines and twice this for the lesser lines. More than 2000 lines are here measured for the first time. Because of some peculiarities in the conditions of excitation it is possible to fit these lines into 3 rough classes of which at least 2 are such that the lines behave quite differently. An alphabetical bibliography is appended.

GEORGE GLOCKLER

Molecular spectra. F. HUND. Univ. Rostock. *Z. Physik* 51, 759-95(1928).—An attempt is made to systematize the electron terms in mols. similar to the present arrangement of energy levels for atoms. With the two-center mol. there are assigned certain terms to certain electron configurations. For varying nuclear sepn. the sequence of binding of individual electron shells is discussed and a sort of principle for mol. formation is described. The spectra of the hydrides are the simplest to interpret but for other mols. the interpretation is still very arbitrary. Differences in the energy diagram of mols. with equal and unequal nuclei or kernels are noted and the alternate intensity in the N_2^+ bands is explained. The relations between ionizing and resonance potential are much more complex in mols. than they are in the atoms. A few rules for dissocn. energy are found. The shells of electrons in the many-center systems are in a certain sense simpler than in the two-center systems. The connection of this study with problems of chem. combination and valency is discussed.

GEORGE GLOCKLER

Diffuse molecular spectra. B. ROSEN. Univ. Berlin. *Z. Physik* 52, 16-20 (1928); cf. C. A. 22, 2717.—In the S_2 spectrum it is shown that dissocn. does not explain always the diffuse character of the bands. It is necessary also to consider the greater diam. or vol. of an excited mol. caused by the large amplitudes of nuclear vibrations. Wherever dissocn. is possible on energetic grounds it appears to happen

GEORGE GLOCKLER

Helium band spectrum. W. WEIZEL. Univ. Rostock. *Z. Physik* 51, 328-40 (1928).—The carrier of the band spectrum of He is a He mol. made up of 2 excited He atoms. The mol. does not consist of 1 normal and 1 excited He atom. A model for such a He mol. is proposed and an energy level (= term) diagram is worked out. Some former discrepancies in the assignment of certain bands are discussed. Three new bands are recorded.

GEORGE GLOCKLER

Band spectrum of aluminum hydride. E. BENGTSSON. Univ. Upsala. *Z. Physik* 51, 889-94(1928).—New Al-H Bands are found in the ultra-violet and the bands

λ 2229 and 2254 are studied. An energy diagram is given. Certain electron levels are found and several consts. of the mol. are given. GEORGE GLOCKLER

Raman effect of aqueous solutions and the degree of polarization of Raman lines. A. CARRELLI, P. PRINGSHEIM AND B. ROSEN. Univ. Berlin. *Z. Physik* 51, 511-19(1928).—Raman spectra of pure H_2O and solns. of HNO_3 , $NaNO_3$, $NaNO_2$, NH_4NO_3 and NH_3 obtained with the Hg arc are studied and compared with infra-red frequency spectra of the substances. The infra-red frequencies are due to vibrations within a grouping (such as NO_3 for instance) and the residual-ray frequencies have so far not been found. So for instance it is found that NaCl and HCl do not show displaced lines. It is also found that apparently optically inactive vibrations (not found in the infra-red) show up as displaced Raman lines. The degree of polarization of Raman lines is a complex function of the scattering process of the individual case. G. G.

The influence of the disaggregation upon the specific fluorescence of complex natural products. HANS PRINGSHEIM AND OTTO GERNGROSS. Tech. Hochschule, Berlin. *Ber.* 61B, 2009-11(1928).—Many inorg. materials, also cellulose and proteins and their derivs., show a strong specific rotation. In this work the visible rays were filtered out and a Hanauer Analytical Quartz lamp was used, which supplies a monochromatic light wave 360μ long. This study included 7 different polysaccharides and their disaggregation products and 7 different solns. of gelatin. The increase in fluorescence was in direct ratio to the increased disaggregation products. The % concn. of gelatin was 24, the pH 5.05 for 5 solns. The solns. were heated in sealed glass tubes from 336 to 8 hrs. and at varying temps. The fluorescence from the 10 % gelatin soln. heated 11 hrs at 120° was greatest. In both, high temp. and long boiling yielded the greatest fluorescence. The 7 polysaccharides used were lichenin, cellulose, glycogen, amylopectin, potato starch, inulin, and inulin acetate. The last three showed fluorescence; the fluorescence of the disaggregation products was intensified three-fold. G. W. M.

The cause of luminescence of phosphorus. A. PETRIKALN. Univ. Riga. *Z. Physik* 51, 395-409(1928); cf. *C. A.* 22, 1912.—In order to det. the carrier of the luminescence of P oxidation, the emission and absorption spectra of P_2O_3 and P_2O_5 were studied. P_2O_3 when excited by electron impact in the gas phase shows only the spectrum of O_2 , which gas is liberated during the decompn. of the P_2O_3 . P_2O_5 shows no absorption in the ultra-violet (to about λ 2100); its emission spectrum is located in the Schumann region. *The spectrum of P_2O_5 vapor under electron bombardment consists of a band spectrum which is completely identical with the spectrum of P luminescence.* P_2O_5 shows a continuous spectrum in the visible and a band spectrum consisting of 2 band systems called A and B. The longer-wave-length system A could be partially analyzed and the shorter-wave-length system B could be completely analyzed and a term diagram established. It is surmised that the continuous spectrum belongs to solid P_2O_5 . The conditions of excitation of P_2O_5 during luminescence of P are discussed. G. G.

Quantum yield of the action of x-rays on silver bromide. J. EGGERT AND W. NODDACK. *Z. Physik* 51, 796-804(1928).—Each absorbed x-ray quantum liberates about 1000 Ag atoms and causes thereby the development of a grain. This relation is shown for certain films and plates. A difference between their expts. and the ones of Eggert and Noddack (*C. A.* 21, 3562) and March (*C. A.* 22, 2113) is discussed.

COLIN G. FINK

Industrial electric heating. ALEX DOW. *Elec. World* 92, 1189-91(1928).—An analysis. Research in mfg. processes and technic must precede application of elec. heat. C. G. F.

Design and construction of an electric furnace. A. TENIVELLA. *Met. ital.* 20, 381 8(1928).—Detailed calcns. are shown for size of electrodes, power consumption,

thermal efficiency, as well as the size of a three-phase, carbon-arc, basic furnace for handling 5 to 10 tons of pig iron per charge.

Commercial cells for fused electrolytes. P. DROSSBACH. *Metall. Ers.* 25, 437-9(1928).—In the author's equation: $E = \frac{e}{\gamma} + \frac{e}{\gamma - \frac{c}{2}} = \frac{e}{\gamma} + \frac{e}{\delta c \left(\gamma - \frac{c}{2} \right)}$, $E =$

the energy required for the electrolysis, e = the decompn. voltage, γ = the quantity of metal deposited in unit time, c = the metal which goes back into the melt during the same unit time, i = amperes, and w = the cell resistance. In this c may be detd. as a function of the current and the surface, e is known or may be calcd., and the cond. of the fused electrolyte is fixed. The heat balance is formulated mathematically. J. B.

Fundamental principles of commercial zinc electrolysis, current requirements and composition of electrolyte. P. RÖNTGEN AND H. HÖGEL. *Tech. Hochschule, Aachen. Metall. Ers.* 25, 12, 291-8, 319-27(1928).—The effects of the Zn and H_2SO_4 concns. and of the c. d. on the quality and yield of the Zn deposit were studied. The soly. of $ZnSO_4$ in varying H_2SO_4 concns. was detd. At 46.50% H_2SO_4 there is a sharp decrease in the soly. of $ZnSO_4$. H_2O of crystallization or hydration is removed and $ZnSO_4 \cdot 7H_2O$ forms $ZnSO_4 \cdot H_2O$. Sheet-Pb anodes and Al cathodes, in electrolytes contg. 0, 10, 20, or 40% H_2SO_4 and a 2, 5 or 8% Zn content at 250, 750, 1250 or 3000 amp./sq. m. were used in the electrolytic expts. Glue up to 0.005% does not affect the Zn deposit; 0.005-0.05% glue gives a metallic deposit, while with further addn. it increases in brittleness and the yield decreases until upon the addn. of 0.5% no Zn deposit is obtained. Upon electrolysis of neutral solns. treeing of the Zn occurs. Mn affects the electrolysis only when in presence of PbO_2 (anode). The bath voltage decreases with increasing H_2SO_4 to 20%, and remains const. at higher concns. In solns. contg. up to 6-7% H_2SO_4 , the voltage decreases with increasing Zn concn. and above this acid concn. increases with increasing Zn concn. The current efficiency increases rapidly in 2% Zn soln. with both acid concn. and c. d. With increasing Zn concn. the difference in the yields decreases at varying c. ds., the greatest difference between 250 and 3000 amp./sq. m. being 16% in 2% Zn soln. and 6% in 5% soln. In 8% Zn soln. the yield is nearly const. at all c. ds. except at 250 amp./sq. m., at which it decreases strongly with the higher H_2SO_4 concns. Up to 18% H_2SO_4 in solns. with 8% Zn the yield decreases with increasing c. d., above which it increases. In neutral soln. with 8% Zn the deposit is metallic at c. ds. up to 2000 amp./sq. m., with 5% Zn up to 750 amp./sq. m., and with 2% Zn up to 250 amp./sq. m. Above these c. ds. the deposit is black and spongy. As the acid content increases up to 20% the deposit becomes more metallic. Above this concn. further addn. of H_2SO_4 serves only to dissolve the deposited Zn. For a given acid concn. the metallic character of the deposit increases with increasing Zn. In 2% Zn soln. the min. power required for the electrolysis is at 13-14% H_2SO_4 , 2.9 kw. hrs. being consumed in the deposition of 1 kg. Zn at 250 amp./sq. m. and 5.5 kw. hrs. at 3000 amp./sq. m. In both 5 and 8% Zn solns. it is the same, being min. at 14-20% H_2SO_4 (depending on the c. d.); for the deposition of 1 kg. Zn the min. consumption at 250 amp./sq. m. is 2.7 kw. hrs., and at 3000 amp./sq. m. is 4.7 kw. hrs. J. BALOZIAN

Bauxite and aluminum in 1927. JAMES M. HILL. *Bur. of Mines, Mineral Resources of the U. S. 1927, Pt. I, 7-24* (preprint No. 2, published October 24, 1928).

Pyrochemical Daniell cells. RICHARD LORENZ AND FRITZ MICHAEL. *Univ. Frankfurt a. M. Z. physik. Chem. Abt. A*, 137, 1-17(1928); cf. *C. A.* 21, 2215.—The voltages of cells composed of metals in contact with their molten chlorides were measured over the temp. range 350-720°. The liquid junctions were either 1 of the molten chlorides or a molten eutectic of KCl - $LiCl$ or KCl - $NaCl$. The e. m. fs. in milliv. for 1 temp. and the temp. coeff., dE/dT , (second figure) follow: $Sn/SnCl_2/KCl + LiCl/TiCl/Tl$, $E_{100} = 367$, 0.15; $Sn/SnCl_2/TiCl/Tl$, $E_{100} = 403$, 0.45; $Pb/PbCl_2/TiCl/Tl$, $E_{100} = 365$, 0.39; $Zn/ZnCl_2/SnCl_2/Sn$, $E_{100} = 306$, 0.1; $Zn/ZnCl_2/CdCl_2/Cd$, $E_{100} = 148$, -0.13; $Zn/ZnCl_2/PbCl_2/Pb$, $E_{100} = 276$, -0.095; $Zn/ZnCl_2/TiCl/Tl$, $E_{100} = 110$, 0.48; $Mg/MgCl_2/PbCl_2/Pb$, $E_{720} = 1078$, 1.075; $Mg/MgCl_2/KCl + NaCl/CdCl_2/Cd$, $E_{720} = 964$, 1.07; $Mg/MgCl_2/TiCl/Tl$, $E_{720} = 530$, -0.43; $Mg/MgCl_2/ZnCl_2/Zn$, $E_{720} = 759$, -0.73. A method for the prepn. of pure anhyd. $ZnCl_2$ and the detn. of its melting pt. is given also. H. F. JOHNSTONE

Corrosion and residual currents (TÖDT) 9. Corrosion at discontinuities in metallic protective coatings. II. Different methods of applying a Zn coating (EVANS) 9. Electrolytic reduction of nitrosoantipyrine (GIORDANI) 10. Coking pitch [for making

electrodes for electric furnaces] (U. S. pat. 1,694,800) 21. Oil by low-temperature distillation and hydrogenation (Fr. pat. 636,609) 21. Thermometer for measuring temperatures of electrical apparatus (Brit. pat. 288,735) 1.

Electric batteries. EUGÈNE FOURNIER. Fr. 636,664, Oct. 21, 1926. The pos. electrode is hollow with its internal surface in contact with the air while its external walls are immersed in the electrolyte.

Reversible electric battery. FREDERICK W. HOCHSTETTER and WM. BROAD. U. S. 1,693,385, Nov. 27. Structural features.

High-tension electric battery assembly. BERLINER BATTERIE-FABRIK GES. Brit. 288,597, April 13, 1927. Structural features.

Dry-cell electric batteries. LESLIE G. JENNESS. U. S. 1,694,919, Dec. 11. In producing "bobbins" of dry-cell batteries, substances such as $Al_2(SO_4)_3$ and $CaCl_2$ are added which will form a ppt. giving hardness to the bobbin.

Dry batteries. GUSTAVE ENGISCHE. Fr. 639,872, Aug. 19, 1927. Polarization is prevented by placing an insulation material such as ozocerite between the C electrode and the fabric surrounding the polarizing material.

Storage battery. CLAUDIUS BAULT. Fr. 639,749, Jan. 31, 1927. The pos. electrode is of PbO_2 , the neg. of Sn, the latter being disposed at the bottom of the tank below the former. A screen partially seps. the 2 electrodes and divides the electrolyte into unequal vols. The charge is preserved indefinitely on open circuit.

Storage battery. DEAN W. DAVIS (to Albert L. New). U. S. 1,694,530, Dec. 11. A battery contg. an electrolyte such as dil. H_2SO_4 from which gases may be evolved is provided with a body of catalytic material such as Pt adapted for promoting combination of the gases and so placed that a portion of the catalyst at least will be unsubmerged in any position of the battery. Various structural details are described.

Storage batteries. CHARLES JEAN VICTOR FÉRY. Fr. 637,152, Oct. 30, 1926. The neg. plates have active C disseminated through them to render them porous and of high cond. at a sufficient temp.

Storage battery. JOHN G. JACKSON. U. S. 1,694,856, Dec. 11. Structural features.

Storage battery. THOMAS E. MCCARTY and HAROLD E. SALISBURY. U. S. 1,692,217, Nov. 20. Structural features.

Storage battery. EDWARD W. SMITH. U. S. 1,692,316, Nov. 20. Structural features.

Storage batteries. SIDNEY J. WILLIAMS. Fr. 639,513, Aug. 13, 1927. The oxide of Pb is made in hard blocks, placed in a mold and molten Pb is run in to form the plates.

Zinc-lead storage battery. KOLOMAN NÉMETH and ALBERT SZANTO. Fr. 636,806, June 29, 1927. The construction of a cathode and its support is specified.

Separators for storage batteries. SOC. ANON. DES ACCUMULATEURS MONOPLAQUE. Brit. 288,959, April 16, 1927. Structural features.

Electric system for indicating the liquid level in electric batteries. IRLAND R. WELLS. U. S. 1,694,609, Dec. 11.

Electric system for indicating the electrolyte-level in storage batteries. THOMAS MCCARTY. U. S. 1,694,687, Dec. 11.

Preventing overcharge of storage batteries connected to alternating-current chargers while supplying a load. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 288,249, April 5, 1927. The resistance of a dry metallic rectifier supplying the charging current is so chosen that the rise of battery voltage reduces the charging current to a small amount at the end of the charge.

Photoelectric cells. G. R. STILWELL (to Electrical Research Products, Inc.). Brit. 288,539, April 6, 1927. Cells which may be of comparatively large size have a cathode of light-sensitive material such as K on the inner surface of a closed vessel, and an internal member (such as a reentrant tube in a vessel of Pyrex glass) which carries an anode and is adapted to be heated by external means to assist the formation of the cathode during manuf. Various details of manuf. and structure are described.

Electric resistances. H. A. JONES (to British Thomson-Houston Co., Ltd.). Brit. 289,030, April 20, 1927. A ballast resistance of the type having a wire in an enclosure contg. a gas such as H or He at a low pressure is provided with 2 or more wires of different materials such as Fe and Ni, connected in series, so that the temp. ranges over which the 2 wires have a ballast action continue each other.

Electric resistance heater units. HOWARD S. LEE (to Jasper Marsh). U. S. 1,694,600, Dec. 11. Structural features.

Electric discharge devices. A. LEDERER. Brit. 288,561, April 12, 1927. An electron-emitting wire or ribbon is formed of an alloy or compd. of more than 2% Th with one or more metals of the Pt group, preferably Os, to which highly refractory metals such as W may be added. Details are given of the manuf. of filaments by squirting an oxide-contg. mixt. and then heating and reducing the product and of coating W cores electrolytically or otherwise.

Copper oxide rectifier plates. SIEMENS-SCHUCKERTWERKE A.-G. and E. DUHME. Brit. 288,499, Oct. 28, 1927. The oxide coating of Cu plates of rectifiers is produced by heating the plates to above 1040° (suitably to 1053–1060°) and plunging them into warm water (which may be at a temp. of 40–60°).

Electrodeposition of nickel. SOC. ANON. LE NICKEL. Brit. 288,605, April 13, 1927. Ni is deposited from a Ni chloride soln. in a diaphragm cell and the spent catholyte is passed to the anode chamber which contains anodes of impure Ni. The liquid from the anode chamber is treated with Ni(OH)₂ in a sep. vessel to ppt. Fe, Co, As and other impurities and returned to the cathode chamber at a temp. above normal. The electrolyte is maintained at a d. of 1.2–1.3 corresponding to 150 kg. of Ni per cu. meter. Ni(OH)₂ and air may be used instead of Ni(OH)₂. Crude alloys before formation into anodes are refined by converting the greater part of the Fe into slag, to obtain a Ni content of 90–95%. Anodes may be produced from the oxidized ores of New Caledonia. Various details and modifications are described.

Cadmium plating. ARTHUR W. YOUNG and MAURICE E. LOUTH (to Udylyte Process Co.). U. S. 1,692,240, Nov. 20. Electroplating of Cd is effected from a cyanide bath to which is added a cereal ext. such as an ext. from whole wheat and bran and caramelized sugar, which serve to facilitate production of uniform, bright, coherent deposits.

Electrolysis of zinc sulfate solutions. URLYN C. TAINTON. Can. 285,310, Dec. 4, 1928. In the electrolysis of ZnSO₄ solns. contg. Mn, the use of an anode composed mainly of Pb and contg. substantial proportions of Ag and As improves the quality of the Zn deposited at the cathode and of the MnO₂ deposited at the anode. Cf. C. A. 22, 2890.

Electrolytic apparatus for deposition of copper, etc. GUNNAR ROSENQVIST. U. S. reissue 17,141, Nov. 20. See original pat. 1,594,509 (C. A. 20, 3136).

Electrolytic apparatus for treating anode plates in vertical position. FOSTER C. NIXON. U. S. 1,692,757, Nov. 20. Structural features.

Electrolytic manufacture of compounds containing active oxygen. I. G. FARBEN-IND. A.-G. Swiss 126,402, Mar. 21, 1927. The manuf. is conducted so that such compds. are formed simultaneously in the anode and cathode compartments. In the example, (NH₄)₂SO₄ soln. to which H₂SO₄ has been added is introduced into the anode compartment of a cell having earthenware diaphragms, and 0.5% H₂SO₄ into the cathode compartment, through which a brisk stream of O is passed. The anode is Pt, the cathode is amalgamated Au, and the c. d. is 20 amp./sq. dm. at the anode and 0.4 amp./sq. dm. at the cathode, the voltage being 3.7. (NH₄)₂S₂O₈ is obtained in the anode compartment, and H₂O₂ in the cathode compartment.

Aluminum. DEUTSCHE VERSUCHSANSTALT FÜR LUFTFAHRT E. V. Fr. 639,173, Aug. 8, 1927. See Brit. 276,911 (C. A. 22, 2331).

Beryllium. SIEMENS & HALSKE A.-G. (Hellmut Fischer, inventor). Ger. 467,247, Oct. 8, 1926. See Brit. 278,723 (C. A. 22, 2517).

Perborates. HENKEL & CIE. Swiss, 126,527, Mar. 14, 1927. Addn. to Swiss 120,794. The soln. employed in the electrolytic prepn. of NaBO₃ from soda and borax is regenerated by adding a silica soln. under excess pressure, boiling and allowing the gel to set.

Treatment of mixed sulfide ores. HORACE FREEMAN (to The Honorary Advisory Council for Scientific and Industrial Research in Canada). Can. 284,442, Oct. 30, 1928. Mixed sulfide ores are heated in a furnace with Na₂S, thereby producing a fused mixt. of sulfides and a slag; the slag is sepd. from the fused mixt., and a d. c. passed through the fused mixt. thereby sepg. the metals and the S, which is distd. from the furnace, and the metals are tapped off.

Apparatus for electric precipitation of smoke. COMPAGNIE DES MINES D'OSTRICOURT. Brit. 288,208, April 4, 1927.

Removing dust from gases. SIEMENS-SCHUCKERTWERKE AKT.-GES. (Carl Hahn, inventor). Ger. 467,975, Oct. 4, 1924. In an app. for electrodeposition of dust from gases, plates are arranged at intervals in the gas stream below the electrodes and are

combined with sloping tubes or channels arranged so that dust flows from the plates down the tubes and the gas passes without hindrance between them. Cf. C. A. 22, 2045.

Electric condenser. ROBERT BOSCH A.-G. Fr. 636,969, July 4, 1927. Condensers are protected against moisture by a layer of gum lac and a layer of "bakelite."

Device for shaking the electrodes of electrical gas purifiers. SIEMENS SCHUCKERT-WERKE A.-G. Ger. 467,410, Oct. 1, 1926. Constructional details.

Oxidized cathodes. SÜDDEUTSCHE TELEFON-APPARATE-, KABEL- UND DRAHTWERKE A.-G. Ger. 467,323, June 1, 1922. A pure metallic coating is deposited on the cathode electrolytically, and then oxidized by treatment with acid.

Device for regulating the area of the focal spot of a glowing-cathode Röntgen tube. C. H. F. MÜLLER A.-G. Ger. 468,271, Feb. 23, 1926.

Thermionic cathodes. L. DE FOREST (to de Forest Phonoflms, Ltd). Brit. 289,424, April 27, 1927. Parallel filaments are bound together by transverse elements which may be formed of Pt, Mo or nichrome and may be interwoven with the filaments to form a mesh, and a coating of electron-emitting material such as oxides of the rare earths or of alk. earth metals is used.

Coating filaments. COMPAGNIE DES LAMPES. Fr. 639,785, June 4, 1927. An app. is described for coating filaments by projecting them upwardly into a closed space by a jet of air contg. the coating substance.

Coating wax surfaces with graphite. W. McLAUGHLIN and H. KNOWLES. Brit. 288,709, Jan. 11, 1927. Wax surfaces such as those to be used in prepg. electrotypes are coated with graphite in the form of an aq. colloidal suspension which may be applied by spraying and may contain a protective colloid such as tannic acid or a deflocculating agent such as Na silicate, glycerol or eucalyptus oil. An alkali such as NaOH also may be used. "Aquadag" also is suitable. An app. is described.

Rust-resisting coatings. CHRISTIAN J. WERNLUND (to The Roessler and Hasslacher Chemical Co.). Can. 284,269, Oct. 23, 1928. Steel articles are first cleaned and then put in hot alk. cleaning soln. contg. 1 to 5% NaOH. The cleaned article is rinsed in water and suspended from the cathode rod into a Cd-Hg alloy plating soln. contg. water 1 l. (1 gal.), NaCN 60 g. (8 oz.), NaOH 15 g. (2 oz.), Cd(OH)₂ 15 g. (2 oz.), HgO 0.1 g. (0.0125 oz.). Anodes of Cd are used, the temp. is 25° (77° F.), e. m. f. 3-6 v., c. d. 15 amp. per sq. ft. An av. analysis of the coating produced is Cd 98-99% and Hg 1-2%.

Electric furnace. WESTINGHOUSE ELECTRIC & MANUF. CO. Swiss 126,670, July 9, 1927.

Electric furnace of the tilting type. CHARLES B. FOLEY (to Charles B. Foley, Inc.). U. S. 1,694,536, Dec. 11. A gas inlet extends through the side walls of the furnace and is so located that during normal operation the tapping device is above the surface of the melt while the gas inlet is below the surface of the melt. The furnace is suitable for melting and refining Cu, etc.

Electric furnace for heat or chemical operations. HENRI GEORGE. Fr. 637,024, Oct. 27, 1926. The furnace contains an intermediate mass composed of a conducting substance and liquid which receives the elec. energy either directly from electrodes or by induction or by forming one or more arcs.

Electric furnace for heating liquid steel and other metals. IVAR RENNERFELT. Fr. 636,918, July 2, 1927.

Electric furnace (with a bottom mounted for lowering and raising) for heat treatment of metal articles. HARRY O. BREAKER. U. S. 1,694,964, Dec. 11.

Electric furnace for annealing copper wire, etc. FRANK T. COPE (to Electrical Furnace Co.). U. S. 1,694,684, Dec. 11.

Induction furnace. SIEMENS & HALSKE A.-G. Fr. 636,879, July 1, 1927.

Electric induction furnace. GUSTAVE M. RIBAUD. Fr. 636,844, June 30, 1927.

Electric induction furnaces. EDWIN F. NORTHRUP (to Ajax Electrothermic Corp.). U. S. 1,694,791-2, Dec. 11. Structural features.

Electric resistance furnaces adapted for heat treatment of metal articles. JACOB WENTZ (to The Strong, Carlisle & Hammond Co.). U. S. 1,692,478-9, Nov. 20.

Electric resistance furnace suitable for heat-treating various articles. ORA A. COLBY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,693,370, Nov. 27. Structural features.

Electric resistance heater. S. THOMPSON. Brit. 289,226, March 16, 1927. Structural features.

Electric heater. "I. C. E." (Industria Costruzione Elettrotermiche). Fr. 639,679, Aug. 19, 1927. An elec. heater for heating the interior of casks, etc., to be filled, emptied or sterilized by heat is described.

Automatic regulators for electric furnaces. COMPAGNIE DES FORGES ET ACIERS DE LA MARINE ET D'HOMECOURT. Fr. 639,198, Jan. 14, 1927.

System for regulating current supply to electric furnaces. D. F. CAMPBELL, G. E. TAYLOR and ELECTRIC FURNACE CO., LTD. Brit. 289,114, Dec. 20, 1926.

Electrical apparatus for regulating air and fuel supply to steam generator furnaces. SIEMENS & HALSKE A.-G. Brit. 289,079, April 23, 1927. The steam pressure serves to actuate the control devices through the action of a Wheatstone bridge.

Electric energy. NICOLAS BOGENSKY. Fr. 639,363, July 28, 1927. Liquids boiling below 100° are used when vaporized to drive a motor for the production of elec. energy and condensed again within a closed container. CHCl_3 , Me_2O , Et_2O , EtCl , liquid NH_3 and liquid CO_2 may be used.

Molded carbon articles for electrical uses. M. OSWALD. Brit. 289,680, July 27, 1927. Mech. features of producing furnace electrodes, metal-coated articles, etc.

Thermal cut-out for electric circuits. MAURITS J. SANDIN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,693,404, Nov. 27.

Electric system for operating signals or control devices, etc. RAY E. HALL (to Hall Research Corp.). U. S. 1,694,653, Dec. 11. A cell contg. a polyiodide may be used.

Leading-in conductor. SAMUEL RUBEN. U. S. 1,692,998, Nov. 27. A leading-in conductor for use with glass bulbs or like devices is formed of a suitable metal such as Cu carrying a layer of Cu_2O .

Electrically heated agitating device for stirring liquids. AAGE JENSEN. U. S. 1,692,270, Nov. 20.

Metal tubing. EDWARD R. BERRY (to General Electric Co.). U. S. 1,694,962, Dec. 11. Metal such as Cu is electrodeposited on a silica support and the latter is removed after heating sufficiently to cause sepn. of the silica from the metal by differences in thermal expansion.

Mercury-vapor lamp. WILHELM ULBRICH. U. S. 1,694,836, Dec. 11. Structural features.

Mercury-vapor lamps. DEUTSCH-ENGLISCH QUARZSCHMELZE G. Swiss 126,672, Dec. 4, 1926.

Alloys for electrodes of mercury-vapor lamps, etc. COOPER HEWITT ELECTRIC CO. Brit. 288,737, Jan. 17, 1927. Hg is alloyed or combined with a metal or metalloid altering the angle of contact of the Hg with the wall of the container when cold and non-operative, to facilitate starting the lamp. So small a quantity of added material is used that it does not permanently leave the Hg nor blacken the container. Cu 0.01% or a similar mol. proportion of Ni or Cr may be added or Al 0.01 g. may be added to each oz. of Hg.

Mercury-vapor rectifiers. A.-G. BROWN, BOVERIE & CIE. Ger. 457,932, Feb. 20, 1923. The space between an annular cathode insulator and an inserted cylinder is closed at the top.

Apparatus for concentrating light from a "quartz burner," etc., for chemical or other purposes. QUARZLAMPEN-GES. Brit. 288,613, April 13, 1927.

Machines for forming and inserting into glass rods wire supports for incandescent lamp filaments. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN (Richard Shepherd, inventor). Ger. 467,895, June 7, 1925.

Use of getters in making incandescent lamps. C. SEVERIN (to British Thomson-Houston Co., Ltd.). Brit. 289,478, April 29, 1927. Halogen compds. such as cryolite or other suitable double fluoride are applied as "getters" to the filaments of gas-filled lamps such as are described in Brit. 10,918 of 1913 and flashing is then effected with a gradually increasing voltage, which may be increased in about 5 steps from about one-fifth of the normal to the normal voltage.

Protecting brass caps of incandescent electric lamps from oxidation. PATENT-TREUHAND-GES. FÜR ELEKTRISCHE GLÜHLAMPEN (to General Electric Co., Ltd.). Brit. 289,440, April 27, 1927. Brass caps or the like are heated in a reducing atm. between the process of cleaning by pickling and the setting of the cement, which enables the latter operation to be carried out at higher temps. Brit. 289,441 specifies pickling and then heating in an atm. comprising N 80 and H 20%. The articles may be heated for a short time to 500-600°.

Luminescent tubes. PAUL F. J. LEBRUN. Can. 248,156, Oct. 23, 1928. Luminescent tubes are evacuated and then filled with a scavenging gas (as N, a mixt. of Ne and He or Ne alone) and a high-tension current of the order of 10,000 v. is passed through the scavenging gases, for the purpose of disengaging all impurities, including gases, from the surface of the tube, and removing all traces of H and N from the interior of

the tube, the operation being observed with a spectroscope. The tube is finally exhausted and then filled with a pure gas as He, Ne or other gas of a character to produce luminescence of the desired color when a current is passed through it in the usual way.

Electric arc lamp electrodes. COMPAGNIE LORRAINE DE CHARBONS POUR L'ELECTRICITE. Brit. 289,042, April 21, 1927. Arc lamp carbons contg. rare earth metals contain also small quantities of Si or its carbides or B or other elements of the same groups such as Zr or V or their compds. These added materials may form the core of the carbon, or, in a modification, the Si or B is added to the shell of the carbon and the rare earth metal to the core.

Lamp filaments. SOC. FRANÇAISE DES LAMPES À INCANDESCENCE LUXOR. Brit. 288,557, April 11, 1927. A fine W filament may be wound on a coarser filament as a core, or helices may be wound on brass mandrels which are then dissolved out or upon permanent asbestos mandrels. Various details and modifications are described.

5—PHOTOGRAPHY

C. E. K. MEES

The processes of color photography. I. Early history. C. E. K. MEES. Eastman Kodak Co. *J. Chem. Education* 5, 1385-91(1928). E. H.

Na sulfide [for use in preparing photographic toning solution] (Brit. pat. 289,354)
18. Cleaning gelatinous surfaces (U. S. pat. 1,692,358) 18.

Photography. I. G. FARBENIND. A.-G. (Emil Mauerhoff, inventor). Ger. 468,171, Oct. 15, 1925. Addn. to Ger. 464,450. Animal or vegetable proteins, broken down by treatment with acids, are added to the Ag salt emulsion. Cf. C. A. 23, 348.

Photography. GUSTAV KÖGEL. Ger. 468,155, July 13, 1926. Addn. to Ger. 467,089. Light-sensitive layers are prepd. by using colorless light-sensitive org. substances other than ketones. Thus, a soln. of flavindulin O II is mixed with gelatin and chrome alum soln., to form the sensitive layer and is developed with phenylenediamine and CO_2H_2 . Cf. C. A. 23, 349.

Photographic films. TECHNICOLOR MOTION PICTURE CORP. Ger. 467,817, April 24, 1927. See Fr. 633,306 (C. A. 22, 3361).

Photographic films. PETER WIELFF and BRUNO WENDT (to I. G. Farbenind. A.-G.). Can. 284,234, Oct. 23, 1928. Fogging is prevented in the manuf. of light-sensitive silver halide emulsions by incorporating a compd. of the imidazole series. E. g., a sensitive Ag halide emulsion manufd. according to one of the known processes with a certain sort of gelatin showed considerable fog and little sensitivity. When there was added to the gelatin before or during the making of the emulsion or when the emulsion is poured on the support of the sensitive layer, 0.1 to 0.4% of nitrobenzimidazole a clear and highly sensitive emulsion is obtained.

Photographic films. I. G. FARBENIND A.-G. (Hermann Lummerzheim and Eduard Schnitzler, inventors). Ger. 467,780, Mar. 17, 1927. See Fr. 639,330, below.

Photographic films. I. G. FARBENIND. A.-G. Fr. 639,330, Aug. 11, 1927. Letters or figures are printed on films during their manuf. by a soln. of a dye in a non-volatile solvent such as glycol acetate and on the reverse side to the sensitive layer.

Protective layers on photographic films. MAX HAGEDORN (to I. G. Farbenind. A.-G.). Can. 284,233, Oct. 23, 1928. A protective layer on photographic films made of cellulose derivs. sol. in org. solvents contains several different radicals as substituents, particularly radicals of more than one acid or besides ether groups radicals of acids. Such compds. may be obtained from cellulose derivs. having still esterifiable hydroxyl groups, particularly from mono-esters, di-esters, mono-ethers, di-ethers or mixts. of such compds. swollen or dissolved in org. solvents by treating them, preferably in the presence of a substance promoting the esterification, with functional derivs. of inorg. or org. acids, for instance their esters, chlorides, amides, anhydrides or mixed anhydrides.

Film for color photography. ARON HAMBURGER. U. S. 1,695,045, Dec. 11. A transparent support carries on one side a single film continuous tone positive image corresponding substantially to yellow and red sensations and on the other a similar image corresponding to green and blue-green sensations.

Coloring images on photographic films. GEOFFREY WHEELER. U. S. 1,693,500, Nov. 27. The image is bleached and treated with a reducing agent such as NaHSO_3 .

and is then dyed with a dye such as basic magenta or methylene blue 2B and toned with TiCl_4 .

Colored photographic prints. E. H. FARMER. Brit. 289,411, April 26, 1927. A photographic underprint (which may be formed on paper or celluloid sensitized with a thin coating of gelatin and AgCl or AgBr and developed with metol-hydroquinone, and may be a "weak print") is painted in different parts with an excess of different colored pigments with a gelatinous vehicle, the pigmented vehicle is subjected to a tanning agent (which may be a soln. formed from KBr , $\text{K}_2\text{Cr}_2\text{O}_7$, $\text{K}_2\text{FeC}_6\text{N}_6$, HOAc , alc. and water) and the surplus unhardened vehicle is dissolved away to leave a selectively colored image. Various details are given.

Photographic developers. I. G. FARBENIND. A.-G. (Gustav Reddelien and Werner Müller, inventors). Ger. 467,818, Nov. 22, 1927. Addn. to 454,839. The *N*-mono hydroxyethyl derivs. of the homologs or substitution products of 4-amino-1-hydroxybenzenes are used as photographic developers. Examples of developing solns. contg the sulfate of 4-hydroxyethylamino-2-chloro-1-hydroxybenzene, the oxalate of 4-hydroxyethylamino-3-methyl-1-hydroxybenzene and 4-hydroxyethylamino-1-hydroxybenzene-2-carboxylic acid are given. Cf. C. A. 23, 49.

Photographic sensitive materials. I. G. FARBENIND. A.-G. Brit. 289,386, April 25, 1927. Salts of substitution products (such as those of halogen, hydroxy or sulfo substitution products) of 1,2-naphthoquinone-4-disulfonic acid are used in sensitive layers instead of salts of the unsubstituted acid as described in Brit. 286,233 (C. A. 23, 49) and Brit. 286,736 (C. A. 23, 349).

Light-sensitive materials. THE WADSWORTH WATCH CASE CO. Swiss 126,216, Feb. 10, 1926. See Brit. 265,769 (C. A. 22, 548).

Light-sensitive materials. THE WADSWORTH WATCH CASE CO. Swiss 126,217, Feb. 10, 1926. Instead of the resinous products used in Swiss 126,216 (above) there is used a resinous product derived from an aldehyde, e. g., a formaldehyde- β -naphthylamine condensation product or a benzaldehyde- β -naphthylamine condensation product.

Sensitized papers, etc. VICTOR PLANCHON. Fr. 639,189, Jan. 13, 1927. The blue images obtained on sensitized papers, etc., by Fe salts are converted into a permanent black by passing them into a bath of a Cu salt, e. g., the sulfate and, after washing, into a soln. of Na_2S or liver of S. The process may be completed by coloring with aniline dyes.

Desensitizing agent. I. G. FARBENIND. A.-G. Ger. 468,093, Dec. 12, 1925. Addn. to Ger. 396,402. Desensitizing agents are prepd. by condensing *m*-nitrobenzaldehyde with salts of *p*-alkoxyquinaldine, especially the bromide, chloride or alkylsulfate. Thus, *p*-methoxyquinaldine methobromide and nitrobenzaldehyde are dissolved in alc. Glacial CO_2H_2 and copellidine are added and the whole is heated some hours. On cooling, the condensation product crystallizes out. Other examples are given.

White sheet material for reflecting light in viewing multi-color screen-film pictures. J. H. CHRISTENSEN. Brit. 289,175, Jan. 26, 1927. The white layer used may consist of a cellulose deriv. penetrated by numerous air fissures and mixed with a white pigment such as lead white or Ti oxide, agitated with toluene and then poured upon a support.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Preparation of tantalum pentabromide. K. R. KRISHNASWAMI. *Nature* 122, 845(1928).—Br is distd. on to powd. Ta heated to 260–300° in an atm. of N or Ar.

E. J. C

Ammonium polysulfides, hydrogen pentasulfide, and the thiocarbonic acids. HERBERT MILLS AND PERCY LUCOCK ROBINSON. Univ. of Durham. *J. Chem. Soc.* 1928, 2326–32.— $(\text{NH}_4)_2\text{S}_5$ (I) is prepd. by satg. with H_2S , free of O, a soln. of 40 g. of S in 100 cc. of aq. NH_3 (d. 0.88). Yellow crystals deposit on cooling. Increase in the quantity of S gives a non-homogeneous product supposed to be $(\text{NH}_4)_2\text{S}_7$ (II). CS_2 extn. of II leaves a solid with the properties of I. II is a solid soln. of S and I. I upon decompn. yields monosulfide and not the disulfide. I with anhyd. formic acid yields H_2S_5 (III); mineral acids yield products with higher S content. III is a glassy solid at -50° , is a thin, clear yellow oil, $d_{16} 1.67$, and cannot be distd. under reduced pressure. By digesting I and CS_2 and subliming a very pure $(\text{NH}_4)_2\text{CS}_3$ (IV) is obtained; incomplete refluxing leaves a yellow cryst. residue, $(\text{NH}_4)_2\text{CS}_5$ (V). IV and concd. HCl yield a bright red liquid which dried over P_2O_5 shows the following: $d_{16}^{17} 1.47$; f. p. -30.5° , surface tension 48.3 dynes/cm. at 12.5° ; it is slightly sol. in H_2O , org.

solvents, or acids giving yellow solns. which decompose rapidly; it dissolves in acetone with no decompn. even on long standing. Distn. yields H_2S and CS_2 . V and 98% formic acid yield an oil vigorously decompd. by acetone. On distn. CS_2 is obtained, then an oil at 70° , with properties of H_2S_2 . Polysulfides and thiocarbonates only slowly decomp. below -7° .

ARTHUR, FLEISCHER

The reaction between nitroprusside and sulfide of sodium. G. SCAGLIARINI AND P. PRATESI. *Atti accad. Lincei* 8, 75–82(1928).—The reaction between $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO}$ and Na_2S or K_2S has been shown by various investigators to take place in equimolar proportions, giving a product $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot \text{Na}_2\text{S}$. S. and P. hold that S is combined directly through N (1) because a deep red though labile compd. has been prepd. by Tasker and Jones (*C. A.* 4, 1023) by action of NOCl_2 and a mercaptan, the formula being undoubtedly $\text{N}=\text{SR}$; (2) because neither ferri- nor ferropentacyanide which differ from nitroprusside only by absence of the NO group, combines with sulfides, so that the missing N atom must be that which holds the S; and (3) because by analogy between S and O in the reaction of $\text{Fe}(\text{CN})_5\text{NO}$ with S^{--} and alkali $[\text{Fe}(\text{CN})_5\text{NO}]^{11} + 2\text{OH}^- =$

both these reactions, electrometric titration reveals a large drop in cond. for equimol. concns. of the 2 reagents.

A. W. CONTIERI

Rotation dispersion and space configuration of complex salts of cobalt and rhodium which contain ethylenediamine and trans-1,2-diaminocyclopentane. F. M. JAEGER AND H. B. BLUMENDAL. Univ. Groningen. *Z. anorg. allgem. Chem.* 175, 161–230 (1928); cf. *C. A.* 22, 3596.—Racemic 1,2-diaminocyclopentane is prepd. according to the following scheme: $\text{CH}_2(\text{CH}_2\text{CN})_2 \rightarrow \text{CH}_2(\text{CH}_2\text{CO}_2\text{H})_2 \rightarrow \text{CH}_2(\text{CH}_2\text{CO}_2\text{Et})_2 \rightarrow$ condensation with $(\text{CO}_2\text{Et})_2$ to di-Et cyclopentanedione dicarboxylate \rightarrow cyclopentanedione dioxime \rightarrow 1,2-diaminocyclopentane. The pure base is a colorless liquid, b. 170° , has a weakly ammoniacal odor, becomes turbid in the air, taking up CO_2 to form a solid white carbonate. The hydrochloride is more sol. than the sulfate, and the picrate can be crystd. from H_2O in long, yellow needles which decompose at 210° . The diacetyl deriv. is used for a study of crystal form; it is monoclinic-prismatic. 1,2-Cyclopentanedi-amine can be split into its optically active antipodes by means of *d*- and *l*-tartaric acid; for the sulfate of the *l*-base $[\alpha]_D = -12^\circ$, for that of the *d*-base $[\alpha]_D = +14^\circ$. The rotation dispersion data are given for the *l*-base. With a wave length of 7002 Å. U. $[\alpha] = -37.67^\circ$, with 4209 Å. U. $[\alpha] = -113.44^\circ$. B. p. is 166° and sp. gr. is 0.9463 at 15° . By the action of the racemic base upon CoCl_2 solns. contg. H_2O_2 , complex Co salts of the hexammine or triethylenediamine type are formed. Thus by action of the diaminocyclopentane upon praseo-diethylenediamine-dichlorocobaltic chloride with exclusion of CO_2 , followed by neutralization with HCl and pptn. with alc., the ppt. can be dissolved in NaI or NaBr soln. to form the correspond-

ing salt, diethylenediamine-trans-diaminocyclopentane cobaltic iodide, $\left\{ \text{Co} \begin{array}{c} (\text{En})_2 \\ (\text{Cptdin}) \end{array} \right\} \text{I}_3$,

or bromide, $\left\{ \text{Co} \begin{array}{c} (\text{En})_2 \\ (\text{Cptdin}) \end{array} \right\} \text{Br}_3 + \text{H}_2\text{O}$. By transposition with Ag salts the nitrate, per-

chlorate and salts of other acids can be prepd. The iodide crystallizes in rhombic pyramidal form, brown-red in color. These can also be split into optical antipodes by *d*- and *l*-tartaric acid. Co and Rh salts of the same rotational direction have the same spatial configuration; the dextrorotatory ions contain only 3 levorotatory, the levorotatory only 3 dextrorotatory mols. of diaminocyclopentane. The entrance of 3 dextrorotatory mols. of the base is incompatible with the dextrorotatory configuration of the ion, just as the entrance of 3 levorotatory mols. of the base is incompatible with a levorotatory configuration of the complex. It is shown that all other theoretically possible substitutions of dextro- and levorotatory mols. of the base in the optically active complexes are not realized, since these unstable groupings decompose as follows: $3\{M(d-d-l)\}X_3 = 2\{M(d-d-d)\}X_3 + \{M(l-l-l)\}X_3$. On the other hand, by the action of *d*- or *l*-diamino-

cyclopentane upon praseo- or violeo- salts of the type $\left\{ \text{Co} \begin{array}{c} (\text{En})_2 \\ \text{Cl}_3 \end{array} \right\} \text{Cl}$, a partially racemic,

optically active compd. is formed which can be split into 2 optically active salts with the formulas: $\left\{ \text{Co} \begin{array}{c} (\text{En})_2 \\ (l\text{-Cptdin}) \end{array} \right\} X_3$ and $\left\{ \text{Co} \begin{array}{c} (\text{En})_2 \\ (d\text{-Cptdin}) \end{array} \right\} X_3$. These are not mirror

images. In the reaction of the original praseo- or violeo-salts, however, upon the racemic base, a racemate is formed which can be split into 2 optically active antipodes by the action of *d*- and *l*-tartaric acid. These have the formulas: $\left\{ \text{Co} \begin{matrix} (\text{En})_2 \\ (l\text{-Cptdin}) \end{matrix} \right\} \text{X}_3$ and

$\left\{ \text{Co} \begin{matrix} (\text{En})_2 \\ (d\text{-Cptdin}) \end{matrix} \right\} \text{X}_3$. It is not possible to introduce 1 mol. of ethylenediamine or 1

mol. of *d*-diaminocyclopentane in salts of the type $\left\{ \text{Co} \begin{matrix} (l\text{-Cptdin})_2 \\ \text{Cl}_2 \end{matrix} \right\} \text{Cl}$, or to substi-

tute a mol. of the *d*- or *l*-base in salts of the type $\left\{ \text{Co} \begin{matrix} (d\text{-Cptdin}) \\ (l\text{-Cptdin}) \end{matrix} \right\} \text{Cl}$ which are prepd.

from the racemic base. Such substitution products quickly decompose in soln. with formation of salts of a highly symmetrical type as follows: $3 \left\{ \text{Co} \begin{matrix} (l\text{-Cptdin})_2 \\ (\text{En}) \end{matrix} \right\} \text{X}_3$ -

$\{ \text{Co}(\text{En})_3 \} \text{X}_3 + 2 \{ \text{Co}(l\text{-Cptdin})_3 \} \text{X}_3$ and $3 \left\{ \text{Co} \begin{matrix} (d\text{-Cptdin}) \\ (l\text{-Cptdin}) \end{matrix} \right\} \text{X}_3 = \{ \text{Co}(d\text{-}d\text{-}d) \} \text{X}_3 +$

$2 \{ \text{Co}(l\text{-}l\text{-}l) \} \text{X}_3$. From the spatial standpoint the contrast between 2 mirror-image-forming mols. is much more marked than between one of these antipodes and a foreign substance such as ethylenediamine. The optically active chlorides, chlorates and perchlorates of Co and Rh salts of the type $\{ \text{Me}(\text{Cptdin})_3 \} \text{X}_3$ all crystallize in the cubic system (pentagonal icositetrahedral). Of the chlorides and nitrates there is also a hydrate with $3\text{H}_2\text{O}$ crystg. in the hexagonal system, and of the perchlorates a rhombic form with $1\text{H}_2\text{O}$. The racemic perchlorate splits into its antipodes by spontaneous crystn., in the Co salt with a min. transformation temp. of -1.6° and in the Rh salt with a min. transformation temp. of 48° . In both cases, the transition from the mixed antipodes to the racemic compd. is accompanied by a hydration or dehydration. The mol. rotation obtained with these optically active complex ions reaches very high values, that given by the tri-diaminocyclopentane salts of Co being about 3 times that given by the analogous triethylenediamine salts at low wave length. The mol. rotation obtained with $\{ \text{Co}(l\text{-Cptdin})_3 \} \text{Cl}_3 + 4\text{H}_2\text{O}$ at 7002 Å. U. is given as $[\text{M}].10^{-2} = +1794^\circ$ and at 4209 Å. U. as $[\text{M}].10^{-2} = +5148^\circ$. In general the rotation obtained with Rh salts is less. Thus for $l\text{-}[\text{Rh}(\text{Cptdin})_3] \text{Cl}_3 + 4\text{H}_2\text{O}$, $[\text{M}].10^{-2}$ at 7002 Å. U. = -1179° and at 4249 Å. U. $[\text{M}].10^{-2} = -4010^\circ$. For Rh salts these values are about 8 times those obtained with analogous triethylenediamine salts at low wave lengths and about 7 times as great at high wave lengths. As the wave length increases, the rotation dispersion falls more steeply with the diaminocyclopentane salts of Rh than with analogous triethylenediamine salts.

H. STOERTZ

Cyanosulfo compounds of molybdenum. I. F. CREPAZ. R. Scuola d'Ingegneria, Padova. *Gazz. chim. ital.* 58, 391-401 (1928).—The formation of derivs. contg. trivalent Mo from MoS_3 and KCN by the method of Heide and Hoffmann (*Z. anorg. allgem. Chem.* 12, 278 (1896)) involves the difficult prepn. of MoS_3 by the method of Péchard (*Compt. rend.* 118, 804). Expts. were therefore directed toward their formation from MoS_3 . Concd. KCN was let stand 1 week with still moist MoS_3 (e. g., 5 g. MoS_3 and 15 g. KCN in 50 cc. water) at ordinary temp., and from the intense green soln. was pptd. by EtOH an oil from which definite compds. could not be crystd. An entirely different method was therefore used. When H_2S was passed through a soln. contg. 25 g. of K_2MoO_4 and 40 g. of KCN in 120 cc. of water, the soln. became successively green-yellow, blue, green and brown-green, while heat was evolved, indicating several successive reactions. Pptn. with EtOH at the various stages yielded different-colored oils from which, however, individual compds. could not be isolated. H_2S passed into a soln. contg. 5 g. of K_2MoO_4 and 10 g. of KCN in 50 cc. of water only to the appearance of a green-blue color, the soln. then let stand 3-4 hrs. (until yellow), H_2S again passed through until green, let stand again until yellow and the process repeated, EtOH added, the oil sepd. and agitated with EtOH until crystd. yields a *K octacyanomolybdate*, $\text{K}_4[\text{Mo}(\text{CN})_8].2\text{H}_2\text{O}$, yellow, showing that the reaction involves reduction from Mo^{VI} to Mo^{IV} . If instead of restoring the yellow color, H_2S is passed in until the soln. is green and EtOH is added, a green oil is pptd. This oil crystd. by the aid of more EtOH gives a mixt. of at least 3 cryst. compds., from which no individual compd. could be isolated in the pure state. The mixt. contained K, Mo and CN, and no S, the salts probably being double cyanides

of K and Mo. A concd. aq. soln. of this mixt. treated with concd. KOH pptd. a violet-red cryst. compd. which, washed with EtOH, showed the following % compn.: K 29.85, Mo 17.94, CN 19.71, O (by oxidation) 3.00, which corresponds closely to $K_4[Mo(OH)_4(CN)_4] \cdot 6H_2O$, and was therefore the compd. described by Hoffmann and Heide (Z. anorg. allgem. Chem. 12, 277). H_2S passed into a soln. contg. 20 g. of MoO_3 and 40 g. of KCN in 200 cc. of water (contg. just sufficient KOH to dissolve the MoO_3), until the soln. is yellow-green, let stand 24 hrs., filtered, the residue washed with water and EtOH until no longer alk., the salt dissolved in water and repptd. by concd. KOH, and the purification repeated yields a compd. of the % compn.: K 30.78–30.94, Mo 24.2–24.35, S 8.03–8.18, N 14.30–14.36, which corresponds closely with $[Mo^S(CN)_4]K_3 \cdot 2H_2O$.

It is light blue, decomp. when heated, and its aq. soln. changes after 1–2 days from blue to violet. In water acidified with H_2SO_4 , it is oxidized by $Fe_2(SO_4)_3$, with sepn. of S on warming. It is also oxidized by ammoniacal AgCl, a study of which reaction confirmed the presence of Mo^{III} in the compd. Application of the method of Brintzinger and Oschatz (C. A. 21, 3577) to the detn. of Mo showed a transition from Mo^{VI} to Mo^V , then to Mo^{IV} and finally to Mo^{III} . To det. the basicity of the compd., cond. measurements were made at various concns., the results of which show that in soln. the mols. are not complex and do not contain a multiple no. of Mo atoms. Slight hydrolytic decompn. probably takes place. The salt originates from a tribasic acid.

C. C. DAVIS

Addition products of hydric acids and salts of heavy metals. III. FRITZ EPHRAIM AND AUGUST SCHÄRER. Univ. Bern. Ber. 61B, 2161–73(1928).—Hydric acids can be added by dry sulfates, phosphates, phosphites and hypophosphites. Pulverulent addition products can be isolated. The addition compds. formed with arsenates, selenates and benzoates undergo rapid or instantaneous decompn. With HBr or HI the compds. are less stable than with HCl. Heating a compd. contg. HCl liberates the majority of this hydric acid. Compds. formed from a sulfate and HBr yield Br and SO_2 on heating. MBr_2 and MSO_3 are formed. With HI compds. this type of decompn. is by far predominant. The addn. products are pulverulent. They do not show a trace of acidity. Their color resembles that of the corresponding metallic halide. They

are represented by the general formula:
$$\begin{array}{c} \diagup X-H \\ M \text{---} O_3S \\ \diagdown X-H \end{array}$$
 Phosphates are capable of

adding 3 hydric acids; sulfates, phosphites and hypophosphites only 2. The new compds. isolated were: $CdSO_4 \cdot 2HBr$; $CuSO_4 \cdot 2HBr$; $Ag_2SO_4 \cdot 2HBr$; $PbSO_4 \cdot 2HBr$; $ZnSO_4 \cdot 1.5HBr$; $HgSO_4 \cdot HBr$; $HgSO_4 \cdot 2HBr$; $Hg_2SO_4 \cdot 2HCl$; $Ag_3PO_4 \cdot 3HCl$; $Pb_3(PO_4)_2 \cdot 6HCl$; $H_3(PO_4)_2 \cdot 6HCl$; $Fe_3(PO_4)_2 \cdot 5HCl$; $Ni_3(PO_4)_2 \cdot 6HCl$; $Ni_3(PO_4)_2 \cdot 2H_2O \cdot 6HCl$; $Ag_3PO_4 \cdot 3HBr$; $Hg_3(PO_4)_2 \cdot 3HBr$; $Ni_3(PO_4)_2 \cdot 2H_2O \cdot 7HBr$; $CdHPO_3 \cdot 2HCl$; $PbHPO_3 \cdot 2HCl$. Addn. of hydric acids on numerous other salts were observed but no definite compound could be isolated.

7—ANALYTICAL CHEMISTRY

W. T. HALL

Advances in analytical chemistry in 1927. AUGUST RAUCH. Fortschrittsber. Chem. Ztg. 2, 124–30(1928).—A review with bibliography. E. J. C.

Advances in potentiometric analysis. ERICH MÜLLER. Z. angew. Chem. 41, 3–6, 1176–8(1928). E. J. C.

Reaction end point in certain analyses by saturation. L. STAPPERS. Soc. des Hautes "De Cavel et Roegiers," Ghent, Belgium. Bull. fédér. ind. chim. Belg. 7, 306–11(1928).—In order to prevent errors during the detn. of the acid index and the saponification number in mineral oils, due to the influence of CO_2 from the air on the indicator (phenolphthalein or alkaline blue VI B) a current of CO_2 -free air should be blown through the liquid during the titration. [By "saturation point" the author means the end point of a volumetric titration, and an "analysis by saturation" is really a volumetric detn. Abstractor.] A. L. HENNE

Limits of accuracy and importance of sampling in chemical analysis. L. FRESSENIUS. Metall. Erz 25, 395–400(1928).—A lecture. J. BALOZIAN

Systematic study of indicators. XIII. The solvent error. 1: The alcohol error of methyl orange and allied azo indicators. A. THIEL AND W. SPRINGEMANN. Univ.

Märburg. *Z. anorg. allgem. Chem.* 176, 64-80(1928).—The alc. error of the azo indicators is partly optical and partly electrochem. Since there is no absolutely reliable information as to the change of sensitivity to acid, the values obtained cover this displacement of the "half-value" stage. The optical bases of the alc. error were detd. for methyl orange, methyl red, monomethyl orange and methyl yellow. In carrying out the expts. 0.5 *N*, 0.4 *N*, 0.1 *N* and 0.01 *N* HCl solns. were used and 0.01 *N* (CH₃)₄-NOH. Solns. of NaOH could not be used because it was practically impossible to avoid slight absorption of CO₂ which caused pptn. of Na₂CO₃ in the presence of alc. and the ppt. interfered with the spectrophotometric work: For methyl orange the $p_{H^{1/2}}$ value changes from 3.40 in pure water to 2.51 in water which has been dild. with an equal vol. of alc. XIV. A new source of error in colorimetric measurements: the "light error" of some azo indicators in the presence of organic solvents. *Ibid* 112-20.—The yellow form of methyl orange in the vicinity of the transition point is very sensitive to light when alc. is present and this accounts for the fact that the various shades at the transformation point are not additive when studied with the spectrophotometer. The red form of the indicator is perfectly stable to light. Methanol, acetone and other org. solvents produce similar effects. Besides methyl orange, other disubstituted *p*-amino derivs. are bleached by light in the presence of org. solvents. The reaction involved, however, is monomolecular in type and in reversible, the yellow color returning after the sample has been allowed to stand in the dark for some time. It is explained on the assumption that the dye stuff is activated by light and in the active state combines with the org. solvent with the disappearance of the azo chromophor. In the dark, the compd. breaks down and the chromophor is regenerated. In colorimetric measurements this "light error" may be the cause of trouble unless precaution is taken to avoid it.

W. T. H

The salt error of indicators in the colorimetric determination of $p_{H^{1/2}}$. I. M. KOLTHOFF. Univ. of Minn. *J. Phys. Chem.* 32, 1820-33(1928).—The fact that neutral salts often causes a change in the color obtained with certain indicators at definite H ion concn. has been known for at least 20 years but the real reason for this error is not quite clear. Bjerrum, to be sure, has attempted to explain it, but the explanation meets with certain difficulties. Neither the acid nor alk. colors of dil. solns. of bromophenol blue, bromocresol green, bromothymol blue, phenol red, cresol red and thymol blue are affected by large quantities of salts but the acid colors of methyl orange, tropaeolin OO and methyl red are more intense when considerable salt is present and the alk. colors of various nitrophenols and salicyl yellow are more intense at high salt concn. Although it is hard to give a general theory to account for this salt error, an attempt is made here to calc. the error on the basis of the equation of Debye and Hückel and the results were tested by expt. It was found that when the ionic strength of the soln. is much larger than that in the ordinary buffers, the calcd. corrections are higher than the exptl. values. Moreover, indicators of the same general type do not behave alike. The av. salt correction for the different phthaleins at an ionic strength of 0.1-0.0025 was detd. and the values related to an ionic strength of 0.1 for the buffer soln. Methyl orange and methyl red show very small salt errors under different conditions and are, therefore, very suitable indicators. This is probably due to the amphoteric character of these indicators and it may be expected, in general, that amphoteric indicators will be found ideal for the colorimetric detn. of $p_{H^{1/2}}$.

W. T. H

Diphenylcarbazone as indicator in hydrargyrometry. L. ROSENTHALER. Univ. Bern. *Apoth. Ztg.* 43, 944-5(1928).—An exptl. study of the behavior of varying amts. of HgO when titrated with 0.1 *N* NH₄CNS in the presence of diphenylcarbazone (indicator in Et₂O). Satisfactory results are reported.

W. O. E

New reagent for potassium, ammonium, rubidium and cesium ions. Very sensitive reagent for the phosphate ion. Specific reaction for tin and antimony. TEOPHIL GASPAR Y. ARNAL. *Chimie et industrie* 20, 631-2(1928); cf. *C. A.* 23, 52.—A precipitant for K, Rb and Cs is prepd. by adding UO₂(NO₃)₂ in stoichiometrical proportion to a Na₂CrO₄ soln. (contg. about 5% CrO₄), taking care to avoid excess of UO₂(NO₃)₂ and presence of NaCl. The soly. of the ppt. decreases from K to Cs. The reagent can also ppt. NH₄ salts. The soln. obtained by adding excess of Na molybdate to SbCl₃ constitutes an extremely sensitive reagent for the phosphate ion. When added to solns. of various salts the reagent gave the following results: carbonates, bluish color or ppt. gradually turning darker (but always fairly light); bicarbonates, yellow; borates, yellow; arsenites, bluish yellow, the blue tinge very slowly deepening; arsenates, bluish white; phosphates, bluish white turning very deep blue (indigo); KNO₃, yellow; UO₂(NO₃)₂, yellow ppt. sol. in excess of reagent; Na₂S₂O₃, reddish brown; NiSO₄, light bluish green; (NH₄)₂C₂O₄, no ppt.; Pb(OAc)₂, yellow; MgSO₄, bluish white; Ca(OAc)₂,

yellow; $K_2Cr_2O_7$, slight ppt. at first with subsequent slow formation of a light brown ppt.; $K_2Cr_2O_4$, no ppt. at first, then slow formation of a light brown ppt.; KBr , ppt.; $FeCl_3$, no ppt.; Na_2SO_3 , whitish yellow; $(NH_4)_2SO_4$, whitish yellow. A. P. C.

Determination and separation of rare metals from other metals. XI. The quantitative analysis of gallium. Part I. LUDWIG MOSER AND ALFRED BRUKL. Tech. Hochsch. Wien. *Monatsh.* 50, 181-92(1928).—The best precipitant for Ga is the negatively charged tannin hydrosol which adsorbs the positively charged $Ga(OH)_3$ hydrosol produced by hydrolysis; 0.2 mg. of Ga_2O_3 per l. can be detected. The pptn. is best carried out as follows: To the soln. of Ga^{III} salt in dil. AcOH (about 1%) add sufficient NH_4NO_3 to bring the content to about 2%. Heat to boiling and to the boiling soln. add dropwise 10% tannin soln. until the pptn. is complete, using 0.5 g. of tannin as a minimum. The ppt. is so voluminous that not more than 0.1 g. of Ga_2O_3 can be handled easily and about 1 g. of tannin should be sufficient for this quantity. Wash the ppt. with hot water contg. some NH_4NO_3 and a few drops of AcOH. Dry, ignite and weigh as Ga_2O_3 in a quartz or porcelain crucible. In Pt there is danger of reduction and damage to the crucible. Although Ga is not pptd. by H_2S in acid soln., it is adsorbed by all sulfides and pptd. with them as $Ga(OH)_3$. For this reason, perhaps, Ga has seldom been detected in minerals although it is widely distributed in small quantities. The sepn. of Ga from Zn, Ni, Co, Mn, Cd, Be and Th is discussed in detail and although in some cases other methods will give good results the pptn. with tannin is excellent in every case. To the soln. contg. only very little free mineral acid, NH_4OAc should be added to make the content about 1% of AcOH. Then to 100 cc. of soln. add 2 g. of NH_4NO_3 , heat to boiling and ppt. as described above. W. T. H.

Determination of small quantities of antimony in the form of stibine. JULIUS GRANT. *Analyst* 53, 626-32(1928).—The app. recommended is an improved type of that commonly used for the electrolytic production of AsH_3 . The cathode is an inverted Pt cone against which a swift current of H_2 is directed so that the SbH_3 is rapidly carried away and is not decompd. by remaining in contact with the soln. As electrolyte, 40 cc. of 0.5 HCl is suitable and a current of about 5 amp. is satisfactory. The SbH_3 is passed through a glass tube heated before a restriction and the Sb detd. by comparing the mirror with standard mirrors or by dissolving the deposit in HCl and comparing colorimetrically the Sb_2S_3 produced with H_2S . W. T. H.

Determination of molybdenum. H. A. DOERNER. *Metal Ind.* (London), 33, 106(1928).—See C. A. 22, 4081. E. J. C.

Precipitation of zinc from solutions containing considerable sodium chloride. F. DEBE. Hessisch. Inst., Bad Nauheim. *Ber.* 61B, 2248-51(1928).—Former expts. have shown that the presence of salts often tends to prevent the pptn. of sulfides. One theory is that the Debye effect between the anion and the H^+ ion is diminished by the addn. of a salt of a strong acid so that the H^+ ion is more effective in preventing the ionization of H_2S . The expts. here described serve to discredit this theory because the pptn. of ZnS in neutral, in dil. AcOH and in NH_4OH solns. is made incomplete when considerable NaCl is present. W. T. H.

Determination of manganese in the presence of silica. CLIVE NEWCOMB. *Analyst* 53, 644-5(1928).—In the colorimetric detn. of Mn as MnO_4^- difficulty is encountered if SiO_2 is present, as in the examn. of plant ashes, on account of the tenacity with which SiO_2 adsorbs Mn. The difficulty can be overcome by fusing with Na_2CO_3 , dissolving the melt in water and adding it at once to an excess of HNO_3 . The resulting soln. is a colloidal one but all the Mn therein can be oxidized by persulfate and the cloudiness disappears when the oxidation to MnO_4^- is complete so that the colorimeter can be used. W. T. H.

Determination of iron in silicates. A. E. J. VICKERS. *Trans. Ceram. Soc.* (Eng.) 27, 156-60(1928).—Methods are described for the detn. of both FeO and Fe_2O_3 when present in silicates, with special directions for the use of the Reinhardt method of titrating Fe in the $KMnO_4$ in HCl soln. For total Fe fuse the silicate with Na_2CO_3 and a little $NaNO_3$, take up in HCl, remove the SiO_2 by double evapn., and pptg. R_2O_3 as usual. Filter, dissolve off the filter with hot HCl (1:1), catching the soln. in the beaker used for the R_2O_3 pptn. Make up the soln. to 200 cc., and det. Fe by the Reinhardt method in 100 cc. For acid-sol. Fe, digest 10 g. of the powd. silicate with 20 cc. of hot 1:1 HCl, heat for 2 hrs., filter, reduce and titrate. For the KSCN method, wash the R_2O_3 ppt. free from chlorides, ignite, fuse with 8-10 g. $KHSO_4$, take up with H_2O and 10 cc. H_2SO_4 and make up to 250 cc. Compare the color obtained with an aliquot treated with the KSCN soln., with the color produced by standard Fe soln. added from a buret into a KSCN soln. For FeO the sample should be crushed in a mortar (coarsely) to prevent oxidation. Treat a 5-g. sample with 12 cc. H_2SO_4 (1:1) and 10 cc. concd.

HCl in a Pt crucible and heat over a small luminous gas flame for 10 min. Plunge the crucible into a 600-cc. beaker contg. 400 cc. H_2O , 20 g. pure KHSO_4 and 10 g. pure pptd. SiO_2 and titrate at once with 0.01 N KMnO_4 . H. F. K.

Sampling methods for gray cast iron. RAYMOND H. HOBROCK. *Foundry* 56, 797-8(1928). R. F. M.

The sensitiveness of the detection of small quantities of impurities in iron. G. TAMMANN AND W. SALGE. Univ. Göttingen. *Z. anorg. allgem. Chem.* 176, 152-4 (1928).—By treating a piece of metal weighing about 0.3 g. with 15% $(\text{NH}_4)_2\text{S}_2\text{O}_8$ soln contg. a very little H_2SO_4 , it is possible to detect in the residue as little as 0.002 % of FeS, less than 0.05% Al, 0.05% Sb, 0.02% Sn and 0.001% Si. W. T. H.

Study of the hydrogen-antimony-tin method for the determination of oxygen in cast irons. BENGT KJERRMAN AND LOUIS JORDAN. *Bur. Standards J. Research* 1, 701-20(1928).—Sb and Sn are added to Fe for the purpose of reducing the m. p. and, in some way, these metals help to accomplish the reduction of SiO_2 and of MnO on heating in H_2 . Unfortunately, however, when much C is present in the material under investigation, there is danger of some CO and CO_2 being formed while heating in H_2 and to absorb these gases as well as H_2O complicates the method so that it has become the practice to recover H_2O alone with the understanding that the method is applicable only to samples low in C and not contg. much SiO_2 or Al_2O_3 . Very recently Müller and his associates have studied the limitations of this H-reduction method and concluded that the method is useful only when the metal contains very little C, Si or P. On the other hand, Oberhoffer and his collaborators have regarded the method accurate for high-C alloys. In the present work, the H-Sb-Sn method, with suitable provision for recovering CO and CO_2 as well as H_2O , was applied to a pig Fe contg. C 3.7, Mn 0.7, P 0.12, S 0.04 and Si 1.3% and the results are compared with those obtained with the graphite-crucible, vacuum-fusion method. It was found that for either method it is important to use lump samples rather than millings because of the danger of air and H_2O being adsorbed from the atm. and, to a lesser degree, the possibility of superficial oxidation. With cast Fe contg. 0.01-0.04% O, the vacuum-fusion method is to be preferred, as it is more precise. The H-Sn-Sb method, however, gives values agreeing within 0.006% of those obtained by the more sensitive vacuum-fusion method. The rather complicated nature of the blank that must be run is pointed out. The limitation of the H-reduction method to Si-free samples does not appear to hold with respect to high-C materials of the type used in this investigation. W. T. H.

The sensitiveness of the detection of small quantities of impurities in cadmium and copper. G. TAMMANN, A. HEINZEL AND F. LAASS. Univ. Göttingen. *Z. anorg. allgem. Chem.* 176, 143-6(1928).—When a metal dissolves without liberating any gas, a part of the impurities is often left behind in the form of a delicate film. For the detection of small quantities of impurity it has been recommended to dissolve all of the metal, crystallize out the major constituent and look for impurities in the mother liquor. In this way Mylius succeeded in detecting 0.005% of Pb, 0.001% of Fe (1.2 mg.) and a trace of Zn in 120 g. of Cd metal. By the method of dissolving 0.2 g. of Cd in 50% NH_4NO_3 soln. and exang. the residue, it is possible to detect 0.02-0.04 mg. of Pb, Bi, Sb and Sn. This method, therefore, besides being more rapid serves to detect quantities of impurity which are absolutely smaller, although the method of Mylius permits the detection of smaller percentages. The presence of Sb, Bi and Pb in Cu metal can also be detected by exang. the residue. The method is particularly advantageous when the impurity lies below the chief metal in the e. m. f. series. By treating Hg with HNO_3 the residue serves to indicate 0.01% of Au. W. T. H.

Metallic lead in red lead. HERMAN HEINRICHS. *Glastech. Ber.* 5, 505-8(1928).—The usual treatment of a large sample has the disadvantage that appreciable amts. of Pb are dissolved. H. agitates a 20-g. sample with water, washing away the greater portion of PbO and leaving the Pb in a 2- or 3-g. residue. This goes into soln. with HCl and hydrazine chloride so rapidly that Pb is not attacked. Results on English and German red leads are given and the effect of Pb in pot melts is discussed. J. A. GRANT

Determination of minute quantities of iodide in the presence of much chloride. A contribution to potentiometric titration. F. KIEFERLE AND E. ERBACHER. Forschungsanstalt für Milchwirtschaft, Weihenstephan. *Biochem. Z.* 201, 305-17(1928).—For potentiometric analysis of very dil. soln., a modification of the Ostwald rheostat is suggested which has besides the 100-ohm and 10-ohm, also dials for 1 and 0.1 ohm. Titration of minute quantities of iodide in the presence of much chloride, as in milk, is unsuccessful in the presence of AgNO_3 , because PdCl_2 is not sufficiently sensitive to iodide, but I can be pptd. with $\text{Hg}(\text{ClO}_4)_2$ on a Ag electrode if the titration is performed carefully. The method fails, however, when it is applied to milk. S. MOROULIS

Detection of traces of carbonate. J. RAE. *Pharm. J.* 121, 315(1928).—The app. used is similar to that of A. E. Parker for the detection of sulfites (*C. A.* 21, 1155). Place in the flask 25 cc. of air-free water, 2 cc. of CHCl_3 and 1 g. of the substance. Add 10 cc. of dil. H_2SO_4 , quickly insert the stopper, which carries a thistle tube with 2–3 cc. of $\text{Ca}(\text{OH})_2$ soln., and heat on the water bath. The CHCl_3 vapor sweeps the CO_2 into the tube, causing milkiness. With 1 mg. Na_2CO_3 a distinct reaction is seen when viewed against black paper, with 2 mg. a decided turbidity; hence, if 1 g. of substance is employed, 0.1% Na_2CO_3 is readily detected. If no reaction is noted after 2–3 min., less than 0.1% or no carbonate is present. Any turbidity caused by CHCl_3 through unduly long boiling is differentiated by dil. HCl . If sulfites, nitrites or sulfides are also present, add excess of a 1% KMnO_4 soln. and H_2SO_4 . S. WALDBOTT

A very sensitive reagent for phosphate ions. Distinction between antimony and tin. T. GASPAR Y ARNAL. *Anales soc. españ. fís. quim.* 26, 181–3(1928).— $(\text{NH}_4)_2\text{MoO}_4$ gives a blue coloration when treated with an acid soln. of SnCl_2 . With SbCl_3 and Na_2MoO_4 the reaction is quite different; a yellow ppt. is obtained which is sol. in excess SbCl_3 . In the presence of PO_4^{---} and without using an excess of SbCl_3 , the original ppt. soon turns an intense blue and the color is more permanent than the blue characteristic of the SnCl_2 reaction. Possibly this can be used not only as a test for PO_4^{---} but also for its differentiation from HPO_3 and $\text{H}_4\text{P}_2\text{O}_7$. The Na_2MoO_4 soln. used in the test should be concd. E. M. SYMMES

Use of potassium iodate in back titration for the determination of the hypochlorite content of solutions. JOHN R. LEWIS AND R. F. KLOCKOW. Univ. Wisconsin. *J. Am. Chem. Soc.* 50, 3243–4(1928).— NaOCl solns. can be reduced to NaCl by NaH_2AsO_3 , $\text{Na}_2\text{S}_2\text{O}_3$ or KI and the excess reductant detd. by titration with KIO_3 . In the last 2 cases, the presence of chlorate interferes seriously. W. T. H.

Highly accurate method for the analysis of urea. MILLICENT TAYLOR. Univ. of Bristol, Eng. *J. Am. Chem. Soc.* 50, 3261–5(1928).—By adding a slight excess of HCl to an aq. soln. of urea and heating in an autoclave for 30 min. under 2 atm. and for 4 hrs. under 4 atm., it is possible to convert all of the urea to NH_4Cl and CO_2 and the urea can be detd. with great accuracy by a back titration with Na_2CO_3 , using methyl orange as indicator. W. T. H.

The occurrence and detection of hydrogen in mines. L. WEIN. *Z. ges. Schiess-Sprengstoffw.* 23, 265–6(1928).—The Fleissner method, proposed, by Heyer (*C. A.* 22, 3047) for detg. H in mine gases, was found to detect not less than 0.8 cc. of H, and is, therefore, not sufficiently sensitive for samples of the usual size. The method is also not satisfactory because color standards prepd. from gases of known compn. are not permanent. W. prefers the combustion method. C. G. STORM

Method for determining carbon and hydrogen in organic substances in the dry way. D. BUTESCU. Univ. Bucarest. *Ber.* 61B, 2336–40(1928).—Details are given for carrying out combustions in a 50-cm. tube heated by 3 Teclu burners; CuO and platinized asbestos are used for filling the tube. W. T. H.

Detection of isopropyl alcohol. JOHN RAE. *Analyst* 53, 646(1928).—The method described by Henville (*C. A.* 22, 3864) is almost identical with that of R. (*C. A.* 20, 3665). W. T. H.

The identification of coloring matters by stratification of mixed solvents. J. J. HOFMAN. *Pharm. Weekblad* 65, 1190–8(1928).—If 5 cc. of H_2O is added to any of the following mixts. at room temp. the soln. remains homogeneous: $\text{EtOH} + \text{PhCH}_2\text{OH}$ 1:1, $\text{EtOH} + \text{AmOH}$ 1:1, $\text{MeAc} + \text{C}_6\text{H}_6$ 10:1. Further addn. of 5 cc. of H_2O then causes the mixt. to sep. into 2 layers. If the first 5 cc. of H_2O added contains a dye or other coloring matter the color becomes uniformly distributed throughout the mixt., but when the mixt. is sepd. into 2 layers by the second addn. of H_2O the color tends to accumulate in one or the other of the 2 phases. The distribution of the color, and the change in color produced in one or the other layer by addn. of acid (5 drops HCl), alkali (5 drops KOH soln.), reducing agents (6% SO_2 or NaHSO_3), or oxidizing agents (5 drops 30% H_2O_2), is more or less characteristic for individual dyes and coloring matters. The test is useful in the identification of aniline dyes and vegetable colors, especially if a control test is made with a known soln. of the suspected substance. These color reactions are tabulated for 34 coal-tar dyes and 12 vegetable colors. A. W. DOX

Determination of acidity of industrial casein. A. CHOLLET. *Ecole Lait Surgeres. Lait* 8, 21–2(1928).—Grind casein as fine as possible; weigh 2 g. of rennet origin or 1 g. lactic origin into a 50-cc. conical flask. Add 10 cc. H_2O and a few drops of phenolphthalein. Titrate with standard NaOH , $N/10$ or $N/9$ to a pink coloration and alternately add more NaOH and heat the flask until the color persists on cooling. Calc. as percent lactic acid. H. F. ZOLLER

Determination of fat in industrial casein. A. TAPERNOUX, R. DESRANTE AND J. BINEAN. *Lait* 8, 592-4(1928).—*Laboratory method*.—Weigh 1 g. of ground casein into a 100-cc. beaker, add 10 cc. H_2O and heat to boiling. Add 15 drops NH_4OH for lactic casein, 30 drops for rennet casein. Heat gently with agitation to complete soln. Cool and transfer into a Meillere tube (Rose-Gottlieb modification. Shaw 1920). Add 20 cc. Meillere soln. ($EtOH$ 41.5%, Et_2O 50%, H_2O 8.5%). Shake briskly and let stand for 5-10 min. Withdraw 10 cc. of the aq. layer, add 10 cc. petroleum ether, shake and allow to stand for 10 min. Run off all the aq. layer, and transfer the alc.-ether layer into a tared dish, rinsing with petroleum ether. Evap. the fat solvent, cool and weigh. *Plant method*.—An application to casein of the Teichert method for milk powder (A. Schoonjans, C. A. 20, 785). Using a butyrometer graduated 0-35° B., add 10 cc. H_2SO_4 (d. 1.82), then 8 cc. H_2O and exactly 2.5 g. casein, and 1 cc. amyl alc. Place the butyrometer in the water bath at 85-90° for at least 2 hrs. Centrifuge 3 min. at 1200 r. p. m. and read at 65°.

H. F. ZOLLER

The action of basic lead acetate in the presence of alkali on dextrin and its application in the sugar determination. C. PERTUSI. *Ann. chim. applicata* 18, 414-21 (1928).—In the analysis of gummy substances for sugar content, the soln. is treated with basic lead acetate to clarify it before measuring the rotatory power, and the excess Pb is pptd. with Na_2SO_4 . Very often a clear soln. is not obtained. P. throws down the Pb by means of $NaOH$, adding only enough excess to color phenolphthalein slightly. In this way a clear soln. is always obtained. Excess OH does not affect the polarimeter readings, the pH value being held near the neutral point merely to give a more rapid coagulation.

A. W. CONTIERI

The purity of ether for analytical use. G. MIDDLETON. *Pharm. J.* 121, 82-3, *Chemist and Druggist* 109, 112-4(1928); cf. C. A. 22, 2030.—The presence of peroxide in old Et_2O , in addn. to the danger of explosion caused by it when in contact after evapn. with unsatd. org. compds., markedly affects the accuracy of the detn. of fatty acids (e. g., oleic acid) or alkaloids (e. g., those of aconite, hydrastis and ipecac) extd. by it. Tabulated results show that const. wt. is attained more slowly than with pure Et_2O , and the final wts. are generally higher. The evapn. residue is chemically altered as seen in the changed appearance, soly., I no. and titration results. Other impurities affecting detns. are: e. g., aldehydes, which on evapn. in presence of $NaOH$ leave a brown residue of aldehyde resin.

The trass deposits of Mount Karadag, Crimea. D. V. SOKOLOV. *Trans. State Expl. Inst. Silicates* (Moscow) 1926, No. 22, 5-18.—S. presents a report of a geological investigation on the deposits. Their extent could not be detd. J. S. JOFFE

Report of prospecting on Mount Karadag, Crimea. B. S. SHIVETZOV. *Trans. State Expl. Inst. Silicates* (Moscow) 1926, No. 22, 19-23; cf. preceding abstract.—S. reports on the prospecting for trass-deposits. At the older workings the material proved not to be genuine trass. The true trass deposits found were of indeterminate extent. J. S. JOFFE

Clays. XII. Changes of certain clays into acidic ones through weathering. ISURUGI OKAZAWA. *Bull. Inst. Phys. Chem. Research* (Tokyo) 7, 974-83(1928); *Eng. Ed.* 1, 93-4. O. explains exactly what he means by the term acidic, which he used in his previous communications (cf. C. A. 17, 3078; 22, 358) and was found misleading. An acidic clay is one which develops acidity when treated with a neutral salt. The actual amt. of free acid present in the clay before treatment is exceedingly small, whereas the amt. detectable after treatment is quite appreciable. The acidic properties are to be referred to Al compds. The constitution of acidic clays probably resembles that of zeolites. A. L. HENNE

Helium studies. IV. Helium content of natural gases. F. PANETH, H. GEILEN and K. PETERS. *Univ. Berlin. Z. anorg. allgem. Chem.* 175, 383-401(1928); cf. C. A. 22, 3110. This paper contains an extensive bibliography of work on He and other noble gas detns., with criticisms and explanations of the technic and difficulties encountered. Considerable detail is given to a description of a new app. and the technic of its operation. While previous methods of analysis required very large samples of natural gas (as much as 15 l.) for even approx. detns. of the noble gas content, this app. will conveniently utilize 5-cc. samples but can be used with portions as small as 0.01-0.001 cc., accurately measuring 10^{-5} to 10^{-6} cc. of He. Hydrocarbons, N_2 , O_2 , are removed with heated Ca and H_2 by admixture with O_2 , the gases then being passed over heated Pd. A, X and Kr are absorbed in an "activated" charcoal, the remaining gases being Ne and He. The noble-gas contents of a large no. of samples obtained from Central Europe are given and compared with analyses of American, Canadian and Japanese wells; the data indicate that apparently there can never be any European competition with the latter sources. Studies in mineral separation in a finely divided state. R. C. EMMONS. *Am. J. Sci.* [5], 16, 423-45(1928).—A report of progress in expts. to find a new means of affecting minerals selectively with a view to applying the selective force to the problem of sepg. minerals in the dry state and in the finely divided state. Selective action should be based very largely upon definite mineral characteristics which reflect chem. compn. or mineral species and the action should be as far as possible independent of variables which are difficult of control. A radiometer consisting of two or more vanes in vertical position supported by one or more horizontal cross arms which rotate on a vertical axis passing through the center of the cross arms causes deflection of mineral particles when under conditions of a vacuum. Radiometer deflection curves of certain minerals are illus. and the app. and the procedure described. Application to mixts. of minerals is hindered by an adhesive force between grains of different species—an influence becoming progressively stronger with reduction in grain size. The outstanding objection to the method is the necessity of working with a vacuum, which requires expensive app. and knowledge of glass blowing and vacuum technic. W. H. BOYNTON

A new process and some new principles in the metallurgy and dressing of complex sulfide ores. HARALD SKAPPEL. *Metall Erz* 25, 367-70(1928).—S.'s "Zerfall-Prozess," in which the constituents of ores are sepd. by chem. rather than mech. means, is briefly described. The application of the process to sulfide ores is investigated. Certain metal sulfides (I) (similarly to metals) form 2 sharply sepd. layers upon fusion with non-metallic compds. with which they do not react. This and other phys. properties lead to the classification of I as "metallic" (the heavy metal I), "semi-metallic" and "unmetallic" (the light metal I). By fusing together "metallic" I with metals or "unmetallic" I, all gradations of "semi-metallic" I may be obtained. Usually these 3 types of I are formed by crystn.-differentiation on cooling of I melts. The heat of formation (II) of metallic I, from S and the corresponding metal, plays a large part on the type of I produced, their metallic properties decreasing with increase in II. Thus, I with II less than 25 cal./g. at. combined S show "metallic" properties, while those with II greater than 40 Cal./g. at. combined S are markedly "unmetallic." In the series O, S, Se, Te and its neighbor N, P, As, Sb of the periodic system, there is an increase in the "metallic" properties from left to right, the compds. behaving analogously to the metallic I. *Ibid* 400-11.—To study the chem. equil. in the system metal, I, silicate (III)

an electrolytic process is described in which the O_2 and S present are gradually diminished, thereby shifting the entire equil. of the system. In this process the III phase is the electrolyte, a C anode dipping into it, and the metal and I phase form the cathode. The distribution of the elements in the system changes with its reduction degree. According to the reciprocal action between the III and I phases the FeO , CaO and Al_2S_3 stages may be distinguished. The general order of transference of metals from III to I is given as: heavy metals, Zn, (Sn), K, Na, Ba, Fe, (Cr), Mn, Ca, Mg, Al, Li, the position changing with the reduction degree of the system. The sepn. of metals from molten I is investigated. An electrolyte contg. oktavi ore (with more than 10% each of Pb, Cu, Zn, SiO_2 , less than 2% each of As, Fe, Al_2S_3 , CaO , MgO , S and 240 g./t. Ag) charged in a graphite crucible and heated to $1200-50^\circ$ in an elec. resistance furnace, is electrolyzed. The expts. are so conducted that in one group only slag, mat and crude metal are formed, while in another speiss is formed in addn. In the electrolysis, Pb seps. out until its content in the mat falls to a certain value, depending on its Fe content. Up to the sepn. of Fe, As distributes between the mat and crude Pb in the ratio of 1:8.2, but when Fe begins to sep. it absorbs the As from these to form speiss. The distribution of Ce and Zn between the mat and crude Fe metal is 14.8% Cu, 23.0% Zn and 1.59% Cu, 0.51% Zn, resp.; their distribution between FeS and Fe metal is in the ratio of 9.5:1 — 9.1 for Cu, and 1:4.14 — 1:2.8 for Ni, resp.; that of ZnS (contg. Na_2S and reduced in a thin silicate slag with Cu turnings) between the I and metal layers is 23.3% Zn, 56.2% Cu_2S and 10.12% Zn, 89% Cu, resp.; that of Ag between mat and crude Pb is 1:7; and that of Mo between the I and metallic layers is traces to 29%, resp. According to these investigations "speiss" is to be regarded as a pure metal contg. most of the As and Sb. The distinctions between speiss, mat, slag and crude metal are discussed. J. B.

Hearth and bosh investigation of a blast furnace with special regard to the combustion relations before the tuyères. WILHELM LENNINGS. *Archiv. Eisenhüttenwesen* 1, 549-64(1928).—An investigation of the combustion in the hearth and bosh of a 600-ton blast furnace (hearth diam. 3900 mm.); over 1100 gas (from the main and emergency tuyère, and C-pocket levels), Fe and slag analyses were made. The gas currents before the tuyères are studied, by spraying H_2O (0.5 l./sec. for 5 sec.) into the hot blast. In agreement with van Vloten (*Stahl. u. Eisen* 13, 26-9(1893)), it is found that most of the heat in the furnace is developed in a ring-shaped zone extending 1 m. beyond the tuyères. At the main tuyère level, O_2 decreases with increased distance from the tuyères, CO and H_2 increase, and CO_2 increases to a max. at 60 cm. from the tuyères and falls, being zero at the center. The gas compns. from the emergency tuyères, the C-pocket and the throat are uniform. It is shown that a considerable portion of the reduction in the furnace takes place in the lower bosh and hearth zones. The metal burning before the tuyères is not diminished by hearth enlargement. The output of a blast furnace is detd. by the amt. of coke consumed before the tuyères in a unit of time and the sp. coke consumption. J. BALOZIAN

Views of the Amenabar-process for the recovery of copper with iodine in a wet way. ERNST HENTZE. *Metall. Erz* 25, 370-2(1928).—A lecture dealing with the Claudet and Amenabar processes. J. BALOZIAN

Accurate sampling from unit-pulverizers. P. A. WILLIS. School of Mines and Metallurgy, Univ. of Mo. *Power* 68, 1003-4(1928).—A practical device is described and illustrated. D. B. DILL

Calculation of carbon balance on metallurgical furnaces. ROBERT D. PIKE. *Ind. Eng. Chem.* 20, 1356-61(1928).—An application of stoichiometry to the development of a complete C balance and the fuel balance of a type of metallurgical furnace in which account is taken of the possibility of leakage outward, from certain parts of the furnace, of C-bearing gases. The furnace was of the open-hearth regenerative type. The data required are outlined, also the method of calcn. and the derivation of general pilot tube formulas contg. terms for A , (wt. of air leaking into regenerators and flues in lb per min., when generators are being heated), and L (decimal portion of the hearth gases leaking out from the hearth). The leakage of air out of the regenerators during the period of heating is measured and 5 tables show: (1) a summary of drafts, (2) analyses of combustion gases, (3) mols. of gas per min. in hearth, (4) mols. per min. of gases at pilot tube, and (5) a summary of results—flow of air and gases and leakages. W. H. BOYNTON

Pig-bed dressing and molding machine. ANON. *Iron and Steel Ind.* 2, 77-80(1928); illus.—For pig iron. E. J. C.

The Ludwig-Soret effect in metallic alloys. MARCEL BALLAY. *Rev. métal.* 25, 427-54, 509-20(1928).—The Ludwig-Soret effect is the variation in concn. which takes place in unevenly heated solns. and was discovered independently by Ludwig at Vienna

in 1856 and by Soret at Geneva in 1879. The effect of different temp. gradients was studied on Pb-Sn alloys in vertical tubes and showed that the Pb always concs. at the pt. of lowest temp. The curves for a stationary anisothermic condition were drawn for the whole Pb-Sn system between temps. of 360° and 800°. The difference in the effect of temp. gradient in vertical and in horizontal tubes, which had previously been suspected, is clearly brought out: (a) in horizontal tubes of uniform bore prolonged heating causes no notable variation in concn.; (b) when the tube is contracted at one pt. to prevent convection currents, with some alloys the variation in concn. is sometimes in one direction and sometimes in the other, without any cause for these divergences having been discovered; with other alloys the results are more concordant, but, contrary to what occurs in vertical tubes, the Pb concs. at the pt. of higher temp. The differences in concn. can be expressed as a function of time by an expression such as $\Delta c = \Delta c(1 - e^{-kt})$, which is applicable not only for the expts. described in the present paper but also for the results obtained by Eilert (*C. A.* 8, 3143) on aq. solns. The preceding results make it possible to calc. the influence of the Ludwig-Soret effect on segregation in the cooling of castings under normal conditions; the resultant heterogeneity is very small, and it is only under exceptional circumstances that this phenomenon will occur to an appreciable extent, at least with Pb-Sn alloys. The effect of a temp. gradient was also detd. for a few liquid Cu-Sn, Sn-Cd and Sn-Zn alloys. With the latter, consisting of 2 metals having almost the same d., the concn. of Sn, which has a slightly higher d., increased in the upper end of the vertical tube, which was maintained at the higher temp. The effect of uneven temp. on the heterogeneity of 2 solid alloys (Pb-Th and Pt-Rh contg. 10% Rh) was also shown. In working out a theory of the Ludwig-Soret effect, the laws of thermodynamics may be applied, with the assumption that part of the phenomenon is reversible; the variations in concn. can thus be expressed as a function of the heat of diln. and of the vapor tension of one of the constituents. This theory, though not strictly true, accounts for the fact that with very dil. solns. the ratio of concns. in the hot and cold regions tends toward 1 and not toward the reciprocal of the ratio of abs. temps. as would be the case if van't Hoff's theory were true. As B.'s expts. did not readily lend themselves to calcn., in order to verify his theory he used some of the detns. carried out by Eilert on aq. solns. for which he was able to find values for vapor tension and heat of diln. The agreement can be considered fairly good in view of the facts that the data on which the calcns. are based are none too accurate and that extrapolations have to be resorted to. In any case, the results thus obtained are far better than those obtained with van't Hoff's theory. B.'s theory does not indicate in a satisfactory manner the direction of the phenomenon. In a vertical tube, it is nearly always the heavier constituent that migrates toward the bottom.

Liquation and tensile properties. G. FIEK AND G. SACHS. *Mill. Materialpruf. Amt Berlin-Dahlem, Sonderheft* 3, 88-93; *Chem. Zentr.* 1927, II, 2347.—By testing the tensile strength it becomes evident that I-beams showing strong liquation in the cross-section are of inferior mech. qualities. First of all, the reduction of the section of rupture is always smaller in the liquated material than in the purer material of the outside parts. In tests on the flange, the cross-piece, and the parts between cross-piece and flange, it was noticed that the resistance against deformation is a little greater in the liquation zone than in the purer parts, while the ability of alteration of the form is considerably smaller. Samples from the zone forming the transition between flange and cross-piece are frequently very brittle. The poor tensile properties of this part are, aside from other factors, probably due to the fact that this part is subjected to a particularly heavy strain in the rolling process.

G. SCHWOCH

X-ray investigation of the phenomena accompanying the stamping of metals. JEAN J. TRILLAT. *Chimie et industrie* 20, 618-22(1928); cf. *C. A.* 22, 3125.—A more detailed account of the investigation. **Conclusions.**—Stamping produces an alignment of the micro-crystals of the metal such that one of the directions of the cubes becomes an axis of rotation, which has been detd. as being the (110) axis, i. e., the diagonal of the face of the cube, and it is located parallel to the direction of the av. deformed fiber, as proved by tests in 3 rectangular planes. The orientation is particularly intense in regions having a small radius of curvature or in which there is a marked double curvature. The orientation effect due to stamping is accompanied by a considerable decrease in the size of the grains; comparative tests showed the av. size of the grains to be a few hundredths of a mm. in the deformed regions and about 0.02-0.1 mm. at some distance (of the order of 1-2 cm.) from the former. Stamping sets up internal tensions which are most intense as the degree of curvature increases; they are due to distortions and deformations of the reticular planes and are distributed symmetrically about the axis of orientation, so that they are felt only in certain preferred directions in the (110) planes.

In the undeformed regions, no orientation effects nor internal stresses are apparent at some distance from the deformed regions; the grain of the metal is much coarser, and these grains are placed haphazard. The cold rolling to which the sheet metal had been subjected before stamping was not apparent from the diagrams, because of the fact that it had been subjected only to relatively slight rolling. X-rays afford an accurate method for examg. the internal structure of stamped sheet metal; it is suggested that the fibrous structure and internal stresses produced by stamping might be corrected by suitable local heat treatment, the results of which could be followed by means of x-rays. The quantity of material required to carry out x-ray investigation is so small that it can be taken without serious drawback from a finished piece, and much more complete information is obtained than by micrographic examn.; no complicated prepn. of the samples is necessary, and the method could easily be adapted to current industrial control by using a spectrograph allowing of making 8, 16 or 24 diagrams simultaneously. A. P.-C.

The manufacture of case-hardened rolls. HELMUT CREYDT. *Z. ges. Mühlenwesen* 4, 4-16; *Chem. Zentr.* 1927, II, 1888.—Survey of the principles concerning the examn. of the quality of case-hardened rolls. In the elec. furnace, chill-castings may be manufd. that equal the Swedish charcoal pig-iron and even are superior to it in some respects. G. SCHWOCH

Boiler drums for the largest 1200-lb. power plant go through the shop. JOHN McQUILLAN. *Power* 68, 950-3(1928).—The process of mfg. solid-forged seamless drums is described and illustrated. The final dimensions are: length 50 $\frac{1}{4}$ ft.; inside diam. 52 in.; outside diam. 60 in. The open-hearth steel used meets the following requirements: tensile strength 75,000 lbs. per sq. in. max.; yield point one-half tensile strength; elongation in 2 in., (min.) 24%; reduction in area, (min.) 38%; test specimen to stand cold bending through 180° around a pin 1 in. in diam. without cracking on the outside of the bent portion. The compn. is C_{max.} 0.45%; Mn 0.30 to 0.45%; P_{max.} 0.04%; S_{max.} 0.04%. D. B. DILL

The effect of impurities in raw acetylene on the health of the welder. J. H. VOGEL. *Acetylen in Wissenschaft u. Ind.* 31, 54-8(1928).—The contention that danger from PH₃ poisoning in welding does not exist is supported by a literature survey and personal experience. Cases reported in the medical journals have been traced to metallic oxides from tinned or galvanized metal. F. S. GRANGER

Present status of structural-steel welding. F. T. LLEWELLYN. *Blast Furnace and Steel Plant* 16, 1430-2, 1583 6; *Engineering* 126, 664-6, 693 5(1928). E. H.

Cold and hot working of metals. I. W. ROSENHAIN. *Metallurgist* (Suppl. to *Engineer* 146, No. 17) 152-3(1928).—A review. D. B. DILL

Contribution to the study of the causes of formation of blow holes in open-hearth steel according to the manner in which deoxidation is conducted. P. Y. YVANOV. *Rev. soc. russe métal.* 1, No. 4, 459-65(1927); *Rev. métal.* 25 (Extraits), 431(1928).—Contrary to the opinion of M. M. Karnaoukhov (*C. A.* 20, 2637), who considers that this phenomenon is due to the decompn. of the Si nitrides formed during deoxidation, the presence of blow holes in steel is due to the formation of CO. A. P.-C.

Influence of cobalt, vanadium and manganese on some properties of tool steel. A. SCHERER. *Arch. Eisenhüttenwes.* 1, 325-9(1927); *Chimie et industrie* 20, 667(1928).—The tests were carried out on eutectoid C steels contg. increasing amts. of Mn, V, and Si, Co, V and Co. Co steels were least affected by variations in quenching conditions, and particularly unaffected by excessive heating. They also exhibited least change in vol. on quenching. The steels best suited for making tools are Co and V steels, which have both max. hardness and min. sensitiveness to hardening treatment. A. PAPINEAU-COUTURE

Length changes in steel produced during quenching. EDGAR C. BAIN AND WILLIS S. N. WARING. *Fuels & Furnaces* 6, 1727-34(1928). E. H.

Deformations due to quenching of case-hardened pieces. R. BARAT. *Rev. métal.* 25, 585-9(1928).—A mathematical discussion based on the change in d. before and after quenching of steels with various C contents, showing the general application of a method of calcn. of the deformation according to the Co content and relative thicknesses of the core and of the case-hardened layer. A. PAPINEAU-COUTURE

The effect of oxygen on iron and steel. II, III. ANON. *Metallurgist* (Suppl. to *Engineer*, Nos. 13 and 17) 131-2; 147-9(1928).—A review of recent literature. D. B. DILL

British refined pig irons. ANON. *Metallurgist* (Suppl. to *Engineer* 146, No. 17) 150 1(1928).—The compn. of 4 specimens of a com. brand of pig Fe refined by the modern cupola practice is C 3.0, Si 1.0-1.6, Mn 0.6-0.75, S 0.06-0.09, P 0.1-0.6%. Tensile

strength varied from 12 to 18 tons per sq. in. The principal refining methods followed are described. Causes for occasional lack of uniformity are discussed. D. B. DILL.

The growth and the contraction of cast iron and gray cast iron of high quality. E. PIWOWARSKI. *Giesserei-Ztg.* 23, 379-85, 414-21; *Chem. Zentr.* 1927, II, 2566.—P. discusses the problems concerning the quality of gray cast iron, the significance of the systematic overheating in the melting-process, and the refinement of the graphite. The density of the castings is an important factor in the problem of producing constancy of vol. The shaking and the vacuum treatment of the melt, the carbide decompn., and the process of growth are discussed in detail. G. SCHWOCH

The wear of cast iron and its relation to the structure and to the mechanical properties. KÜHNEL. *Giesserei-Ztg.* 24, 533-41; *Chem. Zentr.* 1927, II, 2566.—The wear of cast iron was examd. by plant lab. tests on brake-blocks and other instruments, and it was found that gray cast iron with pearlitic texture does not possess sufficient resistance against wear. Further on, the relation between wear and the mech. properties was investigated. The taking up of S and the change of texture caused by the mfg. process were examd. on fire bars. The results are demonstrated in the form of curves and photographs. G. SCHWOCH

Improved process for casting (cast-iron) pipe centrifugally in green sand molds. GUISEPPE GUERRINI. *Foundry* 56, 832-5(1928).—A description of the method developed and used in Italy. The process is compared with that using permanent molds. The Italian process has the usual advantages of centrifugal casting, namely, good distribution of graphite and P in the form of fine grains, a pearlitic instead of a ferritic structure apart from the thin film on the inside which may be removed by more rapid cooling. The general characteristics of the process and of the pipe produced are pearlitic matrix and great tensile strength; uniformity in the various thicknesses; less heavy than vertically cast pipe; rapid production; low installation and production costs; rejections reduced to a min.; min. quantity of slag inside the pipe because of use of a filtering feed runner. ROBERT F. MEHL

Anomalies of annealing copper and brasses after cold hardening. EUGENE. *Compt. rend.* 187, 378-80(1928); cf. *C. A.* 22, 1945.—A systematic study of the influence of annealing on the mech. properties of these metals has established: (1) this anomaly affects not only the hardness but also the fitness for stamping as characterized by the Ericksen test (depth of penetration of stamp) and to a lesser degree by the elongation in the slow traction test. (2) An anomaly, A_1 presenting the same characteristics as A_2 , manifests itself immediately before A_2 , the beginning of the "germination zone." In pure Cu A_2 is more marked than A_1 but with the addn. of Zn A_1 increases and A_2 decreases. Brass 60-40 showed for A_2 2 successive steps in the curve. H. M. McL.

Physical properties of 72 : 28 and 90 : 10 brass as a function of final reduction and previous annealing. JOSÉ M. FERNÁNDEZ-LADREDA. *Anales soc. españ. fis. quím.* 26, 81-112(1928).—The phys. properties of 72:28 and 90:10 brass depend upon the work previous to the last annealing. Differences due to different working in factories disappear at final annealing temps. between 500° and 600° for 72:28 brass and between 350° and 400° for 90:10 brass. The phys. properties of some of these alloys also depend upon the annealing previous to the last reduction. Differences due to variable temp. of annealing in factories disappear at final annealing temps. between 300° and 500° (depending upon whether great or slight reduction has been used) for 72:28 brass and between 250° and 300° for 90:10 brass. It has been found that while the hardness test can be an auxiliary aid in manuf. and receipt of material, replacing the tensile strength test, investigations on thin sheets should be continued with the baby Brinell and Rockwell machines. There has been detd. the most appropriate scale of working and annealing, starting from the ingot 32-mm. thick, for 3.35-mm. sheets, 72:28 alloy, and 1.55-mm. sheet, 90:10 alloy, which the factories should adopt when submitting this material to ammunition plants. E. M. SYMMES

X-ray spectrography of copper and of a few brasses. JOSEPH LOISEAU. *Rev. métal.* 25, 572-84(1928); cf. *C. A.* 22, 4442.—A study of Laue patterns of Cu and brasses. In rolled samples, as such or after annealing at moderate temp., the (100) planes are the reflecting planes. They constitute the faces of the cubes. They are oriented by rolling and make an angle of about 11° with one another for severe cold-working. The bisecting planes of these angles are perpendicular to one another and their intersection lies along the axis of the beam. The first effect of annealing is to orient the (100) planes about an axis perpendicular to the rolled sheet; it then produces an orientation of the reticular planes (in order of decreasing spacings) (110), (111), (200). In the α -solid soln. zone orientation due to rolling is manifested at all annealing temps. below the m. p. Passing through a transformation point modifies the form of the diagrams, giving the spots

a radial orientation and neutralizing the effects due to rolling. Examn. of the Laue diagrams enables 4 temp. zones of cryst. equil. to be detd.: (1) no effect, the properties retaining their initial values and the diagram being about the same as that of the rolled metal; (2) increasing effect, the properties varying with the temp. and the diagrams showing that the (100) planes begin to be oriented; (3) const. effect, the properties retaining the values they had at the end of the 2nd zone; at this stage the metal is entirely annealed; the zone is characterized by the orientation of the (100) planes; (4) harmful effects, the properties decreasing simultaneously; the metal is overheated; the diagrams indicate reflection from the (110), (111) and (200) planes. A. PAPINEAU-COUTURE

X-ray analysis of the copper-magnesium alloys. ANNA RUNQUIST, H. ARNFELT AND ARNE WESTGREN. *Metallog. Inst., Stockholm. Z. anorg. allgem. Chem.* 175, 43-8 (1928).—The thermal analysis of the Cu-Mg alloys, as well as the structure of the intermetallic compd. Cu_2Mg as detd. by Friauf (*C. A.* 22, 705), has been confirmed by x-ray analysis. A change in the lattice const. of Cu from 3.608 A. U. to 3.624 A. U. indicates a soly. of Mg in the Cu lattice, not to exceed 1.5 at. %. The addn. of Cu to Mg does not change the lattice dimensions of the latter, showing that the solid soly. of Cu in Mg is negligible. The dimensions of the hexagonal close-packed structure of Mg have been re-detd. for very pure metal: $a_0 = 3.203$ A. U., $c_0 = 5.196$ A. U. The structures of the intermetallic compds. Cu_2Mg and CuMg_2 have been studied by the powder method and by the rotating-crystal method. Cu_2Mg crystallizes as a face-centered cube which contains 24 atoms in the unit cell: $a_0 = 7.029$ A. U. The cube edge of Cu_2Mg varies from 7.021 A. U. when it is in equil. with the Cu phase to 7.036 A. U. when in equil. with the CuMg_2 phase. CuMg_2 has a face-centered rhombohedral lattice whose parameters are: $a = 5.273$ A. U., $b = 9.05$ A. U., $c = 18.21$ A. U.; the axial ratios, therefore are $a : b : c = 0.295 : 0.497 : 1$. The elementary parallelepiped contains 48 atoms.

A. J. KING

X-ray analysis of the copper-tin alloys. ARNE WESTGREN AND GÖSTA PHRAGMÉN. *Metallog. Inst., Stockholm. Z. anorg. allgem. Chem.* 175, 80-9 (1928).—By means of x-ray analysis it has been shown that the Cu-Sn system is a structural analog of the Cu-Zn system. The satn. concn. of α -bronze contains slightly more than 15% Sn. The lattice parameter of this increases from 3.608 A. U. to 3.698 A. U. The lattice of tetragonal Sn has the dimensions for the elementary prism: $a_0 = 5.818$ A. U., $c_0 = 3.174$ A. U. The β -phase which appears at high temps. has a body-centered cubic lattice with a parameter of 2.972 A. U. at 15 at. % Sn. The Cu and Sn atoms are distributed statistically on the lattice points. The phase which is sometimes called Cu_4Sn gives a powder diagram which resembles that of the γ -Cu-Zn and the γ -Cu-Al phases. According to this the lattice appears to be face-centered cubic with an elementary cube which contains 416 atoms and which has an edge of 17.91 A. U. The phase is homogeneous at a compn. which corresponds exactly with the formula, $\text{Cu}_{31}\text{Sn}_8$. The valence electron concn. for this is as 21:13, the same as the corresponding phases of the Cu-Zn and the Cu-Al series whose formulas are Cu_7Zn_3 and Cu_9Al_4 , resp. The ϵ -phase which is generally considered as Cu_3Sn has a close-packed hexagonal lattice. The parameters change with increasing Sn content from $a_0 = 2.747$ A. U., $c_0 = 4.319$ A. U. to $a_0 = 2.755$ A. U., $c_0 = 4.319$ A. U. The Cu and Sn atoms are statistically distributed. The η -phase which appears at about 60% Sn at lower temps. has the NiAs structure, with the following distribution of the atoms on the unit prism: Cu: 000; $00\frac{1}{2}$; Sn: $\frac{2}{3}$, $\frac{1}{3}$, $\frac{1}{3}$, $\frac{1}{3}$, $\frac{1}{3}$, $\frac{1}{3}$. The lattice parameters of the phase when satd. with Sn are: $a_0 = 4.190$ A. U., $c_0 = 5.086$, $c/a = 1.214$. The Cu atoms in excess of the formula CuSn are distributed statistically within the inner space of the lattice.

A. J. KING

Spectrographic analyses of Irish ring-money and of a metallic alloy found in commercial calcium carbide. A. G. G. LEONARD AND P. F. WHELAN. *Univ. Coll., Dublin. Sci. Proc. Roy. Dublin Soc.* 19, 55-62 (1928).—I. *Ring-money.*—The base metal forming the core of the ring is Sn with traces of Cu and Pb. The Sn was in a purer form than that in a pair of "pure" Sn electrodes used for comparison purposes. The Au sheath contains Ag and a trace of Cu. II. *Metallic alloy.*—The subject of this examn. was a metallic substance found occasionally in small quantities in a certain brand of com. CaC_2 . Its sp. gr. was between 9 and 10 and it conducted electricity like a metal. It resembled steel, but was brittle, and its hardness on Moh's scale was 5. It has a great resistance to acid attack. The presence of Fe, Ti and Si was proved and quantitated as Fe 66.2, Ti 22 and Si 11.3%. Details of measurements and identifications are given in tabular form.

Rational recovery of clippings in the manufacture of aluminum alloys. P. SCHWERBER. *Metall* 1927, 165-6, 169-70; *Chem. Zentr.* 1927, II, 2566.—S. describes the various sorts of clippings of light metals, the circumstances encountered disfavoring their recovery, and finally their rational melting-down.

G. SCHWOCH
The influence of the shape of the mold on the properties of cast aluminum and its alloys. WILLI CLAUS AND FRITZ GOEDERITZ. *Giesserei-Ztg.* 24, 516-20; *Chem. Zentr.* 1927, II, 2347; cf. *C. A.* 22, 2912.—Pure Al, the "German alloy" (88% Al, 10% Zn, 2% Cu), and the "American alloy" (92% Al, 8% Cu) were cast in various kinds of molds, namely, the dry sand-mold, the green sand-mold and the Fe ingot-mold. The mech. properties of these castings were examd. The results are recorded in tables and photomicrographs.

G. SCHWOCH
Corrosion and residual currents. F. TÖDT. *Korrosion* 3, 37-8(1928).—The electrochem. explanation of corrosion is not the lowering of the overvoltage of H, but measurements have shown that the increased soln. of base metals connected to noble metals in H₂O solns. is due to residual currents caused by O, as indicated by current measurements with the following pairs: Zn-Pt, Zn-Cu, Zn-Pb, Zn-Cd, Cd-Pt, Cd-Cu, Cu-Pt, Cu-Pb, Pb-Pt, As-Pt, C-Cd. Under the same conditions of internal resistance, stirring, surface, etc., the resulting currents were nearly equal, but stirring the electrolyte increased the current tenfold; the current was nearly proportional to the surface of the noble metal, but independent of the base metal surface, of the internal resistance and the p_H value; by passing a current of O the elec. current was increased to several times that caused by passing air, but passing H decreased the current to 0.1 that caused by air, addn. of H₂O₂ raised the current to 10 times that of air; boiling the electrolyte and covering with paraffin reduced the current to about 0.25 of its former value, but on removing the paraffin the current was gradually restored. The measuring app. is described.

J. H. MOORE
Corrosion at discontinuities in metallic protective coatings. II. Different methods of applying a zinc coating. ULICK R. EVANS. *Metal Industry* 33, 281-3, 300-2(1928), cf. *C. A.* 22, 4100.—By measuring the potentials of galvanized Fe vs. pure Zn vs. time the thickness and type of Zn coating were detd. for sprayed, hot-dipped, sherardized and electrodeposited Zn. The electrodeposited and sprayed coats were pure Zn, the sherardized coating was a Zn-Fe alloy and the hot-dipped coating a mixt. of alloy and pure Zn. Sprayed and hot-dipped metals showed cracks on the convex side when bent. The electrodeposited coatings indicated the presence of cracks at bends upon subsequent immersion in 0.5 N NaCl soln. Sherardized coating showed cracks on the concave side of the bend, indicating brittleness in compression. In most cases rust first developed at the bends. Heavy sherardizing showed upon partial immersion, the presence of iron rust in 9 days, lightly sherardized coats in 4 days, while electrodeposited coats showed no attack on the Fe for 28 days. In Cambridge water all but the sherardized metal showed no yellow spots for 51 days while the sherardized coating showed slightly yellow tinges after 3 days and a heavy yellow deposit after 28 days. Thickly sherardized metal showed yellow tinges after 51 days. Bent specimens showed rust spots at the bends after 40 days. In moist air contg. SO₂ sherardized specimens darkened before sprayed and hot-dipped metal. Spraying in 0.5 N NaCl and 0.01 (NH₄)₂SO₄ showed localized attack at areas concluded to be discontinuities in coatings. A protective film of corrosion products is built up upon spraying in NaCl which prevents further corrosion. B. E. R.

Roasting sulfide minerals. JOHN B. READ and MELVILLE F. COOLBAUGH. U. S. 1,694,794, Dec. 11. In subjecting sulfides such as those of Cu and Zn to an oxidizing roast, the minerals and gases are caused to travel in the same direction through the furnace; sulfates are formed and, toward the end of the roast, a predetd. quantity of sulfide mineral is added to react with sulfates already formed, so that the sulfates may be decompd. to produce oxides and retain regulated quantities of sulfates.

Roasting kiln for zinc blend. GEORG BALZ. Ger. 468,166, Oct. 23, 1924. Addn. to Ger. 419,308. The blend is scraped between vertical fixed and rotating teeth.

Vertical reduction chamber for zinciferous materials. THE NEW JERSEY ZINC COMPANY. Fr. 639,281, Aug. 10, 1927. Constructional features.

Reduction of zinciferous materials. THE NEW JERSEY ZINC COMPANY. Fr. 639,323, Aug. 11, 1927. An app. is described in which Zn ores are reduced in a chamber externally heated and combined with a condenser, the flow of gases liberated being induced by a chimney and the necessary pressure being maintained at one or more points along the chamber and condenser.

Refining metals. ALADAR PACZ. Can. 285,291, Dec. 4, 1928. Five parts of Na_2SiF_6 and 1 part of powd. Al and a quantity of one or more metallic deoxidizers such as Si, Ti or more Al are mixed together and briquetted, and the briquets are introduced below the surface of a ferrous metal bath to purify and refine it.

Compositions for refining metals. ALADAR PACZ. Can. 285,290, Dec. 4, 1928. Compos. for refining metallic baths and producing alloys consists of a double fluoride of an alkali metal and a non-alkali metal mixed with a quantity of Al powder approx. equiv. atomically to such non-alkali metal, and an addnl. quantity of metal which is to be incorporated into the bath.

Protecting the inner walls of iron melting pans. FERDINAND BUSCH and ANDREAS SCHROTER. Ger. 468,322, July 26, 1927. The inner walls are coated with asbestos.

Ferruginous blocks. SOCIÉTÉ LORRAINE DES ACIÉRIES DE ROMBAS. Fr. 639,147, Aug. 6, 1927. A mixt. of dust from the mouths of blast furnaces, coal and ferruginous flux moistened with water is pressed into blocks and afterward scorified and used in different types of metal furnaces.

Treating ores containing copper and zinc. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 288,266, April 7, 1927. Ores such as roasted pyrites contg. Cu and Zn are subjected to chloridizing roasting at a temp. above 550° with NaCl in excess (suitably about 15%) so that most of the Zn is converted into chloride and most of the Cu into sulfate. The product is then subjected to fractional lixiviation, and various treatments of the solns. to recover their values are described. Ag present passes into the Zn soln. and is pptd. with Cu present.

Treating chromium ores. BOZEL-MALETRA SOC. INDUSTRIELLE DE PRODUITS CHIMIQUES. Brit. 288,250, April 6, 1927. Decompn. of Cr ores with alkalis or alk. reagents (with or without use of diluents) is effected in a mech. furnace of the type usually employed for roasting pyrites, and through which the material may be continuously

fed while undergoing agitation in thin layers. The temp. used may be 200–300° less than usually heretofore employed and recovery of Na chromate formed is facilitated.

Treating chromium ores. I. G. FARBENIND. A.-G. Brit. 288,973, April 16, 1927. The proportion of Cr oxide in Cr ores is increased by treating the ore, at a temp. above 100°, with an alkali hydrate or carbonate, or both, in the absence of free O. The ore may be treated with a soln. under pressure or may be fused with the reagents and the products washed with water, alkali or acid and further treated.

Treatment of iron ores. JOHN W. HORNSKY (to the Granular Iron Co.). Can. 284,060, Oct. 16, 1928. Fe ore and carbonaceous material passing $\frac{1}{4}$ " mesh or finer is heated in a cylinder (the mixt. moving in counter flow to the reducing gases) at a temp. below 900° in a reducing atm. to reduce the Fe to form small particles without melting. The mixt. is transferred to a cylinder contg. a non-oxidizing atm. and cooled to below the oxidation temp. of the Fe. The mixt. is then removed into the outside air and the metallic particles are sepd. from the gang. The sepd. Fe particles are mixed and agitated with a polishing material to clean the Fe, which is finally introduced into a non-oxidizing atm. at about 1200° and therein welded to relatively large masses.

Treating platinum ores. S. C. SMITH. Brit. 289,220. Pt and other precious metals such as Pd, Rh, Ir, Au and Ag are extd. from Pt ores or concentrates contg. only small quantities of precious metals by treatment with HCl together with Cl or a substance (other than HNO₃) which evolves Cl or an oxide of Cl during the treatment such as MnO₂, a hypochlorite or a chlorate, which is preferably added gradually as the treatment proceeds. Numerous details are given.

Treating titanium ores. W. F. WASHBURN (to Titanium Pigment Co.). Brit. 288,569, April 12, 1927. A solvent such as H₂SO₄ is used for treating Ti-bearing material such as ilmenite under such conditions that gases or vapors (evolved *in situ* or introduced from an external source) are present in the interior of the reacting mass; no external heat is applied during the course of the reaction, and the latter may be controlled by agitating with a mech. device or by introducing gases such as air. A small quantity of water may be added to the mixt., contg. concd. H₂SO₄, to initiate the reaction, and water may be further added from time to time to maintain the desired temp. or steam may be injected to raise the temp., preferably to 80–120°. An aq. acid soln. obtained by leaching the product may be treated with Fe or Zn in Pb baskets to reduce ferric Fe and some quadrivalent Ti and obtain a soln. suitable for hydrolysis.

Iron and iron chlorides from ores. VEREINIGTE STAHLWERKE A.-G. Brit. 288,319, April 7, 1927. Fe ore is crushed and mixed with chlorides of alkali, alk. earth or Mg-group metals and the mixt. is heated to 150–250° to form Fe chloride. HCl may be added to the mixt. and the process may be carried out in a neutral atm. such as N. The resulting mixt. of Fe oxide and chloride is then treated with H at temps. below the b. p. of Fe chloride (suitably 150–200°) and the metallic Fe produced is sepd. magnetically or otherwise; or the Fe chloride may be volatilized at a temp. of about 250° with water and HCl, sepd. from the latter and then reduced by H at 300°. The HCl produced is used for chlorination of the ore. Cf. C. A. 22, 4450.

Recovery of tin and copper from waste bronze. HENRY GIL. Fr. 636,694, Oct. 26, 1926. Waste bronze is heated with HCl, the H being collected, and the liquid sepd. by decantation and washing. The solid residue of Cu and traces of Pb is dried and mixed with wood charcoal and heated in a reducing atm. in a foundry crucible to obtain Cu. The liquid is concd. and the Sn recovered by electrolysis.

Gold from sea water. B. CERNIK and B. STOCES. Brit. 289,638, May 3, 1927. See Fr. 633,998 (C. A. 22, 3621).

Treating metals and metalliferous material in cupola furnaces. D. H. MELOCHE (to American Radiator Co.). Brit. 289,007, April 19, 1927. Carbonaceous fuel such as powdered coal or coke is burned in a combustion chamber external to the charge-receiving chamber, and the resulting combustion products are passed upwardly through the charge. Various structural details of a furnace are specified.

Cupola. WILHELM STEFFE (to Freier Grunder Eisen- und Metallwerke G. m. b. H.). Can. 284,396, Oct. 30, 1928. Cupola provided with a particular form of front hearth is specified.

Metallurgical furnace. FRANCIS M. SIMONDS (half interest to Albert F. Hyde). Can. 284,448, Oct. 30, 1928. A furnace is specified in which the crushed ore in the form of a hollow cylindrical sheet or shell gradually thickening toward the bottom is heated while it descends to a discharge hopper.

Superposed-multiple-hearth rabble furnace for roasting ores, etc. ERZRÖSTUNG GRS. and G. BALZ. Brit. 288,823, April 25, 1927. Structural features.

Open-hearth regenerative furnace. FRANK R. MCGEE. U. S. 1,691,982, Nov. 20.

Regenerative furnace suitable for metallurgical purposes. W. MILLWARD. U. S. 1,695,199, Dec. 11.

Vertical furnace for iron reduction. CHARLES M. DAY and CHARLES J. SCULLIN. U. S. 1,694,376, Dec. 11.

Furnace for annealing metal sheets in an inert atmosphere. W. G. BEESTON. Brit. 289,121, Jan. 15, 1927.

Furnace for annealing metal articles in inert gases. ADALBERT BESTA. U. S. 1,695,224, Dec. 11.

Furnace for fusion of iron. FRITZ WÜST. Fr. 639,093, Aug. 5, 1927. For fusing Fe poor in C a cupola furnace is placed in front of a reverberatory furnace in such a way that the melt flows directly from the cupola into the reverberatory and the gases from the latter heat the former. The content of C may be regulated in the cupola.

Pot furnace for treating articles with molten cyanide, etc. ALBERT J. HANSON (to American Metallurgical Corp.). U. S. 1,694,416, Dec. 11.

Acid or basic converters. VEREINIGTE STAHLWERKE A.-G. Fr. 639,244, Aug. 9, 1927. See Ger 466,629

Utilization of blast-furnace dust. PAUL HESKAMP. Can. 284,140, Oct. 23, 1928. Blast-furnace dust recovered from the furnace gases is blown into the furnace shaft above the smelting zone with the aid of non-oxidizing gas.

Casting ingots. RHEINISCHE METALLWAAREN UND MASCHINENFABRIK. Ger. 467,361. Oct. 26, 1926. To avoid formation of hollow spaces within the ingot, the mold is provided centrally at the bottom with a pin movable within a larger pin, both pins being driven into the ingot as the metal cools.

Casting hollow ingots. J. BROWN & Co., LTD and W. H. ELLIS. Brit. 288,424, March 11, 1927. Mech. features.

Casting hollow metal articles. B. L. M. VAN DER LANDE. Brit. 288,573, April 12, 1927. A core formed of or coated with refractory material (which may be rotated during the casting) is drawn through the mold while the metal to form the hollow article is being poured.

Casting steel ingots for rolling into railway rails. VEREINIGTE STAHLWERKE A.-G. Brit. 288,271, April 8, 1927. Ingots are cast from soft steel with an insert of wear-resisting steel (which may contain Cr, Ni, Mn, Si, Ti or C) so placed as to form the wearing faces of the finished rail.

Hot top construction for ingot molds. MAXWELL G. DUMAS (to Dumas Engineering Co.). U. S. 1,692,491, Nov. 20.

Wash (containing aluminum powder and tar) for coating ingot molds. JOHN W. ALDEN (to Central Alloy Steel Corp.). U. S. 1,692,532, Nov. 20.

Invertible mold for casting metals, etc. CHARLES A. WOOD. U. S. 1,695,001, Dec. 11. Structural features

Centrifugal metal-casting machines. DAVID BROWN & SONS (HUDDERSFIELD), LTD., AND DAVID BROWN. Fr. 639,109, Aug. 5, 1927.

Apparatus for molding metals and alloys under pressure. NUMA P. R. V. J. DU DONJON. Fr. 636,575, June 25, 1927.

Apparatus for casting magnesium and its alloys while protected from oxidation. ELEKTRON-METALL GES. and K. F. WAGNER. Brit. 289,693, Sept. 7, 1927. A protective substance such as S may be so placed as to protect the metal from oxidation by compressed air used or by air in the mold.

Casting apparatus for first-quality and refined steels. FRANZ GEISSLER. U. S. 1,693,076, Nov. 27. Mech. features.

Cooling aluminum-alloy castings while clamped to prevent warping. ALLEN B. NORTON (to Aluminum Co. of America). U. S. 1,695,239, Dec. 11. Mech. features.

Molders' core materials. K. MICHAELIS (to A. Stahn). Brit. 288,587, April 12, 1927. A binder for making self-supporting cores from quartz sand comprises a water-sol agglutinant such as sulfite liquor and an oil-sol. pitch such as stearin pitch. Not more than 4 parts of this binder is required for each 100 parts of sand.

Magnetic dust cores. GUSTAF W. ELMEN (to Bell Telephone Laboratories). U. S. 1,695,041, Dec. 11. Cores such as those of elec. coils comprise particles of magnetic material such as an alloy of Ni and Fe substantially all of which have a continuous curved surface, insulated and compressed together to form a coherent structure. The particles may be prepd. by spraying the molten metal into a bath of water. Cf. C. A. 22, 2350.

Hard-surfaced engine pistons of light metal. F. FEHRENBACH. Brit. 288,467, July 28, 1927. Pistons are made by casting in a metal chill an alloy of Al with Si 18-35% with or without 5% of other metals or metalloids. Details of the operation are described.

Malleable cast iron. C. E. KLUIJTMANS and W. H. W. PROCTOR. Brit. 288,980, April 16, 1927. A charge of steel scrap and residues from previous melts is melted in a cupola with addn. of small quantities of ferro-Si and ferro-Mn to produce a white iron of the compn.: C (cementite and pearlite) not over 2.9, Si 1.1-1.5, Mn 0.42-0.75, P 0.1-0.2, S below 0.2 and Fe 98.38-94.45%. The iron is then embedded in sand or Fe ore in an annealing furnace and rapidly heated to 680°, then for 12 hrs. at 680-730° rapidly from 730° to 800°, then for 12 hrs. at 800-830°, then rapidly from 830° to 880°, then for 48 hrs. at 880-900°, cooled at the rate of 5-8° per hr. down to 700° and then rapidly cooled.

Black-heart malleable cast iron from white cast iron. TARIO KIKUTA (to Tobata Imono Kabushiki Kaisha). U. S. 1,692,842, Nov. 27. In a process not using packing material, the white cast iron is first maintained at 850-950° for 15 hrs., then cooled to and maintained at 730-650° for 20-50 hrs., then removed from the furnace and cooled rapidly.

Improving cast-iron surfaces. WILHELM KLEPSCH. Fr. 639,590, Aug. 17, 1927. Surfaces of cast iron are made more resistant to heat, acids or alkalis by forming thereon a layer of appropriate thickness of Fe contg. 1.4 to 2.6% C. Other metals may be added to the Fe.

Apparatus (with long narrow retorts arranged in a row) for reducing metallic oxides such as those of iron (to form sponge iron). WILLIAM H. SMITH (to General Reduction Corp.). U. S. 1,692,587, Nov. 20. A heating system is specified which provides for preheating between the retorts. U. S. 1,692,588 specifies continuously passing Fe oxide or the like through a reducing zone of fixed temp. and utilizing the heat from reduced Fe to preheat the incoming ore. An app. is described.

Rust-proofing iron and steel. NEAL HARRIS. U. S. 1,694,820, Dec. 11. A black rust-resisting oxide or other coating is formed on *cans for holding foods* or other articles by Parkerizing or other suitable process and the coating is then covered with a film of adherent easily fusible metal such as Sn.

Enamel-coated iron, steel or other articles. JOHN A. ANDERSON (to Central Oil and Gas Stove Co.). U. S. 1,693,130, Nov. 27. A base material such as iron or steel is coated with enamel contg. 60% silica and an anchoring material such as oxides of B, Na, Al, Ca, Co and Ni.

Steel. WELTON J. CROOK (three-fourths interest to The Pacific Coast Steel Co.). Can. 283,961, Oct. 9, 1928. C steel of high elastic limit and ductility for structural purposes is produced by heating normal steel contg. not over 0.25% C and between 5% and 1% Mn to 1300-1700° F., holding this temp. for 10 min. to 1 hr. or longer, quenching rapidly and then reheating to a temp. not above 1300° F., maintaining this temp. for 10 min. to 1 hr. or longer and thereafter cooling slowly or quickly.

Steel. DEUTSCHE EDELSTAHLWERKE A. G. Ger. 467,307. Apr. 25, 1926. Scale is removed from stainless steel during manuf. by treatment with a soln. of HF or salts of HF with alkali or alk. earth metals. E. g., an aq. soln. of HCl, HNO₃, HF and NH₄F may be used.

Hardening steel for high-speed tools, etc. WERNER STAUFFER. Swiss 126,252, Apr. 23, 1927. The pieces to be hardened are heated while packed round with a finely divided carbide, particularly a Si carbide.

Hardening articles of high-speed steel. W. STAUFFER. Brit. 289,082, April 23, 1927. The articles are packed in a carbide such as granular SiC and may be heated to about 1380°. Graphite powder may be added to the carbide.

Hollow drill steel. LESLIE PRYCE. Can. 284,179, Oct. 23, 1928. Hollow rock drill steel is manufd. with the bore through the steel formed of pure Fe, non-corroding metals as Ni, and non-corroding ferrous alloys such as Al and Cr alloys. Cf. C. A. 22, 2138.

Crucible steel. J. K. SMITH (to The Granular Iron Co.). Can. 284,059, Oct. 16, 1928. Crucible steel is produced from solid-produced Fe, i. e., Fe produced from low-grade ores by a process which does not involve the melting and in which there is present to a greater or less degree, earthy or mineral dross. The dross and oxide are completely sepd. from the metallic Fe, and thus is avoided subsequent formation of slag, and the Fe is then briquetted and used as a crucible charge. From this point on the melting process is as customarily followed in crucible practice. The quality of the steel is equal to that of crucible steel made from high-grade Swedish iron base.

Aluminum. ELEKTRIZITÄTSWERK LONZA. Fr. 639,645, Aug. 18, 1927. Al₂O₃ is divided sufficiently for the prepn. of Al electrothermally, by very rapid cooling, e. g., by pouring the molten Al₂O₃ in a thin stream into water, whereby crystals are formed with spaces between them.

Alloy. WILLOUGHBY S. SMITH, HENRY J. GARNETT and JOHN A. HOLDEN. Can. 283,831, Oct. 9, 1928. A magnetic, substantially C-free alloy contains Fe 12.90, Si 1.6, a metal selected from the group Cr, W, V, Mo 2.20, Mn 0.30% and the rest Ni.

Alloy. EUGEN VADERS. Can. 284,193, Oct. 23, 1928. An alloy comprises Al 5 to 9.5, Mn 1 to 6, Ni 0 to 3, Fe 0.1 to 3 and Sn 0.01 to 2%, the remainder being Cu.

Alloys. ALADAR PACZ. Can. 285,298, Dec. 4, 1928. The production of an alloy of a metal whose oxide is refractory consists in forming a double fluoride of the metal with Na, pulverizing such fluoride, mixing with a quantity of powd. Al necessary to replace the first-mentioned metal, agglomerating the mixt. into lumps, and adding to a molten bath of the metal with which the first metal is to be alloyed.

Alloys. MICHAEL POLYANYI and STEFAN VON BOGDANDY. Ger. 468,103, July 29, 1927. Addn. to Ger. 449,973. App. for the estn. of the compn. of a Cu, Zn alloy by distg. off the Zn *in vacuo* is described.

Fusible alloy. WILFORD J. HAWKINS (to the American Machine and Foundry Co.). Can. 285,319, Dec. 4, 1928. A fusible alloy capable of being used to unite metallic surfaces consists of pure Pb having incorporated Pb phosphide (0.1%). When a bright or lustrous appearance is desired a brightening metal (Al, Sb, Sn or Zn) may be fused with the alloy.

Alloy capable of rapid magnetization and demagnetization. SIDNEY OSSER. U. S. 1,692,690, Nov. 20. Fe is associated with Mn 0.51, P 0.10-0.15 and Si 0.3-0.5% to form a material suitable for use in electromagnets, transformers or other elec. devices or app.

Alloys for blades and nozzles of turbines. H. HOLZWARTH. Brit. 289,089, April 23, 1927. Blades and nozzles of gas turbines are formed of alloys of Ni, Cr and Fe. A suitable alloy for the nozzles and stator blades comprises Ni 60, Cr 12 and Fe 25 parts, and, for the rotor blades, Ni 65, Cr 15, Fe 10 and Mo (to increase the hardness) 1 part. Traces of P, Mn, S and Si also may be present.

Bearing-metal alloy. KARL MÜLLER and WILHELM SANDER. U. S. 1,691,931, Nov. 20. Pb 70-75, Sb 15-25, Sn 3-6, a metal of the Co type 1-3 and Cu 0.6-2.0%. U. S. 1,691,932 specifies Pb 70-75, Sb 15-25, Sn 3-6 and Cd not over 5%. Small quantities of auxiliary ingredients also may be added.

Hard alloys and carbides. S. L. HOYT (to British Thomson-Houston Co., Ltd.). Brit. 288,521, April 6, 1927. Compns. consisting of W, C and Co, and of W and Cu are referred to. W carbide may be first formed by heating W with finely divided sugar C or gas C or in CH₄ or illuminating gas. The carbide formed may be powdered and mixed with Co and the mixt. placed in a C mold and heated to about 1300-1450° between electrodes while subjected to a pressure of about 1000 lb. per sq. in. Instead of first forming W carbide, a mixt. of W, Co and C may be treated.

Magnetic alloy. OLIVER E. BUCKLEY (to Western Electric Co.). U. S. 1,695,038, Dec. 11. Alloys suitable for loading submarine cables comprise Fe together with 80-85% as much Ni as Fe (and may also contain some Cu, Cr, etc.) and have a higher permeability than Fe at magnetizing forces less than a few tenths of a c. g. s. unit. Cl. C. 122, 3128.

Deoxidizing molten metals and alloys. SIEMENS & HALSKE A.-G. Brit. 288,543, April 11, 1927. Be (usually not over 0.5%, which may be in the form of an alloy) is added (with or without other additions such as Li) to metals such as Cu and Ni, to effect deoxidation.

Increasing the electrical conductivity and flexibility of aluminum alloys. KARL HALMANN. U. S. 1,695,044, Dec. 11. Alloys of Al which may also contain Zn, Cu, Si, Cd or Be are annealed to recrystn. temps., reduced in cross-section by cold treatment and then reheated to 160-200°.

Purifying antimonial lead alloys. UNITED STATES SMELTING, REFINING AND MINING Co. Brit. 288,939, Dec. 21, 1927. A modification of the process described in Brit. 236,782 (C. A. 20, 1214) for purifying antimonial Pb alloys with NaOH, Na₂CO₃ or the like consists in carrying out the operation at temps. of 335-480° (preferably 450-460°).

Purification of copper or its alloys. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 639,596, Aug. 17, 1927. Molten Cu or Cu alloys such as bronze is purified by the addn. of an alk. earth metal such as Mg, or a Mg-Al alloy (90-85 Mg to 10-15% Al). One part of the alloy is added to about 320 of the Cu, just before casting at a temp. of about 1200°.

Copper alloys. FRIEDRICH HEUSLER. U. S. 1,692,936, Nov. 27. In order to increase the hardness and elastic limit of alloys of Cu contg. Mn 0.5-20 and Si 0.3-8%, the alloys are first annealed, after they have been cast, rolled or forged, at a temp. above 450°, then cooled, and finally hardened at a temp. of 200-350°.

Copper alloys. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 288,314, April 9, 1927. A modification of the alloys described in Brit. 286,616 (C. A. 23, 369) consists in replacing the Fe content by one or more of the metals Cd, Sn and Mn. The alloys may contain Cu 96, Ni 2, Si 1% and up to 1% of Sn or Cd or both or up to 3% of Mn; and may be heat-treated at about 750°, quenched, cold-rolled, annealed at 300–600° and further worked, or may be annealed at above 600°, cooled rapidly to 300–400° and then cooled slowly.

Copper-silicon alloys. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 288,974, April 16, 1927. Cu-Si alloys which may also contain other elements such as Ni, Fe, Mn, Sn, Cr, W, Zn, Al, Mg, As, Sb, Ca, Co, P and Ti, contain also up to 10% of Pb, Cd and Tl.

Iron alloys. B. D. SAKLATWALLA. Brit. 288,861, June 30, 1927. Can. 284,361, Oct. 30, 1928. Fe alloys contain Cr 1–8, Cu 0.5–5 and Si 1–6%. C may be present up to 3.5% and scavenging and refining agents such as Al, Ti and V may be added.

Cast iron alloys. H. L. GREENE and C. TAYLOR (to Molybdenum Corp. of America). Brit. 289,075, April 21, 1927. Cast iron alloys are formed contg. about 1–4% C, 0.5–2.5% Si, 1–4% Ni and up to 1% Mo, without other intentionally added constituents. S, P and Mn may be present as impurities and metals such as Cr, V and Cu may also be included if they are present in scrap metal used for making the alloys.

Iron-beryllium alloys. SIEMENS & HALSKE A.-G. Brit. 288,579, April 12, 1927. Alloys of Fe with less than 13% Be (which may also contain up to 40% of other elements such as Al, Ni, Cu, Sn, Zn, Co, C and Si and which may be worked mechanically before treatment) are improved by quickly cooling in air or by quenching from temps. above 550° and then heating to 250–500°.

Non-magnetic or feebly magnetic iron alloys. FRIED. KRUPP A.-G. Swiss 126,436, June 14, 1927. Typical alloys comprise (1) 6–12% Mn and 3–7% Si, and (2) 3% C, 3–8% Mn, 1–5% Si and 4% Ni.

Magnesium alloys. I. G. FARBENIND. A.-G. Fr. 639,256, Aug. 10, 1927. Alloys of Mg for pistons of internal-combustion engines contain 1 to 6% of Si and Al, Cu, Zn, Cd or Ca separately or mixed and in such proportions that the fusion point is not below 400° and in quantity not above 20%.

Alloys of sodium and potassium. LOUIS HACKSPILL and ÉMILE RINCK. Fr. 639,218, Aug. 8, 1927. Na is heated with KCl above the fusion point of KCl. The salt residue forms a sep. layer or becomes solid at ordinary temp., whereas the alloy remains liquid.

Hard alloys of tungsten, etc. E. G. GILSON (to British Thomson-Houston Co., Ltd.). Brit. 289,477, April 28, 1927. A hard metallic compn. consisting of a metal of the Cr group such as W together with C and a metal of the Fe group such as Co is prepd. by subjecting a mixt. of the powd. elements to pressure at a sintering temp. A C mold and a pressure of about 1000 lb. per sq. in. may be used.

Phonograph needles or styli made of aluminum and its alloys. E. R. LAUBER. Brit. 288,279, April 6, 1927. The Al may be hardened by rolling or drawing or by alloying with Si, Fe, Cu, Zn, Sn, Mn, Ni, Mg or other suitable metals.

Apparatus for kneading and forming amalgams. KARL ZENTNER. U. S. 1,694,524, Dec. 11.

Protecting metals. SOCIÉTÉ ANON DE PERFECTIONNEMENTS ÉLECTROLYTIQUES. Fr. 639,701, Jan. 21, 1927. Metals such as Fe which are coated with a protecting layer of another metal such as Cr are afterwards dipped into a heated bath of melted paraffin, whereby any cracks or fissures in the coating are filled up.

Coating metals. THE EXPANDED METAL CO., LTD. Fr. 639,116, Aug. 5, 1927. A metal to be impregnated with Al or an alloy is first coated with Cd electrolytically and then exposed to vapors contg. the Al or alloy.

Coating metals. SIEMENS & HALSKE A.-G. Fr. 639,841, Aug. 20, 1927. Metals of alloys are coated with Be in a fusion bath composed of an alkali halide and a compd. of Be, the metal to be coated forming the cathode, at a temp. below the fusion point of Be. An intermediate coating of a metal, such as Cu, Fe or Ni, which will alloy with Be may be given.

Coating base-metal articles to protect them from corrosion. R. NOVELLY. Brit. 288,674, Jan. 1, 1927. Articles such as malleable iron sheets are coated on one or both sides with a steel alloy contg. Cr 6–25, Ni 0.5–20 and C up to 1% (suitably Cr 16.5, Ni 10.2 and C 0.15%).

Treating metals before painting. JAMES H. GRAVELL. Fr. 636,734, June 28, 1927. See Can. 280,098 (C. A. 22, 2819).

Etching. F. ULLMANN. G. m. b. H. Ger. 468,045, July 31, 1927. Metal plates

are carried on a rotating cylinder and the etching acid is thrown upon it by a bladed wheel rotating in the acid.

Galvanizing. J. H. LAWES. Brit. 288,741, Jan. 21, 1927. Al is added to a Zn bath in the form of an alloy of Al with 40 times its quantity of Zn (preferably commercial virgin spelter) and the use of NH_4 salts as a flux may be dispensed with.

Welding rails by the thermo-aluminic method. H. SCHULTZ. Brit. 288,309, April 6, 1927. Mech. features.

Soldering tungsten and molybdenum. NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 289,553, Jan. 31, 1927. Cu together with a deoxidizing substance such as Si or Al is used for soldering W or Mo, *e. g.*, for uniting W contact plates or rods to leading-in wires. A flux such as borax or glass may be added. Mention is also made of the similar soldering of chrome-iron.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

New investigations relating to organic radicals during the years 1922–1928. F. HENRICH. *Z. angew. Chem.* **41**, 1214–8, 1239–42 (1928). E. J. C.

Recent results in the chemistry of alkaloids. ERNST SPATH. *Z. angew. Chem.* **41**, 1234–9, 1257–62 (1928).—A review. E. J. C.

Oxidation of hexane. MAX BRUNNER AND ERIC K. RIDEAL. Univ. of Zürich and Cambridge. *J. Chem. Soc.* 1928, 2824–5; *cf. C. A.* **22**, 3130. —Further investigation of the rate of O consumption, in the oxidation of C_6H_{14} , while confirming the view that the period of rapid pressure increase is associated with an oxidation process by means of peroxide mols. formed prior to the observed pressure increase, has shown that the rate of O uptake during the initial period of no pressure change, previously called the induction period, is in reality rather rapid. The rapid increase in pressure occurs when the O has almost disappeared and is to be attributed to reactions involving the decompn. or reaction of peroxide mols. The rate of O uptake appears to be a 0-order reaction over a wide range of pressure. The reactions which appear to predominate in the initial stages of combustion in glass vessels at low temps. may be summarized by the equations: $\text{C}_6\text{H}_{14} + \text{O}_2 \longrightarrow \text{C}_6\text{H}_{14}\text{O}_2$ (active mol.); $\text{C}_6\text{H}_{14} + \text{C}_6\text{H}_{14}\text{O}_2 \longrightarrow 2\text{C}_6\text{H}_{12} + 2\text{H}_2\text{O}$; $\text{C}_6\text{H}_{12} + \text{O}_2 \longrightarrow \text{C}_6\text{H}_{12}\text{O}_2 \longrightarrow$ decompn. The peroxides cannot be the reaction centers for the propagation of the chem. action through the homogeneous bulk phase. C. J. WEST

The rearrangement of ozonides. ALBERT VERLEY. *Bull. soc. chim.* **43**, 854–7 (1928). —The decompn. of ozonides cannot always be relied upon to fix the position of a double bond. Three types of ozonide formation may occur. (1) The ozonide is formed by the fixation of O_3 at a double bond occupying a special position as with isosafrole. In this case no rearrangement is possible and the ozonide decompn. at the original double bond. (2) The ozonide is formed at a double bond occupying an indifferent position. A typical case is furnished by oleic acid. The position of the double bond between 9 and 10 (numbering from the end of the chain opposite the carboxyl) is indifferent, *i. e.*, if it passes to position 8,9 or 10,11 these 2 positions are equiv. to the first. In this case rearrangement is possible and the ozonide, $-\text{CH}_2\text{CH}(\text{O}-\text{O})\text{CHCH}_2-$, can pass by

the shifting of one of the O atoms around the other to either of the positions

$$\begin{array}{ccc} \text{O}-\text{O} & & \text{O}-\text{O} \\ | & & | \\ -\text{CH}_2\text{CH}_2\text{CH}(\text{O}-\text{O})\text{CH}- & \text{or} & -\text{CH}(\text{O}-\text{O})\text{CHCH}_2\text{CH}_2- \\ | & & | \\ \text{O}-\text{O} & & \text{O}-\text{O} \end{array}$$

(3) The ozonide is formed at a double bond adjacent to a special position. In this case the rearrangement cannot be avoided and always occurs to a certain extent. An example is eugenol, which on oxidation with O_3 behaves in part like isoeugenol.

E. R. SMITH

Several compounds of α -glycols with arsenic acid and arsonacetic acid. BERTIL ENOLUND. Univ. Upsala. *J. prakt. Chem.* **120**, 179–84 (1928).— H_3AsO_4 dissolves easily in $(\text{CH}_2\text{OH})_2$ on slight warming; on cooling, diglycolarsenic acid, $\text{HOAs}(\text{C}_2\text{H}_4\text{O}_2)_2$, m. 120° , seps., which is stable in the air but is immediately hydrolyzed by H_2O ; in CHBr_3 the mol. wt. is twice the calcd. The pyridine and brucine salts are reported. Triglycolarsenic acid could not be obtained pure but an iline, pyridine and brucine salts were obtained when excess of $(\text{CH}_2\text{OH})_2$ was used. Diglycolarsonacetic acid, $(\text{C}_2\text{H}_4\text{O}_2)_2\text{AsCH}_2\text{CO}_2\text{H}$, m. 142° (60% yield), immediately hydrolyzed by H_2O ; brucine salt.

If the $(\text{CH}_3\text{OH})_2$ soln. is heated above 130° , CO_2 is split off, giving *diglycol methyl-arsenate*, b_p $135-6^\circ$. *Dipinacone arsenic acid*, $\text{HOAs}(\text{C}_2\text{Me}_4\text{O}_2)_2$, m. 131° ; *pyridine salt*. *Dipinacone arsonacetic acid*, m. 188° (decompn.). *d-Tartaric acid arsonacetic acid*, carbonizes above 250° .

C. J. WEST

Some side reactions in the preparation of alkylmagnesium halides. HENRY GILMAN AND ROBERT E. FOTHERGILL. Iowa State College. *J. Am. Chem. Soc.* 50, 3334-41(1928).—A study has been made of the gases formed during the prepn. and in the hydrolysis of some alkylmagnesium halides. A table is given showing the gases resulting in the prepn. of MeMgI , EtMgBr and $\text{C}_4\text{H}_9\text{MgBr}$. From the nature of these gases it appears that the free radicals that are probably formed prior to the formation of organomagnesium halides undergo disproportionation and coupling to varying degrees.

C. J. WEST

Synthesis of behenic acid. RAMAKANTA BHATTACHARYA, SHANKAR RAO SALETORRE AND JOHN L. SIMONSEN. Indian Inst. Sci., Bangalore, and Univ. of London. *J. Chem. Soc.* 1928, 2678-81.—An improved method is given for decane-1,10-dicarboxylic acid; the partial hydrolysis of the Me ester gives the *Me II ester*, m. 51° . Reduction with EtOH and Na gives *11-hydroxydodecoic acid*, m. $78-9^\circ$ (*Mg salt*, amorphous). *Me ester*, b_p 160° ; *anilide*, m. 87° . MeOH-HBr transforms the acid into *Me 11-bromododecoate*, m. about 50° ; condensation with $\text{C}_6\text{H}_{17}\text{C}$: CNa gives behenic acid, m. 57° .

C. J. WEST

New esters of α -bromopropionic and α -bromoisobutyric acids. VENANCIO DEULOFEU. *Anales soc. españ. fis. quim.* 26, 315-9(1928); cf. *C. A.* 22, 3881.—By the action of MeCHBrCOBr and $\text{Me}_2\text{CBrCOBr}$ on an excess of the corresponding alcs. the following new esters were prepd.: α -Bromopropionates.—*iso-Pr*, b. $163-5^\circ$ (yield, 41%), *allyl*, b. $173-7^\circ$ (47%); *Bu*, b. $192-6^\circ$ (41%). α -Bromoisobutyrate.—*Pr*, b. $92-6^\circ$ (54%); *iso-Pr*, b. $91-4^\circ$ (40%); *allyl*, b. $90-3^\circ$ (51%). All are oily liquids of peculiar odor, the allyl esters pungent, the others fruit-like.

E. M. SYMMES

Carbazylic acids, the ammonia analogs of the carboxylic acids. E. F. CORNELL. Stanford Univ. *J. Am. Chem. Soc.* 50, 3311-8(1928).—The amidines are to be regarded as the NH_2 analogs of the carboxylic acids and are termed carbazylic acids. The alkyl and aryl cyanides are anammonides of the carbazylic acids. By the action of a metallic amide and a nitrile in liquid NH_3 the following salts were prepd.: *K* and *Na ammonoacetate*, *K*, *Na* and *Ca ammonopropionate*, *K* and *Na ammonobutyrate*, *K ammonovalerate*, *K ammonoisocaproate*, *K ammonopalmitate*, *K ammonosuccinate*, *K*, *Na*, *Ag*, *Cu*, *Cu* and Cu^{++} *ammonobenzoate*, *K ammono-p-toluale* and *Na dibenzylimidamide*. The action of HCN upon KNH_2 gives KCN ; KNH_2 and CN give K_2NCN , KCN and NH_3 , PhCN and KOH in liquid NH_3 , heated 16 hrs. at 175° , give $\text{Bz}(\text{NH})\text{OK}$; EtCN gives $\text{EtC}(\text{NH})\text{OK}$. PhCN and NH_4Cl in NH_3 give $\text{PhC}(\text{:NH})\text{NH}_2$; EtCN behaves similarly. The decompn. of the salts of the carbazylic acids, when heated with a metallic amide, proceeds with the formation of a hydrocarbon and an alkali salt of H_2NCN . $\text{PhC}(\text{:NH})\text{NHK}$ and HCl in EtOH give $\text{PhC}(\text{:NH})\text{NH}_2$, HCl and KCl . $\text{Ph}_3\text{C NMgBr}$ and NH_3 give $\text{Ph}_3\text{C:NH}$ and NH_2MgBr .

C. J. WEST

Reactions relating to carbohydrates and polysaccharides. XVIII. *p*-Nitrobenzylidene glycols and glycerols. HAROLD HIBBERT AND MURRAY G. STURROCK. McGill Univ. *J. Am. Chem. Soc.* 50, 3374-6(1928); cf. *C. A.* 23, 98.— $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$ (20 g.), 31 g. $(\text{CH}_2\text{OH})_2$ and 0.2 cc. 40% H_2SO_4 , heated on the steam bath for 6 hrs., give 60% of *p*-nitrobenzylideneethylene glycol, m. 90.5° ; the corresponding trimethylene deriv., m. 111.5° , results in 71% yield. From $\text{C}_3\text{H}_5(\text{OH})_2$, there results a mixt. of isomeric *p*-nitrobenzylideneglycerols, 1 m. 85° , increasing to 99° on standing, the other being an oil at -15° . The corresponding benzoates, m. 198° and 178° . XIX. Structural, geometrical and optical isomerism of the *p*-nitrobenzylideneglycerols and their derivatives. H. HIBBERT AND NEAL M. CARTER. *Ibid* 3376-88.— $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$ (166 g.), 110 g. $\text{C}_3\text{H}_5(\text{OH})_2$ and 6 drops 40% H_2SO_4 , heated 20 min. at 120° , during the latter part of which suction is applied to remove the H_2O , give 99% of the mixt. of *p*-nitrobenzylideneglycerols; the C_3H_5 soln. at 0° deposits 48% of the 1,1'-isomer (I) and the filtrate yields 51% of the 1,2-isomer (II). Methylation of 100 g I gives 30 g. of a 2-Me ether, m. 139° , and 35 g. of a 2nd ether, m. 100° , corresponding to the 2 theoretically possible, non-resolvable, geometrically isomeric forms. These same forms are obtained by condensing glycerol β -Me ether with $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$, sepn. being effected by crystn. from MeOH . Hydrolysis of either ether gives the β -Me ether in approx. 90% yields. Condensation of glycerol α -Me ether with $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$ gives a mixt. of 1,2-*p*-nitrobenzylideneglycerol 1'-Me ether, m. 47° and 42° , also obtained by methylation of II; these correspond to the 2 theoretically possible, geometrically isomeric, racemic forms. Benzoylation of I gives a mixt. of the 2-Bz derivs.,

m. 204° and 159°; if freshly crystd. I is used, only the higher-melting isomer is obtained. $p\text{-O}_2\text{NC}_6\text{H}_4\text{COCl}$ and I with $\text{C}_6\text{H}_5\text{N}$ give 2 isomeric 2-*p*-nitrobenzoyl derivs., m. 208° and 202°. II and BzCl give 2-*Bz* deriv., m. 178° and 115° and 2-1'-*p*-nitrobenzoyl derivs., m. 117-8° and 110°. Addn. of 0.01% by wt. of dry HCl to either I or II, followed by heating to 130° for 1.5 hrs., causes an equil., the ratio of I:II being approx. 1:5.

C. J. WEST

Sesamin. J. BÖESEKEN AND W. D. COHEN. Tech. Hochschule Delft. *Biochem. Z.* 201, 454-63(1928).—Sesamin is the 3rd unsaponifiable component of sesame oil; it has the empirical compn., $\text{C}_{20}\text{H}_{18}\text{O}_6$. Several reactions of the sesamin are described.

S. MORGULIS

Synthesis of mesoxalates by interaction of nitrogen tetroxide with esters of malonic acid. ELIZABETH GILMAN AND TREAT B. JOHNSON. Yale Univ. *J. Am. Chem. Soc.* 50, 3341-8(1928).— $\text{CH}_2(\text{CO}_2\text{Et})_2$ (25 g.) and an equal wt. of liquid N_2O_4 and about 1 g. Na at -5° for 3 hrs. and at room temp. for 2 days give 90% of $\text{CO}(\text{CO}_2\text{Et})_2$; the principal gas evolved is NO. $\text{CH}_2(\text{CO}_2\text{CH}_2\text{CH}_2\text{Cl})_2$, b₄ 143-4° and N_2O_4 at -5° give 90% of di- β -chloroethyl mesoxalate, greenish yellow oil, b₂ 148°; the hydrate is an oil. Di- β -bromoethyl malonate, b₁ 153°, in 84% yield from $\text{CH}_2(\text{CO}_2\text{H})_2$ and $\text{BrCH}_2\text{CH}_2\text{OH}$, with HCl as the catalyst, gives with N_2O_4 di- β -bromoethyl mesoxalate, b_{0.8} 155°, yellow oil which is decolorized by H_2O but does not give a cryst. hydrate. $\text{Et}_2\text{NCH}_2\text{CH}_2\text{OH}$ in CHCl_3 made just acid by HCl gas, and then treated with $\text{CH}_2(\text{COCl})_2$, gives the di HCl salt, m. 154° (decompn.), of di- β -diethylaminoethyl malonate, b_{4.8} 163°. The ester reacts explosively with N_2O_4 ; with gaseous N_2O_4 at low temps., 3 equivs. were completely decolorized before a green color was imparted to the soln.; the HCl salt produces a much less vigorous reaction and only 1 equiv. is decolorized; no satisfactory method of decompn. the intermediate product formed to yield mesoxalate has been discovered.

C. J. WEST

Synthesis of lactose. A. PICTET AND H. VOGEL. Univ. Geneva. *Lait* 8, 684-5 (1928). cf. C. A. 21, 3602.— β -Galactose was heated *in vacuo* at 150° to obtain β -galactosan, hygroscopic, m. 154-5°, α_D 30.5°. β -Galactosan was mixed with an equal wt. of β glucose, a few cg. of ZnCl_2 added, and the mixt. heated *in vacuo* at 150°, where the mass fused and then resolidified on cooling: $\text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{10}\text{O}_6 = \text{C}_{12}\text{H}_{22}\text{O}_{11}$. The product of this reaction was boiled in H_2O with Ag_2CO_3 to ppt. Zn, then with animal charcoal and evapd. to dryness. The residue on treating with Ac_2O resulted in lactose octaacetate, m. 85°, easily purified by crystn. The acetate was also obtained by heating β glucose with β -galactose and raising the temp. to 175°. The former remained unchanged; only β -galactose was transformed into its anhydride. Further treatment was as above. The acetate was sapond. by NaOEt , according to Zemplén. This gave a reducing sugar, $\text{C}_{12}\text{H}_{22}\text{O}_{11}$, which was completely identified as lactose.

H. F. ZOLLER

Decomposition products of benzene at high temperatures. YOSABURO KOSAKA. Tokyo Imp. Univ. *J. Fuel Soc. (Japan)* 7, 893-900(1928).—Using quartz and coke as catalysts, K. tried to decomp. benzene in a quartz tube. The sample was pure benzene which was treated with concd. H_2SO_4 , dried with CaCl_2 and distd. at 80-81°. K. employed a modified app. and the decompn. took place between 700° and 900°. The rate of decompn. was proportional to the temp. It was accomplished at the rate of 10, 20 and 50% of the original sample at 700°, 800° and 900°, resp., and both catalysts gave similar results. The results conform with those of Haffman, Meyer, Schultz, etc., the following reactions taking place: $2\text{C}_6\text{H}_6 = \text{Ph}_2 + 2\text{H}_2$; $3\text{C}_6\text{H}_6 = p\text{-C}_6\text{H}_4\text{Ph}_2 + 4\text{H}_2$; $n\text{C}_6\text{H}_6 = \text{C}_{6n}\text{H}_{4n+2} + (n-1)\text{H}_2$. Among other decompn. products K. found Ph_2 to be about 3% of the original sample at 700°, 12-3% at 800° and 17-8% at 900°, resp., and also a trace of $\text{C}_6\text{H}_5\text{Ph}_2$. No trace of C_{10}H_8 , anthracene and other similar compds. was found. K. also claims that following reactions take place at various temps.: $2\text{C}_6\text{H}_6 = 3\text{C}_2\text{H}_4 + 6\text{C}$; $2\text{C}_6\text{H}_6 = 3\text{CH}_4 + 9\text{C}$; $\text{C}_6\text{H}_6 = 3\text{H}_2 + 6\text{C}$.

F. J. NAKAMURA

Coupling of diazonium salts in lateral chains of unsaturated compounds. I. ANGELO QUILICO AND MARIA FRERRI. Reale Politecnico, Milano. *Gazz. chim. ital.* 58, 380-90(1928).—In investigations on the sulfonation of amines, phenols and phenolic ethers with $\text{H}_2\text{NSO}_3\text{H}$ (cf. Q., C. A. 21, 738; 22, 1764), a notable similarity was noticed in the behavior of these compds. when sulfonated and when coupled, which was manifest in the formation of *N*-substituted or *o*-substituted derivs., which were converted into derivs. substituted in the nucleus. Furthermore with unsatd. phenolic ethers with a propenyl chain, e. g., anethole (I) (cf. Q., C. A. 22, 1965) sulfonation occurred in the lateral chain, which can be explained by the existence of an active double bond conjugated with those of the nucleus. It was therefore to be expected that propenyl

phenolic ethers would react in the lateral chain with diazo compds. Thus as found by Meyer (C. A. 7, 2540; 8, 2878; 14, 1330) anisole reacts very slowly or not at all with $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}:\text{NOH}$, whereas I reacts very readily. I (14 g.) in glacial AcOH (70 cc.) added with continuous agitation to ice-cold $p\text{-nitrobenzenediazonium sulfate}$ (II) (from 13.8 g. of $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$ by the method of Hantzsch and Jochim, Ber. 34, 3337(1901)) in glacial AcOH (150 cc.), kept cold and agitated for 10–12 hrs., filtered, and washed with a little EtOH, yields (including 2 g. sepg. from the evapd. filtrate) 20 g. of $p\text{-MeOC}_6\text{H}_4\text{CH}:\text{NNHC}_6\text{H}_4\text{NO}_2$ (III) (cf. Ciusa, C. A. 5, 3405), m. 161° . It was identified by its properties, by its synthesis, and by its oxidation in alk. KMnO_4 to anisic acid. Similarly I in EtOH (50 cc.) added to ice-cold II in EtOH (150 cc.), filtered after 12 hrs., and the ppt. (combined with the residue of the evapn. of the alc. liquors) purified by soln. in boiling EtOH and cooling, yields 21–22 g. of III. The purification with EtOH leaves a small proportion of a brown-red powder, m. $223\text{--}4^\circ$ (decompn.), probably a condensation product of II. It contains approx. 28% N, gives intense blue solns. in dil. alkalis, probably because of a change of the $p\text{-HNC}_6\text{H}_4\text{NO}_2$ group to $\text{—N:C:CH:CH:C(:NOOH):CH:CH}$ (cf. Witt and Kopetschni, C. A.

6, 2600; Meyer, C. A. 8, 2878). $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$ (1 g.) diazotized by the method of Hantzsch and Jochim (*loc. cit.*), the product purified as before, dissolved in AcOH (10 cc.), cooled, I (0.91 g.) in glacial AcOH (5 cc.) added with continuous agitation, kept cold 6–8 hrs., filtered and the residue recrystd. from C_6H_6 , yields 1.2 g. of *anisic aldehyde dinitrophenylhydrazone*, $p\text{-MeOC}_6\text{H}_4\text{CH}:\text{NNHC}_6\text{H}_4(\text{NO}_2)_2$ (IV), blood red, m. 243° , gives violet-red solns. in dil. alkalis, oxidized by alk. KMnO_4 to anisic acid. IV can be synthesized by heating 2,6- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{NHNH}_2$ with anisaldehyde (equimol. parts) and recrystg. the product from C_6H_6 . In AcOH and under the condition described with I, the product obtained from isosafrole (IV) and $p\text{-H}_2\text{NC}_6\text{H}_4\text{NO}_2$ contains a considerable quantity of a resin, brown with a green reflection, which gives intense red solns. in AcOH and in MeAc. In EtOH, the reaction gives excellent results, IV (15 g.) and $p\text{-H}_2\text{NC}_6\text{H}_4\text{NC}_6\text{H}_4$ (13.8 g.) yielding, after purification from boiling EtOH, 21–22 g. of *piperonal p-nitrophenylhydrazone*, $\text{O:CH}_2\text{O:C}_6\text{H}_4\text{CH}:\text{NNHC}_6\text{H}_4\text{NO}_2$ (V),

dark red, m. $199\text{--}200^\circ$, oxidized by alk. KMnO_4 to piperonic acid. In the treatment with EtOH there remains a red powder, m. $222\text{--}3^\circ$, identical with that obtained with I. V can be synthesized from its constituents in AcOH, in which case after recrystn. from EtOH, it m. $201\text{--}2^\circ$. A mixt. of the 2 products, m. $199\text{--}200^\circ$ and $201\text{--}2^\circ$, resp., m. $200\text{--}1^\circ$, so it is very improbable that 2 stereoisomers are concerned. When boiled with AcOH contg. a little CrO_3 , the m. p. of the product which m. $199\text{--}200^\circ$ becomes 201° . By the same method of synthesis, IV and $\text{H}_2\text{NC}_6\text{H}_3(\text{NO}_2)_2$ in AcOH form *piperonal dinitrophenylhydrazone*, $\text{C}_{14}\text{H}_{10}\text{O}_6\text{N}_4$, purple-red, m. 265° , can also be prepd. from its components in EtOH. $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$ (6.9 g.) diazotized in the same way as before, suspended in EtOH (50 cc.), cooled, isoapiole (11 g.) in EtOH (50 cc.) added, let stand 12 hrs., filtered, washed with a little EtOH, and the residue purified by recrystn. from boiling $\text{MeC}_6\text{H}_4\text{NO}_2$ or better by soln. in glacial AcOH, pptn. with water and recrystn. from EtOH, yields approx. 13 g. of *apiolic aldehyde p-nitrophenylhydrazone*, $\text{C}_{16}\text{H}_{18}\text{O}_6\text{N}_2$, orange-red, m. $228\text{--}9^\circ$. The coupled compds are very resistant to reducing agents, though dil. alc. $\text{Na}_2\text{S}_2\text{O}_4$ and SnCl_2 in HCl render their solns. colorless. The phenylhydrazones are not the primary products of the reaction, an addn. of the diazo compd. to the double bond of the lateral chain occurring, with formation of a labile compd. which by transposition and elimination of AcH leads to the phenylhydrazone of the aromatic aldehyde, e. g., $\text{MeCH:CHC}_6\text{H}_4\text{OMe} + \text{O}_2\text{NC}_6\text{H}_4\text{N}:\text{NOH} \rightarrow \text{MeCH(OH)CH(N:NC}_6\text{H}_4\text{NO}_2)\text{C}_6\text{H}_4\text{OMe} \rightarrow \text{MeCH(OH)C(:NNHC}_6\text{H}_4\text{NO}_2)\text{C}_6\text{H}_4\text{OMe} \rightarrow \text{MeCHO} + \text{CH(:NNHC}_6\text{H}_4\text{NO}_2)\text{C}_6\text{H}_4\text{OMe}$. C. C. D.

Action of alkyl chlorocarbonates on stibanilic acid. CLIFF S. HAMILTON AND R. E. EZTELMILLER. Univ. of Nebraska. J. Am. Chem. Soc. 50, 3300–3(1928).— $p\text{-H}_2\text{O}_3\text{SbC}_6\text{H}_4\text{NH}_2$, in a slight excess of $\text{N Na}_2\text{CO}_3$ treated, drop-wise, with a slight excess of alkyl chlorocarbonate, gives the following 4-carboalkoxyaminophenylstibonic acids: MeO , 73% yield; EtO , 85%; PrO , 87%; Me_2CHO , 89%; BuO , 70%; $\text{Me}_2\text{CHCH}_2\text{O}$, 85%; $\text{ClCH}_2\text{CH}_2\text{O}$, good yield; $\text{Cl}(\text{CH}_2)_3\text{O}$, good. These compds. are colorless powders, insol. in C_6H_6 , H_2O or dil. acids. Concd. HCl changes them into a tarry oil. They show but slight soly. in dil. NaOH, the soly. decreasing with an increase in their C content. By heating the Cl derivs. with 4 equivs. of 5% NaOH at $70\text{--}5^\circ$ for 30 min., there results 25% of $\beta\text{-hydroxyethyl-}$ and $\gamma\text{-hydroxypropyl-}$ *p-aminophenylstibonic acid*, colorless powders readily sol. in dil. alkali and sol. in HCl. A method of analysis for Sb is given. C. J. WEST

3-Halogeno-2-, 4- and 6-aminophenol. HERBERT H. HODGSON AND ARNOLD KERSHAW. Tech. Coll., Huddersfield. *J. Chem. Soc.* 1928, 2703-5.—3-Chloro-2-aminophenol, m. 122°, by reduction of the corresponding NO₂ deriv. (HCl salt, plates); 3-Br deriv., m. 138° (HCl salt, needles); 3-I deriv., m. 137° (decompn.) (HCl salt, plates). 3-Chloro-4-aminophenol, m. 159.5° (HCl salt, plates); 3-Br deriv., m. 151° (HCl salt, prisms); 3-I deriv., m. 145.5° (HCl salt, plates). 3-Chloro-6-aminophenol, m. 154° (HCl salt, plates); 3-Br deriv., m. 150° (HCl salt, plates); 3-I deriv., m. 141° (HCl salt, plates). Color reactions of these compds. with FeCl₃, bleaching powder soln. and Br-H₂O are given. C. J. WEST

Condensation of chloral with 2,6-dichlorohydroquinone, with anisic acid and with *p*-nitroanisole. F. D. CHATAWAY AND F. CALVET. *Anales soc. españ. fis. quim.* 26, 320-36(1928); *J. Chem. Soc.* 1928, 2913-8.—The general reaction between *p*-substituted phenols and chloral under the influence of concd. H₂SO₄, forming 1,3-benzodioxin derivs. (cf. C. A. 21, 233, 1980, 3606; 22, 1965, 2946) applies to 2,6-dichlorohydroquinone. Whereas substituents in the *o*-position to the Ph group prevent condensation, the existence of 1 substituent in the *m*-position does not interfere. 2,6-Dichlorohydroquinone, in which both *m*-positions to 1 of the Ph groups are occupied by 2 Cl atoms, reacts with chloral normally, giving 6-hydroxy-5,7-dichloro-2,4-bis(trichloromethyl)-1,3-benzodioxin. Boiling alc. KOH acting on this condensation product eliminates 2 mols. of HCl, forming 6-hydroxy-7,5-dichloro-2,4-bis(dichloromethylene)-1,3-benzodioxin. Anisic acid and *p*-nitroanisole condense with chloral somewhat differently, giving products like an aldol condensation of 1 mol. of aldehyde with 1 of the Ph ether. Anisic acid gives first 5,2-HO₂C(MeO)C₆H₃CHClCCl₃, whose constitution was proved by oxidation with alk. KMnO₄, forming 4-methoxyisophthalic acid. The condensation product of *p*-nitroanisole and chloral is 5,2-O₂N(MeO)C₆H₃CHClCCl₃, which on oxidation gives 5,2-O₂N(MeO)C₆H₃CO₂H. E. M. SYMMES

Reduction of quinones by means of phenylhydrazine. ANTONINO GIACALONE. Reale Univ. Palermo. *Gazz. chim. ital.* 58, 409-11(1928).—The literature contains no expts. on the reduction of quinones to hydroquinones by PhHNNH₂. PhHNNH₂ should be of advantage because it avoids the use of an aq. medium in which hydroquinones oxidize rapidly and because the method gives high yields. The rate of the reaction and its violence vary with different quinones. When PhHNNH₂ is added to dry quinone, the reaction is violent, even explosive. However, PhHNNH₂ in C₆H₆ added slowly to quinone in C₆H₆ until the product (at first brown) becomes light colored and no more gas is evolved, filtered, the residue washed with C₆H₆ and recrystd. from hot C₆H₆, yields hydroquinone. In the same way C₆H₆ solns. of thymoquinone and of PhHNNH₂ yield thymohydroquinone, m. 140° (cf. 139.5° in the literature). PhHNNH₂ (2 g.) stirred into naphthoquinone (1 g.) until the reaction is over, PhNH₂ and excess PhHNNH₂ extd. from the reaction mixt. with C₆H₆, the residue washed with C₆H₆ and recrystd. from hot C₆H₆ or CCl₄ yields naphthohydroquinone. Unlike true quinones, anthraquinone is not reduced by PhHNNH₂, even after heating together for 2 hrs. Reduction of quinones by PhHNNH₂ is probably a general reaction. Pure PhHNNH₂ must be used, and if its aq. salts are used instead, condensation products are formed (cf. Ber. 17, 3026(1884)). C. C. DAVIS

Catalytic reduction of nitriles and oximes. WALTER H. HARTUNG. Sharp and Dohme, Baltimore. *J. Am. Chem. Soc.* 50, 3370-4(1928).—PhCN was reduced catalytically in abs. EtOH to pure PhCH₂NH₂ by means of Pd charcoal when 1, or more, equiv. of HCl was present; without HCl a mixt. of PhCH₂NH₂, (PhCH₂)₂NH and NH₃ was formed. PhCH:NOH was similarly reduced to pure PhCH₂NH₂ when 3 or more equivs. of HCl were present; with 1 equiv., or more, of the acid a mixt. of primary and secondary bases resulted. PhCH(OH)CN was reduced in abs. EtOH contg. HCl to PhCH₂CH₂NH₂ but the yield of primary amine was poorer because a non-basic by-product was formed. PhCH(OBz)CN and PhCH(OAc)CN were also reduced; though the esters of PhCH(OH)NH₂ were not formed, good yields of PhCH₂CH₂NH₂ were obtained. C. J. WEST

Action of pyridine as a catalyst in Perkin's synthesis of cinnamic acid. GEORGE BACHARACH AND FRANCIS BROGAN. Fordham Univ. *J. Am. Chem. Soc.* 50, 3333-4(1928).—A substantially increased yield (up to 85%) of cinnamic acid in the Perkin synthesis has been produced by using pyridine as a catalyst at the rate of 8 drops for 20 g. BzH, the time of reaction being 8 hrs. Addnl. C₆H₅N and longer heating do not increase the yield. The product is obtained in a very pure condition. C. J. WEST

Enolization of homophthalic anhydride. THOMAS S. STEVENS AND JAMES L. WILSON. Univ. of Glasgow. *J. Chem. Soc.* 1928, 2827-8.—4,5-Methylenedioxyhomophthalic anhydride (I), yellow, m. 178-80°, is obtained from the acid and AcCl

after boiling several hrs.; it is not readily affected by Br but gives a dark brown ppt. with FeCl₃. Preliminary expts. on the methylation of homophthalic anhydride (II) led to no definite result. An estn. by Hieber's method indicated but a small % of enol but no great reliance is to be placed on the observation. Oxidation of II with aq. KMnO₄ gives phthalidecarboxylic acid, m. 151°; I behaves similarly, giving the methylenedioxy deriv., m. 213-5° (decompn.).

C. J. WEST

Preparation of 4-bromophthalic acid. LESLIE C. BAKER. Univ. Coll., London. *J. Chem. Soc.* 1928, 2829.—C₈H₄(CO)₂O is converted into Et 4-nitrophthalate by Miller's method (*Ann.* 208, 224(1881)) and this reduced to the 4-NH₂ ester by Baeyer's method (*Ber.* 10, 1079(1877)) at 30-40° in 71% yields; through the diazo reaction there results 66% of Et 4-bromophthalate, hydrolyzed with Ba(OH)₂ in EtOH to the free acid in 88% yield.

C. J. WEST

4-Hydroxy-5-methoxycoumarin (β -methylesculetin, scopoletin, gelseminic acid, chrysotropic acid) and its glucoside. ERHARD GLASER. Univ. Wien. *Arch. Pharm.* 266, 573-82(1928).—Methylesculetin, C₁₀H₈O₄, is readily obtained in the form of brilliant yellow needles by the action of Me₂SO₄ on esculetin; it is characterized by a fluorescence capacity exceeding that of esculetin. By virtue of its m. p. (199°), soly., and other reactions it is to be regarded as a mono-Me ether of esculetin (formerly designated β -methylesculetin) and occurring in nature under various names (scopoletin, chrysotropic acid, gelseminic acid) in the plants *Atropa belladonna*, *Gelsemium sempervirens*, *Convolvulus scammonia*, *Ipomaea oryzabensis*, *Prunus serotina*, *Fabiana imbricata*. In view of the fact that Moore by boiling aq. scopoletin with 45% KOH succeeded in splitting off the cinnamic acid side chain and so isolating a 2,4-(H)₂ C₆H₃OMe (m. 66°) differing from the 2,5-compd. (m. 84°) derived from methoxyquinone, the conclusion seems justified that the ether resulting from the above synthesis is 4-hydroxy-5-methoxycoumarin. This constitution is verified indirectly by the investigations of Bargellinis and Montis. Guided by the fact that by the action of persulfate on phenol in cold alk. soln. a new OH enters the nucleus in a very definite position, they were able to convert coumarin into the already known 5-hydroxycoumarin and in the case of 4-methoxycoumarin (Me ether of umbelliferone), which occurs in *Herniaria hirsuta* and *Matricaria chamomilla*, and prep. a 4-methoxy-5-hydroxycoumarin, identical with the α -methylesculetin of Tiemann and Will. The *tetraacetoglucoside* of 4-hydroxy-5-methoxycoumarin, C₂₄H₂₆O₁₃, m. 104-5°, was prepd., and in turn yielded the *l*-rotatory β -glucoside, C₁₆H₁₈O₈, m. 127-8°. Since methylesculetin is more strongly fluorescent than esculetin, while esculin shows no fluorescence at all, it is reasonable to conclude that in fluorescent substances of this character the introduction of the Me group tends to increase, that of sugar to diminish the fluorescent property. Furthermore, since increasing acidity also tends to inhibit fluorescence, attempts were made to measure the differences in fluorescent intensity with varying acidity. In any consideration of the mono-Me ether of esculetin, it is more practical to employ the designations 5-hydroxy-4-methoxy- and 4-hydroxy-5-methoxycoumarin, resp., rather than the terms α - and β -methylesculetin, reserving the latter for compds. like those prepd. by Pechmann and Kraft.

W. O. E.

Phenyl- and α -naphthylcarbamic hydrazones of inactive camphor. VALENTINO MORANI. Reale stazione chimico-agraria, Roma. *Gazz. chim. ital.* 58, 404-9(1928). In expts. on the essential oil of sage, camphor inactive to polarized light was obtained, a form which is considered by some not to exist in nature (cf. Semmler, *Die atherische Öle* 3, 342(1906)). The prepn. of the phenylcarbamic hydrazone gave a different result from that of Borsche and Merkwitz (*Ber.* 37, 3182(1904)) in that the compd. m. 153-4° could be obtained only from *d*-camphor, whereas the *dl*-camphor from sage oil gave a compd. m. 171.5-2.5°. This led to further expts. to det. whether the difference in the derivs. of *d*- and of *dl*-camphor was true of other compds. of similar type. *dl*-Camphor semicarbazone (1 g.) refluxed 5 min. with PhNH₂ (5 g.), cooled, EtOH added, poured into 10% AcOH (40 cc.), let stand overnight, decanted, the cryst. mass washed with water and recrystd. from boiling 95% EtOH yields almost 100% of *dl*-camphor phenylcarbamic hydrazone (phenylsemicarbazone), C₁₆H₁₈:NNHCONHPh, m. 171.5-2.5°. Prepd. from synthetic *dl*-camphor, it m. 171-2°. An intimate mixt. of PhMeC:NNHCONH₂ (1 g.) and α -C₁₀H₇NH₂ (6 g.) heated 10 min. at 200°, cooled, boiled with 95% EtOH, filtered, washed with boiling EtOH (the residue is a 30% yield of dinaphthylurea), and the filtrate allowed to crystallize, yields *acetophenone α -naphthylcarbamic hydrazone*, PhCMe:NNHCONHC₁₀H₇, violet-gray, m. 208°. The formation of dinaphthylurea can be avoided by using quinoline as solvent. PhMeC:NNHCONH₂ (1 g.), α -C₁₀H₇NH₂ (0.8 g.) and quinoline (5 g.) refluxed 5 min., cooled, poured into cold 0.5 N H₂SO₄ (80 cc.) and the product recrystd. from EtOH gives almost a

100% yield. By either of these 2 methods of prepn., *d*-camphor yields *d*-camphor α -naphthylcarbamic hydrazone, $C_{19}H_{18}:NNHCONC_{10}H_7$, violet-gray, m. 172.5°. *dl*-Camphor semicarbazone (from oil of sage) (0.9 g.), α - $C_{10}H_7NH_2$ (0.7 g.) and quinoline (5 g.) refluxed 5 min., treated with 0.5 *N* H_2SO_4 (80 cc.) and purified from 95% EtOH, yields *dl*-camphor α -naphthylcarbamic hydrazone, $C_{19}H_{18}:NNHCONHPh$, rose colored, m. 179–80°. Prepd. from synthetic *dl*-camphor, it m. 179–80°. These compds. are of importance in identifying *dl*-camphor, since other well-known derivs. have the same m ps. as those of the active forms. They may also be useful in identifying ketones, where the semicarbazones themselves give insufficient information. C. C. DAVIS

Chlorination of naphthalene in benzene solution. J. TRAUBENBERG AND E. WASSERMAN. Chem. Fabrik, Rubeschnoje, U. S. S. R. *J. prakt. Chem.* 120, 177–8 (1928).— $C_{10}H_8$ (130 g.) in 250 cc. C_6H_6 , treated with Cl with cooling, Fe being used as the catalyst, gives 85% of the α -Cl deriv. The C_6H_6 is scarcely chlorinated under these conditions. C. J. WEST

Preliminary examination of rotenone and some of its degradation products. GORDON M. WRIGHT. Univ. of Cambridge. *J. Am. Chem. Soc.* 50, 3355–60 (1928).—Extn. of the powd. root of *Derris elliptica* Benth with Et_2O gives rotenone (I), m. 163°; *oxime*, m. 252°; *phenylhydrazone*, yellow, m. 245°; *HCl salt*, m. 197°, whose *oxime*, m. 239° (decompn.); *HBr salt*, m. 190°; analyses of these compds. indicate the formula $C_{23}H_{22}O_6$ for I. Isorotenone, $C_{23}H_{22}O_6$, m. 184°, results by the action of H_2SO_4 on I; *phenylhydrazone*, yellow, m. 230°. Oxidation of I with CrO_3 gives rotenone, $C_{23}H_{18}O_6$, yellow, m. 300°. Fusion of I with KOH gives rotenic acid, $C_{12}H_{12}O_4$, m. 183°; *Me ester*, m. 39–40°; *NO₂ deriv.*, $C_{12}H_{11}NO_4$, yellow, m. 187°. The action of heat on rotenic acid gives a *compd.*, $C_{22}H_{22}O_6$, m. 104°; $FeCl_3$ gives a green color. The action of alc. KOH on I gives tubaic acid, $C_{12}H_{12}O_4$, m. 128–9°. These results confirm the work of Taker (*C. A.* 22, 2941). C. J. WEST

Electrolytic reduction of nitrosoantipyrine. MARIO GIORDANI. Lab. chim. della sanità publica, Roma. *Ann. chim. applicata* 18, 289–96 (1928).—The reduction of nitrosoantipyrine by Zn and AcOH in dil. EtOH is slow and troublesome and necessitates careful control of conditions. Expts. were therefore directed toward developing an electrolytic method. An electrolytic cell in series with a voltmeter of the Oettel type, an ammeter and a variable resistance was used, the process being followed quantitatively by the Tafel method as modified by Pomilio (cf. *Atti. accad. sci. fis. mat. Napoli*, 1914). To det. the best conditions, the influence of the nature of the cathodic deposit, the cathodic c. d., and the concn. of current were detd. Comparative tests of Ni cathodes covered with Ni, Sn and Cu sponge showed that the best results are obtained with Ni sponge, i. e., with an electrode which gives the lowest cathode supertension. Cu gave poorer results and Sn the poorest, which is the order of their supertensions. Nitrosoantipyrine probably acts as a cathodic depolarizer (cf. Dony-Hénault, Gall and Gauye, *Principles et applications de l'Electrochimie* 179; *C. A.* 8, 2531). This was confirmed by the fact that there was an almost const. yield up to the point where the current was approx. 50% of the calcd. value for total reduction. Above this value the yield diminished rapidly. When the c. d. was increased, the yield diminished during the early stages, but subsequently became greater than at the lower c. d. This is explained by the fact that with a const. vol. of liquid an increase in the intensity of the current causes not only an increase in c. d. but also in the concn. of current. The concn. of current therefore plays a part, in fact by tripling the value the depolarizing action is still appreciable when the current is higher than the theoretical value. With increase in the concn. of current, the yield also increases. In conformity with the depolarizing action mentioned above, the potential applied increased slightly from the beginning to the termination of the expts. C. C. DAVIS

So-called bisthiohydantoins of Frerichs, Förster and Höller. HERBERT W. STEPHEN AND FORSYTH J. WILSON. Royal Tech. Coll., Glasgow. *J. Chem. Soc.* 1928, 2826–7; cf. *C. A.* 4, 2294; 7, 3476.—It has been shown (*C. A.* 22, 3410) that the so-called 3,3-bis- ψ -thiohydantoin is really diketotetrahydrothiazole-2-ketazine. It is now shown that the 2 compds. described by F. and F. and by F. and H. are similar in structure. $H_2NCSNHNHCSNH_2$ and $EtCHBrCO_2H$ give 2,4-diketo-5-methyltetrahydrothiazole-2-ketazine, m. 289°; hydrolysis yields N_2H_4 and 2,4-diketo-5-methyltetrahydrothiazole, b_p 166–8°, m. 46–7°. The corresponding 5-Et deriv., m. 233°, behaves similarly on hydrolysis. C. J. WEST

Piperidine derivatives. VI. 3-Methylpiperidinoalkyl benzoates. J. R. THAYER AND S. M. McELVAIN. Univ. of Wisconsin. *J. Am. Chem. Soc.* 50, 3348–55 (1928); cf. *C. A.* 22, 81.— $ClCH_2Ac$ (10 g.) and 20 g. 3-methylpiperidine (I) in 400 cc. Et_2O give 13 g. 1 [3-methylpiperidino]-propan-2-one, b_p 101–2°, analyzed as the *HCl salt* (II),

m. 162-3°. Catalytic reduction of 15.5 g. II in EtOH with Pt oxide-Pt black gives 9 g. 1-[3-methylpiperidino]propan-2-ol, b_{18} 98-100°, analyzed as the HCl salt (III), m. 184-5°. III and BzCl give α -methyl- β -[3-methylpiperidino]ethyl benzoate-HCl, m. 165-6°. A mixt. of 13.5 g. I.HCl, 3.6 g. (HCHO)₃, 30 g. Me₂CO and 5 cc. abs. EtOH, heated 3-4 hrs., gives 12 g. 1-[3-methylpiperidino]butan-3-one-HCl, m. 151-2°; catalytic reduction and the action of BzCl give α -methyl- γ -[3-methylpiperidino]propyl benzoate-HCl (IV), m. 178-80°. (MeCHBr)₂ and PhCO₂Ag give α,β -dimethyl- β -bromoethyl benzoate, b_4 140-1° (the Br value is low, probably because of the presence of dibenzoate). CH₂Ac₂, on catalytic reduction, gives 60% of CH₂[CH(OH)Me]₂; successive reaction of BzCl and SOCl₂ gives α,γ -dimethyl- γ -chloropropyl benzoate, b_2 134-5°, n_D^{20} 1.5074, d_{20}^{20} 1.1008. These compds. do not react normally with I but apparently lose 1 mol. HCl (HBr) to form, presumably, an unsatd. compd. 2-Chloro-2-methylpentan-4-one, b_{14} 50-2° (74% yield), begins to darken immediately after distn. This, also, does not react normally with I. III and IV have higher anesthetic efficiencies and higher toxicities than the corresponding compds. in which the alkylene group between the O and N is unsubstituted.

C. J. WEST

Behavior of pyrazine compounds. I. C. GASTALDI AND E. PRINCIVALLÉ. Reale Univ. Sassari. *Gazz. chim. ital.* **58**, 412-6(1928).—The compds. used in the expts., 2,5-dimethyl-3,6-dicyanopyrazine (I), 2,5-dimethyl-6-hydroxypyrazine (II) and 2,5-diphenyl-6-hydroxypyrazine (III), were prepd. by a method already described (cf. C. A. **16**, 101). I (3.5 g.) heated 2 hrs. at 70° and 1 hr. more at 115° with concd. H₂SO₄ (14 cc.), poured into water and the ppt. recrystd. from EtOH, yields 100% of 2,5-dimethyl-3,6-pyrazinedicarboxylic diamide (IV), m. 290°. By the method of Bouveault, IV can be readily transformed into 100% of 2,5-dimethyl-3,6-pyrazinedicarboxylic acid, m. 194-5° after dehydration. This m. p. differs from the 200-1° reported by Wleügel (*Ber.* **15**, 1051(1882)), but the di-Et ester was found to have the same m. p., viz., 85-6°. III (2.8 g.), KOH (1 g.), MeI (8.2 g.) and MeOH (20 cc.) heated in a sealed tube 10 hrs. at 100° and the product crystd. from water, gives a high yield of 1-methyl-2,5-diphenyl-6-keto-1,6-dihydropyrazine-MeI, the properties of which conformed to those in the literature. It is decompd. by heating with aq. KOH to MeNH₂, the quantity of the latter corresponding to its formation from both N atoms in the pyrazine nucleus. II (1.5 g.), MeOH (15 cc.), KOH (0.75 g.) and MeI (6.7 g.) heated in a sealed tube 10 hrs. at 100°, evapd. *in vacuo*, and the residue recrystd. repeatedly from EtOH, yields 1-methyl-2,5-dimethyl-6-keto-1,6-dihydropyrazine-MeI, MeN.CO.CMe:NMeI.CH:CMe, greenish yellow, m. 215° (decompn.). When

it is decompd. by prolonged boiling with aq. KOH, the MeNH₂ evolved corresponds to its formation from both N atoms. The expts. show that the Rung-Behren-Pinner reaction (cf. *Ann.* **271**, 34(1892); *Ber.* **35**, 2444, 2457(1902)) is not, as generally believed, characteristic of imidazole compds. alone, hydroxypyrazines behaving in the same way. The similar behavior of the two series of compds. $\text{(Alk)N.C(:O).CAr:N(Alk)(Hal).CH:CAr}$ and $\text{ArC:CHN(Alk)(Hal):CAr.N(Alk)}$,

probably depends upon the equivalence of the atomic groups: $\begin{array}{c} | \\ -C-N-C- \\ || \quad || \end{array}$ and

$\begin{array}{c} \diagup \quad \diagdown \\ =C-N=C- \\ | \end{array}$, in which there should be other heterocyclic compds. which give the

Rung-Behren-Pinner reaction. Pinner (*Ber.* **38**, 1532(1905)) has erroneously attributed the structure of 2-benzoyl-5-phenylimidazole to the product of the action of NH₃ on phenylglyoxal, the product actually being III.

C. C. DAVIS

Resinic acids. GEORGES ROUIN. *Inst. du Pin. Bull. inst. pin* **1928**, 121-30, 167-72, 173-6, 197-204, 221-31.—A detailed description of the technic and results of an investigation of the acid constituents of the gum turpentine of *Pinus laricio* and their relation to abietic acid, of the acid constituents of rosin from Aleppo pine, and a verification on pure compds. of the properties investigated by previous authors on isomorphous mixts. generally designated as "abietic acid." The acid constituents of the turpentine of *P. laricio* contain about 0.7% of *d*- and *l*-pimaric acids; the remainder consists chiefly of a primary terebenthenic acid, the crystallographic characteristics, rotatory power and isomerization products (alepabietic and abietic acids) of which identify it with Dupont's α -alepic acid. By means of Darms' method (*Thesis, Paris*, 1910) and a generalization thereof worked out by R. (this method is explained theoretically and mathematically, and exptl. evidence is given to confirm its soundness)

the rosin of Aleppo pine is shown to consist of a mixt. of alepic, alepabietic and abietic acids, and 2 types of binary mixts. were sepd.: (1) isomorphous, *l*-rotatory mixts. of alepabietic and abietic acids, (2) *d*-rotatory mixts. contg. 2 kinds of crystals (alepic form and abietic form), in which alepabietic acid greatly predominates; this constitutes a confirmation of the fact that in its isomerization into abietic acid, α -alepic acid passes through a definite intermediate stage, alepabietic acid, as previously shown by Dupont and Dubourg. Pure abietic acid ($[\alpha]_D^{20}$ -100°) gives gelatinous and crystd. salts and also an acid Na salt. Elimination of CO_2 by pyrogenation, with subsequent conversion into a hydrocarbon $\text{C}_{19}\text{H}_{30}$ shows that it is a true CO_2H acid. Production of a di-HBr salt (m. $146-51^\circ$ (decompn.)) on treating with HBr and of a tetrahydroxy-abietic acid on KMnO_4 oxidation shows that the mol. must contain 1 double bond and a bridge (Grün formula) or 2 double bonds (Easterfield and Baglay-Bunbury). The following were also identified in the oxidation products obtained on treating with KMnO_4 : Me_2CO , the formation of which can be explained either by the presence of an iso-Pr group or by the presence of 2 Me groups attached to the same C atom (Grün formula); butyric (or isobutyric) acid, but no EtCO_2H as indicated by Levy, the presence of the latter being possibly due to the fact that the abietic acid studied by Levy contained *d*-pimaric acid; valeric (or isovaleric) acid. The formation of butyric and valeric acids can be explained by assuming that 1 of the rings is opened, giving rise to di- CO_2H acids which by elimination of CO_2 lead to the above-mentioned acids; though this does not definitely fix the positions of the double bonds, it makes it seem plausible either that 2 Me groups and a double bond are placed as in Grün's formula, or that in Bunbury's formulas the iso-Pr group and 1 double bond belong to the same ring and are attached to 2 neighboring C atoms. Work done on pyroabietic, hydrated and anhyd. abietic acids is described (cf. Dupont, R. and Dubourg, *C. A.* 22, 423).

A. PAPINEAU-COUTURE

Structure of proteins. EMIL ABDERHALDEN AND WALDEMAR KRÖNER. Univ. Halle. *Z. physiol. Chem.* 178, 276-90 (1928).—In the hope of developing a method for the isolation of individual polypeptides resulting from partial hydrolysis of proteins several procedures were tried but without much success. To det. whether dipeptide esters after benzylation could be distd. *in vacuo*, benzoylglutylglycine Me ester (I), m. $78-82^\circ$, benzoyl-*dl*-leucylglycine Et ester (II), m. $145-6^\circ$, and benzoylglutyl-*l*-tyrosine Me ester (III), an oil, were prepd. and examd. I and III decompd. into dark oils, but II distd. without decompn. even at ordinary pressure. When, however, the products of partial hydrolysis of casein, obtained by 14 days' treatment with *N* NaOH, were benzyolated, esterified and distd., there was strong decompn. and no individual substance could be isolated. The use of solvents was then tried, including MeOH, EtOH, BuOH, iso-BuOH, PrOH, iso-PrOH, AmOH, iso-AmOH, EtAc, EtOAc, Et_2O , CHCl_3 and MeAc. Only Et_2O and EtOAc showed a limited solvent action. The former dissolved practically nothing, while the latter extd. a cryst. product which, however, was a mixt. that defied all attempts at sepn., and on complete hydrolysis yielded benzoylleucine, alanine, serine and an unidentified benzoylamino acid. Finally, by adding a large vol. of H_2O to the BuOH ext. from the benzyolated and esterified hydrolyzate, one pure product was obtained, viz. *di-Me benzoylleucylglutamate* (IV). By the usual method of esterification with an alc. and dry HCl, the following esters were prepd. from *dl*-leucylglycine: Me ester-HCl, m. 133° (yield 42%); iso-Pr ester-HCl, hygroscopic powder (35.6%); Bu ester-HCl, hygroscopic powder (33.6%); iso-Bu ester-HCl, m. 46° ; iso-Am ester-HCl, an oil; PhCH_2 ester-HCl salt + $3\text{H}_2\text{O}$, m. 57° , anhyd., m. $64-5^\circ$. From the tripeptide *l*-leucyl-*l*-leucyl-*l*-leucine, the Me ester-HCl, m. 215° , $[\alpha]_D^{20} -40.87^\circ$, was prepd. in the same manner; free base, m. $140-5^\circ$. Heating to 190° converted the latter into *l*-leucyl-*l*-leucine anhydride. IV was also prepd. synthetically by benzylation and esterification of the dipeptide, but neither the benzoyldipeptide nor its ester could be crystd.

A. W. DOX

Preparation of cholestenone. WILFRED A. SEXTON. Univ. of Liverpool. *J. Chem. Soc.* 1928, 2825-6.—A mixt. of 20 g. of pure cholesterol and 15 g. Cu bronze, heated at 2-3 mm. pressure and the temp. raised until distn. commences, gives 80% of cholestenone.

C. J. WEST

Cerebrosides. VIII. Galacto-sphingosine, the partial cleavage product of cerebrosides. E. KLENK AND R. HÄRLE. Univ. Tübingen. *Z. physiol. Chem.* 178, 221-38 (1928); cf. *C. A.* 22, 1782.—Treatment of cerebrosides with $\text{Ba}(\text{OH})_2$ splits off the fatty acid, leaving the linkage between sugar and base intact. The cerebrosides differ among themselves merely in the nature of their fatty acid, especially with those contg. unsatd. acid; hence the residual sugar-contg. base obtained from the mixt. present in a cerebroside fraction represents an individual substance, viz., psychosine. The

linkage in psychosine between its galactose and sphingosine components was thought by Thierfelder to consist in 2 O bridges where the galactose formed either an acetal or a 1,5-glycol ether by condensation with 2 adjacent hydroxyls of the sphingosine. Another mode of linkage which is now shown to be the actual structure is a single ether linkage between galactose and sphingosine with retention of the amylene oxide structure of the galactose. Psychosine was prepd. from 2 cerebroside fractions by the method previously used for its prepn. from cerebrone, and purified by recrystn. of its sulfate from 96% EtOH. The substance was identical with the psychosine from cerebrone, as shown by the sp. rotation of -16.6° . The free base was liberated by treatment of the sulfate with $\text{Ba}(\text{OH})_2$, and obtained cryst. by addn. of petroleum ether to the CHCl_3 -EtOH soln. It was converted into *dihydropsychosine* by hydrogenation of the sulfate in H_2O with a Pd catalyst. The substance sinters at 129° , m. 215° and decomp. 240° . Neither the base nor its sulfate could be obtained definitely cryst. Exhaustive methylation by repeated refluxing with MeI and Ag_2O gave a yellow viscous sirup insol. in H_2O and the usual org. solvents. On long standing it solidified to a glassy mass, and heated in a tube it distd. without charring. The max. MeO content was 20.7%, corresponding to a methylation of 5 OH groups. From 2.9 g. of the dihydro deriv. 3.74 g. of the methylation product was obtained. The methylated deriv. was then hydrolyzed by heating 5 hrs. with 16% H_2SO_4 . A gelatinous ppt. sepd. on cooling. This was washed with ice H_2O and crystd. from MeAc. The max. yield obtained was 57%. Analysis agreed with the formula $\text{C}_{14}\text{H}_{29}\text{CH}(\text{OMe})\text{CH}(\text{OH})\text{CH}_2\text{NMe}_3\cdot\text{HSO}_4\cdot 0.5\text{H}_2\text{O}$. The substance sinters at 70° , loses H_2O at 135° and m. 184° . The chloroplatinate crystallizes from EtOH and m. 215° with previous sintering. Methylation of dihydrosphingosine gave a similar product, the chloroplatinate of which was identical with that of the cleavage product. Only 1 of the 2 hydroxyls can be methylated. A small quantity of the di-MeO deriv. obtained in the first MeI treatment is due to an impurity of methylsphingosine in the original substance, since none is obtained from the mono-MeO deriv. by repetition of the methylation treatment. The failure of the 2nd OH to react with MeI shows that its position must be adjacent to the methylated amino group as in the formula above, and also the point of attachment of the galactose group in psychosine. The other product of hydrolysis of the methylated dihydropsychosine, *viz.*, tetramethylgalactose, was not isolated. A. W. DOX

Observations on the higher fatty acids (MORGAN, HOLMES) 2. Census of synthetic organic chemicals, 1927 (ANON) 25. New formula for the constitution of cellulose (ODDO) 23. Purifying camphor (U. S. pat. 1,693,243) 13. K salts, betaine hydrochloride and glutamic acid from residues of alcohol production from beet molasses (Brit. pat. 288,390) 16.

Volatile hydrocarbons. WILHELM GESSMAN and EDUARDO WILLIAM SHALDERS. Fr. 636,568, June 25, 1927. See Can. 282,392 (*C. A.* 22, 4198).

Hydrocarbons and oxygen derivatives. SOCIÉTÉ NATIONALE DE RECHERCHES SUR LE TRAITEMENT DES COMBUSTIBLES (Étienne Audibert, inventor). Fr. 639,441, Jan. 24, 1927. Hydrocarbons and their O derivs., such as alcs., are prepd. by circulating CO and steam over a catalyst, with heat and pressure. A suitable catalyst is a mixt. of oxides of Fe and Cu.

Hydrocarbons from oxides of carbon and hydrogen. I. G. FARBENIND. A.-G. Fr. 636,882, July 1, 1927. The contact chamber is combined with a high-pressure steam generator so that heat is transmitted between the two.

Hydrogenation of oxides of carbon. RUDOLF WIETZEL and WALTER SPEER (to I. G. Farbenind. A.-G.). Can. 284,235, Oct. 23, 1928. Catalysts for the reduction of oxides of C in addn. to Fe, Ni or Co or compds. of these, contain Cd, Tl or their compds. or mixts. of these substances. Such catalysts are effective at 180° to 200° , but preferably the process is carried out between 250° and 350° ; the catalysts may be used at temps. of about 400° . Admixture of the Cd or Tl prevents deposition of soot on the catalyst. Elements of the 8th group of the periodic system also give in combination

with Cd or Tl a similar action to that given by Fe, Ni or Co. The activity of the catalysts is assisted by addition of substances such as Cu, Au, Ag, Ce, Zr, Al, V, U, Cr, Mo, W, Mn, alkali metals and alk. earth metals or compds. of these, provided the metal compds. contg. O which are difficultly reducible to the metal are absent or present in amt. not exceeding 5%, preferably less than 1% of the catalytically active material. The process may be carried out at ordinary or elevated pressure. According to the conditions of working as regards temp., pressure, compn. of the gases, catalysts and the like, solid liquid or gaseous hydrocarbons may be produced or also products contg. O or mixts. of these. *E. g.*, a soln. contg. 12 parts Fe, 2 parts of Cd and 3 parts of Cu, in the form of nitrates, is pptd. with K_2CO_3 , and the resulting ppt. washed and dried. Over the resulting catalyst placed in a Cu-lined contact tube, water gas, freed from CO_2 and S compds. in the usual manner, is passed at a rate of 60 l. per each 8 cc. of catalyst per hr. at 300–350° at about 100 atm. pressure. From the separator, which is cooled to the ordinary temp. but maintained under pressure, a liquid is drawn off composed of two layers the upper one consisting mainly of hydrocarbons, higher alcs. and esters, while the lower one consists mainly of H_2O and about 40% of lower alcs., especially EtOH and org. acids. By attaching a vessel charged with active C, in the rear of the separator, benzenes and hydrocarbons boiling below 20° also may be recovered.

Concentrated fatty acids. ORRO FUCHS (to Holzverkohlungs Industrie A.-G.). Can. 284,062, Oct. 16, 1928. Concd. fatty acids are prepd. from volatile esters by sapon. the esters and distilling the resulting mixt. of acid, alc., unchanged ester and water. *E. g.*, a mixt. of 300 parts of $AcOEt$ and 300 parts of water is heated in a pressure vessel under about 8 atm. After the sapon. equil. is practically reached the liquid is allowed to enter a low capacious Raschig column which is connected with a condenser through a pressure-reducing valve. The unsapond. ester evapd. together with alc. and a considerable portion of the water travels upward, while the $AcOH$, together with a little water flows away from the bottom of the column. About 40% of the ester is sapond. and accordingly 80 parts of $AcOH$ is obtained as 80–90% acid. To accelerate the evapn. in the column a suitable supply of heat in the region of the point of entry of the column is advantageous. On the other hand, there should be little or no dephlegmation. Sapon. is accelerated by the addn. of small quantities of mineral acids, *e. g.*, 0.1 to 0.2% concd. H_2SO_4 .

Concentrated acetic acid or anhydride and unsaturated hydrocarbons. HOLZVERKOHUNGS-INDUSTRIE A.-G. Fr. 636,781, June 28, 1927. See Brit. 274,076 (C. A. 22, 1980)

Sulfonating aliphatic acids, etc. I. G. FARBENIND. A.-G. Brit. 288,612, June 21, 1926. Stearic or oleic or palmitic acid or other aliphatic or hydroaromatic carboxylic acids contg. more than 8 C atoms in their mol. are sulfonated at ordinary or higher temps. by use of SO_3 , fuming H_2SO_4 , chlorosulfonic acid or concd. H_2SO_4 at a temp. of 100° or higher. Diluents such as $PhNO_2$ or CCl_4 and catalysts such as P_2O_5 , diatomaceous earth and active C may be present. The products may be used as wetting, emulsifying and detergent materials and may be added to acid baths for dyeing, fulling and carbonizing, and may be used as catalytic fat saponifiers.

Aliphatoaromatic acids. I. G. FARBENIND. A.-G. Fr. 639,359, July 20, 1927. Aliphatoaromatic carboxylic acids are obtained by heating unsatd. acids of the type $CX_nC CXCO_2H$, in which X represents H or any univalent substituent with aromatic hydrocarbons contg. more than 2 condensed nuclei. A condensing acid or $AlCl_3$ may be added. In examples acrylic acid is heated with anthracene in the presence of a current of HCl gas. Chloropropionic acid is heated with *meso*-dichloroanthracene. Other examples are given.

2',4'-Dichloro-2-benzoylbenzoic acid and derivatives. I. GUBELMANN, H. J. WEILAND and O. STALLMANN. Brit. 288,884, Aug. 15, 1927. Dichlorobenzene is condensed with phthalic anhydride, the resulting 2',4'-dichloro-2-benzoylbenzoic acid is nitrated and then reduced and the 2',4'-dichloro-5'-amino-2-benzoylbenzoic acid is finally treated with a dehydrating agent in order to close the ring and produce 1-amino-2,4-dichloroanthraquinone.

Aromatic amines. I. G. FARBENIND. A.-G. Fr. 639,557, Aug. 10, 1927. Nitro compds. are reduced by insufficient quantities of solns. of sulfides or polysulfides or thiosulfates for total reduction in the presence of H or CO or mixts. thereof, under pressure and at a high temp. and preferably in the presence of a catalyst such as FeO, spongy Fe or Ni. Examples are given.

Secondary and tertiary aromatic amines from a mixture of bases. BRITISH DYE-STUFFS CORP., LTD., REGINALD W. EVERATT and ERNEST H. RODD. Ger. 468,304, May 3, 1927. The bases are treated with $COCl_2$ in presence of water with sufficient

alkali to neutralize the HCl. Thus, a mixt. of mono- and diethylaniline is added to water and while COCl_2 is led in, NaOH or Na_2CO_3 is slowly stirred in. HCl is then added. The phenylethylurea chloride is filtered off and washed with dil. HCl. It is then hydrolyzed to obtain pure monoethylaniline, or condensed with a further mol. to produce β -diethyldiphenylurea.

Halogen-substituted tertiary amines. I. G. FARBENIND. A.-G. Brit. 288,665, Dec. 10, 1926. Such amines of the benzene or naphthalene series are obtained by treating the amines in aq. soln. with halogens in the presence of an inorg. acid. The halogens may be used in nascent state by adding a bromate or chlorate to the acid soln. Examples are given of the production of 1-methyl-3-chloro-(or bromo-)-4-dimethylaniline, 1-chloro-(or bromo-)-2-dimethylaminonaphthalene, *o*-chloro-(and *o,p*-dichloro-)-dimethylaniline and 3,3'-dichloro-(or dibromo-)-4,4'-tetramethyldiaminodiphenylmethane. The products are suitable for the prepn. of quaternary NH_4 compds. as described in Brit. 286,984. Cf. C. A. 22, 3668.

Higher alcohols from homologs of ethylene. COMPAGNIE DE BÉTHUNE. Fr. 636,651, Oct. 20, 1926. Ethylene from coke-oven gas or from gas cracking is passed through a tower contg. H_2SO_4 dild. to about 90% and kept at a temp. of about 18° , whereby propylene, amylene, etc. are absorbed to form propylsulfuric acid, etc., which are worked up in the usual way to form higher alcs. or ethers.

Aromatic *N*-aminoalkylamino aldehydes. I. G. FARBENIND. A.-G. Brit. 288,972, April 16, 1927. Compds. of this class are prepd. by (a) treating an aromatic aminoalkylamino compd. having a free *p*-position with CH_2O in the presence of an aromatic hydroxylamine compd. and decompg. the resulting anhydro compd. with alkali (in which case the hydroxylamine compd. may be formed *in situ*); or, (b) converting an aromatic aminoalkylamino compd. contg. (or capable of acquiring in the course of the reaction) a substituent group which can be transformed into an aldehyde group, by treatment in the usual manner as by oxidation, for producing aldehydes (suitable substituents being methyl, methylol and isoalkyl groups); or, (c) introducing the aminoalkyl group into the primary or secondary amino group of an aromatic aldehyde by a usual alkylation method. Oily products are obtained which may be used for producing therapeutic compds. Examples are given of the production of *N*-diethylaminoethyl-*p*-aminobenzaldehyde, *N*-methyldiethylaminoethyl-*p*-aminobenzaldehyde and *N*-methyl-(α -dimethylamino- γ -methylpropane)-*p*-aminobenzaldehyde.

Cyclic ketones. I. G. FARBENIND. A.-G. Brit. 288,441, April 26, 1927. Cyclic ketones are obtained by heating aromatic hydrocarbons or their homologs or substitution products with olefin-carboxylic acids or their H halide addn. products and an acid condensing agent with or without use of a solvent. Examples are given of the production of 1-indanone, from C_8H_8 , a mixt. of 4- and 6-methyl-1-indanones from toluene, 4- and 6-chloro-1-indanones from chlorobenzene and corresponding products from bromobenzene, *o*- and *m*-dichlorobenzene, *m*-dibromobenzene and *o*-chlorotoluene and of various other similar compds. Cf. C. A. 22, 4537.

Metallic derivatives of ketones. BRITISH DYESTUFFS CORP., LTD., AND S. COFFEY. Brit. 289,493, Oct. 28, 1926. Normal metallic derivs. of β -diketones are prepd. by treating a β -diketone of the type R.CO.CHR'.CO.R'' , contg. more than 5 C atoms (in which R and R'' represent hydrocarbon radicals and R' is a hydrocarbon radical or H) with Al, Fe, Ni, Co, Mn, Cr, Zn, Ti, Ce or Th or an oxide, hydroxide or salt of these metals. Examples are given of the prepn. of Al propionylacetone, γ -ethylacetylacetone, γ -butylacetylacetone, ferric propionylacetone, butyrylacetone, γ -methylacetylacetone, γ -ethylacetylacetone and γ -butylacetylacetone; nickelous propionylacetone, γ -methylacetylacetone, and acetylmesityl oxide, cobaltous propionylacetone and butyrylacetone, cobaltic propionylacetone and γ -methylacetylacetone, manganic benzoylacetone and propionylacetone, Cr propionylacetone, benzoylacetone, γ -ethylacetylacetone and γ -butylacetylacetone, Zn, Ti, Ce and Th propionylacetone, Th butyrylacetone and benzoylacetone.

Oxidizing aldoses. CHEMISCHE FABRIK VORM. SANDOZ. Brit. 289,280, June 17, 1927. In the oxidation of glucose, lactose or the like to the corresponding mono-carboxylic acids such as gluconic and similar acids, by use of hypochlorite in the presence of Br and I derivs., an alk. medium is used throughout the process and the temp. is maintained at 15° or lower. Milk of lime may be added. Examples are given of the treatment of glucose and lactose, and reference is made also to the treatment of mannose and maltose. Cf. C. A. 22, 4538.

Benzoates. WM. S. CALCOTT and HERBERT W. DAUDT (to E. I. du Pont de Nemours & Co.). U. S. 1,692,927, Nov. 27. Alkali metal permanganate is used to oxidize impurities in crude benzoic acid made from phthalic acid, in aq. soln., pre-

paratory to producing undisclored sol. white benzoates such as those of alkali metals or NH_4 .

Cyanides of the perylene series. ALFRED PONGRATZ (to Felice Bensa). U. S. 1,692,417, Nov. 20. Halogen compds. of perylene such as dichloro-, dibromo- or tetrachloro-perylene are mixed with metal cyanides such as $\text{Cu}_2(\text{CN})_2$ and the mixt. is heated to 300° to form perylene dicyanide, monochloroperylene nitrile or similar compds.

Complex vanadyl compounds of the quinoline series. BEHRINGWERKE, A.-G. (Friedrich Krollpfeiffer and Hermann Schultze, inventors). Ger. 468,300, Mar. 11, 1925. Solns. of vanadyl salts are allowed to react with alk. solns. of 7-halo-8-hydroxyquinoline-5-sulfonic acid, and the complex vanadyl compd. so formed is sepd. by addn. of acid. Thus, 7-iodo-8-hydroxyquinoline-5-sulfonic acid is dissolved in NaOH and V_2O_5 added. On acidulation, the vanadyl compd. seps. out as greenish flakes.

Pyridine derivatives. C. RATH (to Schering-Kahlbaum A.-G.). Brit. 288,628, April 14, 1927. Hydroxypyridines or their derivs. are obtained by treating a halopyridine which has no saponifiable group in the 5-position or a deriv. with an alk. or acid saponif. agent with or without a solvent or diluent; *e. g.*, 2-chloropyridine is treated with KOH to produce 2-hydroxypyridine or 2-chloro-5-nitropyridine is treated with either NaOH or HCl to produce 2-hydroxy-5-nitropyridine.

2-Arylaminoanthrahydroquinone compounds. KARL SCHIRMACHER, HANS SCHLICHENMAIER, WALTER KROSS, WILHELM SCHAICH, HANS TAMPKE and HANS NEUMANN (to I. G. Farbenind. A.-G.). Can. 283,918, Oct. 9, 1928. 2-Acetamidoanthraquinone (26.5 parts) is suspended in 200 parts of alc. and to this 2 parts of Ni catalyst is added and the whole is stirred in an autoclave under 20 atm. pressure of H_2 . The H_2 is absorbed at ordinary temp. with evolution of heat and absorption is finished after a short period. To the suspension of the easily oxidizable 2-acetamido-9,10-anthrahydroquinone thus prep'd. are added 25 parts of NaOH soln. of 40°Bé. and some water, and to this mixt. is then added at ordinary temp., with stirring and exclusion of air, 30 parts of Me_2SO_4 . Heat is evolved and the temp. should not exceed 40° . The mass is kept alk. and, if required, some further Me_2SO_4 is added until the red color of the alk. soln. has disappeared. When the reaction is finished addn. of H_2O causes the sepn. of 2-acetamido-9,10-anthrahydroquinone dimethyl ether, greenish yellow, cryst., m. $235-240^\circ$, and after a single crystn. from alc., m. 253° . It dissolves in alc., benzene and glacial AcOH with a green fluorescence.

Water-soluble santalol derivative. VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. Swiss 126,303, July 13, 1926. Bromoacetic acid santalyl ester is caused to react with hexamethylenetetramine. The initial material may be obtained by reaction of santalol with bromoacetyl bromide in CHCl_3 soln. in presence of pyridine. Cf. C. A. 22, 2812.

A new basic derivative of the camphor series. HANS RUPE. Swiss 126,677, Apr. 17, 1927. The new substance, $\text{C}_8\text{H}_{14}\text{CO.NH.C:NH}$, is prep'd. by treating cam-

phoronitrile acid amide with alkali. It forms transparent crystals m. 238° . The hydrochloride, m. 230° , and the picrate, m. 293° .

Preparation of a lepidine-containing quinoline base mixture by catalytic means. ALEXEI. E. CHICHIBABIN. Ger. 468,303, Sept. 15, 1926. A vaporous mixt. of PhNH_2 , AcH or paraldehyde is led over the oxides of ter- or quadrivalent metals heated to $350-550^\circ$. Thus, vapor contg. PhNH_2 and paraldehyde is led through Cu tubes contg. granular Al_2O_3 at $480-490^\circ$. A quinoline base mixt., b. $220-270^\circ$, is obtained. By fractional pptn. and recrystn. pure lepidine picrate, m. $210-211^\circ$, is obtained.

Preparation of a compound from quinine and isobutylallylbarbituric acid. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,680, May 10, 1927. Quinine and isobutylallylbarbituric acid are mixed in mol. proportions. The product forms colorless crystals, m. $112-115^\circ$; 0.2049 g. neutralizes 14.35 cc. 0.1 $\text{N H}_2\text{SO}_4$.

Compounds of indene and phenols. I. G. FARBENIND. A.-G. Fr. 636,606, June 27, 1927. New compds. of indene and phenols are made by treating with hydric acids (HCl , HBr , HI) or with metallic chlorides a mixt. of indene or substances contg. indene or indene derivs. and uni- or multi-valent phenols or their substitution products. Several examples are given. The products have *disinfectant and therapeutic properties* and may be used for the *manuf. of lakes and dyes*.

Addition products of acetylene and similar hydrocarbons. VEREIN FÜR CHEM. INDUSTRIE A.-G. and H. WALTER. Brit. 288,707, Jan. 11, 1927. C_2H_2 and steam are passed into a soln. formed from HgO and H_2SO_4 , and the vapors are condensed to

recover *acetaldehyde*. C_2H_2 and HOAc vapor are passed into a soln. formed from HgO and HOAc to obtain *ethylidene diacetate*. C_2H_2 and propionic acid similarly yield *ethylidene dipropionate*. C_2H_2 and CCl_3CO_2H are passed into a soln. formed of HgO and fused CCl_3CO_2H to produce a *vinyl ester of trichloroacetic acid*. C_2H_2 and iso-Bu alc. vapor passed into a suspension of mercuric phosphate in iso-Bu alc. yield *ethylidene-diisobutyl ether*. C_2H_2 and ethylene glycol vapor passed into a soln. of $HgSO_4$ in ethylene glycol yield *ethylene ethylidene ether*. Allylene and steam passed into a soln. formed from HgO and H_2SO_4 yield *acetone* (an isomer of the methylvinyl alc. probably being first formed). Allylene and HOAc vapor passed into a soln. formed from HgO and HOAc yield *acetone and Ac_2O* (probably dissocn. products of methylethylidene diacetate first formed). Allylene and iso-Bu alc. vapor passed into a suspension of mercuric phosphate in iso-Bu alc. yield a condensate contg. *methylvinylisobutyl ether*.

Sulfur compounds. WILHELM LOMMEL, THEODOR GOOST and HERMANN FRIEDRICH (to I. G. Farbenind. A.-G.). Can. 284,056, Oct. 16, 1928. New compds. contg. S are obtained by reaction of CS_2 upon secondary alicyclic bases. The reaction can take place in the presence of other org. or inorg. bases or oxides or hydroxides. The reaction mass is cooled and the process carried out with or without a diluent (e. g., $PhCl$, CCl_4 , C_6H_6 , EtOH, or water). The products are partly solids, oils and resins. Nearly all are difficultly sol. in ether and benzene, some are sol. in $CHCl_3$, benzene, or alc. and some in water. They cannot be distd. If heated at elevated temp. decompn. takes place. By slight oxidation thiuram disulfides are formed. E. g., 76 parts of CS_2 is gradually run into a stirred and cooled mixt. of 127 parts hexahydroethylaniline, 99 parts of hexahydroaniline and 400 parts of ice water. The hexahydroaniline salt of ethylhexahydrophenyldithiocarbamic acid seps., at first in form of an oil, which becomes cryst. after some time. The new compds. are valuable in *vulcanizing rubber*.

Tetraalkyl lead. WM. S. CALCOTT and HERBERT W. DAUD (to E. I. du Pont de Nemours & Co.). U. S. 1,692,926, Nov. 27. An alloy of Pb with an alkali metal such as Na is progressively added to EtCl or other alkyl chloride to effect reaction.

Acetic acid. CHEMISCHE FABRIK AUF ACTIEN (VORM. E. SCHERING). Fr. 637,129, July 6, 1927. In the production of AcOH from Ca acetate and H_2SO_4 , the Ca acetate is used in soln. in AcOH and the soln. is effected in a paste or mud of plaster of Paris and AcOH from Ca acetate and H_2SO_4 . Cf. C. A. 22, 4133.

Acetic acid. HERMANN SUIDA. Fr. 639,112, Aug. 5, 1927. AcOH is extd. from a mixt. of superheated AcOH vapor and steam by esters of mono- or poly-basic cyclic org. acids with uni- or multi-valent alcs. Examples are, the dibutyl or dihexyl ester of *o*-phthalic acid, or neutral esters of glycol or glycerol.

Carboxylic acid anhydrides; ethylidene diacetate. CONSORTIUM FÜR ELEKTRO-CHEMISCHE INDUSTRIE GES. Brit. 288,549, April 11, 1927. Reaction between a vinyl ester and a carboxylic acid, e. g., between vinyl acetate and HOAc, is effected preferably by heating together in the presence of a catalyst such as H_2SO_4 , H_3PO_4 , benzenesulfonic acid, sulfoacetic acid or other suitable acid or an acid or neutral salt such as Hg sulfate. Production of Ac_2O and ethylidene diacetate from vinyl acetate and HOAc is described. The process may be made continuous and distn. effected in a column still. Mixed anhydrides may be produced such as acetopropionic anhydride from vinyl acetate and propionic acid and butyroacetic anhydride from vinyl butyrate and HOAc. Increased or reduced pressures, inert gases, solvents or diluents may be used in effecting the reactions.

Acetic anhydride. WALTER BADER (to Celanese Corp. of America). U. S. 1,693,331, Nov. 27. Acetone is subjected to the action of CO_2 in excess under pressure (suitably 750 lb. per sq. in.) at a temp. of about 350° and in the presence of a catalyst such as Mn carbonate pptd. on pumice. Other aliphatic anhydrides also may be similarly produced from the corresponding ketones.

Citric acid. AUGUSTE FERNBACH and JOHN L. YUILL (to Rowntree and Co., Ltd.). U. S. 1,691,965, Nov. 20. In producing citric acid from solns. of sucrose contg. the necessary nutrient materials such as NH_4NO_3 , K phosphate and $MgSO_4$ by means of fungi such as *Aspergillus*, HCl is added to give a p_H of 1.2-2.5, which renders sterilization by heat unnecessary. U. S. 1,691,966 specifies a similar process in which, instead of HCl, there may be added other "strong" acids such as H_2SO_4 . Cf. C. A. 22, 663.

Phthalamic acid and its derivatives. ANTAL FODOR. Fr. 636,846, June 30, 1927. Phthalamic acid is prepd. from phthalic anhydride by adding NH_3 soln. and evapg. to dryness and treating with an alkali. Esters are prepd. from the alkali phthalamate by treating with an alc. and H_2SO_4 at 66° . Compds. of the esters with N derivs. are prepd. by heating then together with alc. under reflux on a water bath. The N derivs. may be esters or amino or benzoyl derivs. of *p*-aminobenzoyldiethylaminoethanol.

Purification of phthalic anhydride. ALPHONS O. JAEGER and FRANK A. CANON (to The Selden Co.). Can. 284,272, Oct. 23, 1928. Technical phthalic anhydride is heated for a shorter or longer time depending on the amt. of impurities with or without elevated pressure, and in some cases, even under diminished pressure, and with agitation. The heating may be about the boiling point of phthalic anhydride at the pressure chosen and causes the unsatd. impurities to condense or polymerize to non-volatile products, which can be easily sep'd. from the phthalic anhydride by distn. or sublimation. When high pressure is used, it is frequently not necessary to heat up to the boiling point of phthalic anhydride, in many cases a temp. of 150° to 280° being quite sufficient. For most grades of technical anhydride heating for 2 to 10 hrs. or longer is desirable, e. g., 1000 kg. of technical phthalic anhydride is heated for $1\frac{1}{2}$ hr. to the b. p. in a kettle surrounded by a metal bath and under 3 to 5 atm. pressure. A little superheated steam is then blown into the boiling melt, whereupon the pressure is allowed to drop and the phthalic anhydride distd. off. A colorless product of good purity is obtained. Cf. C. A. 22, 4539.

Benzimidazolone-earsonic acid. KARL STREITWOLF and ALFRED FEHRLE (to I. G. Farbenind. A.-G.). Can. 283,919, Oct. 9, 1928. N-substituted benzimidazolone-earsonic acids are obtained by the action of H_3AsO_3 on diazo compds. produced from aminobenzimidazolones, substituted at the nitrogen by an alkyl group or alkylene group.

1-Aminoanthraquinone-2-sulfonic acid. I. G. FARBENIND. A.-G. Brit. 289,097, April 23, 1927. 1-Aminoanthraquinone is sulfonated in the presence of a sulfate of an alkali or alk. earth metal (suitably by use of fuming sulfuric acid and Na_2SO_4) so that only 1-aminoanthraquinone-2-sulfonic acid is produced.

3-(4-Methoxyphenylamino)-1,8-naphthosultam-6-sulfonic acid. I. G. FARBENIND. A. G. Swiss 126,339, Aug. 31, 1926. A 1,8-naphthosultampolysulfonic acid having a sulfo group in the 3-position is treated with 4-anisidine.

3-*p*-Tolylamino-1,8-naphthosultam-6-sulfonic acid. I. G. FARBENIND. A.-G. Swiss 126,338, Aug. 31, 1926. *p*-Toluidine is treated with a 1,8-naphthosultampolysulfonic acid having a sulfo group in the 3-position.

2-Hydroxynaphthalene-6-carboxymonosulfonic acids. I. G. FARBENINDUSTRIE A. G. Fr. 636,561, June 24, 1927. A mixt. of 2-hydroxynaphthalene-6-carboxy-3- and 8-sulfonic acids is prepd. by treating 2-hydroxynaphthalene-6-carboxylic acid with conc'd H_2SO_4 . The 2 acids are sep'd. by using the difference in soly. of their alkali salts. By using fuming H_2SO_4 , 2-hydroxynaphthalene-6-carboxydisulfonic acid is obtained, one sulfonic group being split off by heating the sulfonation mass dild. with H_2O , to give 2-hydroxynaphthalene-6-carboxy-3-monosulfonic acid.

4,4'-Dichloro-1,1'-binaphthyl-8,8'-dicarboxylic acid. LEOPOLD CASSELLA & Co. G. M. B. H. Swiss 126,337, June 30, 1926. The diazo compd. from 4-chloro-1,8-aminonaphthoic acid is reduced. Reduction may be effected with ammoniacal cuprous salts. The product melts above 300° .

5,5'-Diethoxy-1,1'-binaphthyl-8,8'-dicarboxylic acid. LEOPOLD CASSELLA & Co. G. M. B. H. Swiss 126,336, June 30, 1926. The diazo compd. from 5-ethoxy-1,8-aminonaphthoic acid is reduced. Reduction may be effected with ammoniacal cuprous salts. The product decomposes at $300-310^{\circ}$.

Formamide of 2-hydroxy-4-aminobenzene-earsonic acid. ÉTABLISSEMENTS POULENC FRERES and ERNEST FOURNEAU. Fr. 637,049, Oct. 29, 1926. The formamide of 2-hydroxy-4-aminobenzene-earsonic acid is prepd. by heating CH_3O with 2-hydroxy-4-aminobenzene-earsonic acid. It crystallizes from water in fine needles which do not have well defined m. p.

Dehydrating ethyl alcohol. FIRMA E. MERCK. Swiss 126,401, Feb. 12, 1927. The alc. is heated with CaO in a closed vessel to a pressure above atm.

Isopropyl alcohol. GEORGE O. CURME, JR., and ERNEST W. REID (to Carbide and Carbon Chemicals Corp.). U. S. 1,695,249, Dec. 11. Diisopropyl sulfate is hydrolyzed suitably at 40° and lower temps.) while emulsified with water.

Furfuryl alcohol and methylfuran. SOCIÉTÉ ANON. DES DISTILLERIES DES DEUX-SEVRES. Fr. 639,756, Jan. 31, 1927. Furfural vapor is hydrogenated with a large excess of H_2 ; a catalyst is used. The proportion of methylfuran increases with increase of H_2 .

Acetaldehyde. CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 288,213, April 4, 1927. AcH is produced by decomp. a vinyl ester such as vinyl acetate with H_2O , suitably with the addn. of a catalyst such as H_3PO_4 , H_2SO_4 , and org. sulfonic acids, acid salts such as NaH_2PO_4 or $NaHSO_4$, and a solvent such as $HOAc$. Alk. agents may also be used in the reacting mixt., in which case the aldehyde produced

may be converted into aldol, crotonaldehyde or aldehyde resin if desired. An excess of H_2O is used to avoid the production of ethylidene ester, which resinifies easily. The reaction may be continuously effected in a column still or similar app., from which the AcH is continuously distd.

Butyraldehyde. CHARLES BOGIN (to Commercial Solvents Corp.). U. S. reissue 17,157, Dec. 11. See original pat. 1,556,067 (C. A. 19, 3490).

Butyraldehyde from crotonaldehyde. CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. Swiss 126, 197, April 30, 1927. See Brit. 271,103 (C. A. 22, 1596).

Formaldehyde, ethylene, etc., from methane. HENRI SPINDLER. Fr. 637,050, Oct. 29, 1926. Methane and O are condensed by heating them together under pressure in the presence of a catalyst such as Cu to produce CH_2O . The CH_2O may be combined with another CH_4 mol. by using as catalyst Fe, Ni, Co, Cu, Cr, etc., or their compds. and the temp. may be raised to 500° and the pressure to 1000 kg. to give ethylene, which may be used to make $EtOH$. If $ZnCl_2$ is used as catalyst higher hydrocarbons, cyclic or acyclic, may be obtained.

Metaldehyde. EMIL LÜSCHER and HEINRICH STEIGER (to the Firm: Elektrizitätswerk Lonza). U. S. 1,693,204, Nov. 27. In producing metaldehyde which burns practically free from soot and ash, acetaldehyde is treated with catalyzer salts such as NH_4Br , hydrazine chloride, or hydroxylamine chloride, which are obtained from the action of strong acids on inorg. N bases.

Acetone. KOLMAN ROKA and KARL WIESLER (to the Holzverkohlungs-Industrie A.-G.). Can. 283,954, Oct. 9, 1928. Fe shavings are coated with iron oxide and manganese oxide and filled into a reaction pipe. A mixt. of 1 part by vol. of acetylene and 10 parts by vol. water vapor is passed at 475° through the reaction pipe. The vapors which pass off are condensed. There is obtained acetone in a yield of 95% of the theoretical amt. calcd. on the acetylene which has been used.

Glycols. GEORGE O. CURME, JR. (to Carbide and Carbon Chemicals Corp.). U. S. 1,695,250, Dec. 11. A chlorohydrin such as ethylene chlorohydrin while dissolved in water is reacted on with caustic alkali until the Cl is substantially completely taken up in the reaction, and the rate of the reaction is restricted (suitably by regulation of the temp. and concn.) so that the major portion of the chlorohydrin is converted into glycol. Cf. C. A. 22, 92.

Esters of glycols. OSKAR LOEHR (to I. G. FARBENIND. A.-G.). Can. 285,356, Dec. 4, 1928. Esters of ethylene glycol and homologous glycols or derivs. thereof are manufd. by heating ethylene oxide or a homolog or deriv. thereof with at least twice the mol. proportion of a carboxylic acid in the presence of a catalyst, *e. g.*, a strong inorg. acid or an acid salt. By this means the ester of the corresponding glycol is produced in which the two hydroxyl groups of the glycol are substituted by the radical of the carboxylic acid. From ethylene oxide and $AcOH$ acid, ethylene glycol diacetate is obtained.

Polyalkylene glycols and their alkyl ethers. OSKAR LOEHR (to I. G. FARBENIND. A.-G.). Can. 285,357, Dec. 4, 1928. Polyalkylene glycols and their derivs. are manufd. by causing 2 or more mol. proportions of an olefin oxide to react upon 1 mol. proportion of a hydroxyl compd. in the presence of a catalyst. If the hydroxyl compd. used is water or a polyhydric alc., polyalkylene glycols are formed; by using monohydric alcs. the ethers of polyalkylene glycols are obtained. As catalysts small amts. of strong mineral acids, *e. g.*, H_2SO_4 or H_3PO_4 , or of acid-reacting salts, *e. g.*, $NaHSO_4$, or basic substances such as alkali alcoholates or tertiary amines can be employed.

Aryl ethers of polyalkylene glycols. OSKAR LOEHR (to I. G. Farbenind. A.-G.). Can. 285,359, Dec. 4, 1928. Aryl ethers of polyalkylene glycols are manufd. by reacting upon 1 mol. proportion of an aromatic hydroxyl compd. with 2 or more mol. proportions of an olefin oxide in the presence of suitable catalyst. As catalysts, basic substances such as alkali phenolates, alkali alcoholates and tertiary amines can be employed. *E. g.*, into 500 parts of technical cresol mixed with 10 parts of KOH , 500 parts ethylene oxide is introduced at 100° . A mixt. boiling between 170° and 200° under 12 mm. pressure and rich in diethylene glycol cresyl ether is obtained besides some monoethylene glycol cresyl ether.

Esters of polyalkylene glycols. OSKAR LOEHR (to I. G. Farbenind. A.-G.). Can. 285,358, Dec. 4, 1928. Acetates of polyalkylene glycols are manufd. by reacting upon 1 mol. proportion of $AcOH$ with 2 or more mol. proportions of an olefin oxide in the presence of H_2SO_4 .

Recovery of glycerol. JOHANNES ALTENBURG. Ger. 467,350, Mar. 12, 1927. Glycerol is recovered from albuminous or glutinous materials by treating them with

CH_2O or compds. which liberate CH_2O , heating to a high temp., with or without the addn. of a condensation medium, and extg. the glycerol from the condensation product by washing.

Camphor. SOCIÉTÉ NOBEL FRANÇAISE. Fr. 636,809, June 29, 1927. In prepg. camphor from borneol or isoborneol by catalytic dehydrogenation, the support for the catalyst is a soft CaCO_3 , e. g., crushed chalk is soaked with a soln. of nitrate or acetate of Ni and reduced by H.

Menthol. RHEINISCHE KAMPFER FABRIK GES. Brit. 289,125, Jan. 17, 1927. Crude inactive menthol obtained by the hydrogenation of thymol, menthone or isomenthone is first subjected to a preliminary freezing-out or fractional distn. or both, and the partially purified inactive menthol is then converted into its esters or ester acids, which are recrystd. and sapond. Pure inactive menthol (racemate of natural menthol) is thus obtained, while from the remaining fractions of the preliminary treatment neomenthol, m. 51° , is obtained together with small quantities of a solid inactive isomenthol, m. 52° . Brit. 289,126 specifies the conversion of solid inactive isomenthol, m. $52-3^\circ$, by heat treatment with H, with or without pressure, into inactive menthol, employing catalysts, or by use of alkali mentholates and heating. The product is subjected to freezing-out or fractional distn. and the crude inactive menthol obtained is purified by conversion into its esters or ester acids, followed by crystn. and sapon. Cf. following abstract and C. A. 22, 4540.

Menthol. RHEINISCHE KAMPFER-FABRIC. Swiss 126,585, Jan. 7, 1927. Impure inactive menthol is converted into a cryst. ester and recrystd. to form an isomeric menthol ester, m. $52-3^\circ$, from which the menthol is then regenerated. Thus, impure menthol is churned with phthalic anhydride and alc. added. The phthalic ester seps. out and is recrystd. in alc. after which the menthol is recovered by steam. Other examples are given.

Thymol and menthol. WALTER SCHOELLER, HANS JORDAN and REINHARD CLERC (to Schering-Kahlbaum A.-G.). Can. 283,943, Oct. 9, 1928. 3-Methyl-6-isopropylphenol and its products of hydrogenation are produced by heating the product of condensation of crude cresol and acetone to effect decompn. thereof, treating the decompn. product with H in the presence of a catalyst until 2 or 8 atoms of H have entered into combination, and subjecting the resulting mixt. to fractional distn. and to freezing out. Cf. C. A. 22, 2756.

Phenol. I. G. FARBENIND. A.-G. Brit. 288,308, April 6, 1927. PhCl is passed with steam over active silica gel at a temp. of about 350° .

Anthraquinone derivative. I. G. FARBENIND. A.-G. Swiss 126,579, Feb. 28, 1927. A new deriv. of anthraquinone is prepd. by the reaction between anthrone and cinnamaldehyde.

Ethylene. GEORGE F. HORSLEY (to Imperial Industries, Ltd.). Can. 284,405, Oct. 30, 1928. Gases contg. C_2H_4 are freed from their S compds. and scrubbed with an acid soln. of AgNO_3 contg. at least about 200 g. of AgNO_3 per l. and about 0.3 N with respect to HNO_3 and cooled to $0-10^\circ$ to absorb the C_2H_4 . The soln. is regenerated and C_2H_4 recovered therefrom by heating to $50-70^\circ$.

Recovery of solid polymerized styrene. WILLIAM S. JOHNSTON and ALEXIS W. KEEN (to Dominion Rubber Co., Ltd.). Can. 283,915, Oct. 9, 1928. Superheated steam at 115 lb. pressure is utilized to heat a jacketed conduit through which conduit a 60% soln. of a polymerized styrene in ethylbenzene or other org. solvent flows while under a pressure of 70 to 80 lbs. The steam when it reaches the end of the conduit intermingles with the preheated polymerized styrene soln. and the mixt. is forced through a constricted passage and on issuing therefrom the vaporized solvent and steam pass out of the dried styrene, leaving a sponge-like mass, which may be pulverized.

Xylenes. I. G. FARBENIND. A.-G. Fr. 639,252, Aug. 9, 1927. The *o*- and *p*-xylenes are obtained by the action of CH_2O on toluene in the presence of HCl , with or without condensing agents such as ZnCl_2 , AlCl_3 , SnCl_4 , the *o*- and *p*-xylyl chlorides being reduced with H. The xylenes may be sepd. by fractional distn.

Filtering xylidine or similar materials. JUSTIN F. WATT. U. S. 1,693,417, Nov. 27. In filtering and sepg. an org. material such as xylidine from inorg. material in a filter cake, the material in the filter is subjected to the pressure of vapors of a volatile substance, such as steam in which the org. component is sol., and the org. component is removed by passing the vapors through the filter cake and subsequently the materials passing through the cake are recovered. Volatile solvents such as benzene also may be used.

Cyclohexylbenzene. PAUL SCHVING. Fr. 636,686, Oct. 23, 1926. Cyclohexylbenzene and its homologs are prepd. by heating, in the presence of concd. H_2SO_4 , cyclohexanol with C_6H_5 and its homologs.

Catalytic oxidation of naphthalene. ALPHONS O. JAEGER (to Selden Co.). U. S. 1,692,126, Nov. 20. $C_{10}H_8$ vapors mixed with an oxidizing gas such as air are caused to react in the presence of a catalyst contg. a zeolite, in order to form products such as *α*-naphthoquinone or phthalic anhydride. Numerous examples are given.

1-Alkoxy- or aralkoxy-methyl-3,7-dimethylxanthines. I. G. FARBENIND. A.-G., K. SCHRANZ and C. LUTTER. Brit. 288,366, Jan. 6, 1927. These compds. are obtained by treating theobromine or its salts with a chloromethyl ether of the formula $ROCH_2Cl$, in which R represents an alkyl group higher than Me or an aralkyl group; e. g., 1-ethoxymethyl- and 1-isopropoxymethyl-3,7-dimethylxanthines are prepd. by the action of the Na or Pb salt of theobromine with chloromethyl ethyl ether and chloromethyl isopropyl ether, resp. Other products referred to are: 1-propoxymethyl-, 1-butoxymethyl-, 1-isobutoxymethyl-, 1-benzyloxymethyl-, and 1-allyloxymethyl-3,7-dimethylxanthines. Chloromethyl ethers such as the butyl chloromethyl ether, benzyl chloromethyl ether and allyl chloromethyl ether are made by reaction of the corresponding alc. with CH_3O and HCl.

Purifying nitroaniline. HAMILTON MERRILL (to Tower Mfg. Co.). U. S. 1,692,308, Nov. 20. *p*-Nitroaniline formed from *p*-nitrochlorobenzene is treated with an aq. soln. of an alkali such as NaOH or NH_3 and the soln. is filtered off from the nitroaniline while it still contains alkali. Cf. C. A. 22, 2756.

Calcium aluminum ethylate. CHEMISCHE FABRIK AUF ACTIEN (VORM. F. SCHERING). Swiss 126,335, Oct. 12, 1926. A complex Ca Al ethylate is obtained by the interaction of Ca ethylate and Al ethylate in the mol. proportions 1:2, at least one of the ethylates being in the nascent state.

Sodium aluminum ethylate. CHEMISCHE FABRIK AUF ACTIEN (VORM. F. SCHERING). Swiss 126,334, Oct. 12, 1926. A complex Na Al ethylate is obtained by the interaction of Na ethylate and Al ethylate in equimol. proportions, at least one of the ethylates being in the nascent state.

Emetine cholate. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,503, Jan. 12, 1927. Emetine and cholic acid are caused to react in mol. proportions. Alternatively emetine-HBr and Na cholate may be used. It is an amorphous yellowish substance.

Quinine cholate. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,502, Dec. 17, 1926. Cholic acid is caused to react on quinine. Thus, quinine methanesulfonate is stirred with Na cholate. The substance seps. out as a colorless amorphous ppt. Its soly. in water can be considerably increased by the addn. of such substances as urethan and urea.

3,6-Diamino-10-methylacridinium cholate. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,678, Jan. 6, 1927. Cholic acid is allowed to act on 3,6-diamino-10-methylacridinium chloride.

Lupanine. E. VON AMMON and K. SZOMBATHY. Brit. 288,637, April 14, 1927. Seeds of lupins such as those of *Lupinus albus* are extd. with a soln. of a neutral salt sufficiently concd. to ppt. the conglutin so as to avoid its loss. A suitable soln. may be formed of water 100, and NaCl 18, or Na_2SO_4 32 or $MgSO_4$ 27 or $CaCl_2$ 8 parts. The soln. is treated with acid such as H_2SO_4 to ppt. the proteins dissolved by the salt soln., filtered and the filtrate is rendered alk. and extd. with C_6H_6 , from which the lupanine is recovered. The lupanine when converted into the hydrochloride can be sepd. into the *d* and *l* forms as the *d*-lupanine-HCl can be dissolved selectively in $CHCl_3$.

Pyridyl iodochloride. SCHERING-KAHLBAUM A.-G. (Curt Rath, inventor). Ger. 468,302, Nov. 12, 1924. The I substitution derivs. of pyridine having the I at the 3- or 5-position are subjected to the action of Cl. Thus, Cl is bubbled into an ice-cooled soln. of 3-iodopyridine in $CHCl_3$. The 3-pyridyliodochloride is pptd. in fine yellow needles, m. 128–130° with decompn.

Ethyl *m*-aminobenzoate methanesulfonate. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,679, March 9, 1927. Equimol. mixts. of *m*- $H_2NC_6H_4CO_2Et$ and $MeSO_3H$ are allowed to react. The substance forms crystals m. 149–150°. 0.3185 g. neutralize 11.9 cc. 0.1 N H_2SO_4 (Kjeldahl); or 0.2940 g. neutralize 10.8 cc. 0.1 N H_2SO_4 .

Bromo derivatives of 1,1'-binaphthyl-8,8'-dicarboxylic acid. I. G. FARBENIND. A.-G. Brit. 288,957, Dec. 10, 1926. 1,1'-Binaphthyl-8,8'-dicarboxylic acid is converted into a monobromo deriv. by brominating it in glacial HOAc. A dibromo deriv. is obtained by treating the acid with excess of Br in the cold. The products may be converted into bromobenzobenzanthronecarboxylic acids as described in Brit. 288,666.

Derivatives of 2,3-hydroxynaphthoic amide. I. G. FARBENIND. A.-G. Brit. 289,037, April 22, 1927. Interaction is effected between 2,3-hydroxynaphthoic acid and a mustard oil, e. g., 2,3-hydroxynaphthoic anilide is made by heating together

equimol. proportions of 2,3-hydroxynaphthoic acid and phenyl mustard oil at a temp. of about 220° until evolution of C oxysulfide ceases.

5-Iodo-2-aminopyridine. SCHERING-KAHLBAUM A.-G. Brit. 288,571, April 12, 1927. 2-Aminopyridine is treated successively with quantities of an iodizing agent which separately would be insufficient to effect complete conversion into the addition product and after each addition the compd. is decomposed with alkali; *e. g.*, I or I chloride may be added alternately with alkali in a three-stage treatment.

3,10-Perylenequinone. GEORGES LE FLOCH. U. S. 1,604,884, Dec. 11. After reaction of a ring-forming reagent such as AlCl_3 on a substance contg. the naphthidine radical such as naphthidine base the product is subjected to energetic oxidation, *e. g.*, by use of $\text{Na}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 .

Aminopentylguanidine. SCHERING-KAHLBAUM. A.-G. Swiss, 126,501, June 10, 1926. Aminopentylguanidine sulfate is prepd. by the reaction of pentamethylenediamine on an alkylisothiurea sulfate. The substance is colorless salt. Concd. alkali causes it to give off NH_3 .

1-Chloro-2-methylnaphthalene. I. G. FARBENIND. A.-G. Swiss 126,716, Dec. 27, 1926. Addn. to Swiss 125,470. Equimol. quantities of 2-methylnaphthalene and sulfuryl chloride are allowed to react. The product is a colorless, odorless oil.

A monochloro-2,6-dimethylnaphthalene. I. G. FARBENIND. A.-G. Swiss 126,717, Dec. 27, 1926. Addn. to Swiss 125,470. Equimol. quantities of 2,6-dimethylnaphthalene and sulfuryl chloride are allowed to react. The substance forms crystals m. 39°.

1,5-Dichloro-2,6-dimethylnaphthalene. I. G. FARBENIND. A.-G. Swiss 126,718, Dec. 27, 1926. Addn. to Swiss 125,470. Sulfuryl chloride and 2,6-dimethylnaphthalene are allowed to react in the mol. proportions 2:1. The product forms white crystals m. 130°.

1,8-Naphthisatin. I. G. FARBENIND. A.-G. Swiss 126,720, Jan. 27, 1927. Addn. to Swiss 125,475. The hydroxyamino acid chloride formed by the action of hydroxyallyl chloride on *p*-toluenesulfo- α -sodium naphthalide is treated with an acid condensing agent to give a *N*-toluenesulfo-1,8-naphthisatin, which is converted to 1,8-naphthisatin by sapon. The m. p. is 300°. Cf. C. A. 23, 156.

Tetranitrodianthrone. I. G. FARBENIND. A.-G. Swiss 126,196, Mar. 10, 1927. Dianthrone is nitrated. The product forms colorless crystals difficultly sol. in H_2SO_4 and gives a green soln. on heating with pyridine.

2,7-Dinitroanthraquinone. I. G. FARBENIND. A.-G. Swiss 126,403, Mar. 10, 1927. Anthrone is treated with concd. HNO_3 and HNO_2 is split off from the product.

2-Styryl-4-amino-6-ethoxyquinoline. I. G. FARBENIND. A.-G. Swiss 126,346, Sept. 7, 1926. 2-Styryl-4-halo-6-ethoxyquinoline is caused to react with hydrazines, and the 2-styryl-4-hydrazino-6-ethoxyquinolines so obtained is reduced with Zn and AcOH .

3-Phenylamino-1,8-naphthosultam. I. G. FARBENIND. A.-G. Swiss 126,340, Aug. 31, 1926. 1,8-Naphthosultam-3-sulfonic acid is treated with aniline. The product m. 165–170° and forms salts by replacement of H attached to N in the sultam ring.

α -Indanone. I. G. FARBENIND. A.-G. Swiss 126,404, Mar. 14, 1927. α -Indanone is made by the interaction of β -chloropropionic acid, benzene, and AlCl_3 at a raised temp.

α -Methylaminopropiophenone. I. G. FARBENIND. A.-G. (Friedrich Stolz, inventor). Ger. 468,305, Jan. 19, 1927. Arylsulfomethylamine or the alkali salts are allowed to react with α -bromopropiophenone and the so-formed arylsulfone- α -methylaminopropiophenone sapond. Thus, the dry K salt of *p*-toluenesulfomethylamine is stirred into a soln. of α -bromopropiophenone in acetone. The ppt. is washed with acetone and dried, and the KBr washed off with water, leaving *p*-toluenesulfo- α -methylaminopropiophenone from which the acetone is distd. off. On washing with MeOH, white crystals of *p*-toluenesulfomethylamine m. 112–113° are obtained. This is sapond. and the solvent evapd., leaving the $\text{C}_6\text{H}_5\text{CO.CH}(\text{NH.CH}_3)\text{CH}_3$ as the *p*-toluenesulfonate.

1-Phenyl-3-methyl-5-pyrazolone. I. G. FARBENIND. A.-G. Swiss 126,198, Jan. 24, 1927. See Brit. 274,366 (C. A. 22, 1983).

1-*p*-Bromophenyl-3,4-trimethylenepyrazolone. CARL MANNICH. Swiss 126,528, Sept. 30, 1926. Addn. to Swiss 123,733. This substance is prepd. by treating the product of the reaction of an ester of β -ketopentamethylenecarboxylic acid on *p*-bromophenylhydrazine with an alk. condensing agent. The substance is a slightly colored, acid-reacting cryst. powder m. 200°. It is insol. in water, but sol. in alkali.

1-*p*-Tolyl-3,4-trimethylenepyrazolone. CARL MANNICH. Swiss, 126,529, Sept. 30, 1926. Addn. to Swiss 1 — — The reaction product of an ester of β -ketopenta-

methylenecarboxylic acid and *p*-tolylhydrazine is treated with an alk. condensing agent. The substance is a slightly colored, acid-reacting, cryst. powder, m. 202°. It is insol. in water, but sol. in alkali.

Solid diazo salt. I. G. FARBENIND. A.-G. Swiss 126,405, Feb. 11, 1927. A solid diazo salt is obtained by treating a soln. of a salt of diazotized *p*-nitroaniline with free *p*-chlorobenzenesulfonic acid or one of its salts.

Synthetic kidneys. WILDER D. BANCROFT AND R. L. NUGENT. *Fifth Colloid Symposium Monograph* 1928, 149-58.—Preliminarily, there must be developed a theory for the selective concn. or diln. of a soln. by filtration or dialysis. Selective membranes may vary from semipermeable to ultra-filtration types. Under the former type, *e. g.*, rubber membranes, are non-porous ones owing their semipermeability to selective soly. and the porous ones, *e. g.*, Cu ferrocyanide membranes, semipermeable because of practically complete negative adsorption. The kidney glomerulus is more than a simple ultra-filter, holding back colloids while allowing the passage of solutes; for changes occur in concentration of solutes. As the org. membranes involved will not stand high pressures, the changes must therefore be due to some form of dialysis or elec. endosmose, water flowing from a place of low partial pressure, to a place of high partial pressure. "If 2 solns., in which the acetone-water ratio is 0.17, are sepd. by a rubber membrane, and if MnSO_4 be added to one side until it forms 17% of that soln., the acetone-water ratio on the other side can theoretically be forced up nearly 200%. If the original acetone-water ratio is 0.06 and if MnSO_4 be added to one side to the extent of 32%, the ratio on the other side should be forced up nearly 1000%." MnSO_4 tends to ppt acetone from aq. soln. The concn. effects in *Valonia* are considered. Blood and urine are never in equil., and therefore the concn. changes in the kidney involve initial flow; "it must therefore be to some extent a problem of negative osmosis. . . . 'Salting-out' effects, negative osmose, initial osmotic flow, and the special nature of the membrane are probably important factors; but we cannot at present say to what extent they enter in. In so far as negative osmose is an elec. phenomenon, it would seem to involve the Donnan equil."

JEROME ALEXANDER

Physico-chemical studies on proteins. III. Proteins and the lyotropic series. ROSS A. GORTNER, WALTER F. HOFFMAN AND WALTON B. SINCLAIR. *Fifth Colloid Symposium Monograph* 1928, 179-98.—From a study of the peptizing effects of 21 inorg. salts on the proteins of wheat flour, concns. ranging from 0.5 to 2.0 *N*, the following conclusions are reached: Arranged in order of increasing peptizing effect, there is a pronounced lyotropic or Hofmeister series of anions $\text{F} < \text{SO}_4 < \text{Cl} < \text{tartarate} < \text{Br} < \text{I}$; with cations, a less pronounced but distinct lyotropic series $\text{Na} < \text{K} < \text{Li} < \text{Ba} < \text{Sr} < \text{Mg} < \text{Ca}$. H-ion differences do not account for these differences, for they are measurable even at const. H-ion concn. Alkali halides all cause decreasing peptization with increased salt concn. The alk. earth halides generally cause increased peptization with increasing salt concn.; this is particularly noticeable for MgCl_2 , MgBr_2 , SrCl_2 and CaBr_2 . Protein "solubility" in neutral salt solns. is, in reality, protein peptization, and as such is governed as to rate and extent by the nature and extent of the particular anions and cations present in the salt soln. Since globulins are defined as "proteins sol. in dil. solns. of salts of strong acids, with strong bases," the question is raised: What salts, what dilns., and what is a globulin? Using wheat flour proteins and *N* solns., KF exts. 13%, KCl 23%, KBr 37% and KI 64%. Obviously none of these exts. is a chem. entity "globulin." "Peptization" by neutral salt solns. is not "hydrolysis," for there is no increase in free amino or carboxyl groups. "The colloid chemical viewpoint still affords the most satisfactory explanation for many of the properties of protein systems."

JEROME ALEXANDER

The dicarboxylic amino acid fraction in gliadin. D. BRESEE JONES AND RUSSELL WILSON. Protein and Nutrition Division, Bur. of Chemistry and Soils, U. S. Dept. of Agr. *Cereal Chemistry* 5, 473-7 (1928).—Gliadin is unique in that it yields on hydrolysis over half its weight of dicarboxylic amino acids (aspartic, glutamic and hydroxy-

glutamic acids), a proportion of this class of amino acids larger than has been found in any other protein: When hydrolyzed by boiling with 20% HCl, gliadin yielded 53.6% of amino acids representing the dicarboxylic amino acid fraction as obtained by pptn. of their Ba salts with alc. Of this quantity, there were isolated the following percentages of pure amino acids: glutamic acid 43.0, hydroxyglutamic acid 7.7; aspartic 0.5. Length of time of hydrolysis of the gliadin (20 and 46 hrs.) had no significant effect on the proportions yielded of these amino acids.

The creatinephosphoric acid of the muscles. ALEXANDER PALLADIN, A. KUDRYASHEVA AND E. SAVRON. *Biochem. Inst. Charkow. Z. physiol. Chem.* 179, 9-23(1928).—Poisoning by large doses of P results in a considerable increase in creatinephosphoric acid and creatine in the white and red muscles of rabbits, and a decrease in lactacidogen content. The increase is much more pronounced in red than in white muscle. The ratio of combined to total creatine increases in both white and red muscle, but to a greater extent in the latter. Small doses of P which cause chronic poisoning bring about an increase in phosphocreatine content and in the phosphocreatine-total creatine ratio in red muscle, while the corresponding values in white muscle remain normal. Tetrahydro- β -naphthylamine lowers the lactacidogen content of the biceps femoris and to a smaller extent that of the semitendinosus. It increases the phosphocreatine content of both white and red muscle, but especially the latter, and increases also the phosphocreatine-total creatine ratio. Muscles which differ in their functional activity thus show different responses with respect to their phosphocreatine and lactacidogen content under the influence of certain toxic agents.

A. W. DOX

Plant proteases. XIII. The proteinase and the polypeptidase of yeast. WOLFGANG GRASSMANN AND HANNS DYCKERHOFF. *Acad. Wissensch., München. Z. physiol. Chem.* 179, 41-78(1928). (XII not yet published).—Although the sepn. of 2 proteases by means of selective adsorption was eminently successful when applied to pancreatic ext., the method has thus far failed with yeast proteases. A new method has now been developed which consists in selective liberation of the enzymes by means of fractional autolysis. At faintly alk. reaction in the presence of CHCl_3 the polypeptidase is only very slowly liberated and not completely in 1 week. The proteinase, on the other hand, is not set free during the first 15 hrs., but after this interval the liberation is very rapid and reaches completion in 24 hrs. After the proteinase has thus been removed, further autolysis of the yeast residue gives a 30% yield of the total polypeptidase entirely free from any activity toward proteins. The proteinase extd. between the 15th and 24th hr. may be obtained in greater purity if the autolysis is performed at slightly acid reaction, e. g., p_H 4.8-5.0, and subsequent purification by adsorption then yields an active prepn. practically free from all activity toward polypeptides and dipeptides. Dornby's view that yeast contains 2 proteinases analogous to pepsin and trypsin, resp., is thus disproved. Yeast contains only 1 proteinase. The polypeptidase does not attack any protein of animal or vegetable source, but readily hydrolyzes peptones obtained by digestion of proteins with pepsin, papain, papain-HCN or yeast proteinase. The polypeptidase is strongly inhibited by KCN and H_2S . The proteinase, on the other hand, is activated by both of these substances. When the proteinase soln. is allowed to stand, a natural activator is formed, the action of which is analogous to that of HCN. The freshly purified enzyme prepn., however, is inactive toward all proteins tested, e. g., gelatin, casein, fibrin and histone, but the cleavage readily occurs in the presence of HCN or H_2S , or after the natural activator has been allowed to develop. As the activator develops, the activating effect of HCN decreases proportionately. The increased activity is not due merely to a destruction of inhibitory substances present in the fresh material. Spontaneously activated proteinase again becomes inactive and capable of re-activation when the elutions are kept at p_H 5.0. Under such treatment the enzyme is perfectly stable but the activator undergoes destruction. Non-activated proteinase is, however, active toward peptones but to a greater extent when HCN is present. A gelatin peptone obtained by papain-HCN digestion is a striking exception since it is not attacked by the enzyme either before or after activation. From this it is inferred that activated papain can replace yeast proteinase as far as its sp. action on gelatin is concerned. This does not apply conversely, since the peptone obtained by digestion of gelatin with yeast proteinase undergoes further hydrolysis by papain or papain-HCN. The relationship between these 2 enzymes is therefore analogous to that between 2 amylases with different limits of saccharifying power. More important, however, is the difference in specificity between the non-activated forms of papain and yeast proteinase. The former hydrolyzes proteins but not albumin peptone or

papain-gelatin peptone, while the reverse is true of the latter. This difference may possibly be due to the presence or absence of 2 sp. natural activators, one of which activates protein cleavage and the other peptone cleavage. Yeast thus contains 3 sp. proteases, viz., a proteinase, a polypeptidase and a dipeptidase, and the terms "yeast trypsin" and "yeast erepsin" should be abandoned. Carboxyl and amino groups are liberated in equal proportions, indicating a cleavage of acid amide linkages. An addnl. enzyme is also present, a sp. asparaginase, which will be the subject of a later paper.

A. W. DOX

Coproporphyrin synthesis by yeast and factors which influence it. VI. The enzymic character of coproporphyrin synthesis in yeast. Cell-free increase in coproporphyrin. R. M. MAYER. Tech. Hochschule München. *Z. physiol. Chem.* 179, 99-116(1928); cf. *C. A.* 22, 3187.—The increase in coproporphyrin obtained by autolysis of yeast is shown to be an enzymic process. Like other enzymic reactions it is suppressed by the addn. of HCN. A cell-free press juice shows the same porphyrin increase when allowed to stand 4 hrs. at 48° in the presence of CHCl₃ or PhMe with buffer solns. of p_H 4.9-9.0 but it is suppressed by 2% AcOH or by HCN. At 62°, as with other enzymes, no reaction occurs, suggesting a destruction or inactivation of enzyme, though it is possible also that enzyme or porphyrin is pptd. with coagulated protein. The enzyme passes through a coarse but not through a fine colloid filter. Whether the assumption of a sp. "porphyrase" is justified or whether the porphyrin formation is a function of some already known enzyme is left undecided.

A. W. DOX

The action of choline on the isolated suprarenal gland. N. V. PUCHKOV. Inst. für Experimentalmedizin in Leningrad. *Z. ges. expil. Med.* 61, 20-3(1928).—Perfusion expts. using Locke soln. contg. 1:1000 to 1:10,000 chlorocholine showed an increase in secretion of adrenaline. There was no choline in the perfusion fluid when only Locke soln. was used and when choline was added it appeared promptly in the perfusion fluid after passage through the gland.

F. L. DUNN

Succinoxidase. II. Influence of phosphate and other factors on the action of the succinoxidase and the fumarase of liver and muscle. PERCIVAL W. CLUTTERBUCK. Univ. Manchester. *Biochem. J.* 22, 1193-1205(1928); cf. *C. A.* 21, 3210.—Liver pulp, wt. for wt., has 8-10 times as great a fumarase activity as muscle pulp. After extg. fumarase with water or saline, steeping the residue in $M/15$ phosphate or in bicarbonate-carbonate buffer of the same p_H and expressing, liberates from the muscle residue a further large quantity of enzyme. The total activity of the water and phosphate exts. of 50 g. liver was approx. equal to the total activity of the exts. of 150 g. muscle. Phosphate not only elutes fumarase but also activates it. The temp. coeff. for the fumarase activity of liver pulp is 2-2.4 but of muscle pulp it is 1.4. NaCl inhibits the action of succinoxidase, but inhibits the fumarase for less. An active fumarase soln. is obtained by pptg. the phosphate ext. of washed muscle with (NH₄)₂SO₄, filtering and dialyzing the soln.

BENJAMIN HARROW

Notes on the irradiation of ergosterol. THOMAS A. WEBSTER AND ROBERT B. BOURDILLON. Natl. Inst. for Med. Research, London. *Biochem. J.* 22, 1223-130(1928); cf. *C. A.* 22, 3907.—Attempts to produce more concd. solns. of vitamin D by the irradiation of ergosterol by selected portions only of the ultra-violet spectrum have not given any definite results. The suspicion that temp. changes during radiation were affecting the results could not be confirmed.

BENJAMIN HARROW

Destructive action of heat on insulin solutions. AUGUST KROGH AND AXEL MARIUS HEMMINGSEN. Lab. of Zoophysiology, Copenhagen. *Biochem. J.* 22, 1231-8(1928).—The destruction of insulin at const. temp. follows the law of monomol. reactions. The relation of rate of destruction to temp. can be expressed by Arrhenius's formula.

BENJAMIN HARROW

Some factors affecting the adsorption of quinine, oxalate, and glucose by fuller's earth and norit. N. B. GUERRANT AND W. D. SALMON. Ala. Polytechnic Inst., Auburn. *J. Biol. Chem.* 80, 67-89(1928).—"The purpose of the investigation was to make a study of some of the factors affecting the adsorption of electropositive, electro-negative and nonelectrolytic substances of known compn. by different adsorbents. Different fuller's earths have different adsorptive capacities because of differences in both compn. and state of division. H-ion concn. plays an important role in the adsorption of electrolytes, and under certain conditions, it also affects the adsorption of nonelectrolytes. Degree of dispersion of adsorbent is more important in apolar adsorption than in polar adsorption. By heating fuller's earth at a red heat for 30 min., its adsorptive capacity for both oxalate and glucose is only slightly altered. The electro-dialyzing of fuller's earth slightly reduces its adsorptive capacity for quinine. Fuller's earth which has been previously digested with hot mineral acid adsorbs only $\frac{1}{2}$ as

much quinine as the untreated earth, while it adsorbs only $\frac{1}{4}$ as much oxalate as before the treatment. Such treatment has little effect upon the adsorption of glucose by this adsorbent. Electrodialysis of the acid-treated earth restores much of its quinine adsorptive capacity but has little effect upon the adsorption of either oxalate or glucose." The optimal adsorption of quinine and glucose by norit occurs at the same H-ion concn. as with fuller's earth but the effect of H-ion concn. upon the adsorption of oxalate is quite different for the 2 adsorbents, being negligible with norit in the alk. range.

A. P. LOTHROP

Inactivation of invertase and raffinase by heat. J. M. NELSON AND PHILIPPOS PAPADAKIS. Columbia Univ. *J. Biol. Chem.* 80, 163-6(1928).—After partial inactivation of some preps. of yeast invertase by heat, a greater loss in activity was observed when the activity was calcd. from the rate of hydrolysis of raffinose (75%) than when calcd. from the rate of hydrolysis of sucrose (58%). In some cases, however, the decrease in activity was the same for both sugars. These observations may have some bearing upon the question whether or not these 2 enzymes in yeast are identical as claimed by some investigators.

A. P. LOTHROP

The formation of free amino acids and peptides by the pancreatic and enteric juices. U. LOMBROSO AND A. DI FRISCO. *Boll. soc. ital. biol. sper.* 3, 460-4(1928).—A comparative study of protein digestion by pure pancreatic juice, by pancreatic juice in the presence of enterokinase, and by enteric juice. The purpose was to demonstrate whether or not there is a parallelism of action between the so-called erepsin of pure pancreatic juice and that of erepsin of enteric juice, and if activated pancreatic juice modifies the course of the digestion. 0.5 g. samples of casein and peptone plus 5 cc. of pancreatic or enteric juice were placed in an incubator. To a number of the tubes contg. casein, peptone and pancreatic juice there was also added enterokinase extd. from the intestinal mucosa. At various intervals of time the tubes were made neutral to azolitmin and divided into 2 equal pts. To one pt. was added EtOH to a concn. of 80% and then this was titrated with 0.1 N NaOH, thymolphthalein being used as an indicator (A). A few drops of methyl red were then added and the soln. was titrated with 0.1 N HCl to a tinge of red (B). The difference between A and B reveals the prevalence of dicarboxylic monoamino acids or diamino acids. To the other fraction was added EtOH to a concn. of 50% and this was titrated with 0.1 N NaOH in the presence of phenolphthalein. The carboxyl groups of the free amino acids and of the peptides were calcd. from Willstätter's formula. Results and conclusions: (1) The digestion of casein and peptone by pure pancreatic juice leads to a gradually increasing quantity of free amino acids and also of peptides. The ratio between the amino acid and peptide carboxylic groups is about 1:3. (2) The addn. of enterokinase to pancreatic juice results in a more rapid digestion. The polypeptide carboxylic groups are more prevalent but the ratio between these and the amino acid carboxylic groups is not so const. or so high. In some cases the digestion reaches a certain stage and then seems to recede; the amino acid carboxylic groups diminish. (3) The ratios between the amino acid and polypeptide groups are almost const.; there is a slight increase in the amino acid groups. (4) The digestion of casein and peptone by enteric juice produces more amino acid than polypeptide carboxylic groups—the reverse of that noted with pure pancreatic juice. The latter, therefore, has a proteolytic action which is markedly different from that of enteric juice and the end products are also distinctly different. Since activated pancreatic juice does not modify the course of the digestion; the conclusion drawn is that pancreatic juice contains its own activated tryptic enzyme.

PETER MASUCCI

Analysis of pancreatic nucleic acids. ERIC JORPES. Chem. Lab. Karolinische Inst., Stockholm. *Acta Med. Scand.* 68, 503-73(1928).—Proof is offered that a pentapentose nucleotide with 3 purine-nucleotides exists in the pancreas. It is, next the thymonucleic acid, the principal nucleic acid of the pancreas.

S. MORGULIS

The assay of digitalis substances by biological methods. MARIE KROGH. *Acta Med. Scand.* Suppl. XXVI, 512-5(1928).—The use of several biol. tests is necessary to obtain some definite idea of the qual. compn. of various therapeutic preps.

S. M.

The destruction of β -hydroxybutyric acid by liver enzymes. I. Preparation and properties of the enzyme complex; demonstration of products of destruction. JOACHIM KUHNAU. Städtisches Forschungsinst., Wiesbaden. *Biochem. Z.* 200, 29-60(1928).—A protein-free liver ext. is prepd. by pptn. at p_H 4.8, which can destroy about 40% of added β -hydroxybutyric acid. The pptn. causes a sepn. of oxidative enzymes in 2 portions: the succino-dehydrogenase and the β -hydroxybutyric acid-splitting enzyme are adsorbed on the ppt. while the aldehyde mutase and the co-reductase remain in the filtrate. The ppt. is collected by centrifuging and is extd. 5 times with about 250 cc. 0.01 N Na_2CO_3 . The ext. is freed from protein by the addn. of small quantities of col-

loidal Fe, an excess of reagent being avoided. After filtration the p_H of the filtrate is adjusted to p_H 6.8–7.1. The properties of the active principle which is made up of a several enzymes and is described as the "hydroxybutyroclastic system" are the following: without inactivation it is pptd. by 66% satn. with $(NH_4)_2SO_4$ or alc. but not with U acetate or colloidal $Fe(OH)_3$; it is inactivated by 20 min. shaking; it is inactivated by boiling or by temp. -10° to $-15^\circ C$; it is sensitive to HCN; it has an optimum activity at p_H 6.8–7.1 and a 0.01–0.024 *N* concn. of β -hydroxybutyric acid; it is neither a peroxidase nor an oxygenase. The study of the sep. products of β -hydroxybutyric acid decompn. gives a definite idea of the nature of the enzymes composing this system. The following enzymes partake in this reaction with β -hydroxybutyric acid: (1) the mol. is attacked by an oxido-reducing enzyme; (2) a hydrolytic enzyme splits aldol and acetoacetic acid; (3) several dehydrogenases of which succino-dehydrogenase was demonstrated; (4) a fumarase; (5) a β -carboxylase; (6) an aldehydemutase; (7) and its coenzyme (coreductase); and (8) probably also an alcoholoxidase. The decompn. proceeds equally well under aerobic or anaerobic conditions. Dextro-rotating hydroxybutyric acid is decompd. 3–5 times as much as the levo-rotating substance. By the addn. of dimedon the decompn. is prevented. The following products were isolated or identified in the reaction: aldol, acetoacetic acid, 1,3-butyleneglycol, CH_3CHO , succinic acid, fumaric acid, malic acid and traces of $AcOH$ and $CH_3COCOOH$. These results bear upon the problem of conversion of fats into carbohydrate. II. The oxidation intensity of the system. *Ibid* 61–80.—The oxidation intensity of the β -hydroxybutyroclastic system was detd. at $r_H = 7.0$ with Clark's indicators. Under anaerobic conditions the oxido-reduction potential of the system is not const. It forms a curve with a neg. tendency, which starting with a r_H above 22, attains after a variable length of time a value r_H 17.6. The longer the enzyme ext. was in contact with air O_2 the longer it takes to reach this const. r_H value. Aldol has a very important influence on the oxidation intensity. Methylene blue is not reduced by the enzyme- β -hydroxybutyric acid system because its potential is below that of the system, and its stimulating action on the β -hydroxybutyric acid oxidation is due to its reducing oxidizing intensity.

S. MORGULIS

Studies of the enzymic proteolysis. II. P. RONA AND E. MISLOWITZER. Univ. Berlin. *Biochem. Z.* 200, 152–65(1928); cf. *C. A.* 23, 163–4.—In the peptic digestion of casein the dispersion of particles observed during tryptic digestion already in the very earliest stage of the enzymic action does not occur. Only after very advanced cleavage the adsorption on collodion tubes characteristic for the breaking up of the mols. occurs also in the peptic digestion of casein.

S. MORGULIS

Studies on the decomposition of gelatin and gelatin peptone with acetic anhydride. Isolation of associated polypeptides. A. FODOR AND CHASUVA EPSTEIN. Hebraische Univ., Jerusalem. *Biochem. Z.* 200, 211–22(1928).—When gelatin is heated with acetic anhydride it undergoes nonhydrolytic decompn., the products being polymers of dipeptides, especially of oxypropylalanine and oxypropylglycine. About 50% of the products are polymeric depeptides of mol. wt. about 800. These are subject to enzymic cleavage. Similar results were obtained when gelatin peptone, obtained from prolonged peptic digestion of gelatin, is used. Studies with the ultramicroscope indicate that one is dealing here with colloiddally dispersed matter which is reversibly coagulated by heat.

S. MORGULIS

The decomposition of gelatin by glycerol under variable conditions. Isolation of a non-colloidal intermediate product hydrolyzable through pepsin. A FODOR AND R. SCHOENFELD. Hebraische Univ., Jerusalem. *Biochem. Z.* 200, 223–35(1928).—Heating gelatin with glycerol at 180° for 2 hrs. yields reaction products precipitable with abs. alc. By fractional pptn. of their aq. soln. by means of abs. alc. they may be sepd. in more or less purified state. These products have no free amino groups. If the heating is carried out at 130° a good yield is obtained of a reaction product which cannot be fractionated and which differs from the previous one in being of a more uniform nature. It shows a mol. wt. similar to that of gelatin peptone (about 400). This product is hydrolyzed by both pepsin and pancreatin. The product is a non-hydrolytic dissociation result of the reaction with gelatin which in spite of its anhyd. character still retains intact the conditions necessary for the pepsin or trypsin attack. The heating to a higher temp. leads to a dissocn. and anhydration to components which can be fractionated and which, on analysis, prove to be low polypeptide-anhydrides unhydrolyzable by enzymes.

Further studies on the stereometric specificity of ketone aldehydemutase. CARL NEUBERG AND ERNST SIMON. Kaiser Wilhelm-Inst. für Biochem., Berlin-Dahlem. *Biochem. Z.* 200, 468-72(1928).—The enzymic dismutation of ketoaldehyde, of which practically all plant and animal cells are capable, presents certain problems from a stereochem. standpoint. *Bacillus Delbrückii* yields *dl*-lactic acid with methylglyoxal but only *d*-mandelic acid with phenylglyoxal; *Bacterium lactis aerogenes* forms only inactive lactic acid from methylglyoxal and a predominantly *l*-mandelic acid. *Mucor javanicus* dismutates methylglyoxal to *d*-lactic while *Mucor stolonifer* to *dl*-lactic acid. S. M.

The chemical structural specificity of carboxylase. CARL NEUBERG AND FRITZ WEINMANN. Kaiser Wilhelm-Inst. für Biochem., Berlin-Dahlem. *Biochem. Z.* 200, 473-6(1928).—It has been found that decarboxylase does not affect $(\text{CH}_3)_2\text{C}.\text{CO}.\text{COOH}$, although it easily splits off CO_2 from $\text{CH}_3.\text{CO}.\text{COOH}$, $(\text{CH}_3)_2\text{CH}.\text{CO}.\text{COOH}$, $\text{CH}_3.\text{CH}_2.\text{CO}.\text{COOH}$; also from $\text{CH}_3.\text{C}_2\text{H}_5.\text{CH}.\text{CO}.\text{COOH}$ or from $\text{CH}_3.\text{CH}_2.\text{CH}_2.\text{CH}_2.\text{CO}.\text{COOH}$. The failure with $(\text{CH}_3)_2\text{C}.\text{CO}.\text{COOH}$ is attributed to a specificity of the enzyme for chem. structure which apparently allows the formation of enolate. S. M.

The nature of the protein-bound blood plasma sugar. ZACHARIAS DISCHER. Univ. Wien. *Biochem. Z.* 201, 74-86(1928).—Horse plasma was hydrolyzed with 3% H_2SO_4 at 120° in an autoclave. After dialysis the protein hydrolytic products were removed by pptn. with phosphotungstic acid and the filtrate was evapd. to a very small vol. On the addn. of Na acetate and phenylhydrazine-HCl a ppt. was formed in the cold which according to crystal structure, m. p. and elementary analysis was identified as mannose phenylhydrazone. The total mannose bound to the plasma proteins is fermentable by yeast and is thus *d*-mannose. Apart from mannose there is no appreciable amt. of fermentable sugar combined with the proteins of the plasma, which, however, contains also another but non-fermentable sugar. The latter by its reaction may be a glucosamine, but the identification of this sugar is not yet positive. It is found in about the same amt. as the mannose. The total sugar of horse blood plasma may be estd. as 0.3%, of which only 0.08 to 0.11% is in the form of the usual free blood sugar, while the sugar bound to the protein, the non-diffusible sugar, is made up of equal parts of mannose and of a non-fermentable sugar.

The conditions necessary for the combination of brain proteins with alkaloids and animal bases. ANNA PETRUNKIN AND MICHAEL PETRUNKIN. Inst. Exptl. Med., Leningrad. *Biochem. Z.* 201, 185-9(1928).—The alkaloids, strychnine, quinine, morphine, cocaine and the animal bases, adrenaline and guanidine, were studied. The brain proteins were placed for an hr. at 15° in mixts. of H_2SO_4 and NaOH of various pH values. They were washed with ice cold water and then treated with 20 cc. 0.02 *N* soln. of the tested substance also for an hr. at 15° . The amt. of alkaloid or base taken up was detd. by analysis. Combination without exception took place only when the pH was above 4.0.

S. MORGULIS

Further studies on metaphosphatase. TORAO KITSATO. Kaiser-Wilhelm-Inst. für Biochem., Berlin-Dahlem. *Biochem. Z.* 201, 206-11(1928); cf. *C. A.* 23, 164.—An enzyme exists which transforms metaphosphate into orthophosphate by the addn. of H_2O . By increasing the strength of the enzyme and reducing the concn. of the substrate 100% transformation was accomplished. The transformation can be followed by means of the colorimetric procedures since the $(\text{NaPO}_3)_x$ yields practically no color. The formation of the orthophosphate was also checked up by forming the $\text{NH}_4\text{Mg}(\text{PO}_4)_2$ ppt.

S. MORGULIS

The so-called coenzyme of alcoholic fermentation. An attempt to form a synthetic viewpoint of the coenzyme problem on the basis of experimental studies. A. J. KLUYVER AND A. P. STRUYK. Tech. Hochschule, Delft. *Biochem. Z.* 201, 212-58(1928).—The addn. of a suitable amt. of sol. phosphate to the ultrafiltrate of yeast maceration juice does not produce fermentation. However, the residue contains the zymase in unaltered condition, because fermentation does ensue when this residue is added to the ultrafiltrate. When, however, the ultrafiltrate is replaced by a suitable quantity of phosphate and acetaldehyde variable results are obtained. In some instances fermentation occurred but it is concluded that even in the presence of K ions the complete replacement of coenzyme by acetaldehyde is out of the question. In agreement with Meyerhof's findings following continued washing of the ultrafiltrate residue it could not be regenerated with Na hexose-diphosphate but could with boiled juice. However, the hypothesis that the coenzyme of boiled juice functions as a H-acceptor and can therefore be replaced by acetaldehyde is not tenable. It follows from this observation

that the boiled juice must contain some other factor of unknown function which is indispensable for the fermentation in a cell-free medium. This factor is considered to be identical with Meyerhof's coenzyme. Further expts. show that it is possible to change a zymase washed free of coenzyme into a soln. which unquestionably contains coenzyme by the simple procedure of heating for a short time at 100° with phosphate. This surprising result is inexplicable when the cozymase is regarded as a substance of definite chem. constitution which can be sepd. from the zymase by dialysis or ultra-filtration. The exptl. evidence speaks in favor of the view that the function of the coenzyme depends upon a non-specific inhibition of the endotryptase-zymase system. This makes clear also Meyerhof's procedure for the extn. of the coenzyme from muscle by liberal extn. with boiling water which, of course, dissolves also much protein or protein-split products together with more or less proteolytic enzymes. Cold water removed relatively little and also yields a coenzyme-poor ext. However, a cold water muscle ext. which is nearly coenzyme-free can be more or less activated by subsequent boiling. Besides, Meyerhof's results showing the presence of inhibiting bodies in the ultra-filtrate residue of a cold tissue ext. coincide with the findings in this study that these inhibiting substances are tryptic in action. The antiprotease property, however, belongs probably only to Meyerhof's coenzyme which is evidently different from that of Harden-Young (different precipitability with Ph salts, also less easily ultra-filtrable). The fact that boiling of the coenzyme-free hot water ext. in the presence of a small amt. of hexose diphosphate regenerates the lost coenzyme activity suggests the identity of Buchner's coenzyme with the diphosphate ester. But Buchner also discovered the importance of the endotryptase in the alc. fermentation, because this tends to destroy the zymase, while the favorable action of the boiled juice furnished antiprotease which inhibits the action of the endotryptase. This suggested that Meyerhof's coenzyme is really an antiprotease necessary to protect the thoroughly washed zymase from proteolytic decomposition. Expts. with this idea in view yielded strong evidence in favor of this hypothesis. The concept of a coenzyme thus appears wholly superfluous, the cell-free fermentation requiring the zymase, an acceptor, a hexosephosphate ester and substances which regulate the proteolysis of the zymase system.

S. MORGULIS

Studies on D-vitasterols. II. The activation of ergosterol. A. JENDRASSIK AND A. G. KEMÉNYFI. Staatliches ungarisches hyg. Inst. *Biochem. Z.* 201, 269-80 (1928).—Ergosterol attains its max. healing effect after 30 min. irradiation. Although longer radiation causes further transformation of ergosterol it does not affect its healing action. By means of fractionation with EtOH a prepn. was made which was 5 times as active as the prepn. made directly by radiation. From radiated ergosterol one can still recover unchanged ergosterol which can be activated through renewed radiation. After irradiation for 10 hrs. the ergosterol loses its activity but no longer contains any unchanged ergosterol. This leads to the conclusion that the D-vitasterol formed through radiation is transformed into an inactive substance through further radiation. This can also be detd. by the I reaction which serves to show whether the ergosterol is in radiated or unirradiated condition.

S. MORGULIS

Studies on the optical activity of insulin-muscle-glucose-sodium chloride mixtures, together with some comments on the hydrogen-ion concentration. CHR. N. J. GRAM AND O. JUL NIELSEN. Med. Universitetsklinik A, Copenhagen. *Biochem. Z.* 201, 369-90 (1928).—In expts. with dialyzates of insulin-muscle-glucose-NaCl and muscle-glucose-NaCl mixts. no difference was noted in the rotation and reduction capacity of samples examd. every 15 min. In a series of expts. where fresh muscle was added to glucose solns. the rotation capacity indicated lower values than the reducing capacity in 27 out of 125 dialyzates, but in some of these the rotation spontaneously increased on standing where insulin was also present in the mixt. The addn. of fresh muscle to the glucose-NaCl mixt. lowers the p_H from the original 7.40 to 6.0-6.2. The use of borate buffers is not permissible because the boric acid combines with glucose, and thus the rotation yields lower results than reduction, but the full rotation capacity can be restored by the addn. of strong acid.

S. MORGULIS

Comment on E. Pollak's paper: Transformation of blood pigment to bile pigment. FRITZ SCHWERTHL. Tech. Hochschule, München. *Biochem. Z.* 201, 435-8 (1928).—E. Pollak in her expts. with a mixt. of hemin and pyrocatechol obtained a pigment to which she assigned the formula, $C_{16}H_{18}N_4O_4$, for which she claims relationship to the bile pigments. That this pigment is not a pyrrole would be indicated only if the same substance could be produced without hemin. She experimented with quinone but failed to obtain a cryst. product. S. repeated these latter expts. using 1 mol. quinine and 2 mols. pyrocatechol in 500 cc. alc. to which was added 40 cc. NH_4OH . This is stirred $1\frac{1}{2}$ hr. with a gentle current of air. After 24 hrs. an ext. with CCl_4 yields a sub-

stance with a characteristic blue color in acid which can be crystd. out from pyridine. About 4% of the quinone is yielded in the form of this cryst. compd. which according to elementary analysis has the formula, $C_{16}H_{10}N_2O_4$, and was identical in m. p., crystal form, spectroscopic properties and soly. with E. Pollak's pigment obtained from hemin.

S. MORGULIS

How many respiratory enzymes are there? OTTO WARBURG. *Biochem. J.* 201, 486-8(1928).—A reply to Dixon's critical inquiry (*C. A.* 22, 249; 23, 162). W. points out that just as there is only one process of O_2 transmission in nature but many different hemoglobins (or even other chromoproteins) so there may be a variety of respiratory enzymes although the process of oxidation is the same. S. MORGULIS

Oxidation of glucose in alkaline solution by oxygen of the atmosphere: Production of carbon monoxide. Facts and hypotheses with reference to the biologic consequences of this reaction. MAURICE NICLOUX. *Bull. soc. chim. biol.* 10, 1135-63(1928); cf. *C. A.* 22, 3633.—More than 35 references to the literature are cited. At a temp. of 85 to 87° and an alk. between $1/16$ and $1/8$ N, 1.6 to 1.7 cc. of CO are produced by 0.25 g. of glucose in 50 cc. of soln. and in the presence of 50 cc. of O_2 . At 40° CO is produced in much smaller quantities. In the absence of O_2 no formation of CO was detected. From 25 to 30% of the vol. of O_2 was consumed and recovered as CO + CO_2 , the ratio CO/ CO_2 oscillating between $1/3$ and $1/4$. The reaction appears in 2 phases, the first corresponding to the formation of several compds. by the alk. hydrolysis of the glucose, and the second an oxidation of these compds. with the formation of CO. Alk. carbonates act like alk. hydroxides but less energetically. Lactose, maltose, galactose and levulose act the same as glucose. Sucrose is not attacked until after inversion. CO has been found in the floats of the alga, *Nerocystis Luetkeana*, and in the blood of mammals, birds and fishes. Dog blood contains about 1.5 cc. of CO per l. Since CO does not exist in uncontaminated air the CO of the blood is probably a product of metabolism.

L. W. RIGGS

Synthesis and biochemical hydrolysis of glycerides. Kinetics of the reactions. LEON VELLUZ. *Bull. soc. chim. biol.* 10, 1213-26(1928); cf. *C. A.* 22, 2393.—The biochem. synthesis of glycerides from glycerol and the aliphatic acids of olive oil proceeds according to the law of mass action. The fermentive hydrolysis of di- and triglycerides corresponding to the aliphatic acids of olive oil obeys the symmetric laws of heterogeneous catalysts. In certain technical conditions there is a parallelism between catalytic action and reversible fermentive action of the active cytoplasm of ricin seeds. This paper is largely mathematical. **Role of the ethylene linkages in the biochemical synthesis and hydrolysis of nonsaturated glycerides.** *Ibid* 1227-37.—The mathematical laws which govern the biochem. hydrolysis and synthesis of the glycerides by the active cytoplasm of ricin seeds are the same whatever may be the I index of the fat used. The velocity consts. are less as the I index of the fat is greater. In the sapon. of fats, there exists an inverse relation between the velocity consts. and the I index of the fat.

L. W. RIGGS

Absorption capacity of serum proteins with respect to biliary salts. P. LÉCOMTE DE NOUY. *Compt. rend. soc. biol.* 99, 1097-9(1928).—Immunized serums (antivenin, antistreptococcic and antigonococcic) possessed less adsorptive power toward biliary salts than normal serums in the cases tried.

L. W. RIGGS

Does carbonic acid combine with protein in a solution of pure serum albumin? E. GREGORIE. *Compt. rend. soc. biol.* 99, 1227-31(1928).—The combination of the carbonic acid of the air with electrodyalyzed protein is scarcely possible. The results of this study do not support the hypothesis of Pauli (cf. *C. A.* 19, 1431).

L. W. R.

Lysozyme. MARGUERITE BORDET. *Compt. rend. soc. biol.* 99, 1252-4(1928); cf. *C. A.* 19, 1440; Fleming and Allison, *C. A.* 17, 143, 2899.—The lysozyme in white of egg passed the Chamberland filter no. 3, but human milk filtered in like manner was completely inactive. A weak acid reaction favored the lytic action, while an alk. concn. greater than 4 in 1000 inhibited it. Lytic action was not prevented by bubbling CO_2 through a bacterial emulsion previous to adding the lysozyme. Lysis was not hindered by decalcifying the active liquid. Serums of different animals had different lytic activity on the bacterial suspension used. Dog saliva had pronounced lytic activity; human saliva had little or none. **Attempt at the extraction of lysozyme.** *Ibid* 1254-6.—Lysozyme may be partially pptd. from dil. white of egg soln. by the addn. of 4 vols. of alc. If the white of egg soln. is previously acidified by AcOH or citric acid, the pptn. by alc. is complete. The prepn. made by macerating this ppt. in acidified physiol. saline did not lose its activity by boiling or desiccation.

L. W. RIGGS

Liberation of sulfur compounds in definite quantities by the alkaline hydrolysis of albumins; their colorimetric measurement by the phosphotungstic reaction. R.

GOIFFON AND R. HAUDIQUET. *Compt. rend. soc. biol.* 99, 1625-8(1928).—The object of this study was to det. the conditions of alk. hydrolysis of albumin which set free all of the substances which are chromogenic with the phenol reagent. A soln. of 0.02 g. of tyrosine in 100 cc. of 0.1 N HCl was used as a standard for measuring the tyrosine index. Heating the albumin soln. alone generally decreased slightly its tyrosine index. Heating the albumin soln. with increasing quantities of N NaOH caused a rapid increase in the tyrosine index which after oscillations became const. Prolonged heating for 30 to 60 min. on the boiling water bath slightly increased the tyrosine index. At low temps. the hydrolysis required more time, but the effect of low temp. may be compensated by greater concn. of NaOH. L. W. RIGGS

Action of ultra-violet light on the autonomous excitability of the surviving intestine and uterus. FOLKE PETERSON. Univ. Upsala. *Compt. rend. soc. biol.* 99, 1677-80 (1928).—The action of ultra-violet light was to weaken the parasympathetic excitability by a diminution of the excitability of the sympathetic inhibitor and an increase in the excitability of the sympathetic motor. These modifications of excitability are durable and persist even after the source of light has ceased to act. L. W. RIGGS

Method for the ultrafiltration of proteins. F. FALUDI. *Magyar Orvosi Arch.* 29, 435-8(1928); cf. following abstr.—The app. is illustrated and described. L. W. R.

Relation of bile secretion to the velocity of ultrafiltration of the blood. F. FALUDI. *Magyar Orvosi Arch.* 29, 439-43(1928); cf. preceding abstr.—By use of the app. described in the preceding paper, it was shown that solns. of Na salts of dehydrocholic and phenylquinolinecarboxylic acids do not influence the velocity of the ultrafiltration of blood plasma or serum when used in the max. concns. in which they occur in the body. Gelatin on the contrary lowers the velocity of ultrafiltration of blood. A mixt. of gelatin and of these cholagog materials behaves in ultrafiltration exactly like gelatin alone. It is assumed that the inhibitive effect of gelatin on the secretion is due to its property of decreasing the velocity of ultrafiltration of the serum. L. W. RIGGS

Effect of cholagog materials on the swelling of colloids. F. FALUDI. *Magyar Orvosi Arch.* 29, 444-6(1928); cf. preceding abstr.—The Na salts of dehydrocholic and phenylquinolinecarboxylic acids diminish the swelling of gelatin and that of agar-agar. Since the same effect is seen in equimolar solns. of cane sugar, it is not assumed that the cholagog activity of these materials has any connection with their action in lowering the swelling of colloids. L. W. RIGGS

A partial reaction of the enzymic degradation of carbohydrates. RAGNAR NILSSON. Univ. Stockholm. *Arkiv Kemi, Mineral. Geol.* 10B, No. 1, 6 pp. (1928). (In German.) Cf. von Euler, C. A. 22, 4552.—It is known that in expts. with muscle or yeast an increase of the phosphorylation observed can be obtained by adding a certain amt. of NaF. This increase runs parallel with an inhibition of the formation of CO_2 and $\text{Me-CHOHCO}_2\text{H}$. N. assumes that this process is connected with an inhibition of the glucose diphosphate formation, and that the phosphorylation observed is due to the action of a monophosphatase and is not influenced by the mutase or cozymase. N. proved by expt. that addn. of NaF to a fermentation mixt. caused inhibition of the glucose diphosphate formation. In a mixt. of glucose, small amts. of phosphate, and dried yeast freed of cozymase by washing, phosphorylation occurs even without addn. of NaF, but it is increased by adding NaF. Addn. of cozymase to the mixt. contg. NaF did not result in increased phosphorylation. In order to det. the compn. of the hexose phosphate formed in the reaction, a mixt. of 125 g. dried yeast freed of cozymase, 125 g. glucose, 250 cc. of 2.5% phosphate soln. of p_H 6.4, 1250 cc. of NaF soln. (2×10^{-2} mol.), and 1000 cc. H_2O was allowed to react for 3 hrs. at 30° . The ester formed was isolated from the mixt. as the Ba salt in a yield of 2.2 g.; the analysis gave values agreeing closely to the formula $\text{C}_6\text{H}_{11}\text{O}_5\text{PO}_4\text{Ba}$ or $\text{C}_6\text{H}_{11}\text{O}_4\text{PO}_4\text{Ba} + \text{H}_2\text{O}$, resp. The value for $[\alpha]_D$ was found to be 14.9° . G. SCHWOCH

Molecular weights of serum albumin and of serum globulin. THE SVEDBERG AND BERTIL SJÖGREN. Univ. of Upsala. *J. Am. Chem. Soc.* 50, 3318-32(1928).—The centrifugal sedimentation and sedimentation equil. methods have been applied to the study of the mol. wts. of serum albumin and serum globulin in buffer solns. at their isoelec. points, with various protein concns. The serum albumin had a mol. wt. of $67,500 \pm 2000$ and the serum globulin $103,800 \pm 3000$, both being independent of concn. Within the limits of exptl. error both these proteins are homogeneous with regard to mol. wt. and they therefore may represent pure chem. individuals. Both these proteins, but especially the serum albumin, are rather unstable substances, easily decompd. during the process of purification. Serum albumin is always partly, although reversibly, decompd. in dil. soln. These facts seem to afford an explanation for the discrepancies between the results of various investigators working on the proteins of the serum. The

mol. wts. of serum albumin and serum globulin are, like the mol. wts. of hemoglobin, phycocyan and phycoerythrin, very nearly simple multiples of that of egg albumin. These new mol.-wt. detns. show that there exist proteins of different chem. compn. and widely different properties but possessing very nearly the same mol. wt. Hemoglobin and serum albumin with mol. wts. near 68,000 and phycocyan and serum globulin with mol. wts. near 105,000 are 2 such pairs. C. J. WEST

Determination of bilirubin in blood. L. JENDRASSIK AND A. CZIKE. Universität Pecs. Ungarn. *Z. ges. expth. Med.* 60, 555-62(1928).—A modification of the Hijmans v. d. Bergh method (Der Gallenfarbstoff im Blute, 1918). F. L. DUNN

Studies with secretin. LADISLAUS TAKACS. Kgl. ung. Pazmany-Peter-Univ. *Z. ges. expth. Med.* 60, 424-9(1928).—A secretin of higher potency and greater uniformity was obtained as follows: The freshly scraped mucosa of the duodenum and upper $\frac{2}{3}$ of the jejunum was ground and crushed with enough 0.4% HCl to make a pulp-like creamy consistency. This was cooked for 15 min., during which time caustic alkali was added to neutralization. The proteins were filtered out. The filtrate was boiled down and dried and dissolved in the smallest quantity of 75% alc., and then 3 vols. acetone were added, and the ppt. was transferred to warm aq. soln. and filtered. Picric acid is added until a ppt. appears and then allowed to stand for 2 days. The sediment is washed with water until the addn. of satd. picric acid to the washings shows a ppt., *i. e.*, that the active principle is being dissolved. The ppt. is dried, dissolved in 10 vols. abs. alc., 5 vols. 5% HCl in abs. alc. and finally double the quantity of acetone is added, and the mixt. filtered. The picric acid is removed from the material on the filter by acetone and ether. The material is then dissolved in alk. soln., acidified, filtered, neutralized and sterilized at 150°. The soln. had a N content of 15% and seemed to be a secondary albumose. It remained unchanged for months and the activity of trypsin and pepsin was proportional to the concn. of secretin and the time. F. L. DUNN

The measurement of chlorine-ion potentials in the presence of proteins. ROBERT S. AITKIN. Physiol. Lab., Oxford. *Biochem. J.* 22, 1239-45(1928).—The Cl-ion potentials were measured by means of Ag-AgCl electrodes. The readings obtained in pure KCl solns. were steady and reproducible. The readings obtained in KCl solns. contg. serum protein were steady but not accurately reproducible. Readings obtained in oxalated human plasma were not steady and not reproducible. B. H.

A method for fractionating lipins (free cholesterol, cholesterol esters and phosphatides) in a single suprarenal capsule of small animals. MICHELE BUFANO. *Boll. soc. ital. biol. sper.* 3, 444-7(1928).—A method for fractionating lipins is given in great detail. Briefly, it is as follows: The suprarenal capsule is extd., freed from connective tissue and weighed. It is placed in a vacuum desiccator over H_2SO_4 and allowed to dry to const. wt. Then it is triturated and divided into approx. 2 equal pts. These are introduced into 2 small extn. thimbles and extd. with acetone for 48 hrs. Cholesterol and cholesterol esters pass into the acetone. After the 1st extn. one of the thimbles is immersed in EtOH for 48 hrs. The phosphatides pass into soln. The total cholesterol is detd. in one of the acetone exts. colorimetrically by means of the Liebermann reaction without previous sapon. with NaOH; in the other extn. the free cholesterol and the cholesterol from the esters liberated by sapon. is pptd. with digitonin and also detd. colorimetrically. The difference between the 2 detns. gives the free cholesterol. The EtOH ext. is dried and its P content detd. colorimetrically by the method of Bell and Doisy. PETER MASUCCI

A method for determining the osmotic pressure of the cations in the serum and a few preliminary results obtained by it. ERIK WARBURG AND KNUD WINGE. *Acta Med. Scand.*, suppl. XXVI, 500-11(1928).—All substances in serum with the exception of the cations Na, K, Ca and Mg can permeate the cell membrane of red corpuscles, which thus alone must det. the size of the cells. The total cation concn. is 0.15 N, of which 96% is Na, 3% K and 1% Ca + Mg, so that the Na alone becomes decisive for the detn. of osmotic pressure upon which erythrocyte size depends. Blood is taken by venous puncture without stasis. One sample is transferred to a centrifuge tube under light paraffin oil; another sample is defibrinated with 2 thin rods before centrifuging. About 2 cc. of serum is introduced into 2 Hamburger hematocrit tubes while 2 other tubes receive a soln. of 21.64 g. $Na_2SO_4 \cdot H_2O$, 0.63 g. KH_2PO_4 and 2.73 g. Na_2HPO_4 in 2 l. of a p_H 7.4. The cation concn. of this soln. is 0.182 N. A suspension of 0.04 cc. erythrocytes is added to each hematocrit tube and these are rotated for about an hr. at 3500 rotations per min. The vol. of the cells is read by means of a microscope. A curve is worked out, showing the relationship between the relative erythrocyte vol. and the relative salt concn. The relative cation concn. in normal and pregnant women, also during lactation, during sweating from hot baths, in pneumonia and in a variety of other diseases was detd. by this procedure. S. MORGULIS

The technic of microdialysis, especially of microelectrodialysis. G. ERTSCH AND W. EWIG. Kaiser Wilhelm-Inst., Berlin-Dahlem. *Biochem. Z.* 200, 250-7(1928).—A glass cell for electrodialysis is described suitable to use with any membrane. The construction of the cell is such that the most favorable condition exists for the utilization of the current for quick removal of ions. The capacity of the middle chamber can be varied from 50 to 1 cc. by the simple device of inserting glass blocks, which makes it possible to use the cell even for microdialysis. S. MORGULIS

A study of the micro-iodine titration. ALEXANDER STURM. Med. Univ.-Klinik. Jena. *Biochem. Z.* 200, 273-9(1928).—Fellenberg's colorimetric detn. of I_2 is only reliable with pure solns. of KI, and for quantities above 1 γ the titration is proposed. The principle of the method is the oxidation of the I^- to iodate with Cl_2 water, evapn. of excess oxidation reagent and liberation of the I_2 by the addn. of purest KI. The I_2 is titrated with $Na_2S_2O_3$ and starch. The Cl_2 must be quantitatively removed; in the

absence of org. matter, this is accomplished when the soln. is evapd. to $1/3$, and the material analyzed must be incinerated in a Pt dish and the HCl soln. of the ash must be kept absolutely dust-free. The sharpness of the end point is very essential for a good analysis. For amts. below 10γ the optimum concn. is 0.5 cc. 1% starch soln. to a vol. of 5-6 cc. The starch must be prepd. fresh daily, by boiling 0.1 g. sol. starch in 10 cc. H_2O for 1 min., and keeping this at $6-8^\circ$, at which temp. the titration should be carried out. For quantities less than 3γ the change of the indicator is inhibited, but the delay is graphically definable. With special care as to the prepn. of reagent, etc., good results are obtained titrimetrically even with quantities of only 1γ (3% error).

Methods of fat analysis. GEORG ROSENFELD. *Biochem. Z.* 200, 280-8(1928).—A comparative study was made of the methods of Kumagawa-Suto, in which the tissue is destroyed with KOH and the fatty acids are set free with HCl and extd. with ether, and of the Rosenfeld method, in which the tissue is first boiled 15 min. with alc. and then extd. with $CHCl_3$. In both methods the operation is repeated twice. From a large no. of analyses it is shown that assuming the value by the Kumagawa-Suto method as = 100, the results by Rosenfeld's method are 131, or almost $1/3$ higher. The original should be consulted for further details of extn.

S. MORGULIS

Methodological study of the in vitro investigation of tissue respiration. ELSA SENNHAUSER. Univ. Zurich. *Biochem. Z.* 200, 351-5(1928).—A comparison was made of the Lipschitz dinitrobenzene method and of the Barcroft gas analytical method in the study of tissue respiration. By the latter method the exptl. results fall within narrower limits. On the whole, for fresh tissue, the 2 methods give about the same variations, and the end results are more or less fortuitously detd. by factors apparently beyond the experimenter's control.

S. MORGULIS

Studies on the method for determining alveolar gas tension. HOKAN RYDIN. Univ. Bern. *Biochem. Z.* 200, 379-400(1928).—An app. together with a special valve is described for detg. the collection of alveolar air. With this automatic respiration valve the alveolar CO_2 tension can be detd. for any depth of respiration. The max. CO_2 tension is found in respiration which is natural in respect to depth and frequency.

Comments on the determination of urotropine in the cerebrospinal fluid. ERICH BERTEL. Chem. Inst. Univ. Innsbruck. *Biochem. Z.* 201, 13-4(1928).—A quantity of cerebrospinal fluid corresponding to 1-10 mg. urotropine (*i. e.*, $9/7 \times 10^{-3}$ HCHO) is heated with 5 cc. $N H_2SO_4$ in a current of steam for 20 min. The distillate is treated with 25 cc. 0.1 $N I_2$ soln., then $N NaOH$ (free from iodate) is added until the brown color changes to yellow. This is left standing for $1/2$ hr., acidified with 10 cc. $N H_2SO_4$ and titrated with 0.1 $N Na_2S_2O_3$. One cc. 0.1 $N I$ corresponds to 1.16 mg. urotropine or 15 mg. HCHO.

S. MORGULIS

A micro-method for determining ether-soluble organic acids in the blood. SÖREN L. ÖRSKOV. Med.-chem. Inst., Lund. *Biochem. Z.* 201, 22-33(1928).—By a special modification of the Widmark shaking app. the extn. of ether-sol. org. acids present in blood is carried out with 0.2-cc. quantities. This is mixed with 0.8 cc. of a soln. of H_2SO_4 in 10% NaCl. By means of the micro-buret (Widmark 0.2 N Örskov) about 200 cu. mm. 0.05 $N NaOH$ is used in the app. to absorb the extd. acid. After shaking 90 min. the alkali is freed of ether and various volatile admixts. by passing a current of CO_2 -free air. An excess of 0.05 $N H_2SO_4$ is added from a microburet until the reaction to phenolphthalein is acid, and titrated back with the NaOH in the first micro-buret.

S. MORGULIS

Gasometric determination of hydrogen peroxide, nitrogenous compounds and of fermentative carbon dioxide by means of Paechtner's ponderovolumeter. P. LUY. Medizinische Hochschule, Hannover. *Biochem. Z.* 201, 65-84(1928).—Paechtner's ponderovolumeter is used in a series of quant. analyses. The app. measures quantities of gas by pressure changes. The utility of the app. for various chem. and biochem. detns. is emphasized. The original description of the app. is given *Z. angew. chem.* 37, 328(1924).

S. MORGULIS

Theoretical and practical consideration about apparatus in which the quantity of developed gas is measured by the height to which the sealing fluid is driven by the gas. MAX SCHLESINGER. Univ. Budapest. *Biochem. Z.* 201, 87-109(1928).—The relation between the change in level of the sealing fluid and the amt. of gas developed is formulated. From this formula the sensitivity of the app. and the deviation from proportionality between change in level and the amt. of gas are detd. With the aid of these theoretical considerations an app. is designed in which the rise of the sealing liquid and the quantity of gas are practically proportioned, or the deviations may be calcd.

S. MORGULIS

Determination of the smallest iodine quantities in organic products by means of acid hydrolysis. II. G. PREIFFER. Landwirtschaftliche Hochschule, Bonn-Poppelsdorf. *Biochem. Z.* 201, 298-304(1928).—The material to be analyzed (finely divided if a solid) is mixed with KOH until reaction is alk. and is dried *in vacuo* at low temp. The relatively dry material, whose H_2O content is detd. by wt., is broken up into pieces the size of a pea and preserved in a closed flask. About 15-20 g. is used corresponding to 60-120 g. fresh substance, but if this is insufficient to demonstrate the presence of I, the distillates from several samples are combined. The material is transferred quantitatively to a Corliss combustion flask of 1.5 l. capacity. The absorption takes place in 2 wash bottles, each with 100 cc. of 10% and 5% KOH, resp. The substance is covered with H_2SO_4 , then a little H_2O_2 is added and the combustion is carried out slowly. The I_2 is set free rapidly. Air is passed in a slow stream of bubbles. By a little practice one soon learns to regulate the aeration, heating and the continuous addn. of H_2O_2 in such a manner that the oxidation is complete for any moment. Before the end of the combustion the addn. of H_2O_2 may be stopped for a few min. when enough CO_2 and CO accumulate to reduce any possible iodate to the volatile I_2 . The most serious source of trouble is the carrying over of fatty acids, which produce soaps; the following procedure is employed to get rid of these. When the combustion has been completed the KOH from the 2 wash bottles is washed into a beaker and digested for a while on the boiling water bath, whereby all the fatty acids are changed to K soaps, and these are then pptd. with $CaCl_2$ (excess $CaCl_2$ can be removed with KOH). The clear supernatant liquid is sepd. from the bulky ppt., which is washed several times with hot water. The combined filtrates are evapd. and dried in a Pt dish. The residue is powdered and repeatedly extd. with alc. The use of a special condenser between the combustion flask and the KOH wash bottles is also recommended, which permits the quant. removal of the fatty acids. The alc. ext., freed from remaining traces of fatty acid if necessary, is now worked up according to the usual procedure. (Cf. C. A. 22, 4558.) S. MORGULIS

Two new laboratory apparatus. II. HANS J. FUCHS. "A. von Wassermann" Inst., Berlin. *Biochem. Z.* 201, 332-6(1928); cf. C. A. 22, 1253.—An app. is described for rapid evapn. at low temps. This is essentially a vacuum desiccator consisting, however, of 2 sep. flasks connected by a wide arch made of glass tubing and fitting into each flask by a ground joint. The tubular arch is also provided with 2 more ground joints for a small manometer and for a funnel, the tip of which reaches into the first flask and serves to run in the material to be evapd. This flask is kept in a water bath of desired temp. The second flask contains H_2SO_4 or other H_2O absorber, and is connected to a vacuum pump by means of a glass-stoppered arrangement. The second app. is a double distn. outfit. Both instruments are shown in figures. S. M.

The pigment analysis of urine. VI. A new spectrometer for qualitative and quantitative analysis of urine. M. WEISS. Inst. med. Chemie, Wien. *Biochem. Z.* 201, 337-40(1928); cf. C. A. 17, 1666.—Description of a spectrometer constructed from a Duboscq colorimeter and adaptable for the study of pigments with a well-defined and limited absorption. The instrument is operated like a colorimeter, but the standard may be used in sealed tubes of definite depth so that the standard pigment soln. need not be prepd. fresh each time. S. MORGULIS

The spreading of protein as a method for the determination of serum albumin and globulin. E. GORTER AND F. GRENDL. Univ. Leiden. *Biochem. Z.* 201, 391-411(1928).—A 0.1 cc. of serum together with 0.1 cc. satd. $(NH_4)_2SO_4$ is placed in a centrifuge tube 6 mm. in diam. and about 5 cm. long and well mixed with a fine rod. This is centrifuged 5 min. at 5000 revolutions or for a longer time at a slower rate. The liquid is poured off quantitatively with the aid of a glass rod and the globulin residue is washed 3 times with 0.1 cc. $1/2$ satd. $(NH_4)_2SO_4$. After the last washing the centrifuge tube is cut off just above the level of the residue and is then placed in a small stoppered weighing bottle. The residue is now weighed and taken up in 950 mg. H_2O (a correction of 50 mg. is allowed for water in the ppt.), and 0.005 cc. of the soln. is used to det. its spreading on 0.1 N HCl. By a simple calcn. the no. of sq. m. which can be spread over by the globulin from 1 cc. serum is easily found. Similarly, 0.1 cc. of the serum is mixed with 0.9 cc. H_2O , and again the spreading of 0.005 cc. of this mixt. on 0.1 N HCl is measured. The spread in sq. m. of total protein in 1 cc. serum is thus calcd., the difference between the 2 values divided by 0.1 representing the percent of albumin. S. MORGULIS

Spectrophotometric studies on oxyhemoglobin. EMERICH KEVE. Univ. Budapest. *Biochem. Z.* 201, 439-53(1928).—When A, the absorption at a definite position of the spectrum of a pigment in a specific solvent, is known, it is possible to find its concn.

C (g. of pigment in 1 cc. soln.) by detg. spectrophotometrically its extinction coeff. E , since $C = A \cdot E$. The ratio $E_{541.5-543.1}/E_{565.2-568.9}$ for once-crystd. oxyhemoglobin of the horse and of the dog is 1.62 and 1.61, resp. The value is lower for recrystd. oxyhemoglobin (1.55) and becomes less the more it is recrystd. For once-crystd. horse oxyhemoglobin the values for $A_{541.5-543.1} = 1.16$ and for $A_{565.2-568.9} = 1.88$. The spectrophotometric hemoglobin detn. in blood is accurate to within 2%. S. MORGULIS

Arterial carbon dioxide pressure in cardiac dyspnea. R. R. FRASER, C. F. HARRIS, R. HILTON AND G. C. LINDER. St. Bartholomew's Hosp., London. *Quart. J. Med.* 22, 1-20(1928).—The following method was used for detg. the CO_2 pressure of the arterial blood by means of a dissozn. curve constructed with arterial blood. A syringe was coated with liquid paraffin and loaded with sufficient Na oxalate to give a final concn. of 0.4% and enough NaF to make 0.1%. Without exposure to the air, 50 cc. of blood was drawn from the femoral artery and transferred under paraffin to a large test tube surrounded with ice. Four portions of 10 cc. each were transferred to tonometers of 400-cc. capacity which had been previously filled with mixts. of air and CO_2 at partial pressures of approx. 20, 30, 40 and 50 mm. of Hg, resp. Each was then placed in a water bath at 37° and rotated continuously for 15 min. The pressure in the tonometer was then measured while it was still in the bath by connecting it with a Hg manometer by small-bore Pb tubing. The blood was run into a small tube under paraffin and again chilled with ice. The CO_2 content of arterial blood and of the tonometer samples was detd. by the method of Van Slyke and Neill, *C. A.* 18, 3615. The pressure of CO_2 in the tonometers was detd. by the Haldane method. At the same time the p_{H} of arterial and tonometer bloods was detd. colorimetrically. Observations were made on 30 bloods from 17 cases of heart failure with dyspnea. The CO_2 pressure may be within normal limits, or above or below them. From a consideration of the O satn., CO_2 capacity, p_{H} of the arterial blood and condition of the patient at the time of observation, it appears that there must be in cardiac dyspnea, a stimulus at the respiratory center independent of the quality of blood at the center, causing increased pulmonary ventilation with a lowering of the CO_2 pressure in the arterial blood. This stimulus may be due to low O tension in the tissues of the center, the result of lowered minute vol. of the circulation. In cases of pulmonary disease in addn. to heart failure, or with pulmonary lesions seen in congestive failure, the arterial CO_2 pressure is raised because of inefficient pulmonary ventilation, or inefficient gaseous exchange in the lungs, which masks this stimulus. The raised CO_2 pressure will act as an addnl. stimulus to the respiratory center. In one case examd. shortly before death, there was evidence of retention of non-volatile acids which would increase the p_{H} and lower the CO_2 , and act as an addnl. stimulus, thus masking the stimulus mentioned above, which was always present in cardiac dyspnea. JOHN T. MYERS

Variation of the glucemic figures obtained as a function of blood dilution after mercurial defecation of the blood. GEORGES FONTES AND LUCIEN THIVOLLE. *Bull. soc. chim. biol.* 10, 1164-78(1928); cf. *C. A.* 22, 2588, 3185.—In defecating total blood, plasma or corpuscles with Hg nitrate or sulfate in increasing dilns., the glucemia values are increased with the diln. If the glucemia of the total blood is detd. for a given diln. of the Hg salt and the glucemia of the plasma and corpuscles is detd. separately at an equiv. diln., their sum equals the glucemia of the total blood. Defecation by tungstic acid gives a glucemia figure independent of diln. The phenomenon of increase of glucemia with diln. of the Hg defecator has no relation to the glucose ester in the blood, since it occurs in the absence of the ester, and, moreover, the ester is pptd. by mercurial defecation. Nor is it explained by the acidity of the Hg salt, since hyperacid tungstic defecator has no influence on the blood reducing power. The phenomenon is not observed after the action of beer yeast on the blood. Accordingly tungstic acid is preferred as a defecating agent. L. W. RIGGS

Microestimation of potassium in biologic media. ALBERT LEULIER, LÉON VELLUZ AND HENRI GRIFFON. *Bull. soc. chim. biol.* 10, 1238-47(1928); cf. *C. A.* 22, 4405.—The liquid such as serum or milk, is deproteinized by means of $\text{CCl}_3\text{CO}_2\text{H}$ and the ppt. is removed by the centrifuge. The excess of acid is neutralized by pure Li_2CO_3 added in small portions, and the undissolved Li_2CO_3 is removed by the centrifuge. The dissolved Li_2CO_3 is neutralized by a few drops of AcOH on the boiling water bath. If NH_4 compds. are present they are removed by heating the deproteinized liquid on the boiling water bath for 30 min. with NaNO_3 and AcOH . K in the liquids thus prepd. is detd. by the cobaltinitrite method. Tissues are brought into soln. by means of HNO_3 and H_2O_2 and the acid is neutralized by pure Li_2CO_3 . Tissues may be mineralized by the sulfoperchloric method. (Cf. Lematte, *C. A.* 21, 2914.) L. W. RIGGS

Estimation of sulfur and phosphorus in plant tissues. R. ECHEVIN AND A. CRÉPIN.

Bull. soc. chim. biol. 10, 1248-50(1928).—Oxidation of org. S by HNO_3 gave results within 5%. The volumetric detn. of P by $\text{UO}_2(\text{AcO})_2$ gave much more accurate results than weighing as $\text{Mg}_2\text{P}_2\text{O}_7$. L. W. RIGGS

Improvement in the Nicloux apparatus for the microestimation of carbon. MAURICE NICLOUX. *Bull. soc. chim. biol.* 10, 1271-2(1928); cf. *C. A.* 22, 202, 3185.—A semi-capillary funnel tube is described whereby the H_2SO_4 is admitted. (Cf. following abstr.) L. W. RIGGS

Modification of the apparatus for the microestimation of carbon by the method of Nicloux. N. BEZSSONOV. *Bull. soc. chim. biol.* 10, 1273-6(1928); cf. preceding abstr.—An alternative arrangement to that proposed in the preceding paper is described. L. W. RIGGS

Application of the Nicloux method to the estimation of carbon in the filtrates from deproteinization of the blood. JEAN ROCHE. *Compt. rend. soc. biol.* 99, 714-6(1928); cf. Nicloux, *C. A.* 21, 3211, 3642.—Details are given for the detn. of C in the filtrate from the deproteinization of 1 cc. of blood. The error is about 5%. **Data on the carbon of filtrates from the deproteinization of total blood, serum and corpuscles.** *Ibid* 716-8.—The figures for total C, total non-protein N, C/N ratio, glucose and C in glucose are tabulated for defibrinated total blood of hog, ox, dog, normal man, uremic man and diabetic man. The detns. were made by the method of Nicloux. The total C after defecation and the total non-protein N in serum and in corpuscles were detd. for the dog, ox and hog. L. W. RIGGS

Estimation of urobilin. M. ROYER. *Compt. rend. soc. biol.* 99, 1003-5(1928).—In the method of Elman and McMaster (cf. *C. A.* 19, 1580) it is necessary to dil. the liquid examd. to that degree which gives optimum fluorescence. R. uses as a diln. liquid a mixt. of the following compn.: $\text{Zn}(\text{AcO})_2$ 25 g., NaAcO 70, concd. HCl 4 cc., 60% alc. up to 1000 cc. This gives a soln. with a p_H of 6.0. The comparison of the fluorescence with that of a standard soln. of acriflavine was made in an app. similar to that used by Brousse, Descomps and Goiffon (cf. *C. A.* 19, 1723). Particular directions are given for the detn. of urobilin in excreta, bile blood and organs. Detns. made in duplicate did not show an error greater than 10%. L. W. RIGGS

Vital coloration of the ossification zone of long bones with p_H indicators. A. POLICARD. *Compt. rend. soc. biol.* 99, 1331-2(1928).—Fresh sections of bones of newborn guinea pigs were immersed in the color soln. for 2 min. and were immediately examd. under low power. The indicators used were bromophenol blue, bromocresol violet, neutral red and thymophenol blue. The colors noted 2 min. after immersion of the section, and the p_H of the various histologic elements are shown in a table. L. W. R.

Reactions of Bordet-Wassermann and of Vernes on the cerebrospinal fluid and blood. A. PRUNELL. *Compt. rend. soc. biol.* 99, 1451-2(1928).—In 132 serums and 90 cerebrospinal fluids the reaction of Vernes and that of Bordet-Wassermann were equally sensitive. L. W. RIGGS

A new lipase determination. L. GZÓONY, JANOS GSELL, AND F. HOFFENREICH. *Magyar Orvosi Arch.* 29, 374-84(1928).—The method depends on the pptn. of a casein soln. of p_H 5.6, on addn. to a mixt. of serum dild. in geometric series 2-4-8, etc., and a satd. monobutyryl soln., the free butyric acid causing the ppt. The results are presented in 11 tables showing the influence of serum components, enzyme poisons, activators and some on the ions on the serum lipase. L. W. RIGGS

Clinical thermometer containing gas under pressure. WM. H. JONES (to General Electric Co.). U. S. 1,693,299, Nov. 27. Structural features.

C—BACTERIOLOGY

CHARLES B. MORREY

Studies on the Coccaceae. XII. Action of the streptococci upon casein. G. J. HUCKER. N. Y. Agr. Expt. Sta. *Tech. Bull.* 141, 1-13(1928).—A series of selected strains of streptococci were grown in milk and by the detn. of the amino N present according to the Van Slyke method, it was noted that certain types had the ability to increase, after prolonged incubation, the amino N content of the milk. When furnished *chemically pure casein* as the only source of N, these strains of streptococci did not produce visible growth if washed cells were used as the inoculum. If large amts. of unwashed cells were used as an inoculum, the streptococci assocd. with milk and milk products generally produced growth. Under no conditions did the pyogenic streptococci produce growth when chemically pure casein was furnished as the only source of N. *Paracasein* and casein appeared to be equally unavailable as sources of N for the streptococci. **XIII. Production of carbon dioxide by the streptococci.** *Ibid*

142, 1-10.—A no. of representative strains of streptococci were secured and their ability to produce CO_2 from either peptone or carbohydrates was studied. Most of these strains, with the exception of *Streptococcus citrovorus* Hammer and *S. kefir* Migula, showed an increase in the amt. of CO_2 produced as the amt. of peptone in the medium was increased. *Streptococcus citrovorus* and *S. kefir* produced no CO_2 from peptone but formed relatively large amts. from glucose. This ability to produce CO_2 from glucose and not from peptone was confined to these 2 species in this study, and further indicates that they are identical or closely related. One strain of *S. ignavus* Holman apparently produced CO_2 from both peptone and glucose, while certain strains of *S. mitior* Schottmüller, *S. cremoris* Orla-Jensen, and *S. stenotrophicus* Bergey produced only small quantities from peptone, which were slightly increased upon the addn. of glucose. XIV. Certain biochemical reactions produced by the streptococci. *Ibid* 143, 1-64.—A study was made of 358 representative strains of streptococci to find const. and convenient characters by which the species of the genus may be differentiated. Only authentic and previously named strains of streptococci were studied and no effort was made to make a floral study of any particular natural habitat of this group. The streptococci can be divided into 2 groups on the basis of the type of lactic acid produced. The low-acid producers, which generally prefer levulose to glucose, attack the pentoses, form relatively large amts. of volatile acid, and many times CO_2 , all form *l*-lactic acid. The more common types of streptococci produce *d*-lactic acid. Many of the strains attacked the nitrogenous constituents in milk and produced an increasing amt. of H_2O -sol. N if the culture was allowed to incubate over a long period of time in the presence of CaCO_3 . Certain of the strains studied, particularly *Streptococcus lactis* Lohnis and related types, produced less than 10% of the total acidity as volatile acid, while *S. kefir* Migula, the aroma types, and certain hemolytic strains produced as high as 40% volatile acid. The relative amts. of non-volatile and volatile acid formed remained approx. const. regardless of the total amt. of acid produced. The non-hemolytic strains all produce AcOH and a volatile acid with a higher distg. const. than acetic, while the hemolytic types form, in addn. to AcOH, a volatile acid with a lower distg. const. than that found for AcOH. The distg. consts. obtained from the hemolytic strains indicate that varying amts. of HCO_2H are present. Const. results were obtained in qual. acid production from sugars if the conditions of growth were controlled, and it was concluded that fermentations of sugars and other C sources were valuable as routine methods in sepg. the species of streptococci. The strains producing *l*-lactic acid hydrolyzed the lactose much faster than it was converted into acid, while the remaining types produced acid as rapidly as the lactose was hydrolyzed. The need for a usable classification of the streptococci is pointed out, one which is based upon const. and easily detd. characters. Conclusion: The biochem. reactions produced by the streptococci studied may be used as a basis for differentiating the species in this genus. XV. Relationships of the various acid-proteolytic cocci. *Ibid* 144, 1-20.—A study of 25 strains of acid-proteolytic cocci showed there were 2 distinct types, micrococci and strains of streptococci which included *S. liquefaciens*. Some of these types are said to play an important part in both the normal and abnormal changes in the ripening of cheese and other dairy products. C. R. F.

Effect of cigaret smoking on the number of bacteria removable in mouth rinsings. J. L. T. APPLETON, JR., AND EARL LEHNER. Univ. Pennsylvania. *Dental Cosmos* 70, 1111-21 (1928).—The smoke from 1 cigaret bubbled through dild. saliva decreased the bacterial count of the latter by approx. 35%. Smoking 1 cigaret reduced the no. of bacteria removable by rinsing the mouth by approx. 40%; 30 min. later, the no. of such bacteria was 14% below its initial value and 26% below the value in a control group. At the end of 1 hr., no difference was found between the smokers and the controls. A bibliography is appended. JOSEPH S. HEPBURN

The importance of the hydrogen-ion concentration for the storage of starch-like substance in iodophil intestinal clostridia. NANNA SVARTZ. *Acta Med. Scand.*, suppl. XXVI, 385-9 (1928).—It is possible to regulate the storage of starch-like substance and spore formation of the iodophil clostridia. By keeping the reaction below 6.6 these bacteria will never store up any I-stainable material or form spores even if there is an abundance of carbohydrate in the medium. If the reaction of the medium is 6.6-7.0 these organisms at once begin to deposit iodophil substance. By preventing acidification of the medium by the addn. of CaCO_3 , spores will be formed. S. M.

Decomposition of olive oil under the influence of the vital activity of some microorganisms; transformation of oleic acid into ketostearic acid. G. PIGULEVSKII AND N. CHARIK. Chem. Lab., Univ. Leningrad. *Biochem. Z.* 200, 201-10 (1928).—Olive oil is utilized by microorganisms. This process is accompanied by a hydrolysis of the

oil, oxidation of the liberated oleic acid and further modification of the oxidation product. Unquestionably the oleic acid is changed to a variety of intermediate substances of which one, ketostearic acid $C_{18}H_{34}O_8$, has been actually isolated. S. M.

The demonstration of metachromatic granules in diphtheria bacilli. Microscopic diphtheria diagnosis. M. GUTSTEIN AND H. NEISSER. Univ. Berlin. *Centr. Bakt. Parasitenk. I Abt.* 108, 253-6(1928).—Heat-fixed films are covered with a 1% aq. soln. of Azure II for 2 to 5 sec., washed with water and differentiated with 3% HOAc (1 to 3 sec.). The granules are reddish violet and the body of the bacillus is light blue. Another method: Stain with 1% Azure II for 2 to 3 min., wash with water and aq. phosphine (chrysaniline extra) Kahlbaum. The granules are black and the body of the bacillus is yellow. Azure II will also demonstrate granules in living cells.

JOHN T. MYERS

Comparative studies of the reduction potential of anaerobic and aerobic bacteria. C. G. REYMAN. Staatens Serum Inst., Copenhagen. *Centr. Bakt. Parasitenk. I Abt.* 108, 401-12(1928).—The reduction potential of facultative anaerobes has usually been considered less than that of obligate anaerobes, and that of obligate aerobes still less. But facultative anaerobes possess the greatest reducing power in either complete or partial anaerobic conditions. Comparisons were made in bouillon which contained a moderate amt. of carbohydrate. This result should be expected since the reducing power is associated with the power of assimilation, which is wider with the facultative anaerobes. Obligate anaerobes have smaller amts. of reducing enzymes than do facultative organisms and are more easily poisoned by O.

JOHN T. MYERS

Limiting factors in lactic fermentation. L. O. ROGERS AND E. O. WHITTIER. U. S. Dept. of Agr. *J. Bact.* 16, 211-29(1928).—Lactic fermentation continues for a time after the bacterial cells cease multiplication, although the same factors appear to limit both. Control of p_H at 5.8 to 6.0 permits attainment of a greater bacterial population than when the accumulating acid is not neutralized. Still greater populations are attained when the culture with controlled p_H is agitated with a mech. stirrer with air, and greater populations still when N is substituted for air. The concn. of the undissocd. lactic acid is the principal factor in the limitation of growth and metabolism. Exhaustion of food factors may limit growth, but ordinarily the supply is more than sufficient. Mech. crowding is not a factor in the limits so far attained. Volatile products of metabolism, easily oxidizable products, total lactate concn., and self-induced changes in reduction potential, are not factors in limiting the numbers of *Streptococcus lacticus*. A substance which is diffusible through a collodion membrane limits the growth of *St. lacticus*.

JOHN T. MYERS

The effect of pure soaps on the bactericidal properties of phenolic germicides. BETTYLEE HAMPH. Johns Hopkins Univ. *J. Bact.* 16, 287-300(1928).—The marked inhibitory action of Na oleate, Na myristate, K palmitate and K stearate on the bactericidal properties of phenol, *m*-cresol, *sec*-butylphenol, butylresorcinol and hexylresorcinol has been demonstrated. The relationship appears to be more or less quantitative and indicates the impossibility of producing a germicidal soap by adding small quantities of a phenolic compd. The addn. of large quantities of non-irritating phenols is precluded by their cost. The germicidal activity of phenol is interfered with more extensively by the dispersed than by the gel phase of soaps. Apparently the soap removes the phenol from soln., thus interfering with its bactericidal activity. There is a good bibliography.

JOHN T. MYERS

A study of *Micrococcus zymogenes*. MARTIN FROBISHER AND E. RANKIN DENNY. Johns Hopkins Univ. *J. Bact.* 16, 301-14(1928).—The organisms studied as *M. zymogenes* may not all belong to the same species. A biochem. study was made of 5 freshly isolated strains. Some produce α , some β , and some γ types of colony on blood agar. There is no apparent relation between hemolysin and proteolytic enzyme production. The proteolytic enzymes resemble histase in their action on cooked meat but differ in their ability to digest coagulated serum, gelatin and casein. There is no direct relationship between *M. zymogenes* and any clinical or pathological entity, although it has been isolated more frequently from endocarditis. *M. zymogenes* and *Streptococcus liquefaciens* are probably identical. There is a long bibliography.

JOHN T. MYERS

Physiological studies on cellulose fermentation. J. R. SANBORN. Macdonald Coll., P. Q. *J. Bact.* 16, 315-9(1928).—China blue-aurin-cellulose soln. is very useful in the study of cellulose-decomp. organisms from soil; isolations may be made by the streak or pouring plate methods using the solid medium. Microbial associations can be studied fairly effectively, and studies can be made of accessory influences in the medium, upon cellulose fermentation. The medium gives excellent results with soil fungi for the detection of cellulose-destroying powers.

JOHN T. MYERS

The inhibiting effect of *Streptococcus lactis* on *Lactobacillus bulgaricus*. L. A. ROGERS. U. S. Dept. of Agr. *J. Bact.* 16, 321-5(1928).—A sol. and diffusible sp. substance is produced by the lactic cultures which will inhibit *Lactobacillus bulgaricus*.

JOHN T. MYERS

A study of rennin action. I. Rennin production by *Bacillus prodigiosus*. JOEL G. WAHLIN. Univ. of Kansas. *J. Bact.* 16, 355-73(1928).—Rennin production by *B. prodigiosus* occurs in media contg. complex proteins, amino acids, and NH_3 as sources of N. The accumulation as reflected by the clotting time proceeds more rapidly at 37° than at 20° . Clotting time is independent of the cell constant of the fluid. Filtrates of cultures are less rennin-active than raw cultures, perhaps because of adsorption of rennin by the filter. Prodigiosus rennin is characterized by being more thermostable, less susceptible to oxalates and apparently less susceptible to the casein concn. than is calf rennin. Both types are within limits accelerated in their action by CaCl_2 and by heat. Prodigiosus rennin coagulates heated milk more readily than does calf rennin. **II. The effect of rennin on sodium caseinate.** *Ibid* 375-86.—Rennin alters Na caseinate and milk in such a way that the protein is more readily precipitable by salts. Certain types of proteolytic bacteria when grown in Na caseinate alter the medium in a similar way.

JOHN T. MYERS

Muller's phenomenon: Distant punctate hemolysis of blood agar by staphylococci. F. M. BURNET. Walter and Eliza Hall Inst. *Australian J. Exptl. Biol. Med. Sci.* 5 [3], 205-12(1928).—Muller's findings are confirmed. Among the conditions of the medium necessary for the appearance of the characteristic discrete areas of hemolysis are the following: Of several species tested human red blood cells only are effective. A certain amt. of serum or plasma must be present. Human, rabbit and guinea-pig serum are all capable of giving the appearances. The nature of the basic nutrient medium actively influences the reaction. Huntton's hormone agar was the most satisfactory basis. Among the bacterial species tested only pyogenic staphylococci gave the reaction. Staphylococci of the *epidermidis albus* type were inactive. L. W. RIGGS

Influence of molds on the growth of luminous bacteria in relation to the hydrogen-ion concentration, together with the development of a satisfactory culture method. SAMUEL F. HILL. Princeton Univ. *Biol. Bull. Marine Biol. Lab.* 55, 143-9(1928).—The influence of molds on the length of life of cultures of luminous bacteria may be simulated by the use of buffer mixts., or by a continuous supply of fresh alkali. The max. alky. produced in these expts. by the influence of *Penicillium* species was p_H 8.6 \pm 0.2. Degeneration of cultures of luminous bacteria may be caused by growth on media insufficiently alk., or so slightly buffered that it soon becomes acid. Diffuse growth and spreading over the surface of the slant is caused by too low salt concn. Long life of cultures may be secured by growing on media sufficiently alk., and sufficiently buffered to resist rapid change by the acid production of the bacteria, which are killed by their own acid at about p_H 5.6. L. W. RIGGS

Elimination of false presumptive tests (JANZIG, MONTANK) 14.

THOMAS G. PHILLIPS

A comparison of some properties of normal and frosted wheats. ARNOLD H. JOHNSON AND W. O. WHITCOMB. Mont. Agr. Expt. Sta., *Bull.* 204, 1-66(1927).—The grade of wheat depends on freedom from frost-damaged kernels. This investigation has for its object the detection by chem. methods of frosted wheat. Wheat frosted when the moisture content is 44-46% or less appears to be equal in milling and baking quality to normal wheat even though the % of wrinkled or blistered kernels may be relatively high. Wheat of such moisture content is in the stiff-dough stage. When allowed to stand in the field before cutting, frosted wheat decreases in wt. per bu. and in yield. Green color in wheat which has been frosted at a very immature stage, changes to more nearly the color of normal wheat if the wheat is allowed to stand in the field some time before cutting. No further translocation of proteins or carbohydrates into the kernels occurs when wheat has been subjected to a killing frost, but such translocation does

occur in normal wheat cut young. The crude protein content of frosted wheat appears not to be significantly different from that of normal wheat. The crude gluten in wheat is lowered by frost damage only when the grain has a moisture content greater than 44-46% at time of freezing. Amino N compds. exist in greater quantity in frosted wheat and flour than in normal wheat and flour. During a given time of autodigestion greater quantities of the protein are broken down in frosted-wheat flour than in normal-wheat flour. The viscosity after acidulation of extd. flour-H₂O suspensions is greater for normal-wheat flours than for comparable frosted-wheat flours; the more severe the frost damage the greater is the difference in viscosity. The ash content of flours milled from frosted wheats is higher than that of flours milled from normal wheats of the same ash content, the differences becoming less as the wheats approach maturity. The reducing-sugar content of frosted wheat and the flour milled from it is greater than that of normal wheat and flour; the more immature the wheat when frosted, the greater is the reducing-sugar content. Reducing sugars are formed at a more rapid rate during the autodigestion of frosted-wheat flours than during similar autodigestion of comparable normal-wheat flours. A temp. of -1.8 to -2.8° will cause frost damage in immature wheat, the degree of this damage depending on the above conditions. The food value of frosted wheat is but little, if at all, inferior to that of normal wheat

C. R. F.

Calcium in lemon and orange leaves. A. R. C. HAAS AND F. F. HALMA. Calif Citrus Expt. Sta., Riverside. *Citrograph* 13, No. 3, 10(1928); cf. C. A. 22, 2390—Preliminary expts. showed that the ash contents of lemon and valencia leaves were approx. the same but that in mature lemon leaves, a much greater proportion of the ash is insol. in H₂O. For lemon leaves this ratio is 11 to 4, while in valencias, it is evenly balanced. The Ca content of the ash of both leaves is about 33%. Only 18% of the Ca in lemon leaves is sol. in H₂O against 48% of the Ca in valencia leaves. This fact may have an important bearing upon the relative sensitiveness of lemon and orange leaves to freezing, the lemon freezing at considerably higher temps. The expts. are being continued.

C. R. F.

Some phases of nitrogen metabolism in Polyanthus narcissus. G. T. NIGHTINGALE AND W. R. ROBBINS. N. J. Agr. Expt. Sta., *Bull.* 472, 1-32(1928).—The roots of the paper-white narcissus appear to be the chief organs concerned with the transformation of nitrates to org. N. Within the roots, nitrates were apparently reduced to nitrites and NH₃, accompanying which there was oxidation of reducing sugars, and a decrease in % and abs. amt. of higher carbohydrates, not only in the roots but in the storage tissues as well. As a direct or indirect result of nitrate assimilation, there was an increase in abs. amt. of total org. protein, proteose, and basic, amide and amino N in bulbs of the paper-white narcissus while in darkness. In one series of bulbs much of the N for new growth of centers and tops was newly synthesized from nitrates, whereas in another group the sole source of N for new growth was derived from the breaking down of more or less complex org. nitrogenous materials of the storage tissue; yet the quality of N in the centers and tops was about the same in both cases. The comparatively active centers or centers and tops of the paper-white narcissus are relatively high in the simpler carbohydrates and the less complex forms of org. N, whereas the storage tissue has relatively much N in the form of protein, and carbohydrates in the form of starch and dextrin. Bulbs with a low initial N content after transfer from darkness to light bloomed earlier as the result of nitrate applications, whereas other bulbs, likewise shifted from darkness to light, with a much higher initial quantity of stored N were delayed in time of blooming by addn. of nitrates to the nutrient medium. Twenty-six references are appended.

C. R. F.

Effects of ultra-violet radiation on various fungi. F. L. STEVENS. *Bol. Gaz.* 86, 210-25(1928).—Ultra-violet radiation has a profound effect upon the reproductive processes in various fungi. There occurs profuse sexual or conidial development in fungi that normally exhibit these stages very rarely.

BENJAMIN HARROW

The biological role of tannin in the plant cell. L. LUTZ. *Bull. soc. bot. (France)* 75, 9-18(1928).—Oxidation processes were noticeably retarded by the addn. of tannin to cultures of the following fungi: *Stereum hirsutum*, *S. purpureum* and *Polyporus versicolor*. Tannins may act as moderators of intracellular oxidation processes; this confirms in part the theory proposed by Moureu and Dufraisse (1922). Reference is made to the many theories concerning the possible role of tannin in the plant.

Algae in sodium phosphate solutions. W. R. TROTTER. *Nature* 122, 729(1928); W. H. PEARSON. *Ibid.*—The occasional occurrence of green algae in bottles contg. Na phosphate solns. is discussed.

E. H.

Germination of sugar-cane pollen in artificial culture media. N. L. DUTT AND G. GANAPATHI AYYAR. Imp. Sugarcane Sta., Coimbatore. *Agr. J. India* 23, 190-202(1928).—The best germinations of sugar-cane pollen were obtained in a culture medium contg. 26% sucrose and 0.7% agar. Solns. of maltose, lactose, galactose, etc., isotonic in concn. with a 26% soln. of sucrose did not give satisfactory germinations. This indicated that the germination of cane pollen was not merely the effect of a balanced osmotic condition but was the result of a response to a definite chem. stimulus by the sucrose. The percentages of germination varied widely with different varieties of cane, a max. of 61% being obtained with M. 54,111, a seedling developed at the Coimbatore station. Germinations were obtained at temps. ranging from 22° to 33°. Pollen of Saretha Desi, a thin cane variety, was found to retain its viability for 2 hrs. when exposed to lab. atm. conditions and for 1 hr. when exposed to free air in direct sunlight. Cloudy weather was found to have no very harmful effect on ultimate germination of cane pollen.

K. D. JACOB

Intervarietal differences of a chemical nature in the mature potato tuber. T. P. McINTOSH. *Scottish J. Agr.* 11, 304-11(1928).—A preliminary study was made of the value of various chem. tests for distinguishing between different varieties of mature potato tubers. *The alkali test.*—This test is based on the development of yellow color, due to the presence of "flavones," when sections of potato are immersed for several sec. in *N* KOH solns. and then laid out on petri dishes. The colors developed varied from very faint yellow to deep yellow, and the color of each variety tested remained relatively const., no substantial variations being noted in samples grown in acid and alk. soils in widely sepd. districts and tested over a storage period of 5 months. The fertilization of the crop had no effect on the results and from a limited no. of tests it seems that the reaction holds in the case of tubers affected with virus diseases. There was no substantial variation in the test when applied to potatoes of the same variety dug at different stages of maturity. *The oxidase test.*—This test is based on the development of colors ranging from light brown to dark purplish brown when slices of potato, free from injuries and eyes, are brushed with a few drops of a 0.5% soln. of benzidine in 50% alc. and dried for 1 hr. at about 40° F. The test gave substantially const. results on the same variety of potato under various conditions. *The blackening of potato tissue.* This test is based on the oxidation of tyrosine to give finally a black coloration due to formation of melanin. The test was carried out as follows: Transverse slices were cut with a stainless-steel knife from the middle of the long axis of the tubers, and the surface of these slices was lightly scratched with a Ag wire in order to expose more tissue. The slices were immersed in a soln. of Na_2CO_3 , p_H 8.3, for about 30 sec. and then incubated in petri dishes in a moist incubator for 30 min. at 37°. The resulting shades of black were classed as faint, intermediate and dark, and, with the exception of slight differences in the intermediate group, the results were consistent for the individual varieties. Toward the end of the storage period there appeared to be a slight decrease in the amt. of melanin formed, but the individual varieties still retained their relative positions. *The tyrosinase reaction.*—This test is based on the formation of a red color, due to oxidation of tyrosine by the enzyme, tyrosinase, on the surface of cut potatoes. *p*-Cresol, which is similar to tyrosine in its structure is also oxidized by the enzyme. In carrying out the test, slices of potato were brushed with a few drops of 0.2% soln. of *p*-cresol and the red coloration was noted after 15 min. at 40° F. This test also gave useful results on the same variety of potato under different conditions. A few expts. indicated that varieties of potatoes might also be distinguished by the shades of color developed when slices are steeped for 2 min. in 20% nicotine soln. Intervarietal differences were not revealed by tests with Millon's reagent, methylene blue, oxidizing agents, reducing agents, common acids in various degrees of concn. and the H-ion concn. of the cell sap. The investigation is being continued.

K. D. JACOB

Changes produced in plants upon emasculation. V. G. TARANOVSKAYA. *Zhurnal Opuhnoi Agronomii* (Russia) 23, 127-64(1927).—Buckwheat was grown in sand cultures with the Prishnitskov medium, consisting of 0.172 g. $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ per kg. of sand and the other ingredients as a 1% soln. in the following quantities: 24 cc. NH_4NO_3 , 15 cc. KCl, 6 cc. $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ and 2.5 cc. FeCl₃. The plants were grown in 4 to 6 pots, from 2 pots the plants were emasculated, the rest were left to develop normally. Similar operations were carried out with the following plants in the field: barley, lupines, corn, buckwheat, mustard, hemp, poppy, soy beans. In general the grain crops were negatively affected by the emasculation as shown by the decrease in dry matter. Chem. detns. were made on the buckwheat both grown in the pots and in the field. The flow of plastic substances not being able to feed the seed and fruit-forming organs goes to the vegetative parts of the plant. The increased concn. of cell sap increases the turgor

of the plants and the osmotic pressure in the cells, thus increasing the activities of the plant and thereby increasing the synthesis of nutrient substances. Emasculated plants show an increased intensity of CO_2 assimilation because of an increase in leaf area and a more successful utilization of mineral substances of the soil because of an intensified ability of the roots to take up these substances. The emasculated plants exercised a selective absorption for certain substances. Thus there was an increase of P_2O_5 , K_2O , Mg and Cl. The N content decreased, but the percent of protein N increased. The bulk of the Ca did not combine with the oxalate and it accumulated primarily in the cell wall. The low oxalate content is due to the increased respiration. There was an increase in carbohydrates, especially sugars and a decrease in cellulose. J. S. J.

Function of potash in the formation of carbohydrates. A. JACOB. German Potash Syndicate. *Z. angew. Chem.* 41, 298-301(1928).—Recent theories of light-energy relations in photosynthesis are briefly discussed. The theory of Stoklasa that the radioactivity of K is responsible for the emission of electrons, which he regards as the effective agent in photosynthesis, is contradicted by his expts. which indicate that light is necessary in the presence of K while Rn is effective in darkness. J. advances the theory that the photoelec. effect could afford an explanation just as satisfactorily as the radioactive theory of Stoklasa. If this could be established it would overcome difficulties met with in other theories advanced, namely, that the energy of light is not sufficient to explain the conversion of CO_2 into HCHO on the basis of the quantum theory. The process could then be explained by regarding the effect of K on plant life as due to the photoelec. effects, by assuming that the K atom stores up the light energy and by emitting electrons provides the necessary energy for the assimilation process. H. R. KRAYBILL.

The significance of the water saturation condition for the carbon dioxide assimilation of plants. (Preliminary paper.) HEINRICH WALTER. *Ber. deut. botan. Ges.* 46, 530-9(1928).—*Elodea canadensis* was grown in water from Lunz (Austria), which contains considerable bicarbonate, and the assimilation measured by changes in cond. according to the method of Ruttner. By adding varying amts. of cane sugar to the H_2O , conditions were obtained whereby some H_2O was withdrawn from the plants. There was then a strong decrease in assimilation and a lesser fall in respiration. When such plants were returned to cultures contg. only H_2O recovery took a no. of days, and if plasmolysis had been too long continued the plants died. LAWRENCE P. MILLER.

The extraction of plant sap by pressure for the determination of osmotic values by cryoscopic methods. HEINRICH WALTER. *Ber. deut. botan. Ges.* 46, 539-49(1928).—If leaves of *Helianthus annuus* are first killed by being placed in a glass cylinder which is put in boiling water for 15 min., the amt. of sap which can be expressed by hydraulic pressure is $3\frac{1}{2}$ times that which can be obtained from living leaves under the same pressure. The osmotic value of the sap thus obtained is twice that of the sap pressed from living leaves. Investigation of other plants showed that only in exceptional cases, such as where the leaf tissue is watery, as in *Rhoeo discolor*, is the proper value obtained from living leaves. That this higher value from dead leaves is not due to hydrolysis induced by the temp. of killing is shown by the fact that if the killing is done by liquid nitrogen similar values are obtained. Thus sap from living leaves of *Buxus sempervirens* gave a value of 7.16 atm., from leaves killed by heat 25.64 atm., and from leaves killed by liquid nitrogen 25.94 atm. In the case of *Prunus laurocerasus*, which stores considerable glucoside, killing of the leaves by heat does result in some hydrolysis and in osmotic values which are somewhat high. It is only in a few isolated cases, however, that killing by heat introduces such an error. LAWRENCE P. MILLER.

The influence of the anions of potassium salts on potato plants and the effect of the root activity of the plant upon the medium. W. VON BREHMER. Biol. Reichsanstalt f. Land- u. Forstw., Berlin-Dahlem. *Ernähr. Pflanze* 24, 393-7(1928); cf. *C. A.* 22, 1428.—Potato plants were grown in sand cultures with a basal nutrient content adjusted to give an initial p_{H} of 4.0. Varying quantities of KCl, K_2SO_4 , KNO_3 and K_2HPO_4 were added and measurements made of the height of the plants produced and the p_{H} of the media. In every case the p_{H} change was toward neutrality. L. P. M.

The carbohydrates of the iris. Nature, genesis and transformations. ANDRÉ AUGEM. *Rev. gén. botan.* 40, 456-73, 537-54, 591-605(1928).—The reserve carbohydrates of the rhizome of *Iris germanica* consist only of sucrose and starch. The rhizome of *Iris pseudacorus* contains a levulosan, irisin, accompanied by a little sucrose but no starch, while that of *Iris foetidissima* contains sucrose, starch and levulosans. Irisin as prepd. from the rhizome and seed of *I. pseudacorus* consists of white lumps, m. 185°, $[\alpha]_{\text{D}}$ before hydrolysis -51° , after hydrolysis -92° . Mol.-wt. detns. indicate that it contains 6 or 7 mols. of $\text{C}_4\text{H}_{12}\text{O}_8$. Two levulosans were isolated from the rhizome and leaves of *I. foetidissima*, the 2 being sepd. through difference in soly. of their Ba compts.

The one present in the larger amt. was obtained as a white, tasteless powder, very hygroscopic, m. 151° , $[\alpha]_D$ before hydrolysis -29° , after hydrolysis -80° . Mol. wt. detns. show this to be a dilevulosan. The second levulosan prepd. had a $[\alpha]_D$ -20° before hydrolysis, -78° after hydrolysis. This substance, differing from the other levulosans, which were resistant to the action of all enzymes tried except a powd. enzyme prepd. from mucedin, was slowly but completely hydrolyzed by yeast invertase. In no case was any aldehyde sugar found in hydrolysis products. Analyses of rhizomes indicates that the reserve carbohydrates are const. in amt. during the greater part of the year. The rhizomes contain no enzymes which hydrolyze the levulosans and starch except during the flowering period, when levulosan-splitting enzymes are present. The leaves contain these enzymes at all times. At the time of flower formation, especially in *I. germanica* and *I. pseudacorus*, there is a marked hydrolysis of the sol. polyoses in the rhizome. These are transported as reducing sugars to the growing seed, where they are condensed to form irisin in *I. pseudacorus*, sucrose in *I. germanica*, and levulosans and sucrose in *I. foetidissima*. As the seed ripens these substances slowly change to a horny albumen, which is the same in the 3 species, and which on hydrolysis yields 80% mannose and 20% arabinose. The leaves contain sucrose, glucose and levulose; those of *I. foetidissima* contain levulosan in addition. Starch is absent in all cases except in the guard cells of the stomata.

LAWRENCE P. MILLER

The significance of oxygen for the production of urea by molds. NICOLAI N. IVANOV AND M. I. SMIRNOVA. Univ. Leningrad. *Biochem. Z.* 201, 1-12(1928).—Molds produce urea only in the presence of the O just as green plants form asparagine. Placed in an atm. of H_2 , the molds cease to form urea but retain their urea content, and commence to produce more urea as soon as they are transferred once more to an O atm. The urea is synthesized from absorbed NH_4 salts. In the absence of O the mold fails to absorb the NH_4 , and when the conditions for this are favorable only as much NH_4 is being absorbed as is transformed to urea. The fact that both urea and asparagine require O for their synthesis suggests a comparison between these 2 substances. S. M.

The destruction of hexoses in plants. III. The problem of the plant cozymase. V. ZALESSKII AND E. SCHATALOVA-ZALESSKA. Plant physiol. Lab. Charkov. *Biochem. Z.* 201, 190-8(1928); cf. *C. A.* 22, 612.—The flour of pea seeds and germinated plantules lose their capacity to utilize AcH after dialysis. The addn. of boiled juice from dried yeast restores the ability to transform AcH. The pea flour thus requires a heat-stable substance for this transformation. This is contained in the dry yeast ext. and is provisionally designated as the coenzyme of pea aldehydase, which is identical with zymase (thus cozymase). The difference in the aldehydase activity of ungerminated and of the germinated pea seeds can be removed by an excess of cozymase; the problem of the change in the aldehydase activity during germination requires thorough reinvestigation. The coenzyme of the aldehydase is firmly bound in the unripe pea seed, and cannot be removed from its flour by dialysis. The dialyzed flour of unripe pea seeds transforms AcH to some unknown compd. S. MORGULIS

The enzymic condensation of formaldehyde to sugar. II. J. BODNÁR. Kgl. ungar. pflanzenbiochem. Inst., Budapest. *Biochem. Z.* 201, 281-5(1928); cf. *C. A.* 22, 1611.—The pulp of *Tropaeolum* leaves does not convert AcH to sugar as it does with CH_2O . Not only the pulp but also the dry leaf powder can condense CH_2O to sugar. The powder has no effect on AcH. Since neither the boiled leaf pulp nor the boiled powder can produce the condensation of CH_2O to sugar it is concluded that this is an enzymic reaction.

Studies on nectar in relation to honey production. O. W. PARK. Iowa State Coll. *J. Econ. Entomol.* 21, 789-90(1928).—This investigation was undertaken: (1) to discover the factors which influence the quantity or the quality of nectar produced by a given species of plant; (2) to find a means of measuring the value of a plant as a honey producer; (3) to contribute information on the manner in which the honey bee (*Apis mellifera*) changes nectar into honey. About 900 samples of nectar from many species of plants, including the important honey plants of Iowa, were collected and analyzed. Nectars which are secreted abundantly have a lower sugar concn. than those secreted less abundantly. Most of the nectar samples contained 40-55% sugar, few showing less than 30% or more than 60%. Nectar from a given source varied considerably in sugar concn. Sugar concn. was found to be nearly inversely proportional to the relative humidity of the air. Light was a factor of less importance. In some species of plants, the same flower secretes nectar throughout a period of several days.

C. H. RICHARDSON

Metabolism of *Ustilina vulgaris* L. WÜNSCHENDORFF AND CH. KELLIAN. *Compt. rend.* 187, 572-4(1928).—The fungus was grown in Erlenmeyer flasks on cotton pads

covered with filter paper and satd. with the nutrient soln. contg. MgSO_4 , K_2HPO_4 , gelatin and either peptone, urea, asparagine or $(\text{NH}_4)_2\text{SO}_4$. In the cases of peptone, urea and asparagine, NH_3 was produced and the reactions for biuret, cystine, tyrosine and tryptophan disappeared. During several months of active life of the fungus NH_3 was evolved at widely varying rates. An av. of 8 detns. over a period of 23 days was 0.77 mg. NH_3 per 100 g. of dry mycelium. These cultures contained NH_4 salts, amino acids, urea and creatinine but no indole, aldehydes or acetone. In the presence of carbohydrates were produced oxalic, citric, malic and succinic acids. Glucuronic acid sometimes appeared, its amt. varying with the sugar present. L. W. RIGGS

Reducing action by fungi of the *Fusarium* and *Verticillium* genera, parasites of wood tissue. J. BORDAS AND P. H. JOESSE. *Compt. rend.* 187, 574-6(1928); cf. Lutz, C. A. 20, 3485; 21, 1290.—Several species of *Fusarium* and *Verticillium* were grown on the Richard medium to which was added one drop of a 0.125% soln. of methylene blue for each 5 cc. of the medium. The culture tubes, each contg. 10 cc. of the medium, were placed in free air at 25°, and the reduction was estd. by the change in color of the methylene blue. Two species of *Fusarium* and 3 of *Verticillium* showed stronger reducing powers than *Polyporus fulvus*, *Stereum necator* and probably of the greater part of the *Hymenomyces* studied by Lutz. L. W. RIGGS

Variations in the content of vitamins B and C of cereal grains during germination. C. KUCERA. *Compt. rend. soc. biol.* 99, 967-70(1928).—By feeding expts. with guinea pigs it was detd. that vitamin C was developed in practically equal quantities in wheat, rye and barley, and in sufficient quantities during the first 24 hrs. of germination. With oats the development of vitamin C was retarded but was present after 72 to 96 hrs. of germination. Localization of vitamins B and C in young plants. *Ibid* 971-2.—In plants 6 to 12 days old, vitamin C was found in all parts, including the germinating seed. Vitamin B, on the contrary, was found only in the germinating seed. Further work is in progress. L. W. RIGGS

Origin of camphor trees. TOMIZO YAHAGI. *Central Inst. Japanese J. Chem.* 3, 109-29(1928).—The findings of this research were obtained by extensive cytological and morphological studies of tissues from various parts of camphor trees. In the oil cells of camphor trees there exists an enzyme material of the nature of a peroxidase, and the formation of camphor products in them is due chiefly to the direct action of this enzyme material on the substance of the cells. The rate of formation of camphor and oil is closely related to the vigor of tree growth; where the vegetative force is strongest the largest amt. of camphor is found. Once the formation of the oily matter is started within the cell it proceeds rapidly until the cell is filled with camphor products. The formation of camphor and oil occurs in the very early stages of growth, contrary to formerly accepted ideas. The formation of oily matter occurs in nearly all tissues in active growth and especially in wood lying beneath the cambium layer. The sap of camphor tree contains no perceptible amt. of camphor or oil. The "resinogenous layer," which Tschirch indicated along the inside wall of oil cells in plants, probably corresponds to the layer of peroxidase above mentioned. The existence of a peroxidase lining has been found in cells of tissues from *Cinnamomum loureirii* Nees, *Laurus nobilis* L., and a few other trees. This gives addnl. support to the idea of peroxidase formation of essential oils and camphoraceous products in essence-producing plants. L. W. RIGGS

Serum studies in high altitude by means of electrodialysis. A. TÓTH. *Inst. für Hochgebirgsphysiol., Davos. Biochem. Z.* 201, 412-23(1928).—In rats there is a lower globulin content in serum at high altitude. Acute lowering of atm. pressure produced contrary effects on the globulin fraction in different rats. In guinea pigs there was no effect noted at high altitude, and no influence produced by lowering the pressure experimentally. This also applies to the rabbit. In human beings who have been for a long

while in the mountains there is generally a high total protein content and a low globulin in the serum. However, the difference between high and low albumin is too slight to be of any significance.

Variations in blood lactic acid levels in normal and liver-damaged rabbits. G. NOAH. Rudolph Virchov-Krankenhaus, Berlin. *Z. ges. expl. Med.* 61, 59-62(1928).—The blood lactic acid curve following the injection of 0.3 to 0.6 g. Na lactate was detd. in normal rabbits and in rabbits with liver damage following the injection of 0.5-1.0 cc. P. In general the blood lactic acid was lower in the normals. F. L. D.

Calcium oxalate in disorders of metabolism and its relation to salivary calculus formation. BERNARD B. BADANES. *Dental Cosmos* 70, 1122-6(1928); cf. *C. A.* 22, 4618.—A review with bibliography. JOSEPH S. HEPBURN

Further studies on the glycogen in the adeno-carcinoma of the mouse. BRUNO BORCHI. *Boll. soc. ital. biol. sper.* 3, 378-82(1928); cf. *C. A.* 22, 1399.—The aim of this investigation was to study the influence of insulin and glucose treatment on the glycogen content of neoplastic tissue and of the liver of tumor-bearing mice. The animals were injected with 2 units of insulin and $\frac{1}{4}$ hr. afterwards injected with one cc. of a 15% glucose soln. Four hrs. after the last injection the animals were killed and the glycogen was detd. Results: (1) normal mice, av. glycogen in the liver 0.0305 g. = 2.8%; (2) normal mice treated with glucose and insulin, av. glycogen in the liver 0.038 g. = 3.10%; (3) tumor-bearing mice, av. glycogen in the liver 0.0148 g. = 1.0%; av. glycogen in the tumor 0.01 g. = 0.5%. (4) tumor-bearing mice treated with insulin and glucose, av. glycogen in the liver 0.0024 g. = 0.22%; av. glycogen in the tumor 0.0019 g. = 0.1%. Conclusions: In normal animals, insulin and glucose increase the glycogen content of the liver. The liver of tumor-bearing mice shows a marked diminution of glycogen compared to the normals. In tumor-bearing mice the glycogen in the liver and neoplastic tissue is greatly reduced by insulin and glucose treatment. PETER MASUCCI

Further investigations on the metabolism of fatty substances in pathological conditions. III. The action of colloidal silver on the infiltrative liposis of arsenic. G. TRIMARCHI. *Boll. soc. ital. biol. sper.* 3, 399-400(1928); cf. *C. A.* 22, 2613.—The investigation aimed to establish whether colloidal Ag inhibited the infiltrative liposis of As. White mice were injected intraperitoneally on 4 successive days with 0.5 cg. of argyrol dissolved in one cc. H₂O and with 8 mg. As₂O₃ per kg. of body wt. This treatment was also varied by giving different amts. of As₂O₃ and on various days. In the control animals which received 8 mg. As₂O₃, whether administered all at once or in fractions, on alternate days or on successive days, a marked infiltrative liposis of the hepatic cells was observed; nuclear and plasmatic changes were noted and the Kupffer cells were free of fat. In the animals treated with As₂O₃ and colloidal Ag no trace of fat was visible in the hepatic cells. Argyrol therefore exerts an inhibiting action on the infiltrative liposis of As similar to that of P. IV. The action of colloidal silver on the liposis caused by the administration of olive oil. C. CIACCIO AND G. TRIMARCHI. *Ibid.* 401-3.—The action of colloidal Ag on liposis caused by olive oil administered either by mouth or subcutaneously was investigated. (1) The rats were treated with colloidal Ag followed by the administration of 10 cc. of olive oil; (2) alternate treatment: colloidal Ag in the morning followed by 5 cc. olive oil in the evening for 5 successive days; (3) treatment with olive oil for 5 days followed by Ag for 5 days. Results: (1) After the administration of olive oil a marked liposis was noted in the liver and kidneys; (2) such liposis was not noted, however, in animals treated with colloidal Ag. The latter exerts a marked catalytic action on fatty substances even when it has infiltrated into the cells. PETER MASUCCI

Studies on the washing out of edema. ESKIL KYLIN. Allg. Krankenhaus zu Jonkoping, Sweden. *Acta Med. Scand.* 68, 403-26(1928).—A study has been made on 5 patients with edema. The typical occurrences during the washing out of the edema were a fall in the blood Na and K and a rise in the blood Ca. When the edema was completely, or very nearly so, removed the Na and K level again increased while that of the Ca remained unaffected. S. MOROGLIS

A case of spontaneous hypoglycemic coma. ANNA S. PETTERSSON. Krankenhaus zu Umeå. *Acta Med. Scand.* 69, 232-40(1928).—A case of hypoglycemic coma is described which is regarded as spontaneous because none of the familiar causes of hypoglycemia was operative. Besides the hypoglycemia there were low blood pressure

and certain anomalies in the skin, nails and hair which indicate a marked polyglandular atrophy.

S. MORGULIS

Studies on the frequency of goiter in Finland and its relation to the occurrence of iodine in the water. ERIK ADLERCREUTZ. Univ. Helsingfors. *Acta Med. Scand.* 69, 1-45(1928).—Endemic goiter occurs not only in mountains but also in low lands. The mountain endemic goiter is characterized by its intensity and cretinism, whereas in the low lands the progress of the disease is much milder and cretinism is very rare. The endemics of low lands are localized in lake regions or occur on the shores of certain waters. It is stated that the incidence of goiter shows spontaneous diminution in certain localities where the disease has been known for a very long time. II. Etiology of goiter. *Ibid* 187-222.—Discussion of endogenous causes of goiter (disposition, heredity) and exogenous causes (relation to soil, significance of food, water and air). It is pointed out that no theory so far advanced to explain the etiology of goiter is sufficient to account for facts obtainable in territories different from that where the theory has been promulgated. It is maintained that a uniform type of endemic goiter does not exist, because goiter is the result of multiple factors, and regionally one or another factor predominates. III. The presence of iodine in various waters in Finland. *Ibid* 325-91.—An I deficiency is probably not a direct cause for goiter in Finland. As evidence it is shown that the incidence and frequency of goiter along the Finnish coast line as well as along the Bothnic Sea and inner lakes is in the inverse ratio to presence of I. In fact, in certain regions marked by a relative richness in I there is nevertheless endemic goiter present. Neither is an I lack in other regions always assocd. with the occurrence of the disease.

S. MORGULIS

Variations in the serum electrolytes in disease of renal origin with special reference to the cause of renal acidosis. HAROLD A. SALVESEN. Univ. Oslo. *Acta Med. Scand.* 69, 126-86(1928).—In 37 cases of renal disorders (chronic nephrosis without insufficiency, with contracted kidney and with amyloid degeneration, acute eclamptic nephritis, chronic glomerulonephritis in all stages of insufficiency, a case of bilateral cystic kidney and one case of bilateral kidney tumor) detns. were made of the serum Na, K, Ca, Mg, HCO_3 , Cl, P and protein, as well as of the p_{H} and CO_2 tension. These cases have been followed for many months. There was found no gross increase in these constituents except in one case of uremia. Very often a decrease was found both in cases with and without urea retention. A real alkalosis with increase in the bicarbonate was not seen, but in 2 cases a high p_{H} associated with a low CO_2 pressure was observed. Acidosis is very frequent. As a general rule, excepting acute nephritis, there is no acidosis without insufficiency. The phosphate retention was found of no significance in the production of acidosis. A pure HCl acidosis was found only in 2 cases of amyloid kidney. The most important factor is the accumulation of org. acids in the blood together with a more or less pronounced loss of base, probably caused by lack of NH_3 production. Renal acidosis shows a tendency to be uncompensated with p_{H} down to 7.05 because of the loss of ability to lower the CO_2 tension. A case of nephritis is described with amyloid kidney with severe, uncompensated acidosis, due to HCl, which lasted for 3 years. The p_{H} was down to 7.14 and the BHCO_3 13-14 mM. The acidosis is not responsible for any clinical symptoms except occasionally for the forced breathing. A common phenomenon of renal acidosis is the low Cl concn. of the serum. The Cl may act as neutrality regulators and leave the blood, giving up the base for neutralization of the org. acids. Sometimes the base of the chlorides is attacked before that of the bicarbonates, which is thus kept const. The acidosis of acute nephritis is not a true renal acidosis and is due to org. acids formed during convulsions. HCl administration may produce acidosis in the presence of kidney insufficiency. In Bright's disease there are 2 types of decrease in Ca: (1) due to low protein; (2) due to retention of P.

S. MORGULIS

The cause of rapid occurrence of coma upon sudden discontinuation of insulin administration in insulin-treated patients. MARTIN ODÉN. Krankenhaus zu Umeå. *Acta Med. Scand.* 69, 254-67(1928).—The sudden death following the abrupt cessation of insulin treatment in certain severe diabetes cases is evidently due to the failure of the organism to develop an efficient capacity for producing NH_3 . This requires a certain time, and a gradual reduction in the quantity of insulin usually gives the organism time to mobilize its NH_3 -producing capacities and the acid produced is more or less effectively taken care of, so that the insulin can even be left out for a time in such cases without bringing on coma.

The concentration of lactic acid in blood and urine under physiological and pathological conditions. OTTO JERVELL. *Acta Med. Scand., Suppl. XXIV*, 135 pp. (1928).—Two-cc. oxalated blood was measured into a 50-cc. Erlenmeyer flask and deproteinized according to the Folin-Wu method. Of the clear filtrate 10 cc. (1 = 1 cc. blood) was transferred to a large centrifuge tube and treated with 1 cc. 10% CuSO_4 and 2 cc. 10% $\text{Ca}(\text{OH})_2$, and after $\frac{1}{2}$ hr. centrifuged off. The clear liquid was now poured through a small funnel plugged with a little well-cleaned cotton, the filtrate being collected in a 150-cc. Erlenmeyer flask. The centrifuge tube was rinsed twice with H_2O , also poured into the funnel. To the filtrate were added 5 cc. $\text{K}_2\text{Cr}_2\text{O}_7$, and drop by drop with const. stirring 4-6 cc. H_2SO_4 . The flask was stoppered and kept 30-45 min. at 60° . The contents were then dild. with 50 cc. H_2O , 2 cc. 10% KI was added together with some starch and the soln. titrated with $\text{Na}_2\text{S}_2\text{O}_3$. The mean error by analysis by this method is 5%. For the lactic acid detn. in urine Clausen's method of ether extn. was followed. The normal lactic acid concn. in the blood during rest is 20-30 mg. %. Under the same conditions the excretion through the urine is 10-20 mg. per hr. In healthy persons there was no difference noted in the blood lactic acid concn. while lying in bed or being at rest in upright position. A carbohydrate-rich meal causes no increase in the lactic acid concn. of the blood. In expts. where a measured amt. of work was performed by means of a cycle-ergometer it was found that every muscle exercise produces hyperlactacidemia. During exercise with uniform rate of work the increase in lactic acid concn. is greatest in the first minutes and least in the last minutes, which is attributed to the fact that the minute-vol. of the heart is less at the beginning of exercise. The increase in the blood lactic acid concn. depends on, but is not directly proportional to, the amt. of work per min. With an output of work less than 1000 kg.-m. per min. there is small increase, but this is considerable with greater exertion. After an initial rise variations in the intensity of work may produce alterations in the lactic acid concn. of the blood, but individual differences can be noted between exptl. subjects. After the exercise the blood lactic acid level falls, returning to the normal usually in 30 min. On continued mild muscular exertion the lactic acid concn. falls somewhat more rapidly than when the subject is entirely at rest. The hyperlactacidemia of muscular exertion is due to a relative shortage of O, the intake of which is not sufficient to meet the requirement, more lactic acid being produced in the muscles than is consumed by combustion. There is always an O debt at the conclusion of muscular work which is compensated in a few min. It is assumed that approx. $\frac{1}{2}$ the entire organism is in intimate contact with the blood, and that lactic acid concn. of the blood before and after exercise, in g. per l., multiplied by $\frac{1}{2}$ body wt. correspond roughly to the quantity of accumulated lactic acid. From the latter value the O debt can be calcd., and this agrees fairly well with the value actually detd. The lactic acid concn. in urine after physical exertion may rise to 1%, and in more severe muscular work 1-2% of the lactic acid accumulated in the organism is excreted through the urine. In milder muscular work less than 0.5% is thus excreted. Alkali administered by mouth diminishes the alkali concn. in the blood and increases the excretion through the urine. Likewise, the hyperlactacidemia following exertion is much less if the subject had been given previously alkali than otherwise. The increasing concn. of lactic acid in the muscles is the cause of fatigue and it is also probable that the hyperlactacidemia is the cause of the dyspnea during exertion. The increase in lactic acid of the blood may induce an uncompensated acidosis. An increase in blood lactic acid was found when a gas mixt. was inhaled contg. only 7.5% O, and it is suggested that certain symptoms of mountain sickness are associated with hyperlactacidemia. In case of asphyxia several min. elapse before there is a distinct rise in the blood lactic acid concn. In stasis, which is a local asphyxia, there is a rise in lactic acid concn. of the venous blood. During muscular exertion there is a small increase in the inorg. P of blood and urine but much less than the corresponding rise in lactic acid, and it is suggested that on the cleavage of lactacidogen most of the inorg. P is retained in the muscles. In compensated heart disease the blood lactic acid concn. is normal, but in cases of absolute cardiac insufficiency an increased blood lactic acid concn. is not uncommon. Patients with non-compensated heart affection are unfitted for physical exertion because of the O debt already present even in a state of repose. Hence, in cardiac insufficiency the lactic acid concn. during muscular exertion rises much more than in normal persons. On respiring pure O the hyperlactacidemia occurring in asystolia disappears in many cases. The alkali reserve in cardiac insufficiency is practically normal. In anemia the lactic acid concn. of the blood is frequently high, the hyperlactacidemia occurring only if the organism is unable to compensate the deficient O-binding capacity of the blood by an increase in minute-vol. output of blood. In pernicious anemia there is a low lactic acid concn. in the blood evidently due to a low

carbohydrate metabolism. In pneumonia, on account of the asphyxia, there is regularly a small rise in the blood lactic acid. In advanced stages of pulmonary tuberculosis there is hyperlactacidemia which may be complicated by the contributory effect of anemia. Fever does not raise the lactic acid concn. of the blood. In spastic conditions there is hyperlactacidemia; in nephritis a retention of lactic acid is observed only in the uremic condition; in carcinoma hyperlactacidemia is present only in association with anemia. No definite evidence was obtained to decide whether or not liver diseases occasion any change in the blood lactic acid concn. In general it must be concluded that an increase in the lactic acid in venous blood is a sign of deficient O_2 supply to the tissues, in consequence of which the oxidative processes are below par.

Ketonemia of diabetes. V. BÜLOW-HANSEN. *Acta Med. Scand.*, suppl. XXVI, 77-83(1928).

S. MORGULIS

Problems in metabolism in obesity. H. C. HAGEDORN. *Acta Med. Scand.*, suppl. XXVI, 154-6(1928).—In cases of obesity there are at least 2 symptoms of metabolic disturbance, one being a low basal metabolism, the other a low respiratory quotient in the postabsorptive phase following a carbohydrate meal. The 2 symptoms are not necessarily assocd.

S. MORGULIS

A case of alimentary hypoglycemia. INGA SCHRÖDER. *Acta Med. Scand.*, suppl. XXVI, 157-63(1928).—A diet of fat and vegetables brings about a fall in the blood sugar concn. not only in diabetics but in normal individuals as well. In such diet one deals therefore with a general physiol. reaction.

S. MORGULIS

Lactation hypoglycemia. ERIK M. P. WIDMARK. *Acta Med. Scand.*, suppl. XXVI, 164-9(1928).—During milking of cows as well as during lactation by healthy women there is a fall in the blood sugar.

S. MORGULIS

A few observations on the spontaneous hypoglycemic reaction of man. THOR STENSTRÖM. *Acta Med. Scand.*, suppl. XXVI, 170-80(1928).—Description of several interesting clinical cases where the hypoglycemic phase of the sugar tolerance test was very exaggerated, the blood sugar falling below 0.05%, and was accompanied by distinct subjective complaints. It is stated that the hypoglycemic phase following the initial hyperglycemic reaction is not an uncommon phenomenon.

S. MORGULIS

Edema and the diminished water excretion in pernicious anemia. The plasma colloids and the colloidal osmotic pressure in plasma. F. MEULENGRACHT, POUL IVERSEN AND F. NAKAZAWA. *Acta Med. Scand.*, suppl. XXVI, 248-55(1928).—Hypalbuminosis is found in cases of pernicious anemia, which, however, is not of the same severity as that in nephrosis. The colloid osmotic pressure of the serum, which normally is 362 mm. H_2O on the av., is also lowered and is within the range of 240-270, which is favorable to the production of edema.

S. MORGULIS

Studies on the acidosis of nephritis. HARALD A. SALVERSEN. *Acta Med. Scand.*, suppl. XXVI, 256-7(1928).—No acidosis was found in cases of chronic nephrosis or glomerulonephritis without kidney insufficiency. Damaged kidney function seems necessary for the development of renal acidosis.

S. MORGULIS

Provisional report of investigations regarding the pathology of nephritis. CARL HOLTEN AND P. BRANDT REHBERG. *Acta Med. Scand.*, suppl. XXVI, 284-91(1928).—By using Rehberg's formula: $F = Au\% / (Ap\% \times U)$, where $Ap\%$ is the concn. in the blood plasma; $Au\%$ the concn. in the urine measured at the same time of a substance which is not reabsorbed by the tubules of the kidney, and U is the amt. of urine in the given time unit, the rate of formation of filtrate in the kidney was studied. The substance used for this purpose was creatinine. At 9 a. m. the patient gets 3 g. creatinine orally; at 10 and 11 a. m. urine is passed and a blood sample collected at the same time. The creatinine as well as the urea is detd. in the urine and blood. In nephrosis it was found that the filtration process may be normal even though the disease is of long standing.

The occurrence of organ-specific lipases in serum and their diagnostic significance,

especially in liver diseases. EDMUND POLACK. *Acta Med. Scand.*, suppl. XXVI, 491-9 (1928).—The presence in serum of quinine-resistant lipases is ascribed to parenchyma destruction, a quant. relation apparently existing between the two. S. MORGULIS

Hyperlactacidemia in cardiac insufficiency. OTTO JERVELL. *Acta Med. Scand.*, suppl. XXVI, 527-36 (1928).—An increased amt. of lactic acid was found in the blood of patients with cardiac insufficiency. This is regarded as evidence of a permanent "oxygen debt." S. MORGULIS

A study of glucosuria with special reference to the interpretation of the incidental finding of a positive reduction test. HAQUIN MALMROS. Univ. Lund. *Acta Med. Scand.*, suppl. XXVII, 309 pp. (1928).—In an examn. of 365 normal persons only 1.1% gave pos. reduction tests, and of 9272 patients without any subjective symptoms of diabetes only 0.42% gave a pos. reduction test for urine. When these tests were made during 1-2 hrs. after a mixed meal, the pos. tests were found more frequently, on the av. in 7.7% (even 13-17% in some series of tests). In children between 6 and 15 years the pos. tests after a meal were rare (1.9%). After carbohydrate-rich meals (contg. 40-150 g. carbohydrate, half of which was sucrose) the pos. reduction tests were more frequent than after ordinary meals. The urines from a no. of healthy students, nervously upset on account of difficult examns., did not show a higher percent of pos. reactions than under usual conditions. Alimentary glucosuria is apparently the most important factor responsible for the pos. reduction reaction. Urine from healthy persons almost regularly contains a carbohydrate fermentable by common yeast as quickly as glucose, and in most cases also the phenylhydrazine test yielded osazones of the same appearance as can be obtained by the addn. of small quantities of glucose to fermented urines. This is especially true of urines secreted 1-2 hrs. after meals. The evidence indicates that glucose is present in normal urine. After ingestion of 1 g. glucose per kg. of wt., the pos. reduction test is found relatively often as well as the phenylhydrazine test, showing that true alimentary glucosuria is not uncommon. Ingestion of salicylic acid preps. is of no importance as a contributory cause in producing a pos. reaction. Also, there was no evidence found that emotional glucosuria occurs in healthy persons. A study of sugar-tolerance tests led to the following general conclusions: Bang's blood-sugar method gives reliable values for clinical use, and the tolerance can suitably be tested by the administration of 1 g. glucose per kg. when it can be considered that all the glucose will have left the stomach within 2 hrs. The preceding diet is a very essential factor for the course of the blood-sugar curve. Low-carbohydrate diets produce a hypersensitiveness for carbohydrate, resulting in a prolonged hyperglucemia and frequently in glucosuria. If the tolerance test is preceded by a longer time of fasting there is likewise a hypersensitiveness for carbohydrate, and the tolerance test should therefore be made 12 hrs. after the last meal, the patients being kept for some time previously on an ordinary mixed diet. It is denied that emotion, pain or fear causes hyperglucemia in man. In older persons (50-70 years) the blood-sugar rise in tolerance tests are frequently more marked and of longer duration than in younger persons. On an empty stomach the blood-sugar level in healthy persons is not higher than 0.11%, and in young persons during the tolerance test does not exceed 0.20%, falling to the original level in 2-3 hrs. The pos. reduction test incidentally found in wine is often due to alimentary glucosuria, the cause of this being sometimes a low threshold value but more frequently a pronounced alimentary hyperglucemia. Cases of glucosuria with low threshold value have proved to be insulin-resistant and are thus not assocd. with a pancreatic insufficiency. It is to be noted that among persons with glucosuria but no subjective symptoms of diabetes there is a large proportion of corpulent individuals. The glucosuria assocd. with low threshold values often occurs in several members of the same family and may be a congenital quality due to a hereditary predisposition. S. MORGULIS

The significance of the electrolyte composition for the organism. The biochemistry of the parturient paralysis of cows. B. SJOLLEMA. Reichsuniversität, Utrecht. *Biochem. Z.* 200, 300-8 (1928).—The mineral metabolism in milk fever of cows is seriously upset. Particularly the Ca and inorg. P of the blood serum is lowered. Although there is no tetany and no guanidine bases could be found in this disease of the cows, the facts nevertheless have a bearing upon the tetany question. The condition is undoubtedly associated with a functional disturbance of the vegetative nervous system. As soon as enough Ca is available for the organism the symptoms disappear; even a single injection of CaCl_2 brings relief to the sick animal within 1-2 hrs. S. MORGULIS

The intermediate metabolism of rats infected with trypanosomes. GEORG SCHEFF. Elisabeth-Univ., Pécs. *Biochem. Z.* 200, 309-30 (1928).—The trypanosomes as blood parasites primarily deprive the organism of carbohydrate and O, and so long as this can be satisfied there are no noticeable disturbances. But as soon as the liver as the

central regulatory organ is secondarily injured through functional overburdening so that its reserves are used up and the destruction of non-sugar substances ceases there is hypoglycemia. The simultaneous, though much less noticeable, disturbance of the protein metabolism may be due to the trypanosomes or may be due to the resulting dysfunction of the liver. With the increase in the number of trypanosomes in the blood the destruction of the red cells becomes gradually greater. The O consumption of the trypanosomes and the anemia cooperate in impairing the O supply of the organism, which leads to the development of a form of internal asphyxiation toward the end of the infection, with the usual accompaniment of an acidosis.

S. MORGULIS

Studies on the fat metabolism of cancer patients. KAREL KLAUS. Karl-Univ., Prag. *Biochem. Z.* 201, 286-91(1928).—The serum of women with cancer of the genital organs shows invariably a definite lowering of the total cholesterol. The amt. of fatty acids is usually about the upper normal level. Only in clinical cases of very malignant tumors was there an increase in the fatty acids. The proportion of cholesterol in the unsaponifiable portion is about 50%, and the lipemic cholesterol fatty acid coeff. is about 0.5. Hypocholesterolemia follows more or less the extent and malignancy of the tumors. In cases of marked malignancy there is considerable diminution in the total cholesterol, definite increase of the fatty acids and a very low lipemic coeff., but it cannot be stated that these facts are actually an indication of the degree of malignancy. Neither is it possible to decide whether the hypocholesterolemia is a sign of the organism's exhaustion in its struggle with the malignant growth or is an indication of the organism's susceptibility to cancer.

S. MORGULIS

The destruction of acetoacetic and β -hydroxybutyric acid in the organs of dogs with phlorhizin acidosis. I. SNAPPER, A. GRÜNBAUM AND CH. MENDES DE LEON. *Biochem. Z.* 201, 473-8(1928).—Both the kidney and the extremities of phlorhizin diabetic dogs can destroy ketone bodies. According to the analyses even the extent of this destruction is not affected by phlorhizin acidosis. The phlorhizin acidosis must then be due to an increased production rather than to a diminished capacity of destroying the ketone bodies. In diabetes likewise the initial acidosis must be due to an increased acetone bodies production in the organs showing fatty degeneration without any alteration in their destruction. Only in the advanced stages of diabetes, when there is coma which no longer responds to insulin and symptoms of kidney insufficiency appear, there is the possibility that the organs concerned with the destruction of ketone bodies have been injured.

S. MORGULIS

The relationship of precordial stress, blood-uric acid, and salicylate therapy. MILTON A. BRIDGES. N. Y. Post Graduate Med. School and Hosp. *Ann. Internal Med.* 2, 367-72(1928).—In 9 cases of angina pectoris the mean uric acid reading was at or above the upper physiol. limit. Therapy was directed toward the reduction of the blood uric acid by the use of salicylates. In all cases the uric acid gradually decreased and the hemoglobin increased. A transient albuminuria occurred in several cases. In no case were there any permanent untoward salicylate effects. There is no assurance that uric acid produces angina pectoris. It is barely possible that some undetd. product of faulty metabolism may be the factor which ppts. this syndrome.

JOHN T. MYERS

The use of preserved bacterial suspensions for the agglutination test. With special reference to the enteric fevers and typhus fever. A. FELIX AND L. OLITZKI. Rothschild Hosp., Jerusalem. *J. Hyg.* 28, 55-66(1928).—In *B. typhosus*, *B. paratyphosus* A and B, and *B. enteritidis*, low concns. of phenol and HCHO produce a definite inhibition of the O agglutination, while the H agglutination remains unchanged—a fact long established for *B. proteus* X 19. Alc. even in high concns. has no such effect. Such suspensions are not adequate for the qual. test in enteric fevers or the usual diagnostic test in typhus. Phenol and HCHO suspensions are responsible for the negative Widal test in cases of enteric fever which show only the O agglutinin. Such cases are common, especially in typhoid. It is suggested that both alc., and phenol or HCHO suspensions be used to detect both H and O agglutinins. The nature of the inhibition is not clear. There is a good bibliography.

JOHN T. MYERS

The clinical application of total chloride estimations in the fractional test meal; with an analysis of a series in fifty normal children. W. S. C. COPENMAN AND N. GRAY HILL. *Quart. J. Med.* 22, 33-41(1928).—The usual estns. of free HCl and total acidity are not of much clinical value, because of their variability, even in the same individual at short intervals. A total-chloride curve is of more value in detg. whether the stomach secretion is reacting within normal limits to the stimulus of foods. The emptying time of the stomach in children does not seem to be shorter than in adults as evinced by disappearance of starch. The current theory that the emptying time during achlorhydria in adults is faster than when HCl is present, is correct. However, the ptyalin of the saliva

is more active in cases of achlorhydria, which may account for the more rapid disappearance of starch from the stomach.

JOHN T. MYERS

The distribution of electrolytes in hemophilic blood. RONOLD V. CHRISTIE, J. SENDROY, JR., AND D. D. VAN SLYKE. Rockefeller Inst. for Med. Research, N. Y. *Quart. J. Med.* 22, 65-71(1928).—As a result of analyses of both serum and cells sep'd. from blood after satn. with CO_2 at tensions from 25 to 197 mm., it was found that there were entirely normal shifts of Cl and HCO_3 between the cells and serum in hemophilic blood. The serum and cell chloride contents at physiol. CO_2 tension were also quite normal.

JOHN T. MYERS

The osmotic pressure of the blood proteins in nephritis. C. L. COPE. *Quart. J. Med.* 22, 91-105(1928).—The osmotic pressure of blood-plasma proteins was det'd. by the method of Verney. The normal pressure is 30-32 cm. of water. In general disease states the pressure varies from 20 to 45 cm. In non-edematous nephritis the pressure is not reduced except slightly just before death. It may be slightly raised, but this is not assoc'd. with high blood pressure. In nephritis with edema there is a definite fall which disappears with the subsidence of the edema. In cardiac failure, the protein osmotic pressure may be unchanged in the presence of edema, or lowered in the presence of demonstrable edema. The available evidence is inadequate to prove a relation between nephritic edema and osmotic pressure, although such may exist.

J. T. M.

Addison's disease with atrophy of the cortex of the suprarenals. O. BRENNER. Queen's Hosp., Birmingham, England. *Quart. J. Med.* 22, 121-44(1928).—In 4 out of 5 cases of Addison's disease there was a peculiar and characteristic lesion of the cortex with destruction of most of it. The medulla was little or not at all deranged. In the fifth case no suprarenals were found, which may be the end stage. The process may be a necrosis of cortical cells caused by some unknown toxin with a special affinity for them. This is followed by focal regeneration with the production of hyperplastic islands of hypertrophied cells, which are then attacked by the same process. Part of the late degeneration may be due to overwork of the few remaining cortical cells. The adrenal medulla and the rest of the chromafin system may be normal. Hence symptoms must be due to loss of cortical cells. There is a bibliography of 90 titles.

JOHN T. MYERS

Further notes on the sedimentation rate of erythrocytes. H. B. NEWHAM AND P. H. MARTIN. London School of Hyg. and Tropical Med. *Quart. J. Med.* 22, 145-52 (1928).—The results of levulose-tolerance tests do not suggest that marked derangement of the liver necessarily accompanies rapid sedimentation. The sp. gr. of packed erythrocytes and that of plasma are not sufficiently great to account for observed increases in sedimentation rate. The viscosity of the plasma is not decreased; in fact it is increased in kala-azar, which has a rapid sedimentation rate. There is no change in red-cell size. Auto-agglutination seems to be a dominant factor in causing rapid sedimentation. In kala-azar there are a globulin increase, a pos. formol-gel test, very rapid sedimentation, and autoagglutination.

JOHN T. MYERS

Creatinuria as a sequel to fractures of bones, and the influence of thyroid feeding upon it and upon the creatinuria of post-encephalitic rigidity. MARION HIRST AND C. G. IMRIE. Univ. of Sheffield. *Quart. J. Med.* 22, 153-65(1928).—Creatinuria occurs after fractures of bones. The amt. excreted in 24 hrs. varies in different cases from a trace to over 500 mg. It disappears gradually as healing occurs. The rate of excretion is lowest at night. It has been observed in 4 cases of fractured femur, in some fractures of tibia and fibula, in a fracture of the pelvis, and to a less degree in some but not all fractures of the tibia alone. Administration of thyroid ext. increased the output of creatine threefold in a fracture of the femur. This increase was more marked at night. The increase in output preceded any change in the rate of metabolism, or in other nitrogenous constituents of the urine. Creatinine was not increased and uric acid only slightly. Parkinsonian rigidity was practically uninfluenced by thyroid in amts. which produced the above changes in fracture. A diuresis always followed thyroid administration. It was most marked after fracture of the femur.

JOHN T. MYERS

Action of folliculin on the glucemia of ovariectomized dogs. F. RATHERY, R. KOURILSKY AND (MLLE) GIBERT. *Compt. rend. soc. biol.* 99, 667-9(1928).—In the normal dog the injection of 10 units of folliculin with 20 g. of glucose was most frequently followed by an increase in the hyperglucemia compared with the hyperglucemia following the injection of 20 g. of glucose without the folliculin. In the ovariectomized dog the results were variable during the first 3 hrs., but in 6 out of 7 cases there was hypoglycemia after 5 hrs. It appears that the folliculin excites a more rapid secondary secretion of insulin.

L. W. RIGGS

Action of folliculin on the glucemia of depancreatized female dogs. F. RATHERY, R. KOURILSKY AND MLLE YV. LAURENT. *Compt. rend. soc. biol.* 99, 679-83(1928).—The

action of folliculin on the glucemia was not sensibly modified by partial ablation of the pancreas, but in the majority of cases of complete extirpation of the pancreas the injection of folliculin caused a more pronounced glucemia than that in the normal dog. In some cases, however, folliculin caused a transient hypoglucemia. In the same animal the action of folliculin was not the same before and after pancreatectomy, but inverse. In the absence of any insulin secretion folliculin detd. important modifications of the glucemia; therefore insulin was not necessary to the action of folliculin. But insulin when present exercised a certain influence on the reactions of folliculin. Under normal conditions there is probably an equil. between the actions of these internal secretions which intervene in the glucemic regulation.

Concentration of antitoxic serum. P. A. ACHMARINE AND A. W. PONOMAREFF. *Compt. rend. soc. biol.* 99, 694-5(1928).—By fractionating antitoxic serum with Na_2SO_4 a triple and quadruple concn. of the antitoxin may be obtained contg. 7% of Na_2SO_4 . The latter may be removed by dialysis, but with much difficulty. It is recommended to remove the greater part of the Na_2SO_4 by the addn. of CaCl_2 and the pptd. CaSO_4 by means of the centrifuge, when the resulting liquid will contain but 0.6% of Na_2SO_4 .

Role of euglobulin in the reaction of Botelho. J. LOISELEUR AND R. MOREL. *Compt. rend. soc. biol.* 99, 710-12(1928); cf. *C. A.* 22, 810.—Serum was dialyzed and brought to a pH of 4.7. The euglobulin, isolated by centrifugation, was redissolved in physiol. saline and brought to the reaction of serum by the addn. of NaOH . Botelho tests were made on the entire serum, the euglobulin and the part remaining in the serum (pseudoglobulin and serine). In 1 normal and 14 pathological subjects the Botelho test was always pos. for the euglobulin fraction, always neg. for the pseudoglobulin-serine fraction, and pos. in 8 out of 14 samples of entire serum from pathological cases. In cases of epithelioma the Botelho test was always pos. for the entire serum as well as the euglobulin fraction.

Free and protein sugar content of the blood during experimental intestinal occlusion. F. RATHERTY AND LÉON BINET. *Compt. rend. soc. biol.* 99, 739-40(1928).—Dogs were subjected to aseptic ligation of the intestine either at the duodenum, in the middle of the small intestine, or at the large intestine. The animals were fasting and were given only water. The occlusion of the intestine probably caused an inconstant elevation of free sugar in the arterial blood. The protein sugar was always increased with the upper or middle ligations.

Neutralization of highly toxic diphtheritic toxins by *B. pyocyaneus*. LOUIS DUCHON. *Compt. rend. soc. biol.* 99, 777-8(1928).

Study by microincineration of anthracotic tracheobronchial nodes. A. POLICARD, S. DOUBROW AND D. PILLET. *Compt. rend. soc. biol.* 99, 823(1928); cf. *C. A.* 22, 2982.—The pigment in this case is entirely of C.

Mineralization of fluids and muscles in experimental edema in the rabbit. A. NAU. *Compt. rend. soc. biol.* 99, 869-72(1928).—These expts. support the conclusions of Aubel and Mauriac (*Report XIX Congress of Med.* 1927), that it is not exact in hydropogenous nephritis to consider only the retention of the Cl ion, as edemas were produced by means of org. salts of Na. The ratio Na/Cl is ordinarily greater in the liquid of edema than in the blood of the same subject. The retention of water in the tissues is coincident with a complete overthrow of the mineral equil. of the organism, and it appears that this overthrow is conditioned upon the formation of edemas.

Role of the bone marrow in experimental rickets. I. I. NITZESCU, G. POPOVICU AND M. UNGUREANU. *Compt. rend. soc. biol.* 99, 894-5(1928).—Rats were subjected to the rickets-producing diet of Sherman-Pappenheimer nos. 84 and 85 for 3 to 6 days, then there was added to the ration an ext. of bone marrow equiv. to 6 or 7 g. per animal per day. All animals thus fed developed rickets more intensely than controls on the original rickets-producing diet. Rats receiving vigantol or cod-liver oil with the rickets-producing ration were protected against the disease.

Serodiagnostic value of the cytolytic reaction of Freund and Kaminer. OVID COMSIA. *Compt. rend. soc. biol.* 99, 898-9(1928).—In 46 specimens of cancer serum 63% gave a positive and 37% negative cytolytic reactions. The same serums gave 82% positive and 18% negative with the Botelho reaction. Of 104 non-cancerous serums only 3% gave positive cytolytic reactions, while the same serums gave 19% positive with the Botelho reaction.

Alkaline reserve of venous blood in local experimental venous stagnation and its relation to the appearance of edema in animals. M. FRANK. *Compt. rend. soc. biol.* 99, 925-7(1928). Experimental edema caused by intraarterial injection of solutions of various substances. *Ibid* 927-8.—The parallelism between the appearance of edema

and a lowering of the alk. reserve suggests that the state of acidification of the cellular liquids is a cause of the edema in cases of venous stagnation. Edema following the intraarterial injection of various substances depends on the nature of the substance injected. Edema in this case is a consequence of the harmful action of the injected substance on the cells and their vital functions.

L. W. RIGGS

Relations between glucemia and the temperature of the body. ALBERTO DE CARVALHO. *Compt. rend. soc. biol.* 99, 935-6(1928).—From 59 detns. on 6 subjects, it appeared that there was no hyperglucemia in the course of fever, nor any relation between variations of temp. and variations of glucemia.

L. W. RIGGS

Concentration of hemoglobin in the nucleated erythrocytes in the course of anemia in man. L. DRASTICH. *Compt. rend. soc. biol.* 99, 991-4(1928).—In pernicious anemia the concn. of hemoglobin in the erythrocytes is increased, or at least is at the upper normal limit.

L. W. RIGGS

Respiratory quotient in peripheric fever. J. DADLEZ AND W. KOSKOWSKI. *Compt. rend. soc. biol.* 99, 1032-4(1928); cf. *C. A.* 21, 2030; 22, 1392.—The increase in the quantities of O_2 absorbed and CO_2 eliminated as well as in the respiratory quotient, proves that in peripheric fever there is an increased combustion of carbohydrates which is the source of the hyperthermia. Gaseous exchange taken as criterion of the differences between thermic polypnea and polypnea of peripheric fever. *Ibid* 1034-7.—Thermic polypnea differs from the polypnea of peripheric fever in the following points: The cause of thermic polypnea is reflex; it is partly the consequence of the superheating action of the blood on the nervous center. It is independent of chem. excitants, while the cause of polypnea of peripheric fever is chem., depending on the production of lactic acid in the blood. During thermic polypnea the respiratory quotient is not raised, and the quantities of O_2 absorbed and CO_2 eliminated remain the same or are diminished. During the polypnea of peripheric fever the respiratory quotient is raised and the quantities of O_2 absorbed and CO_2 eliminated are increased. In thermic polypnea there is a tendency toward a diminished body temp., but in polypnea of peripheric fever the body temp. is raised.

L. W. RIGGS

Variation in the fibrinogen content of the blood after aseptic traumatism and surgical intervention. PAUL GOVAERTS AND J. DE HARVEN. *Compt. rend. soc. biol.* 99, 1051-3(1928).—A study of 20 cases showed that aseptic traumatism or benign surgical intervention not followed by infection, caused an increase on the following day in the fibrinogen content of the plasma. This increase reached a max. of 2 to 3 times the normal amt. by the 3rd to the 5th day and had not returned to the normal figure by the 11th day following the operation.

L. W. RIGGS

Glucosensitivity of the superior nerve centers in the course of experimental pancreatic diabetes. JEAN LABARRE. *Compt. rend. soc. biol.* 99, 1053-6(1928).—The procedure consisted of a combination of the isolated head and the pancreato-jugular anastomosis technics. Post-diabetic hyperglucemia, by the intermediary of the central and parasympathetic nerve system, caused an increase in the insulin secretion that outside of all humoral mechanism, should constitute a factor favorable to the diminution of the glucemia which abnormally increases in the course of exptl. pancreatic diabetes. Influence of hyperglucemia and hypoglucemia through the superior nerve centers on the external secretion of the pancreas. JEAN LABARRE AND PIERRE DESTREE. *Ibid* 1056-7.—Hyperglucemia of the superior nerve centers increases the quantity of pancreatic juice secreted, whereas hypoglucemia, insulinic as well as sympathetic, diminishes that secretion. With the same technic as above, when the glucemia has been lowered by synthalin and then a massive dose of dextrose is injected, there is a return to normal in the quantity of pancreatic juice excreted per hr.

L. W. RIGGS

Quantitative evolution of bilirubinemia in the course of catarrhal icterus and arsenamine treatment with or without insulin compared. Threshold of renal elimination of bilirubin. D. SMICI AND M. POPESCO. *Compt. rend. soc. biol.* 99, 1084-5(1928).

L. W. RIGGS

Digestion of lecithin by pancreatic enzymes. SIDNEY A. PORTIS. *J. Am. Med. Assoc.* 91, 1248-50(1928).—Normal duodenal contents digest lecithin; gastric contents do not. In patients with cardiac decompensation there is a definite depression of enzyme activity as far as lecithin digestion is concerned. There is no apparent alteration in pancreatic enzyme activity in normal pregnant women. The pancreatic enzyme activity is depressed in the untreated duodenal ulcer and returns to nearly normal with the administration of alkalis. Ulcer patients treated by the ordinary methods of bed rest and food and without the administration of alkalis did not show a return to normal in the 3rd week of management.

L. W. RIGGS

Relation between the hydrogen-ion concentration of the cerebrospinal fluid,

lymph and blood serum and the thermostable bactericidal action of these fluids. TAKEO SHIMIZU. *Tôhoku Univ. Tôhoku J. Exptl. Med.* 11, 344-65(1928).—Cerebrospinal fluid after being heated at 100° for 30 min. possesses strong bactericidal properties to typhoid bacilli. This action runs roughly parallel to an increase in the p_H , whereby the medium becomes too alk. for the growth of the organism. A continuous development of typhoid bacilli is observed in active or inactive fluids in which the p_H is maintained at the optimum figure by the addn. of KH_2PO_4 . The bactericidal properties of blood serum heated to 60° for 30 min. and of lymph show no relation to p_H changes. L. W. RIGGS

Edema formation. V. Reciprocal relations between the hormone of the thyroid, the hypophysis and the pancreas by the intermediary of water exchange. CHROMATSU SATO. *Tôhoku J. Exptl. Med.* 11, 468-82(1928); cf. *C. A.* 23, 205—Pituitrin in perfusion liquid promotes tissue swelling in normal animals. In athyroidic or hyperthyroidic animals, pituitrin opposes tissue swelling, the opposition being stronger in the latter condition. In perfusion expts. insulin opposes swelling of normal tissue. Under athyroidic or hyperthyroidic conditions insulin promotes tissue swelling. Thus pituitrin and insulin exert opposite actions on the water exchange of tissues. VI. Edema formation in edematous tissue. *Ibid* 482-8.—Edema formation in normal Ringer-perfused thigh preps. of normal, U-poisoned and edematous rabbits was most pronounced in the U-poisoned animals. The increased edema of normal and of edematous animals was nearly the same. L. W. RIGGS

Importance of contemporary estimation of diastase in blood, urine and excrements for the study of the pancreatic physiopathology. F. GALLI. *La diagnosi* 4 (1928); *Zymol. Chim. dei Col. e degli Zuccheri* 3, 104-5(1928).—Among the pancreatic enzymes diastase is the most easy to est. Determination in the gastro-enteric contents or in blood cannot give a sure indication of the altered functions of the pancreas, as the enzymes can be missing in the duodenum juice, or in the excrements for non-pancreatic causes without anatomic or functional alterations. For this reason the investigation has to be conducted simultaneously on the urine, blood and excrements, where the pancreatic juice is discharged. Investigations were made on sane individuals and on individuals affected by illnesses independent of pancreatic affections, affected by renal forms, affected with occlusion of the duct for non-pancreatic causes and affected by pancreatic forms. The diastase estn. in blood and urine was conducted with Wolgemut's colorimetric method as modified by Bettoni (starch digestion), taking as the unit of diastase the quantity of enzyme contained in 1 cc. of non-diluted urine, that can absorb 2 cc. of 1% sol. starch in $\frac{1}{2}$ hr. at 38°. Diastase was estd. in the excrements by Bettoni's method. After convenient diln. of the ext., obtained by centrifuging a suspension of excrements in a 1% NaCl soln., an increase in the amylolytic contents in the blood and urine, and absence or reduction in the excrements, indicate occlusion of the duct, without alteration of the gland. Low diastase values with the 3, absence of indican in the urine, absence of trypsin in the excrements, steatorrhea, are sure signs of damaged function. If to the said symptoms is added a slight increase of diastase there is a lesion of the pancreas with occlusion of the duct. R. SANSONE

Fever caused by hay infusion. ERICH HESSE AND GERT TAUBMANN. Univ. Breslau. *Arch. exptl. Path. Pharm.* 136, 239-56(1928).—A substance possessing the chem. and biol. properties of humic acid may be isolated from hay infusion. Administration of this substance leads to fever and leucopenia, the febrile reaction being central in origin and of the type assocd. with non-sp. stimuli. G. H. S.

H—PHARMACOLOGY

A. N. RICHARDS

Experimental studies of nausea and its pharmacologic control. M. H. FISCHER. Univ. Prag. *Z. ges. exptl. Med.* 61, 609-26(1928).—F. describes a method of testing the protective action of drugs against nausea produced in brief by a standard rotation of the subject. Vasano (Schering-Kahlbaum, Berlin) and Nautisan (Chemosan A.-G. Wien) had a protective effect but Navigan (Chemische Werke A.-G., Grenzbach, Baden) did not. F. L. DUNN

The oral administration of derivatives of chaulmoogra oil in leprosy. N. E. WAYSON AND L. F. BADGER. *Pub. Health Repts.* 43, 2883-4(1928). E. H.

Action of the blood on acetylcholine. G. VIALE AND J. M. SONCINI. *Compt. rend. soc. biol.* 99, 1440(1928).—Perfusion expts. with the isolated toad heart with a mixt. of blood or serum and acetylcholine showed that the acetylcholine was not rendered inactive by being mixed with blood. The technic of Galehr and Plattner, (*cf. C. A.* 22, 2624) is considered defective. L. W. RIGGS

Synergic effects of some of the alkaloids with narcotics. E. ANNAU AND I. SÁRKÁNY. *Magyar Orvosi Arch.* 29, 420-3(1928).—Strychnine, cocaine and quinine increase the narcotic effect of morphine and Mg. No synergism was found between morphine and atropine. L. W. RIGGS

I content of thyroid glands of Uruguayan cattle (GOSLINO, FERRO) 17. The dangers of certain mineral baking powders based on alum (SCHAEFFER, *et al.*) 12.

MCGUIGAN, HUGH ALISTER: A Text-Book of Pharmacology and Therapeutics. Philadelphia: W. B. Saunders Co. 660 pp. \$6.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Chemistry and food regulation. P. B. DUNBAR. U. S. Dept. Agr., Wash., D. C. *Ind. Eng. Chem.* 20, 1320-2(1928). J. A. KENNEDY

Food control. G. D. ELSDON. Analyst for Lancashire. *Food Manuf.* 3, 541-4 (1928).—The subject is critically examd. from a new angle. After giving reasons why some form of food control is desirable and necessary, E. discusses the question as to whether the present provisions are suitable or adequate. There has been so much controversy over the debatable question of Food Standards that much prejudice has been created by the words themselves. The chief fault which can be found in food-stuffs as sold today is that of misdescription. E. proposes that "Standard Definitions" shall be fixed legally for all classes of foods. J. A. KENNEDY

Chemistry and the dairy industry. GEORGE E. HOLM. Bur. Dairy Ind., Wash., D. C. *Ind. Eng. Chem.* 20, 1312-15(1928).—There is appended a bibliography of 22 references. J. A. KENNEDY

Advances in the milk industry. L. EBERLEIN. *Z. angew. Chem.* 41, 1255-7, 1279-81(1928).—A review. E. J. C.

Dried milk products. LEWIS E. PERSOFF. *Arch. Pediatrics* 45, 681-6(1928).—A concise summary is given of the manuf. of dried milk, the effect of drying upon its nutritive value, the various com. dried milks, and the chem. compn. of modified milk made from them. JOSEPH S. HEPBURN

Foods of the inhabitants of Lebanon (Syria). Lében. Lebneé. P. GUIGUES. *Bull. sci. pharmacol.* 35, 642-8(1928); cf. C. A. 21, 282, 2513.—Lében is milk curdled by a special enzyme. The milk is sterilized by boiling, which also destroys the common enzymes, leaving only the heat-resisting enzymes. After boiling the milk is cooled to 51-53°, when 20 g. of "robb," an enzyme of lében is added to each liter of milk. The probable origin of the first "robb" is discussed. Lében thus prepd. is a jelly. With slow coagulation cream rises to the surface; otherwise it is distributed through the mass. The taste of lében is agreeable and not sour. Lében with bread is the principal N food of the Lebanon mountaineers. From lében is prepd. a kind of cheese known as lebneé and a whey called petit-lait. Analysis of lében gave: d. at 15° 1.036, acidity as lactic acid 1.63%, NH₃ 0.037, solids at 100° 13.77, water 86.23, fat 3.38, casein 4.74, hydrated lactose 3.15, ash 0.69, P₂O₅ 0.25, total N 0.62. In the manuf. of lebneé, 500 g. of lében yielded 396 g. of lebneé and 596 g. of petit-lait. Analysis of lebneé gave: acidity as lactic acid 2.19%, NH₃ 0.088, solids at 100° 27.52, water 72.45, casein 11.89, hydrated lactose 2.46, ash 0.76, P₂O₅ 0.33, total N 1.76. Petit-lait on analysis gave d. 1.029, acidity as lactic acid 1.33%, NH₃ 0.026, solids at 100° 7.33, water 95.6, hydrated lactose 2.46, ash 0.81, P₂O₅ 0.18, Na 0.053, total N 0.066. L. W. RIGGS

Effect of variation in the method of manufacture on the baking quality of dry skim-milk. EMILY GREWE AND GEORGE E. HOLM. Bur. of Dairy Ind. *Cereal Chemistry* 5, 461-9(1928).—Six samples of dry skim-milk with forewarming treatments for 30 min. at 50°, 63°, 73°, 83°, 93° and 100° were used, together with a hard spring (I), a hard winter (II) and a soft winter wheat flour (III). The 3 kinds of flour differed in their reaction to dry skim-milk. The greatest improvement in baking as the result of the use of dry skim-milk was with III. The least improvement was noted with the flour made from II. The range of fermentation time in which doughs give good bread is increased by the use of dry skim-milk. This is a very important factor, as it adds to the ease with which doughs are handled in the bakery. Loaf vol., period of fermentation tolerance, grain, texture and break were used in scoring the bread. In the 3 flours the poorest results in all properties were obtained in the bread containing dry skim-milk that had been subjected to a temp. of 50° for 30 min. previous to changing to the

dry state. The forewarming temp. of 63° gave a slightly better result than that of 50°. There was a marked improvement in the baking quality when the milks had been given one of the 4 higher temps. 73°, 83°, 93° and 100°, but the variation within the latter series was only slight.

L. H. BAILEY

Dairy salt. A. A. RAMSAY. *Agr. Gaz. N. S. Wales* 39, 553-61(1928).—NaCl used in butter manuf. should have uniform particle size, preferably 0.025 to 0.0167 in. in diam., in order to obtain uniform soln. of salt in the butter. The presence of particles of 0.01 to 0.005 in. seems to be undesirable. Brands of salt showing differences in chem. compn. and in size of particle, did not differ in rate of soln., 15 g. of each brand dissolving completely in 100 cc. H₂O in 30 sec. Chem. and mech. analysis are tabulated for several brands of dairy salt sold in N. S. Wales.

The composition of Irish butter. The distribution of the volatile-acid groups among the glycerides of butter fat. PAUL ARUP. *Analyst* 53, 641-4(1928).—When butter fat is allowed to crystallize slowly at 27°, it seps. into liquid and solid portions which can be sepd. by filtration. These portions can be resolved still further by allowing them to crystallize at lower and higher temps., resp. By this treatment 6 different fractions were obtained. Then, to study the distribution of the volatile fatty acid groups among the harder and softer glycerides, the Reichert-Meissl, Polenske and Kirschner values were detd. as well as the m. p. of the fractions of highest m. p. The fractions liquid at 10° yield about 1.5 times as much of sol. volatile acids as the fractions crystd. at 37°. The insol. fatty acids show a similar falling off but to a less degree. In all the fractions, the ratio of the Polenske to the Reichert-Meissl and Kirschner values falls within the range accepted for genuine butters. The various volatile-acid groups appear to be distributed fairly evenly and indicate that there is an impartial distribution of the acid groups among the different glycerides. The mono-olein type predominates in the fraction crystd. at 37° and the di-olein type in the fractions liquid at 10°.

The viscosity of flour suspensions. G. VAN DER LEE. The Novadel Lab., Deventer, Holland. *Cereal Chemistry* 5, 484-5(1928); cf. *C. A.* 22, 1196.—The author refers to a paper by Denham, Watts and Scott-Blair (1928) and points out variations in viscosity nos. found for flour suspensions of the same concn. with different viscometers. He maintains his objections to the applications of the laws of liquids to the flow of flour suspensions, even of low concn.

L. H. BAILEY

Correlation of ash content of wheat and of flour. R. C. SHERWOOD, MINNESOTA STATE TESTING MILL, AND C. H. BAILEY, Univ. of Minnesota. *Cereal Chemistry* 5, 437-44(1928).—Ash content of straight grade flour was found to be positively correlated with the ash content of the wheat from which the flour was milled in 148 samples of wheat representing 3 crops. Coeff. of correlation of these 2 variables, $r = +0.81 \pm 0.02$, is of sufficient magnitude to indicate that a relatively small proportion of the samples failed to correspond to the relationship that has been observed. The correlation ratio in the instance of the same variables $\eta = +0.82$, is so nearly the same as the correlation coeff. as to justify the conclusion that the ratio between the 2 variables is essentially linear. This conclusion is supported by the calcn. of Blakeman's criterion of linearity. When a selected group of wheat samples was taken that represented all the wheats weighing more than 57 and less than 61.1 lb. per bushel, the correlation coeff. of ash in wheat with ash in flour was $r = +0.76 \pm 0.03$. This differs so little from the corresponding value of r resulting from the inclusion of all the wheat samples as to indicate that variations in wt. per bushel occasioned no variations in the relation between ash content of wheat and ash content of flour. Partial correlation of ash content of all the wheat samples and ash content of flour was next computed, with wt. per

bushel held const. The resulting value $wA_{AA} = +0.78$, which again is nearly identical with the coeff. of correlation r detd. in the 2 instances detailed above, further supports the assumption that the ash content of the endosperm varies with the ash content of the entire kernel. Ash content of a highly refined middlings flour was correlated with ash content of the wheat in the same degree as was that of the straight-grade flour. It accordingly appears that the percentage of ash in a flour cannot be used as a measure of the percentage extn. of that flour unless something is known concerning the ash content of the wheat from which the flour is produced.

L. H. BAILEY

Determination of hydrogen-ion concentration of flour-water mixtures. P. HALTON AND E. A. FISHER. Research Assocn. of Brit. Flour-Millers, St. Albans, Eng. *Cereal Chemistry* 5, 445-60(1928).—The electrometric method of detg. H-ion concn. has been shown to be far more reliable than the colorimetric method. The quinhydrone electrode gives results in satisfactory agreement with those obtained by means of the H electrode provided Au or Au-plated electrodes are employed. Quinhydrone with Pt electrodes gives unreliable results, errors in p_H of the order of 0.4 or more not infrequently occurring. Concordant values for H-ion concn. can be obtained with centrifuged exts. and with decantates from suspensions. Filtered exts. generally give slightly low values and suspensions always high values. H-ion concn. of flour exts. increases as the ratio of flour to water increases. The slopes of the concn.- p_H curves are different for different flours and curves for different flours may cross. Hence the H-ion concn. of flour exts. obtained in the conventional way cannot be correlated with the H-ion concns. of the corresponding doughs. The H-ion concn. of flour exts. appears to increase very slightly with increasing time of extn. The apparent buffer action of a flour is widely different from that of a flour ext., the former value varying from $1\frac{1}{2}$ to $3\frac{1}{2}$ times the latter.

L. H. BAILEY

Volume displacement of salt-sugar solutions. EMILY GREWE. Bur. of Dairy Industry, U. S. Dept. Agr. *Cereal Chemistry* 5, 470-2(1928).—A soln. of salt and sugar offers a convenient means of adding these 2 ingredients to the dough mixts. The quantity of water used in this soln. must be known because of its presence as a factor in absorption. A table is given for the concn. ordinarily used in bread making according to the formula reported by Blish (1928). A table is also given for vol. displacement of salt and sugar when solns. for one or more doughs are prepd. at the same time.

L. H. BAILEY

Staling and hydrogen-ion concentration. L. P. KARÁCSONYI. Tech. Univ., Budapest. *Cereal Chemistry* 5, 477-81(1928).—Among the different processes that take place during the staling of bread, the change in acidity is said to play an important part. Acid reaction (Lehmann 1893) is caused by (1) free org. acid, and (2) acid K phosphate, which comes into existence by the interaction of the org. acid resulting from the fermentation of the dough and the neutral phosphates preëxistent in the flour. Other investigators have measured the titratable acidity but K. measured the H-ion concn. electrometrically. Tables are given which show the H-ion concn. of fresh and of stale wheat and rye breads. It is seen from these tables that the acidity does not increase during ordinary keeping at room temp., but either remains const. or shows some decrease. Acidity of stale bread can increase during further keeping, but this can be traced back to the activity of microorganisms.

L. H. BAILEY

The dangers of certain mineral baking powders based on alum, when used for human nutrition. GEORGES SCHAEFFER, G. PONTÈS, E. LE BRETON, CH. OBERLING AND L. THIVOLLE. Univ. of Strasbourg. *J. Hyg.* 28, 92-9(1928).—In female mice fed on alum breads, the diam. of the ovaries was hardly half that of normal controls, and there was an almost total absence of normal follicles. The insol. phosphate may be changed to sol. $AlCl_3$ in the stomach. It is suggested that certain substances not poisons in the usual sense of the word, when absorbed for months or years, can produce physiol. disorders and org. lesions, the etiology of which usually remains unnoticed. Such products are probably responsible for many illnesses.

The cause of deterioration of maize and maize meal. W. L. DAVIES. Univ. Reading. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 784-5(1928).—Excessive moisture is the chief cause of deterioration of maize grain. Sound, air-dry grain contg. not more than 12% H_2O can be kept in good condition for a considerable length of time. Molds, causing rapid deterioration of oil, starch and sugar in the germ of the grain, develop on grains contg. 15% H_2O at normal temps. and with poor conditions of ventilation. Under the same conditions, alcoholic and $AcOH$ fermentations occur when the grain contains 20%, or more, of H_2O . Maize meal deteriorates under the same conditions as

the grain. Meal made from sound grain contg. 12% H_2O can be stored for 4 to 6 months if the H_2O content of the atm. is kept low. K. D. JACOB

The extraction of apple juices in the manufacture of jelly. CARL R. FELLERS. Mass. Agr. Expt. Sta., *Research Bull.* 15, 218-51(1928).—A 3-yr. investigation showed that Baldwin apples varied but little from yr. to yr. as to chem. compn. of fruit and juice or jelly yields. Long extn. periods destroyed the jellifying power of the pectin and impaired jelly yields and quality. Two short extn. periods at 100° are recommended to obtain max. yields of juice contg. sufficient pectin and acid to give satisfactory yields of high-quality jelly. The best ratio of fruit to water was 3:2 with sliced apples, or 3:3 where chopped or grated apples were used. The yield of jelly per lb. of fruit was greatest when the ratio was 3:4 and least when it was 3:2. Tartaric acid added to the apple-water mix in concns. of 0.2 to 0.4% slightly increased the yield of solids and pectin in the ext. as well as the total jelly yield. Added acid always improved the color and often the flavor and consistency of apple jellies. In short extn. periods, the jelly strength of the jellies increased with the % of pectin present. Apples suitable for jelly should yield approx. 20 oz. of jelly per lb. of fruit. The p_H of the varieties tested was suitable for the formation of good yields of well-flavored jellies. There was a fair degree of correlation between the total titratable acidity and H-ion concn. of apples, apple juice and jelly. The sugar content of apple jellies ranged from 65 to 70% with an av. of 67.5%. Jellies contg. less than 65% sugar were often tough, while those with over 70% were uniformly soft or sirupy. In making jellies from fruit, it was found much more desirable to proportion the sugar to the original wt. of fruit than to an uncertain yield of juice of questionable compn. The detn. of jelly strength by means of the Bloom gelometer gave very concordant results. Brix hydrometer readings on extd. apple juice gave an av. of 0.18% higher than by the Abbé refractometer and 0.15% higher than by the gravimetric detn. of solids in soln. The mean sugar content of the sol. solids in heat extd. apple juice was 76.5%. C. R. FELLERS

Relation of chemistry to the citrus-products industry. C. P. WILSON. Cal. Fruit Growers Exchange, Ontario, Cal. *Ind. Chem. Eng.* 20, 1302-7(1928).—Of all the com. citrus products, *pectin* is the one requiring the most careful attention to every detail of production and use. Some specific problems relating to its production and use are presented. There is a bibliography of 52 references. J. A. KENNEDY

Research in the confectionery industry. H. S. PAINE. U. S. Dept. Agr., Wash., D. C. *Ind. Eng. Chem.* 20, 1325-7(1928).—The field of application of chemistry to devise new types of confections, to obtain suitable consistency and texture, to retard aging, and to design appropriate types of packages has hardly been touched. J. A. K.

Cuban honey. J. FIEBE. *Z. Untersuch. Lebensm.* 55, 460-6(1928).—Analyses of 17 samples are given, together with a list of honey-flowers of Cuba. Honey obtained from near sugar mfg. plants, was shown to contain *artificial invert sugar* by the use of the following method: Five g. of honey is triturated in a mortar with ether (stored over Na). To the ether ext. in a porcelain evapg. dish is added drop by drop a soln. consisting of 1 g. of carefully prepd. pure resorcinol in 100 g. of HCl (sp. gr. 1.19). The soln. of resorcinol must be kept in the dark. Within 1 hr., a permanent cherry-red will appear if artificial invert sugar is present. In pure, natural honeys there is only a rapidly disappearing orange to rose-red color. The latter reaction may occur only on heating. Linden-blossom honey is easily identified by a microscopic examn. for the characteristic pollen grains. C. R. F.

Chemistry and the beverage industry. F. M. BOYLES. Jack Beverages, Brooklyn, N. Y. *Ind. Eng. Chem.* 20, 1289-92(1928).—Progress of the carbonated-beverage industry is discussed. J. A. KENNEDY

Chemistry and the flavoring-extract industry. BERNARD H. SMITH. *Ind. Eng. Chem.* 20, 1307-9(1928).—Problems that suggest themselves are: (1) Classification of flavoring materials by taste and its relation to odor, (2) further studies of higher esters of anthranilic acid, (3) further studies of acetals, (4) further work on pure vanilla, etc. J. A. KENNEDY

Chemical composition of Philippine fishes. AMADO N. BALAGTAS. Univ. of Philippines. *Philippine Agr.* 17, 253-61(1928).—The compn. of the edible portion of catfish, *Clarias batrachus* Linn.; flounders, *Pseudorhombus neglectus* Bleeker; herring, *Harengula moluccensis* Bleeker; and sardines, *Sardinella longicops* Cuv. et val., resp., was as follows: moisture 76.34, 80.13, 79.36 and 75.29; ash 1.16, 1.56, 1.65 and 1.60; crude fat 4.75, 0.49, 2.45 and 2.61; protein 17.66, 17.42, 16.40 and 19.21; and carbohydrates 0.09, 0.40, 0.14 and 1.29%. Similar analyses as well as additional data for the entire series are given for 33 species of fishes. On the av. nearly 50% of the live wt. is refuse, the percentage of fat varies inversely as the moisture content, carbohydrates, when present at all, are insignificant in amount and about $\frac{1}{4}$ of the wt. of the edible portion is protein. A. L. MEHRING

Woolly finger grass in Bechuanaland. HENRICI. *Farming in South Africa* 3, 711-2(1928).—Droogland grass (*Pennisetum cenchroides*), Rhodes grass (*Chloris gayana*), Guinea grass (*Panicum maximum*), Natal grass (*Pennisetum unisetum*), woolly finger grass (*Digilaria eriantha*), golden millet grass (*Setaria aurea*) and limpopo grass (*Echinochloa pyramidalis*) were grown under the same dry land conditions near Groenkloof, Pretoria. The grasses were allowed to stand uncut and ungrazed until the middle of the winter when they were in a brown and frosted condition. They were then cut and analyzed with the following results: H₂O 7.2, 8.3, 8.0, 7.9, 8.1, 8.0 and 7.0; crude protein 2.2, 3.2, 3.4, 2.6, 4.8, 2.5 and 2.4; ether ext. 2.5, 1.3, 1.2, 1.5, 1.5, 1.2 and 0.9; fiber 30.6, 32.0, 35.1, 39.6, 26.6, 35.1 and 36.8; ash 11.3, 9.5, 10.5, 9.2, 10.7, 9.7 and 10.3; carbohydrates 40.2, 45.7, 42.8, 39.2, 48.3, 43.5 and 42.6%, resp. The figures show that in this stage woolly finger grass is much richer in protein and carbohydrates and lower in fiber than the other grasses, and is a superior grass for winter grazing. The green leaves of woolly finger grass contain 13.4-20.0% crude protein and the brown leaves, after leaching for 5 months, contain 5.4%. The grass also contains higher percentages of P than the other grasses. K. D. JACOB

Digestibility trials on Indian feeding stuffs. Some Punjab hays. P. E. LANDER AND PANDIT LAL CHAND DHARMANI. Punjab Agr. Col., Lyallpur. *Memoirs Dept. Agr. India, Chem. Ser.* 9, 235-46(1928).—This paper gives the results of an investigation on the compn. and feeding value of hays from various districts in the Punjab. The hays were not all cut at the same stages of growth and the results are, therefore, not strictly comparable, but they indicate the importance of a high content of mineral elements. K. D. JACOB

Bread. AUGMENTINE SOC. ANON. Brit. 289,060, April 21, 1927. To increase the yield of bread from a given quantity of flour, there is added to the dough a small quantity of an emulsion comprising a neutral fat or paraffin oil, glycerol and water. Details are given of the dough prepn.

Apparatus for cooling milk immediately before entering the transport containers. OTTO M. HANSEN. Fr. 636,757, June 25, 1927.

Apparatus for pasteurizing milk. WM. SANGSTER (to DeLaval Separator Co.). U. S. 1,695,207, Dec. 11.

Apparatus for pasteurizing milk in bulk. WM. SANGSTER (to DeLaval Separator Co.). U. S. 1,694,452, Dec. 11.

Apparatus for pasteurizing and electric treatment of milk. JOHN O. TEMPLETON (to Electropure Corp.). U. S. 1,692,874, Nov. 27.

Apparatus for congealing milk and like products in thin homogeneous layers. HENRI CORBLIN. Fr. 636,692, Oct. 25, 1926.

Apparatus for treating milk by irradiation. THE DRY MILK COMPANY. Fr. 636,749, June 25, 1927.

Vat for treating milk, cheese, etc. CHARLES PAULY. U. S. 1,693,249, Nov. 27. Structural features.

Yoghurt. ALFRED ZIERER (Gustav Winkler, inventor). Ger. 467,710, June 12, 1926. See Brit. 272,468 (C. A. 22, 1814).

Homogeneous emulsified food product containing butter, honey and egg albumin. EDWARD F. BURTON AND JAY H. MONTGOMERY (to Honey-Butter Co.). U. S. 1,694,680, Dec. 11.

Cheese. HERMAN H. KAUFMANN and AUGUST H. KAUFMANN. U. S. 1,694,921, Dec. 11. In making curd cheese, 100 lb. of standard curd is ground to a fluffy mass, approx. 3 lb. of Na phosphate and 25 lb. water are added, the mixt. is heated to about 70° until thoroughly melted, ground cheese 98 lb. is added and thoroughly mixed in, the temp. is then raised to about 65° and the liquid is run into and sealed in foil-lined containers.

Preserving cheese. ELMER E. ELDREDGE (to Kraft-Phenix Cheese Co.). U. S. 1,693,025, Nov. 27. Comminuted cheese is mixed with a small proportion of water-sol. pectin at a temp. not exceeding about 52°, subdivided and introduced into shipping receptacles and then heated in the receptacles to a temp. not materially in excess of 65° while quiescent. U. S. 1,693,026 relates to a generally similar process in which gum tragacanth is added to the cheese.

Vitamin preparations. AAGE W. OWE. Ger. 468,301, Nov. 4, 1924. See Norw. 43,892 (C. A. 22, 4205).

Beverage from apple juice. H. MACKESON. Brit. 289,601, March 9, 1927. A beverage is made from apple juice as described in Brit. 267,236 (C. A. 22, 1211) but without use of malt ext. either before or after fermentation.

Preparing fresh citrus fruits for market. ERNEST M. BROGDEN and MILES L. TROWBRIDGE (to Brogdex Co.). U. S. 1,693,575, Nov. 27. The entire surface of fruits such as citrus fruits, apples or peaches is treated with soap and borax in aq. soln. and in sufficient concn. to inhibit blue mold.

Coating fruits with paraffin or similar protective and preservative agents. ERNEST M. BROGDEN (to Brogdex Co.). U. S. 1,692,286, Nov. 20. A mixt. of paraffin and white medicinal mineral oil or similar coating material is applied in a fluent condition to grapes, oranges, grapefruit or other fruits and the latter are treated with a blast of air. An app. is described. Cf. C. A. 22, 2627.

Dried marmalade. HARVEY L. HULBERT (to Murray Calif. Food Products, Inc.). U. S. 1,692,040, Nov. 20.

Preserving foods such as animal carcasses. P. C. LAVENDER and A. E. SHERMAN. Brit. 289,653, May 24, 1927. Air from a cold-storage chamber is circulated, in a cyclic system, through towers where it is treated with reagents such as a permanganate, HCl, aq. glycerol and CaCl₂. An app. is described.

Cattle food. HARAND ROBINSON (to The Piercy Co.). Can. 284,079, Oct. 16, 1928. Waste vegetable roughage is cut into particles not exceeding 1 in., and reacted on in a moist state and in an alk. medium with approx. 8% of several enzymes of animal origin acting selectively on the protein and starchy materials in the presence of NaHCO₃, 5%, chlorides, bromides or nitrates (such as NaCl) 32%, Ca salts (such as CaCO₃) 36%, malt 15%, anise or other flavoring 4%. The reaction takes several hrs. depending on the concn. of the converter compd., the character of the roughage and the temp. maintained. The reaction is completed by the fact that the starches have been substantially entirely transformed and the resulting material no longer gives evidence of the presence of any untransformed starch.

Food for poultry. B. H. BERTELS. Brit. 289,289, July 11, 1927. A granulated food is made from a mixt. of various ground grains, cereal meals, animal meal, partially expressed oleaginous seeds, nutritive salts and materials contg. vitamins such as cod-liver oil and dried yeast.

13—GENERAL INDUSTRIAL CHEMISTRY

- The grinding of materials. Theoretical and experimental researches on particle-size distribution incident to the disintegration process. A. H. M. ANDREASEN. *Kolloidchem. Beihefte* 27, 349-458(1928).—It is emphasized that the character of a disintegrated product is to be considered in detg. the most satisfactory means of disintegration. A single numerical value, e. g., the particle surface-area increase per unit of material, is an insufficient criterion to measure character of product. Particle-size distribution is an essentially better basis for judgment. A critical discussion of accepted research methods is given and a method proposed to give the best results for particle-size distribution detns. consistin_g of the application of sifting, wet elutriating, and sedimentation. A series of related problems is given, the solution of which by mathematical considerations led to the development of a series of ideas in regard to particle size, shape and degree of disintegration. Later a series of functions is defined for use. The relations so derived were then applied to 2 special cases: (1) that the product is evenly graded by weight; (2) that the compound-interest law held for the frequency curve. The exptl. undertakings intended to show that for such typical substances as quartz sand, feldspar, flint, glass, brick, barite and hematite which had been disintegrated by means of such typical mills as rolls, hammer mill, ball mill, etc., the following held: (1) The amt. of material is dependent upon particle size, and not width of mesh, velocity of blow, etc. (2) The accuracy of measurement in the range used held for all sizes. (3) The practical methods would be applicable. It was shown that the usually employed method of sedimentation was excluded for the finer particles. A method consisting of suspension in glycerol contained in a counting cell was developed for the detn. of particle sizes of different fractions. For the water dispersions no electrolyte was used as peptizer for quartz sand, feldspar, glass and flint; Ca citrate was used for brick and barite; and Na arsenite for hematite. A new type of washing and settling chambers with tapered sides was designed which gave good agreement with Stoke's law. The exptl. results are given in tabular and graphic form. In conclusion it was desired to see how well results checked the fundamental considerations: (1) For disintegrated products no general law holds for the particle-size distribution method and material. (2) The particle shape is not dependent upon its size if the same method of disintegration is used. (3) The compd.-interest law did not hold for ball-mill disintegration. (4) Nothing was found that showed the particle shape varied with particle size. A bibliography of 74 references is given. L. F. MAREK

Purification of gases. JEAN HENRY BRÉGEAT. Ger. 467,880, July 25, 1925. Volatile substances are recovered from natural or artificial gas mixts. by washing with terpene derivs. rich in H such as pinene or oil of turpentine or hydrogenated terpene, either alone or with other washing agents.

Purification of gases containing hydrogen sulfide. I. G. FARBENIND. A.-G. (Johann Behrens, inventor). Ger. 466,802, Apr. 30, 1925. The oxidation of H_2S with air or mol. O is effected in presence of powd. active charcoal mechanically suspended in the gas.

Removing dust from gases. LÉON L. BEURRIER. Fr. 639,090, Aug. 5, 1927. In a "cyclone" dust separator in which the gas is submitted to centrifugal action in the space between two tubes, one tube is made to touch the other and one is rotatable about the axis of the inner tube.

Desulfurizing gases. PAUL G. GRENÉ. Fr. 636,684, Aug. 31, 1926. Gaseous mixts. are desulfurized by metallic dioxides which are found sufficiently pure as ores to be used directly, such as dioxides of Mn or Sn.

Storing gases under pressure. CHRISTIAN W. P. HEYLANDT. Fr. 639,614, Aug. 17, 1927. See Brit. 271,692 (C. A. 22, 1637).

Separating constituents of air by liquefaction. ROBERT G. AUBERT. Swiss 126,482, Apr. 9, 1927. To avoid explosions in air-liquefying and N-distg. app., the combustible gases or vapors in the air are sepd. in solid state from the liquid air, suitably by filtration, at a point prior to the O-collecting zone.

Liquid air. ROBERT G. AUBERT. Fr. 639,702, Jan. 24, 1927. Explosions in liquefaction app. for liquid air are prevented, by leaving in the air until liquefaction, gases such as acetylene or its homologs which can be sepd. as solids from the liquid air before it reaches the O-collecting app.

Aerated liquids. BRITISH DVESTUFFS CORPORATION, LTD., AND CECIL HOLLINS AND ERNEST CHAPMAN. Fr. 639,558, Aug. 16, 1927. Sulfonic acids of high mol. weight having wetting or dispersing properties are added to water or beverages to be aerated with CO_2 , or to sirups to be added to beverages.

Filtering. MARCEL KOEHLER. Fr. 639,445, Jan. 24, 1927. Filtering surfaces, particularly for lubricating oil, comprise a permeable support, the pores of which are filled with a substance by adsorption and are then reduced in size.

System of magnetic separation of materials. JAMES L. HOPE (to Ding's Magnetic Separator Co.). U. S. 1,693,033, Nov. 27.

Evaporating liquids to recover crystallizable residues. HENRY W. CARR. U. S. 1,694,841, Dec. 11. Residues such as those of brines are dropped upon a hot bed of previously prepd. residues of like character to those to be recovered, maintained at a temp. sufficient to evap. liquid present. An app. is described.

Freezing organic liquids. B. TSROVITSCH. Brit. 288,310, April 8, 1927. Solns. of biocolloids such as fruit and plant juices, medicinal toxins, beer, milk and cream are rapidly frozen into amorphous condition by spraying into a freezing chamber.

Centrifuging, pasteurizing and degasifying milk or other liquids. AAGE JENSEN. U. S. 1,693,034, Nov. 27. An app. is described.

Purifying camphor and similar volatile substances. EVARTS G. LOOMIS. U. S. 1,693,243, Nov. 27. The material is reduced to a liquid form and a current of air, N,

CO₂ or other suitable gas below the b. p. of the camphor (or other material being treated) is forced upon the surface of the material so as to become satd. with the vapor and is then led to a condensing chamber where the product condenses and coalesces. An app. is described.

Product for absorbing vapors from volatile solvents. SOC. INTERNATIONALE DES PROCÉDÉS PRUDHOMME HOUDRY. Fr. 636,645, Oct. 20, 1926. The product obtained from the hydrogenation of light oils from gas-works or coke-plant tar with or without a fractionation to remove light or heavy components is used to absorb vapors of volatile solvents such as ethers, alcs., acetones or to absorb light hydrocarbons.

Crystallization. CHEMISCHE FABRIK GROSS-WEISSANDT G. M. B. H. and PAUL SEIDLER. Ger. 467,788, Nov. 15, 1927. Addn. to 463,184. Large crystals, e. g., of NH₄Cl, are obtained by adding dried exts. of wood, ligneous material or plants to the soln.

Crystallization. GES. FÜR LINDE'S EISMASCHINEN A.-G. Ger. 467,233, Dec. 4, 1923. Addn. to Ger. 413,819. Salts and like substances are sepd. by adding a super-cooled liquid to the mother liquor.

Emulsion. G. STADNIKOFF, ROBERT KLASSON and VICTOR KIRPITSCHNIKOFF. Ger. 468,135, Oct. 23, 1924. The clearing velocity of emulsions is accelerated by the stirring in of coagulated peat or like colloidal substance. Thus, pptd. CdS after treatment with H₂S water forms a colloidal suspension which settles much more rapidly after addn. of coagulated peat. Other examples are given.

Emulsions. RUDOLF AUERBACH. Fr. 639,245, Aug. 9, 1927. A liquid such as water, milk or aq. solns. of salts or acids is emulsified in an insulating liquid such as paraffin oil, linseed oil, etc., by a direct or induced elec. charge.

Colloidal substances. MINERAL A.-G. Swiss 126,190, Nov. 10, 1925. The material to be subdivided is finely ground and mech. colloidalized in presence of a liquid, the non-colloidal particles are sepd. by centrifuging, and the colloidal product is then sepd. by centrifuging at a higher speed or by ultra-filtration or osmosis. A protective colloid may be added during the first colloidalization and rendered inactive again prior to sepg. the colloid. Examples are given of the prepn. of *colloidal ocher* and of the sepn. of *colloidal CaCO₃* from siliceous limestone.

Dispersion of solids. PIERRE G. M. A. FIGACHE. Fr. 639,069, June 27, 1927. Solid bodies such as dyes, catalysts or reagents normally insol. are dispersed by grinding, malaxing, etc., with hydrosol colloids swollen or dispersed in an aq. medium.

Measuring temperature. ALFRED ROBERT MEYER, MARCELLO PIVANI and WERNER VON SIEMENS. Ger. 468,151, Apr. 22, 1926. Change of temp. in a gas-filled room is measured by variation in elec. cond.

Measuring the temperature of gases. KAISER-WILHELM-INSTITUT FÜR EISENFORSCHUNG (Hermann Schmidt, inventor). Ger. 468,128, July 17, 1926. The heat es are compensated for by elec. heating.

Effecting chemical reactions at high temperature. GOTTFRIED TRÜMLER. Swiss 126,493, May 1, 1927. The reaction mixt. is placed in a drum which is rapidly rotated so that the mixt. is spread out on the inner surface of the drum. The mixt. may be heated by passing hot gases through the drum, or the drum may be elec. heated externally or may have perforated internal walls which may act as electrodes.

Drying substances at a low temperature. MARIUS M. C. GUILBAUD. Fr. 636,610, . 16, 1926. Substances which are affected by heat are dried by steam at low pressure rising from a vacuum evaporator. The substance may be caused to travel in a cascade.

High-tension electric cables. FELTON & GUILLEAUME CARLSWERK A.-G. Brit. 3,284, April 7, 1927. To reduce transformer current losses, the Pb sheathing or noring of a high-tension cable is divided into sections insulated from each other suitably protected against moisture by a covering of tarred jute or asphalt-treated er, and are insulated from earth throughout their length by a covering of gutta sha, bitumen, rubber or the like.

Operating producers or shaft furnaces. JAMES W. REBER (to Woodall-Duckham P), Ltd.). U. S. 1,692,572, Nov. 20. In operating a producer or shaft furnace a jacket comprising 2 superposed sections with blast nozzles extending through ver section, water is supplied under high pressure to the upper section of the jacket under low pressure to the lower section of the jacket, which serves to facilitate -tion and operation.

ating apparatus of the absorption type. GUNNAR ROOS. U. S. 1,692,053,

; system of the absorption type. HERVEY S. VASSAR. U. S. 1,693,357,

Refrigerating system of the absorption type. CARL G. MUNTERS (to Electrolux Servel Corp.). U. S. 1,693,553, Nov. 27.

Refrigerating system of the reversing absorption type. A. SCHICKLER. Brit. 288,738, Jan. 17, 1927.

Refrigerating apparatus of the compression type. T. ZEMANN. Brit. 289,088, April 22, 1927.

Refrigerating apparatus of the compression type. ALFRED M. THOMSON (to Joseph Mercadante). U. S. 1,694,630, Dec. 11.

Refrigerating apparatus of the compression type. G. ZWICKY. Brit. 288,611, April 13, 1927. Structural features.

Packing material for compressors of refrigerating apparatus, etc. H. A. FRASER, W. L. PRICE and J. HETHERINGTON. Brit. 289,365, Jan. 12, 1928. A mixt. of grease, graphite and Hg.

Refrigerating apparatus precipitating sodium nitrate from solution, etc. CHARLES L. BURDICK (to Guggenheim Bros.). U. S. 1,694,369, Dec. 11.

Safety plug (fusible in case of fire) for permitting escape (without explosion) of volatile substances used in refrigerating systems. R. S. TAYLOR (to Electrolux, Ltd.). Brit. 289,064, April 21, 1927.

Heat insulator. SOCIÉTÉ DES ÉTABLISSEMENTS WANNER, S. A. Fr. 636,957, July 4, 1927. A heat-insulating material for pipes or other objects is made from powd. or granulated ashes, infusorial earth, clay and asbestos.

Electrical or heat insulation, etc. C. ZARFEL and W. D. STROEVER. Brit. 289,676, July 14, 1927. Waste tan bark or the bark of coniferae and foliage trees is boiled for 2-3 hrs. in a closed vessel contg. a 3-4% soda soln., sepd., rinsed with water, ground and molded. Pulp fibers may be added for reducing the hardness of the product.

Heat insulation for refrigerators, etc., formed of synthetic resin strips, cork and sheet metal. J. L. KNIGHT (to British Thomson-Houston Co., Ltd.). Brit. 288,576, April 12, 1927. Structural features.

Heat insulation of vacuum-walled receptacles. WM. D. COOLIDGE (to General Electric Co.). U. S. 1,694,967, Dec. 11. The evacuated jacket contains a filling of finely divided solid material such as lampblack and P_2O_5 , at least part of which has a strong affinity for water so that detrimental absorption of water by the material is prevented.

Mica insulation. J. M. COFFEY (to Mica Insulator Co.). Brit. 288,260, April 5, 1927. Mica flakes are agglomerated by a condensation product of glycerol and phenol or its homologs (which may be used in alc. soln.). Details of manuf. and use of the condensation product are given. Cf. C. A. 22, 4187.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Water problems in Morocco. EDMOND BOUCHV. *L'eau* 21, 121-2(1928).—Because of the arid nature of Morocco the sanitary engineering problems are quite different from those in France. The use of large reservoirs and very long pipe lines are necessary. Great progress on water engineering projects now under way is reported.

C. R. F.

Hydrogen-ion control in water softening. JOHN R. BAYLIS. Dept. Publ. Works, Chicago. *Ind. Eng. Chem.* 20, 1191-4(1928).—Knowledge of p_H of water through the different stages of the softening process enables the most efficient results to be obtained in a plant where lime is used for softening. The approx. satn. equilibria of $CaCO_3$ and $MgCO_3$ have been established. The concn. of $MgCO_3$ at satn. equil. is much higher than $CaCO_3$ for a given p_H . Most natural waters contain some $MgCO_3$ and this throws the satn. equil. somewhat higher than the curve for $CaCO_3$. Mg begins to ppt. as the hydroxide when the p_H is increased above 10.3. When Mg occurs largely as carbonate it can be reduced to about 3 p. p. m. of Mg by increasing the p_H to about 10.8 with $Ca(OH)_2$. The max. softening possible for waters contg. both $CaCO_3$ and $MgCO_3$ is to add lime until the p_H is about 10.8 and then ppt. the Ca by converting it to carbonate. It is better to recarbonate at 2 or 3 stages of the process than to attempt to recarbonate at only 1 point.

J. A. KENNEDY

Developments in water softening. CHARLES P. HOOVER. *J. Am. Water Works Asscn.* 20, 642-54(1928); cf. C. A. 22, 3941.—An interesting résumé covering the handling of chemicals and their applications to water as well as mixing or agitating by

baffled tanks or mech. agitators. The use of clarifiers is considered. Improvement in softening procedure is discussed and in that connection re-carbonation is discussed at some length.

D. K. FRENCH

Manganese in the Croton water of New York City. FRANK E. HALE. *J. Am. Water Works Assocn.* 20, 661-70(1928).—Troubles due to Mn in water from Croton Lake are described. The use of an intervening reservoir for sedimentation is a temporary solution.

D. K. FRENCH

Zeolite softening. JAMES FITZGERALD. *Textile Colorist* 50, 759-60(1928).—General.

RUBY K. WORNER

Phototurbidimeter in the determination of water turbidity. Atilio A. Bado and Rogelio A. Trelles. *J. Am. Water Works Assocn.* 20, 674-6(1928).—This app. is described as to construction and operation. It is claimed to show directly turbidities up to 100.

D. K. FRENCH

Oxygen-consumed determination. GEORGE W. BURKE. *J. Am. Water Works Assocn.* 20, 677-83(1928).—To decrease inaccuracy it is recommended that 25 cc. KMnO_4 soln. be used. Oxalic acid is preferred to its salts.

D. K. FRENCH

Filter-plant loadings. H. W. STREETER. *Proc. 10th Texas Water Works School*, Jan., 85-8(1928); *U. S. Pub. Health Repts.* 43, 3102(1928).—A survey showed that av. well-designed and operated rapid sand filter plants in the Ohio River Basin could produce a final chlorinated water which would meet the requirements of the Treasury Department Standards, if the raw water *B. coli* index is not over 5000 per 100 cc., while in the Great Lakes region, 2000 per 100 cc. is the limit for water to be purified to meet these standards. Raw water of the Ohio River type cannot be treated consistently so as to produce an unchlorinated effluent meeting the standard if the *B. coli* content of the raw water exceeds 60 to 100 per cc., while with lake waters the limit appears to fall somewhere less than 10 per 100 cc. To increase the bacterial efficiency of the plants a no. of possibilities for plant elaboration are suggested: (a) long-time preliminary storage prior to its delivery for treatment; (b) double-stage preliminary sedimentation, aided in some instances by two-stage coagulation; (c) double filtration; and (d) double chlorination, including prechlorination of the raw water. Excess lime treatment is also suggested where feasible. Tests at 5 Ohio River plants and at Cincinnati exptl. plant indicate that plants elaborated to include (b) with a *B. coli* index ranging as high as 50,000 per 100 cc. in the raw water will produce a standard chlorinated effluent. Results from (d), although not as good as those from (b), are sufficient to increase the permissible bacterial pollution of raw water two-fold as measured in *B. coli* index. All observations were made in summer and autumn.

C. R. F.

Elimination of false presumptive tests. A. C. JANZIG AND I. A. MONTANK. *J. Am. Water Works Assocn.* 20, 684-95(1928).—By proper control of the H-ion concn. of lactose broth the no. of false presumptive tests can greatly be reduced.

D. K. F.

Cast-iron service pipe. WM. W. HURLBUT. *J. Am. Water Works Assocn.* 20, 595-607(1928).—The advantages of such pipe from the standpoint of service, durability and cost are stated and the method of connecting is outlined. A free discussion brings out many addnl. points.

D. K. FRENCH

Dead ends. S. B. MORRIS. *J. Am. Water Works Assocn.* 20, 608-14(1928).—The problem is largely of taste and odor due to bacterial action under conditions where such action is not interfered with. This action does not seem to affect the corrosiveness of a water, though corrosion from electrolysis is sometimes increased. In general, dead ends are not desirable.

D. K. FRENCH

Acid mine drainage in Western Pennsylvania. R. D. LEITCH. *Bur. Mines, Repts. of Investigations* No. 2889, 18 pp., 2 figs., 10 tables (1928).—A stream in each a low-S and a high-S district was investigated. Workings are mainly drift mines. In the low-S district an av. of 4.5 tons of H_2O is discharged per ton of coal in a normal dry season with a variation from 0 to 22 tons. In the high-S district the vol. varies from 1.7 to more than 3.5, depending on production. Data were taken for 2 wet fall seasons in each and for 1 dry summer in the low-S district. Total acidity is reported at boiling temp. In the low-S district above the mines the p_{H} is 6.4-6.8, although, the water is alk. at boiling temp. Tabulated values from the low-S district show total acidity as high as 14,484 p. p. m. with 400-500 p. p. m. common. Cold acidity is considerably less and free acidity varies up to over 500 p. p. m. Some samples were alk. The p_{H} of 17 out of 24 mines was less than 3.2 at some period during the investigation. Few values were over 5.0. In the high-S district total acidity reached 8221 p. p. m., and free acidity varied from 0 to 684 p. p. m. with 4 out of 14 samples alk. The p_{H} of 5 out of 7 mines was less than 3.2. Drippers were in general alk. with a p_{H} of 4.6-9.0. Many faces of entries in the low-S district were less than p_{H} 3.2; in the high-S district only

a few were under 5.0. Abandoned sections in the low-S district were somewhat higher than the operating mine; in the high-S district every sample was highly acid, many total acidities in the thousands with free acidities of 87-1715, every p_H less than 3.2. Typical total acidities follow:

Mine	Type	Active sections	Abandoned sections
1	Low S	..	458
2	Low S	673	840
4	Low S	217	464
7	Low S	..	595
13	Low S	..	512
15	Low S	2325	5985
17	Low S	..	6
18	Low S	55	..
21	Low S	547	1090
27	High S	..	5054
28	High S	1645	4760
29	High S	24	1400

Material outside the mine liberates the most acid and it is suggested that less damage would be done if this were sealed off in dry sections of the mine. There is no marked difference in acidity from mines having a limestone floor. Some active mines do not have acid water. Crystals of ferrous and ferric sulfate accumulate in some abandoned workings. Water from high-S coal is more acid than that from low-S coal. Abandoned mines give highly acid water for many years, some for 35 years. During flood periods mine water is negligible; during low water it may constitute almost all of the stream. Recovery of a stream rendered acid by mine drainage may be by neutralization or by dilution. As a chem. treatment neutralization with lime or limestone followed by 4-5 hrs.' sedimentation is feasible. Sludge disposal by drum drying is used in one plant. Such individual installations would be too expensive for most mines. Experience shows that if abandoned workings were sealed to keep air out, water from those mines would become pure more quickly. There is little doubt that chemically and mechanically the problem can be solved. The final problem is one of economics. F. D. S.

Modern views on the formation and prevention of incrustations in boilers. ROBERT STUMPER. *Bull. soc. chim. Belg.* 37, cv-cxii(1928).—A survey. ALBERT L. HENNE

Power-plant efficiency increased by application of chemistry. H. C. DINGER. U. S. Naval Acad., Annapolis. *Power* 68, 714-6(1928).—A general discussion of feed-water treatment, protective coatings and deaeration. D. B. DILL

The chlorination of raw sewage for odor control. JAMES L. BARRON AND R. E. LAWRENCE. Univ. Kan., *Eng. Bull.* 16, 29, No. 3, 1-28(1928); *U. S. Public Health Eng. Abs.* E-660b, 62(1928).—In sewage-treatment plants the sprinkling filters usually release the H_2S , thus causing odors. Important factors in the reduction of sulfates to H_2S are: (1) conditions of flow previous to the sprinkling operation, permitting bacterial growth; (2) the septicization of fluid and accumulation of dissolved gases. The most practical means of preventing odors is to prevent the growth of H_2S organisms. Cl does this and also combines with any H_2S that may be present. The quantity of Cl needed in various expts. was greatly reduced by making changes in the tanks which kept the sewage moving and avoided dead spaces. Taking advantage of weather conditions permitted savings in Cl to be made on days when the wind carried the odors away from the city or during rainy weather when the sewage became diluted. Excellent results could be obtained when residual Cl was present in the tank influent although none was present in the effluent. The usual quantity added to the influent for dry weather flow was 10 p. p. m. In one expt. the construction of suitable baffles made the addn. of Cl unnecessary to control odors. C. R. F.

Sewage-treatment plant at the Grand Canyon National Park. H. B. HOMMON. U. S. Pub. Health Service, Wash. *U. S. Public Health Repts.* 43, 2583-98(1928).—Water is brought to the Park by railroad from Flagstaff, Ariz., a distance of 100 miles at a cost of \$3.09 per 1000 gals. In order to conserve this water a specially designed sewage-treatment plant was built and operated for approx. a year and is still in operation. The activated-sludge process with rapid sand filters and Cl sterilization of effluent was utilized. At first laundry waste was purified separately by pptn. with 25 gr. per gal. but finally the sewage plant absorbed it without difficulty. The recovery of water as purified effluent was 99%. The effluent was used for locomotive boilers, flushing toilets, cooling engines, irrigation of lawns and for washing automobiles with excellent results,

It is economically practicable to reclaim sewage for industrial purposes and to use this sewage, after sterilization, in crop irrigation. For large sewage-disposal installation the cost per acre-ft. for sterilizing a well-oxidized effluent is approx. 60c. In small treatment plants where cylinders of Cl are used, the cost may reach \$1.20 per acre-ft. The principles involved are of great interest in arid communities. C. R. F.

Note on the composition of the air in Paris. D. FLORENTIN. *Municip. Chem. Lab., Paris. Tech. Sanit. Munic.* 23, 172-5(1928).—See C. A. 22, 1069. C. R. F.

Removing water vapor from agitation air. M. F. KNOV. *Power* 68, 923-4(1928).—Air used for agitation in the raw-water ice plant may be dried by (1) cooling to a temp. below that of the freezing tank, (2) treatment with a hygroscopic chemical, or (3) cooling under pressure nearly to tank temp. and then expanding. The last method is most commonly used. D. B. DILL

Studies on the use of deratisation gas for ships. AKIRA MOTOMURA. *J. Pub. Health Assocn. (Japan)* 4, No. 7, 1-9(1928); *U. S. Pub. Health Eng. Abs.* E-660b, 11 (1928).—The germicidal power of SO_2 was detd. by exposing both moist and dry silk threads which had been cultured with *B. coli*. Both moist and dry threads were exposed simultaneously to varying concns. of SO_2 . Two lb. of S burned per 1000 cu. ft. of area did not affect *B. coli*. Five lb. of S sterilized the moist threads only, with no effect upon the dry threads. At this concn. there was injury to cargo and metal parts of the ship. The bacteria should be destroyed by means other than S fumigation, which is recommended merely for deratisation. A summary of 6 yrs.' work on ship fumigation by S is given. C. R. F.

Present tendencies regarding disinfection. E. C. FARR. *Munic. Eng. Sanit. Record* 81, 333(1928). C. H. BADGER

Progress report on cannery waste treatment studies conducted by the Ohio Canners' Association at Canal Winchester, Ohio, Aug. 24 to Oct. 8, 1926, and Association of New York State Canners, Inc., at Albion, N. Y., Aug. 9 to Oct. 25, 1927. Under supervision of A. ELLIOTT KIMBERLEY. Ohio State Dept. Health, Columbus, Ohio. 85 pp. (cf. C. A. 22, 656).—An illustrated report with diagrams describing the test treatments given wastes from the canning of corn, lima beans, succotash, green beans and tomato products. Numerous tables show operating data, results of screening and chem. pptn. tests and compn. of the screened raw wastes and their effluents. The cannery wastes proper were sepd. from the cooling and condensing waters and domestic sewage. Screenings and silage liquors were carried away. Concd. wastes as dried bean soak and blancher liquors are probably best disposed of in this manner. Mech. operated screens having openings of about 0.010 in., with proper control of the rate of flow, seem most effective for screening. After fine screening, filtering on lath (cypress) or coarse limestone filters, inoculated with sewage bacteria, at the rate of 2 million gal. per acre per day gave effluents requiring limited diln. for corn, lima-bean, succotash and green-bean wastes. With tomato products a short sedimentation period is necessary before filtering to prevent clogging, because of the excessive finely divided matter passing the screens. This effluent requires a 4-fold diln. Sand filters were also found effective but because of costs are probably only suitable for small plants. Successful chem. pptn. methods using lime and Na aluminate (2.8 and 17.5 grains (65% CaO) per gal. resp.) for tomato-products wastes are described. The use of 15 or 20 grains $Al_2(SO_4)_3$ with or without 5 and 8 grains Na_2CO_3 per gal. produced after 2 hrs.' sedimentation clear but highly putrescible effluents with raw screened wastes from corn, lima beans and succotash. 46 p. p. m. Cl applied to screened corn, lima bean and succotash wastes did not retard fermentation although the Cl-demand figures were 31, 20 and 10 p. p. m., resp. It was recommended that the National Canners' Assocn. continue the studies on other packs. C. H. BADGER

Apparatus for purifying waters by separating solids according to their density. LUCIEN LINDEN. *Fr.* 639,481, Aug. 12, 1927.

Apparatus for softening water with base-exchange material. OSCAR W. JOHNSON (to Ward-Love Pump Corp.). *U. S.* 1,692,939, Nov. 27.

Apparatus for softening water with base-exchange substances. UNITED WATER SOFTENERS, LTD., and E. B. HIGGINS. *Brit.* 289,112, Dec. 15, 1926. Numerous structural details are described.

Apparatus for softening water by use of zeolites, etc. EDWARD T. TURNER. *U. S.* 1,694,804, Dec. 11.

Apparatus for softening water with zeolitic substances. W. NEUMANN (H. Baron). *Brit.* 288,660, Nov. 5, 1926.

Preparing natural zeolite for use in water softening. MARTIN F. NEWMAN (to

Wm. B. Scaife & Sons Co.). U. S. 1,693,284, Nov. 27. Natural silicates such as greensand marl and glauconite are washed and treated with superheated steam at a temp. of not less than about 315°. Borax or $\text{Al}_2(\text{SO}_4)_3$ also may be used.

Liquid injector or ejector nozzle suitable for use in water-softening apparatus. CHARLES A. STICKNEY (to Stickney Hydraulic Co.). U. S. 1,692,592, Nov. 20.

Water-softening agent. GEORGE L. BORROWMAN (to Wayne Co. to The Permutit Co.). Can. 284,455, Oct. 30, 1928. Glauconite is heated to 200–400° and then allowed to cool. The baked glauconite is first washed with water and then treated with salt brine. After rinsing it is ready for use as a water-softening agent. It can be regenerated by salt brine.

Water-softening agent. ARTHUR C. SPENCER (to The Permutit Co.). Can. 284,454, Oct. 30, 1928. Native greensand is washed and purified to free it from sol. matter and mechanical impurities such as clay. This greensand is then used for purifying hard water. When the activity of the material has diminished it can be revived by brine or common salt soln.

Automatic apparatus for softening water by use of zeolites, etc. HARRY A. TOULMIN, JR. (to Duro Co.). U. S. 1,694,457, Dec. 11.

Soft water. ARTHUR ROSENHEIM. Ger. 466,259, Feb. 23, 1926. Glauconite is recovered from softened water by 5% (or less) solns. of NaCl.

Neutralizing the alkalinity of water. ALFRED H. WHITE. U. S. 1,693,065, Nov. 27. In order to render alk. water suitable for use in boilers it is treated with a quantity of H_3PO_4 sufficient to adjust its final acidity after reaction and removal of its CO_2 content, to a proportion not in excess of 0.5%. U. S. 1,693,066 specifies prepg. water for use in steam boilers by adding H_3PO_4 sufficient to form insol. phosphates with the Ca, Mg and Fe carbonates in soln. and sufficient Na phosphate to form insol. phosphates with the other Ca, Mg and Fe salts in soln., the addns. being made in such proportions as to effect substantial neutralization of the water after the CO_2 has been removed from soln.

Filter for water. CHARLES P. EISENHAUER (to Duro Co.). U. S. 1,694,467, Dec. 11. Structural features.

Regeneration of a filter for softening water. PERMUTIT A.-G. Ger. 468,344, May 18, 1927. Addn. to Ger. 458,017. A funnel contg. exactly one or more times the vol. of the filter is used for introducing the purifying and washing fluids.

Regeneration of filtering material. KARL HUFSCHMIDT. Fr. 636,940, July 2, 1927. Filtering material such as *permutite for softening water* is regenerated by a soln. of NaCl, which flows through the material in a permanent cycle. Sprinklers for the NaCl soln. are arranged in tiers through the material, which also serve for introducing the water to be filtered.

Apparatus for controlling the feed of water into boilers, etc. RICHARD G. JONES. U. S. 1,694,621, Dec. 11.

Preventing scale. JOHANN BILLWILLER. Fr. 639,856, Aug. 20, 1927. Scale is removed or prevented by adding oxidized or polymerized resinic acids, such as abietic, pimaric or guaiaconic acid or resinic acid contg. water obtained by sapon. with alkalis or carbonates and pptn. with an acid, to the feed water, with or without gum arabic, glycerol or gummy substances. Cf. C. A. 22, 3010.

Electrode and associated connections for preventing incrustation in boilers, condensers, etc. J. G. BARBER. Brit. 289,586, Feb. 16, 1927. Structural features.

Apparatus for supplying disincrustants, etc., to steam boilers. J. R. BOWICK and J. M. BOWICK. Brit. 288,710, Jan. 11, 1927. A modification of the app. described in Brit. 253,194 (C. A. 21, 2403).

Preventing rust formation in water systems. RALPH A. SEALEY. U. S. 1,692,706, Nov. 20. Various structural details are specified of a water-supply system in which water is heated and to the supply line of which is connected a receptacle for material adapted to check rust formation in the system.

Protecting iron water pipes. CHRISTIAN BÜCHER. Swiss 126,205, Oct. 4, 1926. Iron water pipes are preserved from attack by treating the water with sufficient $\text{Ca}(\text{OH})_2$ to unite with all the CO_2 and to render the water neutral or alk.

Septic tank. JOHN P. THURELL. U. S. 1,695,217, Dec. 11.

Heatable sludge-digestion chamber for sewage treatment. KARL IMHOFF. U. S. 1,692,446, Nov. 20.

Apparatus for disintegrating sewage before discharge into the sea, etc. PULSOMETER ENGINEERING CO., LTD., AND J. BJÖRNSTAD. Brit. 288,814, April 11, 1927.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Soil research activities in 1927. N. M. COMBER. Univ. Leeds. *Agr. Progress* 5, 9-20(1928).—This paper reviews some of the important work done in 1927 on soil acidity, org. matter in soils and other phases of soil research. K. D. JACOB

An acidity survey of the soils of two parishes in Berwickshire. W. G. OGG AND W. T. DOW. *Scottish J. Agr.* 11, 273-86(1928). K. D. JACOB

The soils of Shropshire. W. MORLEY DAVIES. *Agr. Progress* 5, 50-6(1928).—The different types of soil are briefly discussed and chem. and mech. analyses are tabulated. K. D. JACOB

A comparative study of the methods of preparation of the soil for mechanical analysis with a note on the pipet method. AMAR NATH PURI AND BHAILAL M. AMIN. Agr. Research Inst., Pusa, *Bull.* 175, 15 pp.(1928).—Results obtained on several types of soil indicate that treatment with dil. HCl is necessary to obtain max. dispersion. Treatment with H₂O₂ (Official English method) or hot 0.2 N HCl (Hissink's method) is not necessary. Treatment with 0.05 N HCl is less drastic and is effective in giving max. dispersion. Results obtained by other methods, with and without the use of chemicals, are tabulated. An improved form of pipetting app. for the mech. analysis of soils is described and the various sources of error are discussed. K. D. J.

The phosphoric acid requirements of Czechoslovakian soils. E. G. DOERRELL. *Superphosphate* 1, 128-32(1928).—A large no. of soil samples from estates in Czechoslovakia were examd. for acidity and lime and P₂O₅ requirements. Of these soils, 2% were below p_H 5, 12% p_H 5-6, 14% p_H 6-7, 57% p_H 7-8 and 15% p_H 8-9. There was a fairly definite relation between the p_H values of the soils and their interchange acidity as detd. by Kappen's method. Eighteen % of the soils of large estates contained sufficient readily assimilable P₂O₅, as detd. by the Neubauer and Lemmerman methods, while 82% required P₂O₅ fertilization. In general, the subsoil was more in need of P₂O₅ than the surface soil. K. D. JACOB

Studies on iodine as a biogenous element. XVII. Studies on the ability of soils to split off iodine. K. SCHARRER AND J. SCHWAIBOLD. Tech. Hochschule, München. *Biochem. Z.* 200, 258-72(1928); cf. *C. A.* 22, 4547.—An examn. was made with a variety of soils. Mineral soils with an acid reaction had great ability to split off I, while those of neutral or alk. reaction were relatively inactive in this respect. Of the former loam soils were more active than sandy soil of the same degree of acidity. Heating the soil to 100° or sterilization destroyed this ability to split off I. On the contrary, incineration of the soil to const. wt. resulted in an increased ability, several times as great as the original. Likewise an increased activity followed preliminary treatment with phenol or AlCl₃. Furthermore, an alk. soil which did not split off I did so to an appreciable degree after it has been boiled with HCl and has acquired an acid reaction. Ultra-violet radiation had only a slight influence. In a certain sense the H₂O₂-splitting property of the soil is reciprocal to the I-splitting capacity, the latter being greater the more below p_H 7.0 the soil reaction is and the greater its content in colloidal compds. of Fe and Mn. In soils rich in org. substance the split off I is secondarily bound so that in such soils the I-splitting cannot be utilized. S. MORGULIS

Experiments for the determination and explanation of the buffer action of carbonate-poor soil. K. MAIWALD. *Kolloidchem. Beihefte* 27, 251-346(1928).—The buffer action of 14 soils of known origin taken from places not used agriculturally has been studied. The soils contained 1.0-20.5% raw clay and 2.6-52.7% silt and ranged from light sandy to a heavy clay. They were classified by the triangular method of M. Whitney, U. S. Dept. Agr., Bur. of Soils, *Bull.* 78, 11(1911). Colloidal matter (cf. Robinson, *C. A.* 17, 444) ranged from 12 to 39%, indicating that the clay fraction and more or less of the silt were of colloidal nature. Colloidal matter was from 6 to 45% after strong mech. treatment or after chem. transformation of constituents reactive to strong bases. The soils were classified into 3 groups: 4 weakly alk. and neutral soils with under 0.2% carbonate, 4 intermediate soils with slightly alk. character and 6 carbonate-free, unsatd. soils. Titration curves of the reactions of the soils in water and in KCl soln. are given and possess these characteristics: (1) Conclusive figures are obtained only after more than one day of reaction. (2) In the exptl. range the curves do not show any transformation or turning point. (3) The curves taken as a whole are different from the titration curve of buffer-free quartz sand; also the soils have a good buffer action against admixed reacting compds. (4) Titration from either basic or acid side gives a continuous, symmetrical curve. In soils poor in carbonate it is probable

that colloidal complexes of humus and clay give the buffer action. The degree of buffering and the form of titration curve of a soil depend on the factors: (a) the chem. character of the colloid complex as detd. by the abs. base-binding capacity of the anion, (b) the satn. condition of the colloid complex as indicated by x in the formula $xR^+ + (100 - X) H^+$, (c) the abs. content of substances capable of reaction, i. e., colloidal content or better the sum $R^+ + H^+$ per gram, (d) the type of colloid and its change in the titration range, (e) the character and compn. of adsorbed, interchangeable bases, (f) the character of the admixed reagents. Factors (a) and (b) can be considered as material factors; (c) and (d) as concn. factors; and (e) and (f) as secondary factors. The combined effects of the 6 factors give the smooth, flat titration curve with a wide buffer-action zone. A no. of improvements for the electrometric titration are recommended. A bibliography of 118 references is given.

L. F. MAREK

Losses and gains of nitrogen in an Indian soil studied in relation to the seasonal composition of well waters, and the bearing of the results on the alleged deterioration of soil fertility. HAROLD E. ANNETT, A. R. PADMANABHA AIVAR AND RAM NARAYAN KAYASTH. *Memoirs Dept. Agr. India, Chem. Ser.* 9, 155-234(1928).—This paper gives in detail the results of an extensive investigation on the loss of N from black cotton soils in the Central Provinces of India. Accumulation of nitrates reached a max. during the early part of the rainy season and then decreased rapidly because of leaching. Cropped soils, whether fertilized or not, lost more nitrate than uncropped soils. Analyses of water from a well surrounded by an unfertilized, unirrigated field indicated an annual loss of nitrate equiv. to 165 lb. N per acre, while analyses of water from a well surrounded by an irrigated, highly fertilized field indicated an annual loss of 550 lb. NO_3 nitrogen per acre; however, the av. annual loss of nitrate was equiv. to approx. 165 lb. N per acre. Apparently, loss of N by leaching was counterbalanced by fixation of atm. N as it was found that the actual N content of the soil had not decreased during a period of 25 years.

K. D. JACOB

The determination of the electrical conductivity of the aqueous extract of soil as a rapid means of detecting its probable fertility. ASHUTOSH SEN. *Agr. Research Inst., Pusa. Memoirs Dept. Agr. India, Chem. Ser.* 9, 247-54(1928).—Samples of dry soil from fertile and non-fertile fields were shaken with cond. H_2O , and allowed to settle for 2 hrs. The elec. cond. of the mixts. of soil and H_2O was then detd. at intervals over a period of several days, the mixts. being shaken 2 hrs. before the detns. In all cases, the conductivities of the exts. from fertile soils increased progressively with time of contact with the soil while those of exts. from non-fertile soils remained approx. const. This phenomenon was independent of the initial cond. of the exts. The results indicate that fertile soils progressively supply sol. salts to the soil soln., probably through combinations of chem. and bacteriol. processes, while non-fertile soils do not have this power. The non-fertility of a soil known to be incapable of growing cinchona was readily detected by the cond. method although its chem. compn. and pH value were approx. the same as that of an adjacent soil upon which cinchona thrived.

K. D. JACOB

Bone fertilizers. FRANK E. CORRIE. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 753-4(1928).—The history of the use of bones as fertilizers is briefly discussed and data are given on the compn. and relative value of the various types of bone fertilizers.

K. D. JACOB

The 1927-28 fertilizer constituent tests at Western Pampanga. MANUEL L. ROXAS, RAMON ADVINCULA AND JUAN O. UNITE. *Rept. of Committee on Cane Varieties, Diseases and Fertilizers for the 6th Annual Convention, of the Philippine Sugar Assocn. Manila 1928*, 90-3.—From the results of the 7 fertilizer tests in light and heavy soils, it is concluded that although large increases (24-300%) in yield were obtained from the use of $(NH_4)_2SO_4$ alone, the addn. of K_2O and P_2O_5 to the N in the fertilizer gave no significant increase in yield over that when N alone is used. Ammonium sulfate quantity tests in Western Pampanga (Luzon). MANUEL L. ROXAS, JUAN O. UNITE AND RAMON ADVINCULA. *Ibid* 94-7.—Practically all fertilizer quantity tests indicated no additional significant increases from the use of more than 250 kg. of $(NH_4)_2SO_4$. Increasing sugar yields per hectare by application of fertilizer in Western Pampanga. MANUEL L. ROXAS. *Ibid* 97-9.—R. has compiled the data obtained by him and his co-workers for 1927-28, and finds that with use of 250 kg. $(NH_4)_2SO_4$ per hectare, (a) the number of stools per hectare is increased by 8%; (b) the weight of stools by 58%; (c) the wt. of cane by 72% and the wt. of sugar by 64%. The fertilizer had no effect on the rendement (piculs sugar per ton cane).

V. G. LAVA

The use of calcium sulfate as a soil amendment on clay loam soil in Laguna. MANUEL L. ROXAS, E. DAYTON, A. CARANDANG AND G. H. BISSINGER. *Rept. of Committee on Cane Varieties, Diseases and Fertilizers for the 6th Annual Convention of the Philippine*

Sugar Assocn., Manila 1928, 119-20.—A consistent response from the application of 2 tons of CaSO_4 per hectare has been obtained with heavy clay loam at the Laguna district, although a still better yield was obtained when this was supplemented with 250 kg. $(\text{NH}_4)_2\text{SO}_4$ per hectare. The effect of the CaSO_4 is to correct the phys. structure of the soil through base replacement.

V. G. LAVA

Formosan agriculture in 1928; some observations made during a short visit. ROBERT L. PENDLETON. *Rept. of Committee on Cane Varieties, Diseases and Fertilizers or the 6th Annual Convention, of the Philippine Sugar Assocn., Manila 1928*, 121-6.—Formosan agricultural conditions are largely similar to those of the Philippines; Formosa with $\frac{1}{10}$ the area and $\frac{1}{2}$ the population, produces nearly as much sugar as the entire Philippines. A table of sugar cane and sugar production is presented. The Formosan Govt. generously supports agricultural research.

V. G. LAVA

Comparing various quantities of mixture of ammophos and ammonium sulfate plus filler to make a 10-10 formula (10% nitrogen and 10% phosphoric acid). C. L. LOCSIN, F. TABHAN AND E. PUNZALAN. *Rept. of the Committee on Cane Varieties, Diseases and Fertilizers for the Sixth Annual Convention of the Philippine Sugar Assocn., Manila 1928*, 83-6.—The expts. were carried out in Negros red clay soil, which is rich in org. matter, high in Fe_2O_3 and Al_2O_3 , fairly well supplied with available K_2O , fairly normal in N, although deficient in available P_2O_5 . The p_H of the soil is 6.3, while the lime requirement to neutralize a foot depth is 7.3 tons of $\text{Ca}(\text{OH})_2$. Data and graphs are given to show the relation between value of fertilizer applied and yield per hectare. It is concluded that under present conditions it is not advisable to apply more than 50 kg. of N per hectare, accompanied by as much P_2O_5 , or 300 kg. of ammophos. Testing various quantities of ammophos 20-20 (or 16.5% nitrogen and 20% phosphoric acid). CARLOS L. LOCSIN. *Ibid* 86-9.—This expt. is similar to the preceding one; the P_2O_5 content of the fertilizer was made higher than the N. The soil, was similar to that in the preceding expt., but the p_H was lower (5.9), and the lime requirement was 15.1 tons. Although the total K_2O (sol. in strong acid = 0.149%) was lower than the generally recognized limit below which K_2O fertilization is necessary, the available K_2O (sol. in 1% citric acid = 0.0258%) was fairly high. This fact together with the high porosity of the soil indicates the need for K_2O fertilizer in the near future. It is concluded from the data and the graphs that it is not profitable to fertilize with over 250 to 300 kg. of ammophos per hectare. The quantity of N being the same, an increase in P_2O_5 seems to increase the yield, probably on account of the abnormally low P_2O_5 content of the soil. The cane, cut when 12 months old, gave a purity as high as that of greater age but grown in soil of less P_2O_5 content, thus showing that maturity of the cane depends upon P_2O_5 sufficiency for at least one of the factors.

V. G. LAVA

History and technic of the superphosphate industry. ANON. *Superphosphate* 1, 93-100, 109-14, 141-5, 157-66(1928).—This is an interesting account of the early manuf. and history of superphosphate, with special reference to the work of Gilbert, Lawes and Liebig.

K. D. JACOB

Comparative pot experiments with superphosphate, Reform phosphate, Plutophos, Moorphos and two Polish raw phosphates. C. DREYSPRING AND C. KRÜGEL. *Superphosphate* 1, 62-72, 77-90(1928).—Pot expts. on oats and barley were carried out with superphosphate, Reform phosphate, Plutophos, Moorphos—ground Algerian raw phosphate rock, and 2 Polish ground raw phosphates, in a slightly sandy soil and a lowland moor soil, both poor in P_2O_5 . Superphosphate was the only one of the P_2O_5 fertilizers which gave an increase in grain and straw of oats grown on lowland moor soil. With barley on sandy loam soil, the relative yields were—superphosphate 100, Polish raw phosphate (B) 35, Moorphos 25, Reform phosphate and Polish raw phosphate (A) 15, and Plutophos 10. There was a close relation between the yield and the quantity of P_2O_5 assimilated by the plants from the different phosphates. When superphosphate was used the grain contained the highest percentages of P_2O_5 , while with the other phosphates the stalks contained the largest percentages. This was apparently due to the slow rate of assimilation of the less readily sol. phosphates and to the greater time required for the dissolved phosphate to circulate through the plant to the grain. Plants receiving superphosphate ripened 15 to 20 days earlier than those fertilized with the other phosphates.

K. D. JACOB

Effect on soil reaction of nitrogenous fertilizers under the anaerobic conditions of rice production. R. P. BARTHOLOMEW. *Ark. Agr. Expt. Sta. J. Am. Soc. Agron.* 20, 1305-13(1928).—The nitrogenous fertilizers may be divided according to their effect on the H-ion concn. into 3 groups. (a) acid-producing, (b) alk.-producing, and (c) those having practically no effect on the H-ion concn. The groups arranged in order of largest to smallest change are as follows: (a) acid-producing, $(\text{NH}_4)_2\text{SO}_4$, *Leucaena* mulberry,

Ammophos, and urea; (b) *alk.-producing*, NaNO_3 , $\text{Ca}(\text{NO}_3)_2$, and Ca cyanamide; and (c) *practically no change*, cottonseed meal and blood meal. Changes in H-ion concn. due to applications of $(\text{NH}_4)_2\text{SO}_4$, Ammophos, Leuna saltpeter, $\text{Ca}(\text{NO}_3)_2$, NaNO_3 , and Ca cyanamide greatly affected plant growth. The decrease in H-ion concn. caused by the latter was more harmful than the increase caused by the first 3, even though the increases were from 2 to 3 times greater than the decreases. Failure to control changes in H-ion concn. in studies concerning the availability of nitrogenous fertilizers may lead to erroneous interpretations of the results. The changes in H-ion concn. under the conditions studied were due largely to assimilation of the N by plants and bacteria. Some of the change may have been due to the liberation of elemental N by denitrifying bacteria.

E. F. SNYDER

A method of increasing the fertilizing value of mahua cake. N. D. VYAS. Agr. Research Inst., Pusa. *Bull.* 176, 12(1928).—Mahua cake is the residue obtained in the extn. of fat from the seeds of *Bassia latifolia*, *B. longifolia*, and *B. butyracea*. The air-dry material contains approx. 8% H_2O , 2.57% N, and 0.9% P_2O_5 but has a low fertilizer value because of its resistance to the action of soil microorganisms. When a mixt. of mahua cake 100, soil 25, charcoal 5, and H_2O , 65–70 parts is composted for 3 months, with an occasional sprinkling with H_2O , the greater portion of the N is rendered susceptible to attack by nitrifying and ammonifying bacteria. About 23% of the total N is converted into NH_3 during the composting process.

K. D. JACOB

Notes on liming experiments in Berkshire, Dorset, Hampshire and Oxford. H. H. NICHOLSON. Reading Univ. *Agr. Progress* 5, 60–2(1928).— CaCO_3 applied to loamy soils at the rate of 0.5 to 3 tons per acre seemed to disappear at the av. rate of 0.5 tons per acre per year.

K. D. JACOB

Liming tests in Luzon. MANUEL L. ROXAS. *Rept. of Committee on Cane Varieties, Diseases and Fertilizers for the 6th Annual Convention of the Philippine Sugar Assocn., Manila 1928*, 114–8.—It is suggested that a possible explanation for the lack of response to liming lies in the improper way of conducting the expt. The method of liming followed should be that proposed by O. Arrhenius of the Java Sugar Expt. Sta. This consists in first detg. the lime requirement of the soil in the exptl. field, adding this quantity to the soil and allowing the soil reaction to reach equil., adding more and more lime, if necessary, until the p_H of the soil after equil. becomes about 7.

V. G. LAVA

Magnesium and calcium chlorates as substitutes for sodium chlorate for killing field bindweed. Note. W. L. LATSHAW AND J. W. ZAHNLEY. Kansas Agr. Expt. Sta. *J. Am. Soc. Agron.* 20, 1328(1928); cf. *C. A.* 22, 3014.— $\text{Mg}(\text{ClO}_3)_2$ and $\text{Ca}(\text{ClO}_3)_2$ may be used as substitutes for NaClO_3 in the control of field bindweed. Expts. conducted during the past yr. suggest that these chemicals are as effective as NaClO_3 and that they have certain advantages.

E. F. SNYDER

Spraying for woolly aphid. The addition of miscible oil to summer tobacco sprays. A. R. WOODHILL. *Agr. Gaz. N. S. Wales* 39, 613–4(1928).—The results indicated that no advantage is gained by adding small quantities of miscible oil to tobacco sprays for control of woolly aphid on fruit trees, and that if a greater quantity than 2 pints per 100 gallons of spray is added burning of the foliage may result.

K. D. JACOB

A micro-technic for observing oil penetration in citrus leaves after spraying. HUGH KNIGHT. *Science* 68, 572(1928).

E. H.

Spring and autumn spraying for red scale of citrus. A. R. WOODHILL. *Agr. Gaz. N. S. Wales* 39, 561(1928).—Autumn spraying with miscible oil gave a 95% kill of red scale on citrus trees, while spring spraying gave a kill of 65%. To avoid injury to the trees, spring spraying should be done before the young shoots appear.

K. D. J.

Feeding copper carbonate-treated wheat to poultry. E. HADLINGTON. *Agr. Gaz. N. S. Wales* 39, 660(1928).—A pen of poultry was fed for about 3 months solely on wheat which had been treated with CuCO_3 for control of bunt. No ill effects were noted.

K. D. JACOB

Some aspects of the sugar-beet problem (LING) 28. Physiological studies on cellulose fermentation (SANBORN) 11C. Emulsifiable oil (for preparing sprays for fruit trees or sheep dips) (U. S. pat. 1,695,197) 22. Disinfectants (Ger. pat. 467,265) 17. Emulsions, paints, insecticides, waterproofing compositions (Brit. pat. 289,122) 18. Double salt—fertilizers (Fr. pat. 639,648) 18. Dyes and insecticides (Brit. pat. 288,307) 25.

Method of testing the character of subsoil electromagnetically. MAX MASON. U. S. 1,692,849, Nov. 27.

Fertilizer. GEORGE BARSKY and FREDERICK W. FREISE (to American Cyanamid Co.). U. S. 1,695,081, Dec. 11. The proteins of nitrogenous org. waste such as leather scrap, fish scrap, etc., are combined with free cyanamide in the presence of H_2SO_4 .

Fertilizer. R. C. FLUCK and A. THIEL. Brit. 289,284, July 1, 1927. Fecal matter from pit or cask systems or sewers is treated with peat or lignite to remove the solid matter and the sepd. liquid is treated with lime, an Fe salt or other reagent which will ppt. nitrogenous and phosphatic matter as a mud. The fecal matter may be initially treated to drive off NH_3 , which may be recovered as $(\text{NH}_4)_2\text{SO}_4$, and the latter may be added to the fertilizer.

Fertilizers. AGRICULTURAL DEVELOPMENTS COMPANY (PYRFORD), LTD. Ger. 467,850, Apr. 20, 1924. A fermentable material such as straw and an insol. or difficultly sol. compd. of N are kept in a wet state under aerobic conditions to allow free development of NH_3 -assimilating organisms. CaCN_2 or stable refuse may be used as the N compd. and phosphates and CaCO_3 may be added.

Mushroom bed. RICHARD H. MORRIS, 3RD. U. S. 1,694,482, Dec. 11. A compost bed comprises fertilizing material together with fibrous peat and material such as HgCl_2 , CH_2O or a phenolic compd. which is toxic to mushroom-disease germs.

Insecticides. Sheep dips. JAMES BADDLEY and ERNEST CHAPMAN (to The British Dyestuffs Corporation, Ltd.), Can. 284,215, Oct. 23, 1928. The addn. either to the powd. insecticide or to its soln. of 0.1 to 1.0% by wt. of a product prepd. by the sulfonation of a mineral-oil fraction, with or without subsequent condensation with an alc., preferably isopropyl alc., will cause the aq. suspension to wet and penetrate the fleece. A similar addn. to insecticides for use in sprays results in the immediate wetting of the leaves.

Insecticides, fungicides and disinfectants. V. CASABURI. Brit. 289,498, Nov. 24, 1926. Hemicelluloses obtained from locust-tree beans are used in various mixts. for treating plants together with metal salts or other insecticides, fungicides, fertilizing ingredients, etc.

Colloidal fungicidal sulfur composition. HENRY W. BANKS, 3RD (to Loomis, Stump and Banks). Can. 284,411, Oct. 30, 1928. Finely powd. bentonite and finely powd. S are mixed and then heated to 125–140° until the mass is sintered and becomes substantially uniform in color. On cooling, a friable material results which can be ground to a powder. If it is desired to use the S in finely dispersed form in an aq. soln., water may be added to the material and used as a fungicidal spray. The proportions of bentonite and S may be varied from 25 lb. of each, or 15 lb. of S to 25 lb. of bentonite, or an excess of S 25 lbs. to 15 lb. of bentonite, depending on the final material desired.

Insect lime. ARTHUR BIDDLE (to The United Products Corp. of America). Can. 284,093, Oct. 16, 1928. Trunks of trees or shrubs may be girdled with a compn. contg. rubber latex 2 parts, cottonseed oil $\frac{1}{2}$ part and sulfonated castor oil 3 parts by wt. A compn. suitable for application to paper consists of rubber latex (approx. 35% rubber content) 1 part, fish oil $\frac{1}{2}$ part, petroleum oil 15 parts, rosin $\frac{1}{2}$ part, and molasses (or other sweetening) 1 part by wt.

Plant disinfectant containing metallic copper in a state of extremely fine subdivision. RUDOLF ZELLMANN and DIETRICH LAMMERING (to Chemische Fabrik von Heyden). U. S. 1,694,497, Dec. 11. A compn. suitable for treating seeds contains Cu in pptd. form on a carrier such as coal, charcoal, silica gel, infusorial earth or talcum.

Neutralization of hydrocyanic acid. SOCIÉTÉ FRANÇAISE D'EXPLOITATION DES PROCÉDÉS SANSONE. Fr. 639,085, Aug. 1, 1927. HCN gas used for the destruction of insects, etc. is neutralized by CH_2O gas produced by a soln. of KMnO_4 on formalin.

Parasiticide. HENRY W. BANKS (to Loomis, Stump and Banks). Can. 284,410, Oct. 30, 1928. Bentonite is utilized as a carrier for active parasitic poisons (i. e.) salts of the toxic metals such as Cu, Ni, Hg, Ag and Zn; arsenates such as those of Pb and Ca; nicotine compds. such as the sulfate; certain org. mercurials and arsenicals; hydrocarbon oils; cyanide soaps; creosote and the like. E. g., ordinary oven-dried bentonite is mixed with sufficient 10% AgNO_3 soln. to form a smooth paste and the mixt. stirred until the ingredients are uniformly mixed. An excess of concd. alk. CH_2O soln. is now stirred into the paste and allowed to stand and the mixt. dried at a temp. above 100°. The resulting friable mass is ground to form a powder or paste suitable for dusting on plants, or it may be taken up in water to form a colloidal soln. of the reduced Ag, which is suitable for a plant spray.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

The mechanism of alcoholic fermentation. A. LEBEDEV. Univ. Moscow. *Biochem. Z.* 200, 149-51(1928).—Polemical. S. MORGULIS

Maderia. F. DE CASTELLA. *J. Dept. Agr. Victoria* 26, 577-87(1928).—This paper discusses the manuf. and properties of Maderia wines. K. D. JACOB

Estimation of fructose and glucose in sweet wines. F. LUCIUS. Hamburg. *Pharm. Zentralhalle* 69, 725-7(1928).—A general procedure is outlined for detg. these 2 ingredients of sweet wines in connection with the results obtained in the examn. of some 15 different brands. W. O. E.

Economical vinegar production in a plant of moderate capacity. I. B. LAWYER. *Food Products J. and A. n. Vinegar Ind.* 8, No. 2, 9-11; No. 3, 16-18; No. 4, 20-1(1928).—This article is especially prep'd. for those who are seeking authentic information regarding the establishment and operation of small vinegar plants. Complete description of the methods used in starting vinegar generators, of pasteurization and filtration of vinegar, etc., is given. J. A. KENNEDY

Leaf filter for wine (Brit. pat. 288,920) 1.

CRAWFORD, STUART L., AND WARD, J. M. The Interpretation of Cider Vinegar Analyses. With proposed method for the detection of evaporated apple-products vinegar. Rochester, N. Y.: Am. Cider Vinegar Manufacturers' Assoc. 60 pp.

SCHOEN, M.: The Problem of Fermentation. Translated by H. Lloyd Hind. London: Chapman & Hall. 211 pp. 21 s. Reviewed in *Chem. News* 137, 349(1928).

Absolute alcohol. DISTILLERIES DES DEUX-SEVRES. Brit. 289,051, April 21, 1927. In a 3-stage process including (a) distg. a fermented mash, (b) rectifying the alc. obtained, and then (c) dehydrating the alc. by the "azeotropic method," economy of steam is effected by conducting the first stage under pressure and thus raising the temp. of the alc. vapors so that they supply the heat for the remaining stages. An app. is described.

Potassium salts, betaine hydrochloride and glutamic acid from residues of alcohol production from beet molasses. Y. TAKAYAMA. Brit. 288,390, Jan. 22, 1927. The waste liquor remaining after distn. in producing alc. from beet molasses is dialyzed to remove yeast and uncrystallizable substances and, after concn., HCl or H₂SO₄ is added to obtain KCl or K₂SO₄, and by further concn. betaine-HCl seps. HCl in excess is added to the remaining liquor and it is then heated under pressure to convert glutimic acid into glutamic acid-HCl and to remove impurities in the form of a humus-like material. By cong. and cooling glutamic acid-HCl crystallizes. An app. is described in which an elec. current may be used to promote dialysis.

Fermentation of wort. ALFRED LEBBE. Fr. 639,512, Aug. 13, 1927. The height of the fermenting mass is reduced and is made proportional to the d.

Tartaric salts. SOCIÉTÉ RAYNAUD FRÈRES. Fr. 639,573, Aug. 16, 1927. Tartaric salts are recovered from wine lees by adding 2 to 5% HCl, which renders the pectins insol., and filtering.

Cooling and drying yeast. ELMER B. BROWN (to The Fleischmann Co.). U. S. 1,694,807, Dec. 11. A current of air (suitably having a temp. of about 15° and contg. approx. 1.25 grains of moisture per cu. ft.) is passed through a thick comminuted mass of moist yeast (e. g., at a rate which may approx. 2 cu. ft. per min. per lb. of yeast). An app. is described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Fluidextracts. II. Fluidextract of *Hydrastis canadensis*. A. ALBANESE AND A. PEDRONI. *Ann. chim. applicata* 18, 429-46(1928).—A review of the extn. processes as recommended by the Pharmacopeias of Italy, France, U. S., England and Germany. The following alkaloids were identified in *Hydrastis canadensis*, and their characteristic reactions are given. Hydrastine, + H₂SO₄ = violet coloration, + MnO₂ = orange, + K₂CrO₄ = red; with Fröhde reagent, green to brown; KMnO₄ added to the acid soln.

gives blue fluorescence; $(\text{NO}_3)_2\text{C}_6\text{H}_5\text{OR}$ gives distinctive ppt. Hydrastineine, $+\text{HNO}_3$ = yellow-orange coloration, $+\text{H}_2\text{SO}_4$ = maroon; solns. of the esters give slight bluish fluorescence, gives distinctive ppt. with $(\text{NO}_3)_2\text{C}_6\text{H}_5\text{OR}$. Berberine, $+\text{HNO}_3$ = olive-green to red-brown coloration; H_2SO_4 = olive green; Fröhde reagents green to brown; NH_3 = brown color; Cl water and Br water = red coloration; distinctive ppts. obtained with Bouchardat reagent, other with $\text{NO}_3\text{C}_6\text{H}_4\text{OH}$ acetone, and CHCl_3 . Canadine, $+\text{HNO}_3$ = red color with effervescence; $+\text{H}_2\text{SO}_4$ = yellow, then wine-red; Fröhde reagent, violet to greenish brown. A. W. CONTIERI

The disinfection of tuberculous excretion with Caral, T. B. Bacillol and chloramin Heyden. E. BERGIN. *Z. Tuberk.* 49, 355-60(1928).—Chloramine Heyden and T. B. Bacillol proved about equal in value as disinfecting agents for tuberculous excretions. Caral proved less valuable and is not recommended for this purpose. H. J. CORPER

Microchemical reactions of homatropine. M. WAGENAAR. *Pharm. Weekblad* 65, 1213-6(1928).—Of the 5 reactions tested, whereby cryst. salts of homatropine are pptd. the most sensitive is that with Eder's reagent (Br , KBr , H_2O , 1:2:20) which gives a positive reaction when the concn. of alkaloid is 1:1000. The reaction with $\text{KI} + \text{I}$ is about half as delicate, then in decreasing order the pptn. as chloroaurate, picrate and picrolonate. Sublimation gives fine drops of liquid which cannot be crystd. Pptn. as free base by addn. of alkali or alkali carbonate to solns. of the alkaloid salts gives a milky emulsion from which no crystals can be obtained. A. W. DOX

Microchemical reactions of scopolamine. M. WAGENAAR. *Pharm. Weekblad* 65, 1226-7(1928).—Observations are reported on the sublimation, pptn. of free base, and reactions of scopolamine with AuCl_3 and with $\text{KBr} + \text{Br}$. The last reaction is considered the most useful and characteristic for purposes of identification. A. W. DOX

The color of some recent medicinal dyes (tryptaflavine, rivanol, iodtetragnost, mercurochrome 220) at various hydrogen-ion concentration. H. W. VAN URK. *Pharm. Weekblad* 65, 1227-30(1928).—Slight variations in color shades of solns. of each of the 4 dyes at p_H values between 1 and 12 are pointed out. A. W. DOX

Inventions and patents in pharmaceutical and related fields. J. J. L. ZWIKKER. *Pharm. Weekblad* 65, 1230-4(1928); cf. *C. A.* 22, 843.—A discussion of the physiol. action of the glucosides obtained from *Adonis vernalis*, and the methods of extn. according to Dutch patents 35,689 and 39,405. A. W. DOX

Bosamin preparations. C. A. ROJAHN. *Univ. Halle. Apoth. Ztg.* 43, 1452-3(1928).—A series of 4 different preps. for the treatment of asthma was examd. with the following results: (1) Tablets (*Luft für Asthmatiker*) consisted essentially of NaHCO_3 , Na_2CO_3 and talc. (2) Radioactive salts, a sandy powder contg. S , NaCl , MgSO_4 , Na_2HPO_4 , Ca silicate and uranium ore (radioactivity in 1 g. of the sample = 5×10^{-10} g. Ra). (3) Tablets, consisting essentially of lactose with 10% talc. and possible homeopathic medication. (4) Liquid, essentially an alc. soln. or oleum valerianae. W. O. E.

Stability of morphine in aqueous solution, especially during sterilization. C. STICH. *Pharm. Ztg.* 73, 1513(1928).—From an earlier study of this question by Schäfer and Stich with reference to the behavior of morphine solns. (characteristic absorption spectra in ultra-violet light), it is concluded that for all practical purposes all such solns. fall into the thermostable category with respect to their behavior in the ultra spectrum. W. O. E.

Volume and refraction relationship in pharmaceutical tinctures. F. WRATSKO. *Pharm. Presse* 33, 369-72(1928).—An address delivered in Hamburg at the convention German natural philosophers and physicians in 1928. W. O. E.

Carvacrol. ALFRED WAGNER. *Pharm. Zentralhalle* 69, 757-63, 773-7(1928).—The history, constitution, occurrence, formation, isolation, properties, behavior, detection and estn. are discussed at some length, and the following method of estn. is outlined: Shake the sample with an equal vol. of petr. ether *via* Kremers and Schreiner, and with 5% KOH soln. until no further decrease in vol. occurs, add a slight excess of 0.1 N I soln., filter off the pptd. iodocarcacrol, and titrate the I excess with thiosulfate after acidification. One mol. carvacrol requires 4 mol. I for pptn. W. O. E.

Preparation and testing of pepsin wine. W. BRANDRUP. *Apoth. Ztg.* 43, 1471-3(1928). W. O. E.

Manufacture of argentum proteinicum, argentum colloidal and other organic silver preparations. JULIUS SCHWYZER. *Pharm. Ztg.* 73, 1549-53, 1568-70(1928).—Definitions are given and discussed, lab. expts. described, and detailed procedures for *en gros* production given. W. O. E.

Medinal and diethylbarbituric acid. WOLTER. *Pharm. Ztg.* 73, 1463(1928).—

Attention is directed to the erroneous soly. values as stated in the Ger. Pharmacopeia for these two drugs. W. O. E.

Cera flava. BOHRISCH. *Pharm. Ztg.* 73, 1478-80(1928).—A discussion of the official Ger. prepn. with especial reference to methods for its evaluation. W. O. E.

Characterization of official salves. L. ROSENTHALER. Univ. Bern. *Pharm. Ztg.* 73, 1480-1(1928).—Some 17 preps. are discussed in connection with the results obtained in the examn. of 10 different samples. W. O. E.

Tincture hemostatica. WALTER MEYER. *Pharm. Ztg.* 73, 1481-2(1928).—A commentary on the *ergot* prepn. official in the Ger. Apothecary Assoc. (D. Ap.-V. 4). W. O. E.

Mar-Ko tablets. C. A. ROJAHN AND MAX HERTER. Univ. Halle. *Apoth. Ztg.* 43, 1410(1928).—A laxative prepn. contg. per tablet 0.17 to 0.22 g. phenolphthalein and talc. 10% in addn. tr lactose and starch. W. O. E.

Two phloroglucide drugs. W. PEYER AND W. LIEBISCH. *Apoth. Ztg.* 43, 1422-4(1928).—An address dealing with the African drugs *Albizzia anthelminthica* Brongn and *Combretum raimbaultii* Heck. Examn.; of these two drugs yielded the following values, resp.: mineral constituents 10.5, 6.5; insol. in 10% HCl 2.2, 1.7%; H₂O ext. 12.0, 12.5; Et₂O ext. 0.6, 5.0; petr. ether ext. 0.1, 5.5; alc. ext. 2.5, 19.5; CHCl₃ ext. 0.8, 7.5; saponin, 8.2, 2.25; tannin, —, 6.25%. W. O. E.

Essential oil of Agathosma microphylla. JAMES L. B. SMITH AND KENNETH A. C. ELLIOTT. *Trans. Roy. Soc. S. Africa* 17, 23-7(1928).—Chief among the herbal remedies employed by the natives of S. Africa are the various plants designated as "Buchu." *Agathosma microphylla* or "Stembok buchu" is a short, stunted shrub giving off a strong aniseed-like odor. The oil content of the air-dried leaves is subject to seasonal variation, the summer product contg. 2 to 3%, while winter samples yield up to 5% of volatile oil. The latter is levorotatory and has $\alpha_D^{20} = -12' 10''$, $d_{20} 0.920$, $n_D^{20} 1.499$. Its chief constituent is methylchavicol, about 50%; it contains in addn. a terpene hydrocarbon (probably myrcene) 3%, alcs. (in part *l*-linalool), esters 4%, eugenol about 1%. W. O. E.

Labeling galenical preparations. RICHARD BRIEGER. *Pharm. Ztg.* 73, 1531-2(1928).—A critical discussion of the present methods of indicating the strength of such preps., with some suggestions for an only too apparently needed reform. W. O. E.

Biochemical studies of the North American Sarraceniaceae. The use of the genus Sarracenia in medicine: A review. JOSEPH S. HEPBURN. *Am. J. Pharm.* 100, 675-84(1928).—A review and summary of the literature on the use of these plants in medicine. A bibliography is appended. W. G. GAESSLER

The story of gum benzoin. G. H. A. MASSELMAN. *Aromatics* 9, No. 10, 32-7(1928). I. H.

Solubility of iodine in ethyl alcohol. MARCEL DELÉPINE AND MAURICE ARQUET. *Bull. sci. pharmacol.* 35, 625-31(1928).—Previous work was reviewed and a redetn. of the soly. of I in EtOH was made with great care. At 15° 100 g. of 85° alc. dissolved 6.95 g. of I, 90° alc. 9.65 g., 95° alc. 14.3 g. and 99.8° alc. 23.0 g. At 24.5° the corresponding wts. of I dissolved were 8.65, 11.3, 17.4 and 26.6 g. These results are discussed with reference to the requirements of several European pharmacopeias. L. W. RIGGS

Determination of the total alkaloids in cinchona bark. R. DUBREUIL. *Bull. sci. pharmacol.* 35, 635-42(1928).—An ext. of the bark made by a mixt. of CHCl₃ and Et₂O, after many treatments was finally titrated with standard KI-KIO₃ and Na₂S₂O₃. L. W. RIGGS

The clove; the future of its production in Madagascar. EM. PERROT. *Bull. sci. pharmacol.* 35, 667-72(1928).—The production of cloves, essence of cloves and of vanilla in Madagascar and other French dependencies is discussed from an economic point of view. L. W. RIGGS

Trioxymethylene sulfite and the preparation of diphtheria anatoxin. A. CH. HOLLAND AND (MLLE) J. PENN. *Compt. rend. soc. biol.* 99, 1196-7(1928).—In place of using HCHO or other aldehydes in the prepn. of the anatoxin, a mixt. of 10 g. of trioxymethylene in 100 cc. of water and 6 cc. of a 5% Na₂SO₃ soln. was employed. L. W. R.

Iodine content of thyroid glands of Uruguayan cattle. A. E. GOSLINO AND M. I. FERRO. *Compt. rend. soc. biol.* 99, 1446-8(1928).—The I content, detd. by the method of Fabre and Penau (cf. C. A. 17, 2032), ranged from 0.35 to 0.52% of the desiccated gland with the lipoids removed. In females the I content of the thyroid was about the same as in castrated males. No seasonal effect on the percentage of I in the thyroid was detected. It is proposed for pharmaceutical preps. of beef thyroid, that 0.40 g. of I per 100 g. of desiccated ether extd. gland be taken as a basis. L. W. RIGGS

Recent results in the chemistry of alkaloids (SPÄTH) 10. Electric discharge tubes (for therapeutic purposes) (Brit. pat. 289,326) 1. Compounds of indene and phenols (with disinfectant and therapeutic properties) (Fr. pat. 636,606) 10. Javelle water (U. S. pat. 1,694,711) 18. Freezing organic liquids (Brit. pat. 288,310) 13.

ZANDER, H. H.: *Weltproduktion und Welthandel von ätherischen Ölen und die wirtschaftliche Entwicklung ihrer Industrie*. Berlin: Verlag Chemie G. m. b. H. 381 pp. Unbound, M. 15. Reviewed in *Chem. Trade J.* 83, 395(1928).

Pharmaceutical products. WERNER SCHULEMANN, FRITZ SCHÖNHOFER and AUGUST WINGLER (to the Winthrop Chemical Co. Inc.). Can. 284,097, Oct. 16, 1928. Pharmaceutical products of the quinoline, di- and tri-arylmethane, azine, oxazine, thiazine acridine, and xanthene series are manufd. by converting amino derivs. of these classes of compds. into more strongly basic polyamino derivs., in which the newly introduced nitrogen atoms are in heterocyclic combination, or conversely by converting amino derivs. of suitable intermediate products for the manuf. of these classes of compds. into polyamino derivs. of the kind mentioned and subsequently transforming the latter into compds. of the desired classes. *E. g.*, 174 parts of 6-methoxy-8-aminoquinoline melted with 287 parts of 2-dimethylaminocyclohexyl bromide hydrobromide at 140–150° for 8 hrs. with stirring gives 8-(2-dimethylaminocyclohexylamino)-6-methoxyquinoline, a light yellow oil, solidifies to a glassy mass, *b*₁ 192–5°. The *hydrochloride* is easily sol. in water. 6-Methoxy-8-aminoquinoline (174 parts) melted with 305 parts of 4-bromo-1, 2, 2, 6, 6-pentamethylpiperidine-HBr at 160–70° for 12 hrs. with stirring gives 8-(1, 2, 2, 6, 6-pentamethyl-4-piperidylamino)-6-methoxyquinoline, a light yellow oil, *b*₁ 215–8°. The *hydrochloride* is easily sol. in water.

Coatings for pills and pastilles. S. HERMANN and PHARMACEUTISCHE WERKE NORGINE A.-G. Brit. 288,542, April 11, 1927. In making pills or pastilles as described in Brit. 285,091 (C. A. 22, 4725) the mixt. of stearic acid and other fatty acids is replaced by any single fatty acid or by a mixt. of fatty acids the m. p. of which is lower than that of stearic acid. Palmitic acid, mixed fatty acids from coconut oil or mixts. of palmitic acid with lauric acid or coconut oil acids may be used.

Basic therapeutic solutions of quinine. ARTHUR LIEBRECHT (to the Firm Chemisch-Pharmazeutische A.-G. Bad Homburg). U. S. 1,692,900, Nov. 27. Phenyl-dimethyl-pyrazolone is used in prepg. aq. solns. of quinine base, which also may contain quinine salts such as the hydrochloride or formate.

Therapeutic vanadium compounds. HANS HAHN and WALTER KROPP (to Winthrop Chemical Co.). U. S. 1,695,147, Dec. 11. Anti-syphilitic salts are formed of bases such as Mg or Na combined with salicylic, tartaric, thioglycolic or mandelic compds. or other suitable quadrivalent vanadyl carboxylate.

Amino aromatic esters (anesthetics). EDUARD RITSERT. U. S. 1,692,224, Nov. 20. An aromatic amino carboxylic acid ester such as Et *p*-aminobenzoate hydrochloride is combined with Na diiodo-*p*-phenolsulfonate or other suitable compd. contg. a halogenated non-aliphatic sulfo acid radical, in order to form a product of strong antiseptic and anesthetic properties.

Borates of anesthetic bases. WILLIAM J. POPE (to British Drug Houses, Ltd.). U. S. 1,692,695, Nov. 20. Compds. of anesthetic bases such as "ethocaine," butyn, cocaine or amylocaine are formed with about 5 mol. proportions of H₂BO₃, which in soln. have a high local anesthetic effect. U. S. 1,692,696 relates to benzamine borate which may be similarly formed. U. S. 1,692,697 specifies the production of benzamine borate by reaction between benzamine sulfate and Ba borate in a liquid medium. U. S. 1,692,698 specifies producing borates of anesthetic bases such as "ethocaine," amydrine, cocaine or amylocaine by reaction between their sulfates and Ba borate in a liquid vehicle.

Therapeutic phenol aminoalkyl ethers. I. G. FARBERIND. A.-G. Brit. 288,555, April 11, 1927. A phenol contg. an unsatd. alkyl group in the *p*-position to the OH group in which both *o*-positions are occupied is treated with a dialkylaminoalkyl halide in the presence of an alk. agent or may be treated with an alkylene dihalide and the monohalogenated product then combined with an alkylamine; *e. g.*, 4-allyl-2,6-dimethoxy-1-phenol is heated with diethylaminoethyl chloride in alc. to which Na has been added, to obtain the diethylaminoethyl ether of 4-allyl-2,6-dimethoxy-1-phenol.

Mercury derivatives of sulfonefluorescein. EDWIN C. WHITE. U. S. 1,692,237, Nov. 20. Compds. which are strongly germicidal are formed by the action of a Hg salt such as $\text{Hg}(\text{OAc})_2$ on a salt of a halogenated sulfonefluorescein such as the dibromo salt.

Soluble trypanocidal complex organic antimony compounds. I. G. FARBERMIND. A.-G. Brit. 288,870, Jan 7, 1927. Complex Sb compds. are made by treating an antimonyl compd. of an *o*-dihydroxyaryl compd. with a neutral salt of an *o*-dihydroxyaryl carboxylic or sulfonic acid in approx. equimol. proportions; *e. g.*, Na gallate is caused to react with antimonyl pyrocatechol- or Na pyrocatecholdisulfonate with antimonyl pyrocatechol. Compds. of galloicarboxylic acid and 2,3-dihydroxynaphthalenedisulfonic acid are also mentioned.

Pyridine derivatives. C. RÄTH (to Schering-Kahlbaum A.-G.). Brit. 288,629, April 14, 1927. Halo-pyridines contg. a further substituent such as nitro, carboxy or additional halogen are made by treating the corresponding *N*-alkyl or aryl-oxypyridine with a halogenating agent with or without a solvent. The products may be used as or in making therapeutic agents. 2-Chloro-5-nitropyridine is made by heating *N*-methyl-2-oxo-5-nitropyridine with PCl_5 or with gaseous phosgene or with phosgene dissolved in toluene. Thionyl chloride also may be used as halogenating agent in similar processes.

Vaccines. GEORG SCHRÖDER. Swiss 126,676, Nov. 10, 1926. Antituberculosis vaccines are recovered from glandular organs for use as prophylactics or medicants. The discharge from such organs is frozen, then melted and filtered.

Tuberculin. IGNAZ SCHILLER. Ger. 467,246, Feb. 13, 1925. Tubercle bacilli are introduced into water contg. living yeast cells. After the digestion of the cells, the bacilli develop as clouds on the surface of the water, and are collected and made into tuberculin in the usual way.

Tuberculosis pseudoglobulin. ELEKTRO-OSMOSE A.-G. Swiss 126,302, Jan. 7, 1926. Blood serum or exudations, etc., from tuberculous patients is treated to sep. euglobulin, etc., the soln. is electroosmotically purified and filtered, and the pseudoglobulin is pptd. from the filtrate by treatment with neutral salts. The ppt. may be dissolved in water and electroosmotically purified.

Extracting vitamins from liver. BRITISH DRUG HOUSES, LTD., and F. H. CARR. Brit. 289,187, Feb. 7, 1927. An ext. suitable for pharmaceutical or food purposes is prepd. by extg. livers such as lamb or ox livers with an animal, vegetable or mineral oil such as paraffin oil, lard, linseed oil or arachis oil.

A product containing hormones. CHEMISCHE FABRIK AUF ACTIEN VORM E. SCHERING. Swiss 126,304, Oct. 12, 1926. Comminuted and dried glands such as ovaries, corpus luteum, follicles, placenta and testicles are extd. in the usual manner, *e. g.*, with acetone, the ext. is sapond. with alc. NaOH or KOH, the unsapond. portion is extd. with a solvent such as Et_2O , and the Et_2O soln. is distd. to leave a hormone-contg. product.

Medicinal product from internal female secretory organs. WERNER MERKI (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,692,509, Nov. 20. Fresh organs such as ovaries or placenta are cooled to such a low temp. that they become hard and are then pulverized and the powd. material is extd. with a suitable solvent such as ether.

Therapeutic dyes. CHEMISCHE FABRIK VORM. SANDOZ. Swiss 126,504, Jan. 15, 1927. Na cholate on a dye produced by an alk. coupling of tetrazotized benzidine with 1,8-aminonaphthol-3,6-disulfonic acid. The substance is gray-blue powder giving a blue-violet aq. soln. It is toxic to blood parasites.

Dental powder. FRANCIS M. LINDERSMITH. Can. 284,158, Oct. 23, 1928. A dental powder contains tobacco ash 70, NaCl 5, soda 15 and alum 10% by wt.

Disinfectants. ADOLF ABRAHAM'S LABORATORIUM. Ger. 467,245, Mar. 9, 1924. See Brit. 281,530 (C. A. 22, 3492).

Disinfectants. KÖNIGSBERGER ZELLSTOFF-FABRIKER UND CHEMISCHE WERKE KOHOLYT A.-G. UND S. HILPRET. Ger. 467,265, Oct. 22, 1922. A strong bactericide and fungicide is produced by treating spent lye from cellulose with halogen, or halogen-generating substances.

Cleaning and disinfecting. GEORGES TSCHOEPPÉ. Fr. 639,716, Jan. 26, 1927. A cleaning and disinfecting agent consists of water, CuSO_4 , NH_3 , oil of turpentine, salt and flour which are made into a paste.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Barium nitrate, strontium nitrate, sodium fluoride, zirconium oxide. J. FRERE. *Rev. prod. chim.* 31, 733-8(1928); cf. *C. A.* 22, 1656.—The manuf. of these products is described. P. THOMASSET

Potassium ferrocyanide. Its manufacture. F. CHEMNITZ. *Rev. prod. chim.* 31, 697-8(1928). P. THOMASSET

Tripoli. P. B. BUTLER. *Mining and Met.* 9, 527-31(1928).—A concise statement of its properties, occurrence, history, preparation and uses. E. J. C.

Fuller's earth in 1927. JEFFERSON MIDDLETON. Bur. of Mines, *Mineral Resources U. S. 1927*, Pt. II, 39-42 (Preprint No. 5, published Sept. 5, 1928). E. H.

Antimony in 1927. J. W. FURNESS. Bur. of Mines, *Mineral Resources of the U. S. 1927*, Pt. I, 39-49 (preprint No. 4 published Nov. 10, 1928). E. H.

New high-temperature fixation reactions of nitrogen. NORMAN W. KRASE AND BILL MACKEY. Univ. of Ill. *J. Phys. Chem.* 32, 1488-94(1928).—The equilibria for several N-fixation reactions have been calcd. for high temps. by the usual thermodynamic method. They are $\frac{1}{2} \text{N}_2 + \frac{1}{2} \text{O}_2 = \text{NO}$ (1811° to 2675° abs.); $\frac{1}{2} \text{N}_2 + \text{CO}_2 = \text{NO} + \text{CO}$ (2000° to 3500° abs.); $\frac{1}{2} \text{N}_2 + \frac{1}{2} \text{H}_2 + \text{C} = \text{HCN}$ (298° to 3500° abs.); $\frac{1}{2} \text{N}_2 + \text{CH}_4 = \text{HCN} + \frac{1}{2} \text{H}_2$ (298° to 3500° abs.); $\frac{1}{2} \text{C}_2\text{H}_2 + \frac{1}{2} \text{N}_2 = \text{HCN}$ (298° to 3500° abs.). With O and N only a comparatively small increase in the concn. of NO results when stoichiometric proportions are used as compared with the result using air. The reaction of N and CO_2 in the arc should produce at equil. a concn. of NO more than double that with air. N, H and C should yield concns. of HCN greater than 15% at the usual arc furnace temp. The interaction of N and CH_4 to form HCN is complete at 2000° abs. N and C_2H_2 should form 70% HCN at arc-furnace temps. R. L. D.

Wet purification method for hydrogen. I. LARYUKOV. *Masloboino Zhirovoe Delo. (Oil and Fat Ind. (Russia))* 1928, No. 2, 6-7.—H obtained from water gas contains as a rule H_2S , which is removed by passing the gas over iron ore ($\text{Fe}_2(\text{OH})_6$). L. suggests using a cold 5-10% Na_2CO_3 or K_2CO_3 soln., the gas passing up through a coke scrubber and the soln. down. H_2S is absorbed, $\text{Na}_2\text{CO}_3 + \text{H}_2\text{S} = \text{NaHS} + \text{NaHCO}_3$; $\text{NaHCO}_3 + \text{H}_2\text{S} = \text{NaHS} + \text{CO}_2 + \text{H}_2\text{O}$; $\text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O} = 2\text{NaHCO}_3$. NaHS and NaHCO_3 are regenerated by blowing hot air through the soln., forming again Na_2CO_3 and H_2S , the last being carried off by the air. This method allows the same reagent to be used indefinitely. A. A. BÖRRTLINGER

Fineness and available lime content of chemical quicklimes. J. S. ROGERS. Bur. of Standards. *Ind. Eng. Chem.* 20, 1355-6(1928).—In addn. to the chem. analysis the available alkly. is important, as well as the fineness, the latter detg. the soln. and reaction rates. F. O. A.

Carbon dioxide fire protection. ROBERT S. MOULTON. *Quarterly Nat. Fire Protection Assn.* 22, 145-60(1928).—Liquefied CO_2 is not new as a fire extinguisher, but is being applied to many special hazards. Rapid progress is being made in technic of application, but details have been worked out for only a few of the many places where it may be found applicable. Hazard to life from use of CO_2 extinguishers is not regarded as significant; a 4-lb. piece of yellow pine in burning evolves more CO_2 than is discharged from a hand CO_2 extinguisher. Its action is said to be much quicker than other fire-extinguishing methods, producing an inert atm. in spaces protected within a very few sec. The cooling effect due to vaporization of liquefied CO_2 is not regarded as having primary importance in fire extinguishing, compared with smothering action. Advantages, limitations, and suitability of CO_2 systems for special hazards in lacquers, solvents, elec. app., marine hazards, dry-cleaning machinery, fur vaults and record vaults are discussed. While much of the equipment used is patented, there are no basic patents covering the general principles of CO_2 fire protection, and development of this new method appears to be proceeding on a sound basis. Twelve illustrations. C. L. JONES

The consistency of casein glue. F. L. BROWNE AND DON BROUSE. *Fifth Colloid Symposium Monograph* 1928, pp. 229-42.—Consistency is important practically, but difficult to measure because it changes with time, seemingly identical batches differ, and it is hard to establish a satisfactory datum point for working life. A modified Herschel consistometer has drawbacks, but was used. Flow-pressure diagrams for solns. of casein contg. no $\text{Ca}(\text{OH})_2$ indicate that they have more complex flow than the lime-contg., jelly-forming glues, which from present evidence seem to be truly viscous. "The flow-pressure diagrams for jelly-forming water-resistant casein glues (contg. lime) fail to reveal any transition from viscosity to plasticity with lapse of time after mixing, at

least until the consistency has passed far beyond the condition ordinarily considered 'set.' Neither does the viscosity-time curve exhibit any sharp break. The 'setting' point must therefore continue to be defined arbitrarily, but the use of the viscosity-time curve permits cancellation of the personal factor. It is suggested that the glue be considered 'set' when the viscosity reaches 1000 poises." Illustrations are given of the changes in viscosity of water-resistant glues with time, alky. and water content, and the practical significance of these relations is discussed. J. ALEXANDER

Gasifying coal, coke or other similar fuels (for use in NH_3 synthesis) (Brit. pat. 289,080) 21. Rotary drum furnace for lime burning (Ger. pat. 468,288) 1. K salts, betaine hydrochloride and glutamic acid from residues of alcohol production from beet molasses (Brit. pat. 288,390) 16.

Hydrofluoric acid. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Brit. 289,383, April 25, 1927. HF substantially free from Si compds. is obtained from vapors contg. HF and Si compds. (such as those formed from fluor spar and H_2SO_4) by first removing water vapor (suitably by fractional condensation or by use of dehydrating agents such as H_2SO_4) and then condensing the substantially anhyd. HF. The first fractions, which contain H_2SiF_6 , may be used to form AlF_3 , which is converted into cryolite by treatment with alkali fluoride obtained from the Si-free HF.

Molybdc and tungstic acids. METALLWERK PLANSEE G. M. B. H. Fr. 636,697, Feb. 14, 1927. See Brit. 269,947 (C. A. 22, 1319).

Nitric acid. MARTIN BATTEGAY. Fr. 636,637, Oct. 19, 1926. HNO_3 is prepd. by absorbing N_2O_4 in H_2SO_4 and oxidizing the product by atm. O, or pure O, or by electrolysis or by a combination of these means with or without catalysts such as NH_4 vanadate, CrO_3 , or CeO_2 .

Nitric acid. NIKODEN CARO and ALBERT R. FRANK. Fr. 639,344, June 28, 1927. See Brit. 273,718 (C. A. 22, 2035).

Nitric acid from ammonia. LUCIEN H. GREATHOUSE (to Atmospheric Nitrogen Corp.). U. S. 1,692,298, Nov. 20. A gaseous mixt. contg. NH_3 and O is compressed and subjected to catalytic action; a portion of the product is condensed to liquid form and the condensed liquid and uncondensed gases are caused to travel together in the same direction with further cooling; the liquid condensate is then sep'd. from the gases and they are again brought into contact with each other countercurrent-wise with further cooling, and the liquid HNO_3 thus obtained is finally discharged separately from the gases. The entire process is effected under super-atm. pressure. An app. is described.

Sulfuric acid. SOCIÉTÉ GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Fr. 639,259, Aug. 10, 1927. In the production of H_2SO_4 in towers without the use of Pb chambers, almost the whole of the oxides of N necessary is liberated at the head of the system, particularly in the first production app. Cf. C. A. 23, 486.

Sulfuric acid. SOCIÉTÉ GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Fr. 639,440, Jan. 24, 1927. H_2SO_4 prep'd. from cold sulfurous gases is denitrified at a concn. less than 60°Bé. by warm sulfurous gases in a tower contg. small packing material.

Denitrating waste acids. WILLI BÜSCHING. Fr. 639,641, Aug. 18, 1927. Nitroglycerin or other waste acids are denitrated by part of the vapors from a H_2SO_4 concg. boiler. The process is continuous. Cf. C. A. 22, 2444.

Ammonia. SOCIÉTÉ GÉNÉRALE DE FOURS À COKE (Systèmes Lecocq). Fr. 639,129, Aug. 5, 1927. To obtain a granular salt, synthetic NH_3 is mixed with dry steam before passing to the saturators.

Ammonia from its elements. FRIEDRICH UNDE. Fr. 636,874, June 30, 1927. A catalyst for the manuf. of NH_3 from N and H is made by evapg. a soln. of an Al salt (chloride or sulfate) with a soln. of $\text{K}_4\text{Fe}(\text{CN})_6$ or $\text{K}_3\text{Fe}(\text{CN})_6$ in the proportions of 1 to 1.2.

Purifying gases for use in ammonia synthesis. BIRGER F. HALVORSEN (to Norsk Hydro-Elektrisk Kvaelfstofaktieselskab). U. S. 1,694,594, Dec. 11, 1928. See Can. 282,906 (C. A. 22, 4211).

Alkaline earth metal salts. I. G. FARBENIND. A.-G. Brit. 289,196, Feb. 14, 1927. Salts such as SrCl_2 , $\text{Ba}(\text{NO}_3)_2$ or $\text{Ca}(\text{NO}_3)_2$ are obtained from alk. earth metal sulfides by triturating the latter with NH_4 salts, and, if desired, accelerating the reaction by heating or by the addition of small quantities of water. NH_4 sulfide evolved is collected.

Alkaline earth metal oxides. WILLIAM L. LAWSON. Can. 284,341, Oct. 30, 1928.

Oxides of the alk. earth metals, such as Ba, Sr and Ca, are produced by subjecting a mixt. of the carbonate of the alk. earth metal and a catalytic agent (petroleum coke, graphite, coke, bone black, lamp black, carbon black, etc., may be used) in a closed vessel to a sufficiently high temp., not exceeding 2800°F. , for effecting ready decompn. of the carbonate with the evolution of CO_2 under conditions inhibiting any substantial consumption of the catalytic agent. The evolved gases are withdrawn from the vessel as the reaction proceeds, and the resulting reaction product is cooled under conditions inhibiting any deleterious changes therein. This reaction permits lower temp. than would otherwise be possible.

Cyanides. NAAMLooZE VENNOOTSCHAP NEDERLANDSCHE MIJNBouw EN HANDEL-MAATSCHAPPIJ. Swiss 126,193, Dec. 9, 1926. N is passed at about 1000° over pieces of highly absorptive coke contg. alk. compds. and the products obtained by the action of alk. compds. on humous materials are coked; catalytically acting metals of the Fe group may be added to the humous materials before coking.

Alkali metal cyanides. SYLVAIN COULIER. U. S. 1,691,960, Nov. 20. Nitrogenous org. matter such as leather scrap, slaughterhouse offals or vinasse is distd., relatively non-volatile non-nitrogenous substances are sepd. from the rest of the distillate, as by decantation of a sepd. layer, and the elemental N liberated in the course of the distn. is caused to act at a temp. of $800\text{--}1000^{\circ}$ upon the residue of distn. to effect cyanidation. The distn. step is carried out at a temp. considerably below that of cyanidation. Cf. C. A. 22, 305.

Iodates. FRIEDRICH A. HENGLEIN (to I. G. FARBENIND. A.-G.). U. S. 1,693,441, Nov. 27. KI or other alkali metal iodide is contacted with O in the presence of alkali metal hydroxide under superatm. pressure and at temps. above 100° (suitably $180\text{--}600^{\circ}$).

Chromium salts. I. G. FARBENIND. A.-G. Ger. 467,789, Nov. 9, 1924. Basic Cr salts are obtained in a spongy state and free from Fe by submitting the soln. or suspension thereof as a spray to a warm stream of gas or air.

Chromate and alumina. I. G. FARBENIND. A.-G. Fr. 636,782, June 28, 1927. Chrome ore is heated with bauxite or other Al ore in the presence of alkali carbonate, or mixts. forming such carbonates at decompn. temp., so that on lixiviating a soln. of chromates and aluminates is obtained. Caustic alkali, particularly KOH, may replace the carbonate. Al_2O_3 may be pptd. after removal of silicic acid by CO_2 and the soda is crystd. out, leaving an alkali chromate soln. Cf. C. A. 22, 2036.

Lead salts. S. C. SMITH. Brit. 289,105, Oct. 20, 1926. See Can. 283,213 (C. A. 22, 4211).

Titanium compounds. HEINRICH PLAUT (to I. G. Farbenind. A.-G.). Can. 285,355, Dec. 4, 1928. Ti compds. are manufd. by working up ilmenite with strong or fuming H_2SO_4 acid, dissolving the strongly acid material in water with the addition of a suitable quantity of K_2SO_4 , isolating the double sulfate thus obtainable and hydrolyzing. E. g. 1000 parts of strongly acid material obtainable by working up ilmenite with H_2SO_4 , which contains $\text{Ti}(\text{SO}_4)_2$ in a quantity equiv. to about 17% TiO_2 , is quickly heated with 2500 parts of water and 400 parts of K_2SO_4 to 95° . The soln. is filtered while hot. In the cold, i. e., at about $0\text{--}5^{\circ}$, the double sulfate seps. in about 65–75% the quantity calcd. on the dissolved Ti. The greatest part of the rest of the double salt may be isolated by evapg.

Titanium compounds. TITAN CO. AKTIESELSKABET. Brit. 289,111, Nov. 17, 1926. Ti compds. sol. in org. and dil. inorg. acids are obtained by heating a hydrated oxygenated compd. of Ti such as metatitanic acid or basic Ti sulfate, in the presence of alkali, at a temp. (suitably about 150°) below the fusion point of the reaction mass. By reaction of the products with suitable acids or mixts. of acids there may be obtained double salts of Ti and alkali such as Ti Na tartrate or lactate, Ti K oxalate, or Ti Na sulfate.

Aluminum compounds. T. R. HAGLUND. Brit. 289,639, May 3, 1927. Al sulfidiferous material contg. Al_2O_3 and sulfides of Al, Ca, Ba or Mg is oxidized below its m. p. to give O-contg. products and to yield the most of the S in other form than H_2S , preferably as free S which may be volatilized or as SO_2 . With excess air, $\text{Al}_2(\text{SO}_4)_3$ may be formed. Oxidation may be effected by gases obtained by burning H, H_2S , S or C in the furnace, by air, steam, or gases contg. SO_2 or O compds. of C such as CO or CO_2 or COS by which CS compounds such as CS_2 and COS are formed. By treatment of the product first with steam and then with SO_2 , Al sulfite or hyposulfite is formed, and dissolved, and on heating *in vacuo* the basic sulfite is pptd. from which the oxide may be prepd. Various details and modifications are given.

Aluminum sulfate. LOUIS G. PATROUILLEAU (to Soc. Alumine et Derives). U. S. 1,692,692, Nov. 20. Bauxite is treated with H_2SO_4 to form a soln. of mixed sulfates

and the salts of Fe present are converted into sol. ferrous salts by adding Fe and heating, the material is dild. to ppt. basic Al sulfate and the insol. Al sulfate is recovered.

Alumina and hydrochloric acid. I. G. FARBENIND. A.-G. Fr. 639,177, Aug. 8, 1927. Aluminous material is dissolved in H_2SO_4 and NaCl is added corresponding approx. to the quantity of H_2SO_4 and the mass is heated to about 700° , the HCl being collected. The product is mixed with C and heated to 1000° to form aluminate, Na_2CO_3 , and sulfide. The soln. is treated to sep. Al_2O_3 .

Alumina, soda and hydrochloric acid. NOEH J. GAREAU. Fr. 639,844, Aug. 20, 1927; Can. 283,982, Oct. 16, 1928. Clay is calcined in the form of briquets, treated with H_2SO_4 , water, steam and air, SO_2 and SO_3 to produce a product with a high content of $Al_2(SO_4)_3$. The briquets are leached with H_2SO_4 and water, and the $Al_2(SO_4)_3$ obtained is dehydrated and partly dissocd. The resulting mass is mixed with NaCl and coal, made into briquets and heated to a bright red and treated with superheated steam. The mass is leached to obtain pure Al_2O_3 and Na_2CO_3 . A suitable plant is described.

Ammonium nitrate. AZOGENO SOCIETÀ ANON. PER LA FABBRICAZIONE DELL'AMMONIACA SINTETICA E PRODOTTI DERIVATI CARLO TONIOLO. Swiss 126,578, May 16, 1927. NH_4NO_3 is rendered less hygroscopic by continually stirring it during solidification so that it forms a powder.

Metallic and ammonium sulfates. I. G. FARBENIND. A.-G. Brit. 288,977, April 16, 1927. Metal sulfates such as $ZnSO_4$ are obtained by treatment of aq. suspensions of the corresponding sulfides with O under pressure at temps. above 120° (suitably $20-30$ atm. pressure and 180° in treating ZnS). The process may be applied to the purification of coke-oven or raw illuminating gas by treating a metal sulfate in aq. ammoniacal soln. with the gas to be purified, converting the pptd. sulfide into sulfate, and recovering $(NH_4)_2SO_4$ from the filtrate.

Barium sulfate. K. EBERS. Brit. 288,498, Oct. 25, 1927. Crude barytes free from or low in lime but contg. such impurities as silica and Fe and Mn compds. is roasted at a temp. which preferably does not exceed its sintering point, treated with water (as by quenching) and then with an acid such as HCl, to obtain a pure white product, which may then be washed and ground.

Calcium nitrate. APPAREILS ET EVAPORATEURS KESTNER. Brit. 289,370, May 6, 1927. $CaCO_3$ is reacted on with HNO_3 and the gas released is forced in the same direction as the HNO_3 moves, as in the process described in Brit. 279,037 (C. A. 22, 2815). Sandstone spheres or other suitable blocks not affected by the HNO_3 are added to the $CaCO_3$ to maintain the resistance to the passage of liquid substantially const. An app. is described.

Nickelic hydroxide. FRIEDRICH MEIDERT (to I. G. FARBENIND. A.-G.). Can. 284,237, Oct. 23, 1928. $NiCO_3$ is transformed into $Ni(OH)_2$ by suspending the carbonate, in the form of a fine powder, in water and running a hypochlorite soln. into the suspension with vigorous stirring, at ordinary temp. The reaction takes place with development of CO_2 and O. E. g., 500 parts by wt. of $NiCO_3$ is suspended in 2000 parts of water. A hypochlorite soln. contg. 150 g. of active Cl per l. and as little free alkali as possible is slowly run into the well-stirred suspension. The end of the reaction can easily be recognized by the cessation of the gas developed. The consumption of the hypochlorite soln. corresponds to about 140 parts by wt. of active Cl. The output amounts, in accordance with the theory, to 380 parts of $Ni(OH)_2$, contg. 57% of Ni and free from carbonate. The filtrate is colorless and neutral.

Cobaltic hydroxide. FRIEDRICH MEIDERT (to I. G. Farbenind. A.-G.). Can. 284,236, Oct. 23, 1928. The process is exactly similar to that for $Ni(OH)_2$ (preceding abstract).

Potassium phosphates and hydrochloric acid. SOC. ANON. DES CHARBONS ACTIFS E. URBAIN. Brit. 288,330, April 8, 1927. KPO_3 and HCl are formed by heating together KCl and ortho-, pyro- or meta-phosphoric acid. The KPO_3 may be hydrated to form di-K pyrophosphate or mono-K orthophosphate and these substances may be treated with bases such as NH_3 to obtain products suitable for use as fertilizers. The HCl formed may be used for neutralizing synthetic NH_3 . Brit. 288,331 specifies hydrating KPO_3 (prepd. as just described) to form di-K pyrophosphate or mono-K orthophosphate, and treating these substances with N bases such as NH_3 , urea or cyanamide to form complex compds. such as $PO(OK)(ONH_4)NH_2$, suitable for use as fertilizers.

Sodium carbonate. SOCIÉTÉ ANON. DES USINES DIOR. Fr. 636,560, Jan. 23, 1925. Crystals of hydrated Na_2CO_3 are obtained in a compact form by submitting a mass of crystals resulting from a first soln. of Na_2CO_3 to the action of several warm concd. solns. of Na_2CO_3 , the action of each soln. being prolonged till it deposits no more crystals.

Sodium carbonate compounds from brines. WALTER A. KUENZERT. U. S. 1,693,-

237, Nov. 27. A brine such as that of Owens Lake, Calif. is first carbonated with a CO_2 -bearing gas while maintaining the rate of supply of CO_2 to the brine sufficiently low to maintain the temp. below 45° and cause pptn. to occur principally in the form of coarsely cryst. Na sesquicarbonate, until the concn. of Na_2CO_3 in the brine has been materially reduced. Cf. C. A. 22, 2816.

Soda ash from waste liquors. J. HOLMES, H. A. COME and J. L. JARDINE. Brit. 288,699, Jan. 11, 1927. The heat of combustion of org. material in waste liquors (such as those obtained by digestion of wood, grasses or the like with soda) is utilized to effect concn. of the liquors and to generate steam for use in the digesters. The concd. liquor is injected through atomizers into a combustion space, previously heated to start combustion by oil burners. Air for the combustion is preheated. Soda ash collects and is recovered. An app. is described.

Sodium sulfate and hydrochloric acid. CHARLES S. BENJAMIN (to General Chemical Co.). U. S. 1,693,217, Nov. 27. In furnacing a mixt. of NaHSO_4 and NaCl , the moisture content of the mixt. to be treated is adjusted to between 2 and 3.5%. This serves to produce a soft porous Na_2SO_4 which is easily pulverized.

Sodium acid sulfate in globular form. OTTO H. BUSE and RUSSELL R. REID (to The Grasselli Chemical Co.). Can. 284,244, Oct. 23, 1928. Molten nitercake or NaHSO_4 is atomized or sprayed into a cooling atm. to produce globular, dense, hard, smooth, non-porous, discrete particles having a pearly appearance.

Sodium sulfide. R. BOTSON and SOC. INDUSTRIELLE DES APPLICATIONS CHIMIQUES SOC. ANON. Brit. 289,354, Nov. 14, 1927. Crude Na sulfide is purified by use of steam under pressure with the addn. of about 1% of terpinolene to ppt. impurities, dilg. with water to form a soln. of 13° Bé., filtering or centrifuging, adding 35° Bé. NaOH soln. to bring the sp. gr. to 18.5° Bé., again filtering, concg. to a 50% soln. and crystg. The product is free from Fe, Cu and hyposulfite and may be used in prepg. *photographic toning solns.* The dried crystals may be pressed into blocks or aggregated with a binder.

Zinc chloride. METALLBANK UND METALLURGISCHE GES.-A.-G. Brit. 288,253, April 9, 1927. Anhyd. ZnCl_2 is obtained by subjecting ZnO (suitably after preheating to 300 – 400°) to the action of Cl in the presence of H, with or without other reducing agents; water gas, power gas or other gas contg. both H and CO may be used, e. g., a mixt. of Cl and water gas may be used under such conditions that a temp. of 400 – 500° is maintained by the heat of the reaction, and the fused ZnCl_2 produced may be tapped off and filtered before it solidifies. If desired the process may be carried out at 700° or a higher temp. to effect volatilization and condensation of the ZnCl_2 .

Treating zinc chloride solutions containing magnesium. NILS E. LENANDER (to Orkla Grubekaktiebolag). U. S. 1,694,710, Dec. 11. A soln. such as that obtained as a waste in Cu extn. is treated with less lime than would be required to convert the Zn present into $\text{Zn}(\text{OH})_2$, pptd. basic Zn chlorides are removed and mixed with not more than an equiv. proportion of lime and the mixt. is heated at atm. pressure to not higher than about 70° to form ZnO .

Zinc oxide. THE NEW JERSEY ZINC CO. Swiss 126,621, Mar. 9, 1927. Zinciferous and carbonaceous substances are heated and the metallic Zn is volatilized and oxidized. The gas carrying the ZnO in suspension is maintained at 125° .

Purifying zinc sulfate solution. ERNEST R. CRUTCHER (to the Sullivan Mining Co.) Can. 285,390, Dec. 4, 1928. ZnSO_4 soln. to be purified is put into an agitator and a small quantity of zinc oxide is added to neutralize any acid present. MnO_2 (25 lb. per ton of Zn contained in the soln.) is added and the soln. agitated for 5 min. Zn xanthate, or one of the alkyl S derivs. of carbonic acid which has been previously mixed in a small quantity of the soln. undergoing treatment is then added to the soln. in the agitator and the soln. is agitated until approx. all the impurities are pptd. The soln. is then filtered. The temp. of the process is between 50° and 70° . The pptn. can be completed at a temp. as low as 30° , but the time required for complete sepn. is greater.

Lime. E. JEENICKÉ & Co. Ger. 468,253, Aug. 22, 1926. Lime is burned in a kiln in which O-enriched air is admitted under pressure after circulation in heating pipes in the flues.

Copper and carbon compound. GEHR. SIEMENS & Co. (Erich Birnbrauer, inventor). Ger. 467,790, Nov. 16, 1921. Addn. to 454,804. Cu pptd. as in 454,804 is mixed with graphite and heated in the absence of air to a bright red heat (900°). Cf. C. A. 23, 488.

Carbon monoxide. GUSTAV WIERZEL (to I. G. Farbenind. A.-G.). U. S. 1,695,130, Dec. 11. In order to produce pure CO and a mixt. of pure H and N from a gas such as water gas or coke-oven gas which also contains impurities including org. S compds., the impure gas is treated with steam to convert a portion of the CO to CO_2 and sub-

stantially all the S compds. to H_2S , the CO_2 and H_2S are removed (suitably by water under pressure) and the CO is then sepd. from the H and N (suitably by ammoniacal cuprous formate soln. or a similar compd.).

Carbon monoxide. JOHN C. WOODRUFF (to The Commercial Solvents Corp.). Can. 283,913, Oct. 9, 1928. CO is produced by passing granular C downward through a tilted rotating tube which is heated so that the temp. of the contained C will be $800\text{--}1500^\circ$ and passing CO_2 upward through said tube.

Carbon dioxide. PIERRE É. HAYNES. Fr. 637,000, July 5, 1927. See Brit. 277,938 (C. A. 22, 2642).

Nitrogen oxides. ELEKTRIZITÄTSWERK LONZA. Brit. 289,412, April 26, 1927. N oxides (such as those obtained by oxidation of N or of NH_3) are absorbed from gaseous mixts. by treatment in stages with HNO_3 of increasing concn. at temps. below 0° (preferably -20° to -30°). In the first stages the lower oxides of N decomp. the HNO_3 to form NO_2 , which is absorbed in concd. HNO_3 in the final stages.

Sulfur dioxide and hydrogen. CHARLES H. MACDOWELL and HERBERT H. MEYERS (to Armour Fertilizer Works). U. S. 1,693,244, Nov. 27. A mixt. of S vapor and steam is heated in the presence of Fe oxide as a catalyst (suitably at a temp. of about $900\text{--}1000^\circ$) for a time sufficient to produce a gaseous mixt. contg. SO_2 and H which are individually recovered from the mixt.

Hydrogen peroxide. I. G. FARBENIND. A.-G. Swiss 126,577, Jan. 4, 1927. Solns. of H_2O_2 are concd. by bringing the soln. to a finer state of division by a gas current.

Hydrogen sulfide and sulfides. I. G. FARBENIND. A.-G. Fr. 636,963, July 4, 1927. H_2S or sulfides are prepd. by the action of H on S or compds. yielding it, under pressure and at a high temp. and in the presence of H_2O or bases. The H may be partly or wholly replaced by CO or CH_2O or formates. Catalysts such as FeO or FeS may be used.

Minium. JEAN J. TARDAN. Swiss 126,583, Jan. 20, 1927. Minium is manufd. by oxidizing spongy or finely divided Pb in 2 stages. First, a mass contg. the monoxide is formed at a temp. which avoids melting the Pb; then the mass is roasted. The app. for carrying out the process is described.

Protecting calcium chloride or other granular substances from deterioration. BENJAMIN P. RICHARDSON. U. S. 1,692,996, Nov. 27. Active granular material such as CaCl_2 is treated with an excess of a normally inert impermeable solid such as paraffin carried by gasoline or other inert liquid vehicle, the surplus of the fluid mixt. is removed, and the deposit on the granules is caused to solidify by evapg. the solvent.

Double salt; fertilizers. "AZOGENO" (SOCIETÀ ANON PER LA FABBRICAZIONE DELL'AMMONIACA SINTETICA E PRODOTTI DERIVATI), CARLO TONIOLO and BRUNO TANZI. Fr. 639,648, Aug. 18, 1927. A double salt which is non-hygroscopic is prepd. by mixing $(\text{NH}_4)_2\text{SO}_4$ and anhyd. $\text{Ca}(\text{NO}_3)_2$ in the presence of 2 mols. of water for one of nitrate. The water may be added to either salt as moist air, steam or liquid or the hydrate $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ may be used. An NH_4 phosphate may be used instead of the sulfate, and K salts, NH_4NO_3 or urea may be added to obtain a mixed fertilizer.

Purifying alkali or alkaline earth metals. J. J. CONLIN (to British Thomson-Houston Co., Ltd.). Brit. 288,333, April 6, 1927. Metallic Ca or other alk. earth or alkali metal is purified by placing it in a metal container, such as a steel tube with an opening at its lower end, and immersing the container in a molten salt such as CaCl_2 which does not react with the metal to be purified. The impurities sink to the bottom of the tube and the purified metal rises to the top. Mg and Ca may be purified together and simultaneously alloyed. An app. is described.

Active carbon. SOCIÉTÉ INTERNATIONALE DES COMBUSTIBLES LIQUIDES. Fr. 639,242, Aug. 9, 1927. A very active C is obtained by treating the insol. residues from the berginization of coal with acids, washing and heating.

Activated carbon. I. G. FARBENIND. A.-G. Brit. 289,170, Jan. 24, 1927. Activation is effected by gases contg. no free O (e. g., by steam) which may be caused to diffuse through a diaphragm into the activating chamber, or may be introduced directly into the chamber. The gaseous products of the activation diffuse out through a diaphragm and after oxidation may pass back into the chamber for further use in the activation. Various details of app. are described.

Activation of carbon. SOCIÉTÉ DE RECHERCHES ET D'EXPLOITATIONS PÉTROLIFÈRES. Fr. 639,202, Jan. 14, 1927. Carbonaceous materials are impregnated with small quantities of acids, bases or salts which have a fire-proofing effect, before activation. Phosphoric acid, H_3BO_3 , Na_2BO_3 , Na_2CO_3 and alkali phosphates are suitable. Cf. C. A. 22, 4212.

Metallurgical carbon. G. DE KORFF AND G. JAKOVA-METURI (to Carbonisation

soc. générale d'exploitation des carbonés). Brit. 288,551, April 11, 1927. See Fr. 632,623 (C. A. 22, 3387).

Revivifying bone black. WM. W. KEMP. U. S. 1,692,745, Nov. 20. A preformed mixt. of fuel gas and air (contg. not more air than required for combustion of the gas) is burned in a container holding the bone char while excluding other air from the container, and the combustion products and gases and vapors produced are discharged from the container. An app. is described.

Hydrogen. FRANK C. BLAKE (to Lazote, Inc.). U. S. 1,692,811, Nov. 27. Steam and CO are together subjected to the action of a non-ferrous catalyst such as oxides of Cr, Cu, Mn, V, Mg and W in an app. the interior surfaces of which are formed of Cr, Al, Cu, Ag or other non-ferrous material. Cf. C. A. 22, 2817.

Hydrogen. I. G. FARBENIND. A.-G. Brit. 288,662, Nov. 15, 1926. Hydrocarbons or mixts. contg. them such as purified coal gas freed from S are subjected to partial combustion with a limited quantity of O or gas richer in O than air so that the resulting mixt. still contains some hydrocarbons, steam is added if not already present and the mixt. is passed over a catalyst which at least converts the hydrocarbons into CO and H and which may also effect the complete conversion of the mixt. into CO and H. Ni activated with alumina and Fe and Cr oxide are suitable catalysts. Cf. C. A. 23, 488.

Hydrogen. RUDOLF E. BATTIG. Can. 284,117, Oct. 23, 1928. Satd. or unsatd. hydrocarbons or gas mixts. contg. them are passed through a chamber heated to the temp. of decompn. and the decomposed hydrocarbons are passed through a second chamber in which the C is deposited, the H passing through a third chamber and heating the same before being passed to a gas collector. At the end of the process air is passed through the third chamber and after preheating it enters the second chamber, where combustion of the C takes place and the products of combustion heat the first chamber to a high temp., whereupon the decompn. of hydrocarbons is renewed.

Hydrogen. WILHELM GLUUD, KONRAD KELLER, ROBERT SCHONFELDER and WALTER KLEMP. Can. 284,298, Oct. 30, 1928. One hundred cu. m. of a gas mixt., contg. besides H for instance 20 cu. m. of CO, is conducted at atm. pressure together with the quantity of steam required by theory for the conversion of the CO (*i. e.*, 20 cu. m. steam) at a temp. of 300–600° over a mixt. of 15 kg. bauxite with 58 kg. CaO. During the reaction all the CO is converted into CO₂, which is completely bound by the lime, the CO being replaced in the gas mixt. by an equal vol. of H, so that the vol. of the gas mixt. is not altered. As soon as material quantities of CO or CO₂ can be detected in the H produced, the raw gas contg. CO is conducted to an app. charged with CaO and bauxite, in which the same process is carried through, while the lime in the first app. being satd. with CO₂ is regenerated by heating up to 900–1000°.

Helium from natural gas. MONTAGUE H. ROBERTS (to Air Reduction Co.). U. S. 1,693,052, Nov. 27. An app. and system for fractional liquefaction is specified by which He is obtained as a final gaseous residue.

Iodine. WALLACE L. CHANDLER. Swiss 126,576, Nov. 2, 1926. I is prepd. in a finely divided colloidal form by the action of HI on iodic acid at a low temp. in the presence of a protective colloid.

Compounds containing active oxygen. HENKEL & CIE, G. M. B. H. Swiss 126,192, Mar. 16, 1927. The reagents to be used in the manuf. are purified by treatment in soln. with silica gel.

Sulfur from sulfur dioxide. ALFRED P. THOMPSON (to General Chemical Co.). U. S. 1,695,068, Dec. 11. In reducing SO₂ by the action of carbonaceous fuel, an endothermic reaction such as that of CO, mixed with the SO₂ is simultaneously effected in the absence of H in any form, so that the temp. of the reduction process is thus controlled.

Purifying sulfur contaminated with hydrocarbons. JAMES W. SCHWAB (to Texas Gulf Sulphur Co.). U. S. 1,692,422, Nov. 20. The molten S to be purified is agitated with anhyd. AlCl₃ and then sepd.

Purifying gases containing phosphorus. GUSTAV PISTOR and ERNEST BORSBACH (to I. G. Farbenind. A.-G.). U. S. 1,692,787, Nov. 20. See Can. 279,987 (C. A. 22, 2801).

Javelle water. HARRY D. LEVINE. U. S. 1,694,711, Dec. 11. A NaOH soln. is rapidly refrigerated to about 0° and maintained at approx. this temp. while Cl gas is introduced into the soln. An app. is described.

Bleaching liquors. T. BENCKISER, A. REIMANN and A. REIMAN (trading as the Firm of J. A. Benckiser) and F. DRAISBACH. Brit. 289,156, Jan. 21, 1927. In stabilizing bleaching liquors contg. peroxides or persalts by use of alkali pyrophosphates, the *p_H* of the liquors when warm is maintained at 7.0–8.5 in the absence of soap, and at 7.0–10.0 in the presence of soap suitably by the addn. as necessary of acids or acid salts such as bisulfates, mono-Na or mono-NH₄ phosphates or an acid alkali pyrophosphate.

Granular bleaching earths. JOSEF BRUNNER and OTTO HELL. Swiss 126,189, Mar. 10, 1927. Crude bleaching earths in granular form are refined by treatment with acid of sufficient concn. to avoid disintegration of the granules, *e. g.*, with HCl of 10–11° Bé.

Regenerating metallic oxides used for desulfuration. SOCIÉTÉ INTERNATIONALE DES PROCÉDÉS PRUDHOMME-HOUDRY. Fr. 639,774, Feb. 3, 1927. Oxides used for desulfuration of gases are regenerated by passing a reducing gas in the opposite direction through the app. heated to about 350° and when a sufficient thickness has been reached, air or an oxidizing gas is passed through and the heat thereby liberated is sufficient to remove the rest of the S as SO₂, with formation of oxides.

Glazed surfaces resistant to acids, alkalies, etc. ELEKTROCHEM. FABRIK KEMPEN-RHEIN DR. BRANDENBURG & WEYLAND GES. (to R. Arnot). Brit. 288,303, April 6, 1927. Highly glazed surfaces resistant to acids, alkalies, hot and cold water and org. solvents are produced on molded articles or sheet material by applying a coating of synthetic resin by use of a highly polished mold or metal plate coated with a soln. of the resin, and heating to form a hard film which is transferred by pressure to the article to be coated. Various other substances including materials for preventing adhesion may be added.

Rotary furnace for the commercial preparation of lead oxide. SOCIÉTÉ GAMICHON, CARETTE & CIE. Ger. 468,298, July 3, 1926. The inner wall is provided with broad scoop-like projections which carry the lead granules upward and gradually decant them to the bottom.

Furnace for the decomposition of alkali metal chlorides by steam in the presence of silicates in a molten mass. JULIUS KERSTEN. U. S. 1,692,175, Nov. 20. A furnace is specified suitable for the production of HCl from NaCl, Na silicate and steam.

Furnace for producing phosphoric acid, etc. STETTINER CHAMOTTE-FABRIK. A.-G. VORM. DIDIER. Brit. 289,128, Jan. 17, 1927. In a furnace suitable for producing H₃PO₄ from phosphates mixed with coal and sand, and for other chem. and metallurgical purposes, the raw materials are fed in a thin layer to a melting chamber down an inclined neck or throat, and all of the combustible gas evolved is used for heating the furnace. Various structural details are described.

Drying nitrous gases. I. G. FARBENIND. A.-G. Fr. 636,961, July 4, 1927. See Brit. 284,839 (C. A. 22, 4677).

Resinous moldable composition. HARRY M. WEBER. U. S. 1,692,524, Nov. 20. MgO is ground with CH₂O and the resulting mixt. is caused to react with a cresol. Numerous examples are given.

Plastic compositions containing phenolic condensation products. CLARENCE A. NASH (to Cutler-Hammer Mfg. Co.). U. S. 1,692,856, Nov. 27. A condensation binder produced from a phenolic compd. and a reactive CH₂-contg. substance such as (CH₂)₆N₄ is mixed with an inert filler such as asbestos or mica, before completion of the reaction of the substances forming the binder and before molding, and such a quantity of the inert filler is added as will serve to arrest the reaction at a given stage. The product may be used for making molded articles.

Molding phenolic condensation products. SAMUEL L. ABRAHAMS (to General Electric Co.). U. S. 1,693,327, Nov. 27. In forming articles such as *insulating covering* on commutator clamping rings a wall of a mold is coated with a mixt. of mica and a binding material such as shellac which is softened by heating, and a condensation product is molded in contact with the mica and binder, by the action of heat and pressure, so as to form an insulating coating for the molded product.

Phenol-aldehyde condensation products. KUNSTHARZFABRIK DR. F. POLLAK GES. Brit. 288,228, April 6, 1927. "Dispersively acting substances" such as gum arabic, saponin, tragacanth, dextrin, gelatin, casein or other protective colloids, are added to the condensation soln. before or at the moment of condensation. The condensation product forms in finely divided condition and assumes a pulverulent character on heating, without forming a solid cake. By pouring this emulsion or suspension into water or solns. of salts or acids, or by cooling it, a pulverulent cake is formed. Various aldehydes may be used and considerable quantities of condensing agents preferably are employed. Examples are given.

Purification of phenol-aldehyde condensation products. BAKELITE G. M. B. H. Swiss 126,203, Feb. 10, 1926. See Brit. 248,726 (C. A. 21, 828).

Phenol-formaldehyde condensation products. GRIGORI PETROFF. U. S. 1,693,461, Nov. 27. A phenol is condensed with CH₂O in the presence of MeC₄H₉SO₃NCINa, which serves to facilitate the reaction.

Urea-formaldehyde condensation products. I. G. FARBENIND. A.-G. Brit. 288,-

346, Oct. 1, 1926. The condensation is effected in an acid soln. continuously maintained at a p_H between 4 and 6 and the water is then removed at a temp. not exceeding 50° while a p_H between 6 and 7 is maintained. When less than 2 mol. proportions of CH_3O is used for each mol. proportion of urea, the evapn. stage may be wholly or partly dispensed with and the condensation product may be sepd. by cooling the soln. preferably while adding salts such as Na_2SO_4 or $NaCl$. Plasticizers, cellulose esters or ethers and other substances may be admixed with the products. Na phosphates may be used as buffers. Cf. C. A. 22, 2645.

Adsorbent products from zeolitic materials. A. ROSENHEIM. Brit. 289,418, April 27, 1927. The treatment of natural or artificial zeolites or similar substances with acids to obtain adsorbents as described in Brit. 275,203 (C. A. 22, 2248) is so conducted that a sol is produced and the latter is converted into a gel without sepn. of the electrolytes, such as $AlCl_3$ or $FeCl_3$, which are obtained by the action of the acid on the zeolites. After drying, the gel may be freed from the electrolytes by use of water or acids. Numerous details and modifications are described including the use of compds. of Al, Fe, Cu, Mn, Mg and Ti. Acetates, formates or nitrates may be used as electrolytes in the process. Cf. C. A. 22, 4739.

Catalysts containing base-exchange substances. ALPHONS O. JAEGER (to Selder Research & Engineering Corp.). U. S. 1,694,620, Dec. 11. Catalysts suitable for use in producing oxidation products of aromatic hydrocarbons or in other reactions contain base-exchange substances free from chemically combined Si and having catalytically active elements such as V, W, Mo, Cu, Ni, U, Cr or Zn combined in non-exchangeable form. Many detailed examples are given.

System for supplying dried compressed air for discharge of chlorine or other liquefied gases from tank cars. WM. B. LEACH, JR. (to Mathieson Alkali Works). U. S. 1,692,847, Nov. 27.

Porous fillings for storage of gases such as acetylene. SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 289,391, April 26, 1927. Large pieces of charcoal are used with pulverulent material (which may also be charcoal) which by settling assumes sufficient density to prevent propagation of explosions.

"Ethyl alcohol substitute" for use as a solvent, etc. ROBERT M. ISHAM (to Doherty Research Co.). U. S. 1,692,662, Nov. 20. A mixt. of isopropyl alc., acetaldehyde and $BuOAc$ is used, suitably in the resp. proportions of 5 gal., 3 cc. and 6 cc. (which gives an odor similar to $EtOH$).

Impervious material comprising artificial graphite and sulfur. WARREN F. BLEECKER. U. S. 1,694,730, Dec. 11. Conduits, receptacles or other articles are formed of artificial graphite, the voids of which are closed with S. Cf. C. A. 22, 4740.

Gems. LEON H. BARNETT. Can. 284,305, Oct. 30, 1928. Fe contg. C 4.5, Si 3, and P 1% and as little S as possible is melted and poured into a red-hot steel shell of great strength into which particles of opaque corundum have been previously introduced. The shell is then closed and the material permitted to cool to 1050° and is kept at this temp. for 1 hr., after which it is allowed to cool to room temp. The hardened material is cracked open or dissolved in acid to free the resulting rubies, sapphires, etc. Some small diamonds should also be present. A similar high pressure with its accompanying action on C (and corundum if present) can be produced by rapidly cooling a mass of molten cast iron to below 700° with production of cast iron in which most of its C is in the combined form. The cast iron will thereby be in a denser form, there having been no expansion during solidification and cooling. The temp. is now slowly raised to about $700-800^\circ$ and kept at this temp. until most of the C is in a free state; the shell is cooled and broken and the material dissolved as before to isolate the gems.

Organic glass. HENRI SPINDLER. Fr. 637,051, Oct. 29, 1926. An org. glass is prepd. by the action of CO on NH_3 at high pressure and at a temp. of $150-400^\circ$ in the presence of a catalyst such as Fe, Ni, Co, Cu or their compds. to produce CH_3O and urea, which are then combined in known matter.

Composite sheets of glass and cellulose acetate. H. J. MALLABAR and NONIN-FLAMMABLE FILM CO., LTD. Brit. 288,782, Feb. 24, 1927. The surfaces to be united are first coated with a layer of gelatin, which when dry is softened and the sheets are then united by pressure. A blue dye must be used to neutralize the yellow tint of the cellulose acetate. Various formulas of softening liquids, etc. are given.

Cleaning gelatinous surfaces. BERTHA SUGDEN (to Technicolor Motion Picture Corp.). U. S. 1,692,358, Nov. 20. Materials such as film matrices carrying dye residues are immersed in a dil. volatile soln. inert to the gelatinous material, such as a 2% soln. of NH_3 in $EtOH$, followed by drying.

Adhesive. ORANIENBURGER CHEMISCHE FABRIK, A.-G. KURT, LINDNER and JOHANNES ZICKERMANN. Ger. 468,026, June 24, 1926. An org. colloidal adhesive is made stronger by the addn. of a colloidal, high-mol. sulfo acid, or the sulfo salt of an alkylated or arylated aromatic hydrocarbon, sol. in water. The examples given are isobutyl- and isopropyl-naphthalenesulfonic acid.

Dichromate-glue printing plates. MAX WIELAND. U. S. 1,692,528, Nov. 20. A gelatin or glue compn. is mixed with finely ground portland cement in such proportions as to preserve the ability of the gelatin to swell, and the compn. is then spread and sensitized.

Coating composition. JOSEF TOTH. Swiss 126,258, Jan. 13, 1927. The compn. comprises $MgCl_2$ soln. (100 parts), acetone (5 parts), dextrin (10 parts) and calcined MgO (90 parts). The compn. may include also a dye and 6-10% of portland cement. The coating may be rendered impervious by treatment with a mixt. of soda cellulose and Me_2O .

Metallic coatings for loud-speakers. TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE. Brit. 288,334, April 7, 1927. The movable metallic coating of an electrostatic loud-speaker is made of a metal the oxides or sulfides of which are elec. conductors, e. g., powd. Ag is sprayed upon the dielectric of the loud-speaker to form its moving metallic coating.

Printing surfaces. LANKES & SCHWÄRZLER. Brit. 288,550, April 11, 1927. In prepg. a printing surface, one side of a sheet of paper or the like is coated with chalk or clay (preferably in a number of layers), the back of the sheet is impregnated or coated with a substance resistant to the action of a washing or etching liquid capable of removing the chalk or clay, a picture is impressed on the side coated with the chalk or clay and the chalk or clay not covered by the picture is removed, e. g., with a $CaCl_2$ soln. Glue or casein treated with CH_2O may be used as the resistant substance.

Stencil sheets. S. HORII. Brit. 289,511, Jan. 24, 1927. Esters such as cellulose nitrate or acetate or mannan acetate are used with alcs. derived from oils or waxes of marine animals such as oleyl alc., cetyl alc., or selachyl alc., and these and other suitable associated ingredients may be used as a coating on Yoshino paper or may be added to the paper pulp in a mixing hollander.

Material for core of telephone cable loading coils. SIEMENS & HALSKE A.-G. Brit. 289,385, April 25, 1927. Cores with very small hysteresis losses are formed of magnetic material in very small particles which would pass through a sieve of not less than 40,000 meshes per sq. cm., compressed under high pressure. Such particles may be obtained from suspensions or solns. which may comprise shellac or colophony and alc.

Compositions for seats, etc. J. HARRIS. Brit. 289,702, Sept. 26, 1927. The upper layer is formed of a compn. of granulated cork, fiber, sawdust or the like, rubber and glue, with coloring and vulcanizing ingredients, and the lower layer is formed of sponge rubber compn.

Brake-lining material. ROBERT LAUGHLIN (to Brand Co.). U. S. 1,693,304, Nov. 27. A compn. for use on brake linings, clutches and similar devices is formed from rubber sponge, linseed oil, crude paraffin wax, PbO , S, hard wax tailings, rosin, $Ca(OH)_2$ and soft wax tailings or petroleum tailings.

Friction material suitable for brake linings or clutch facings. ISADOR J. NOVAK (to Raybestos Co.). U. S. 1,692,136, Nov. 20. A material with an asbestos base contains a binder comprising the solid residue of waste sulfite liquor produced by drying the liquor.

Hardening casein. SOCIÉTÉ INDUSTRIELLE DES MATIÈRES PLASTIQUES. Fr. 637,157, Nov. 2, 1926. Casein is hardened in the mass to produce a homogeneous artificial horn of any thickness, by soaking softened casein in the cold with the necessary quantity of CH_2O or other substance yielding it, in the presence of a swelling agent and an agent preventing the CH_2O reacting in the cold, and then heating under pressure. In an example casein is mixed with formalin, $EtOH$ and $NaOH$ and heated under pressure to 95-100°. Cf. C. A. 22, 2446.

System for spray evaporation of brine, etc., in a circulating current of relatively cool gas. SALT UNION, LTD., D. V. PLUMBRIDGE and W. E. GIBBS. Brit. 289,116, Dec. 23, 1926.

Piezo-electric crystal. WILLIAM H. BURTIS. U. S. 1,692,074, Nov. 20. The surface of a crystal carries a silicate binder and a powd. metal forming the electrode for the crystal. A layer of metal may also be deposited electrolytically.

Metal foil. CHEMISCHE FABRIK VON HEYDEN AKT.-GES. Ger. 467,884, July 6, 1924. Metal foil used for gilding, etc., is prepd. by mixing bronze powder and dried parchment paper pulp in a mixer and treating the mixt. as for the usual prepn. of parchment paper.

"Color-binding" substances. HENKEL ET CIE, Ges. Brit. 289,053, April 21, 1927. "Color-binding" substances sol. in cold water are obtained by slightly disintegrating starch preps. which swell in cold water, such as alkali-starch, CaCl_2 -starch, NH_4CNS -starch or the like, with disintegrating agents such as H_2O_2 , per-salts, hypochlorites or chloramines. The disintegration may also be effected before or simultaneously with the prepn. of "swelling" starch. When liquid disintegrating agents are used, alc. is added to prevent local paste formation.

"Heat-responsive" material suitable for indicating temperatures. PAUL B. COCHRAN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,693,869, Nov. 27. A compn. including Cu_2I_2 about 30 and HgI_2 about 70 parts is used with oil varnish free from drier or other suitable waterproof vehicle for indicating temp. by change of color at approx. 65° .

"Thermal mine" suitable for loosening ice accumulations, etc. JOHN H. DEFFELER (to Heat Research and Service Corp.). U. S. 1,695,089, Dec. 11. A thermite charge is arranged to be ignited by an internal igniting charge. Various structural features are described.

Emulsions, paints, insecticides, waterproofing compositions, etc. C. J. J. FOX. Brit. 289,122, Jan. 15, 1927. An NH_3 base such as NH_3 itself or an aliphatic amine is added to the oleic, palmitic, stearic or other soap of a metal, the hydroxide of which is solubilized by NH_3 , such as Zn, Cu or Ni. The resulting product, with or without addn. of a diluent such as water, may be used for dispersing glycerol, CS_2 , oils, rubber latex, pigments, dyes or color lakes (especially those formed from the metals mentioned), metallic salts, inert solids such as clay or kieselguhr and aq. and other solns. of substances such as salt, waxes, resins and fats. Several examples are given.

Waterproofing composition. WALLACE B. VAN ARSDEL (to The Brown Co.). Can. 284,377, Oct. 30, 1928. A waterproofing compn. which is hard, non-sticky and wax-like at ordinary temp., remains tenacious at about 100 – 140°F ., and tough at about 40 – 50°F ., is composed of a mixt. of about 40 to 70% petroleum asphalt, 15 to 40% paraffin and 10 to 30% of a finely divided filler (bentonite, fuller's earth).

Vermin-proofing compositions. SCHERING-KAHLBAUM A.-G. Swiss 126,358, Feb. 26, 1927. Powd. vermin-proofing compns. are rendered easier of application by a small addn., for instance 0.5–2%, of a water-insol. resin.

Foam for extinguishing fires. BRITISH DYESTUFFS CORP., LTD., and E. CHAPMAN. Brit. 289,630, April 25, 1927. Gas-developing reagents are used with "foaming agents" such as sulfonic derivs. of aldehyde-phenol condensation products, alkylated naphthalenesulfonic acids, sulfonic derivs. of sulfonatable mineral oil fractions b. above 200° , sulfonated alkylated mineral oil fractions, ligninsulfonic acid, naphthenic acids, taurocholic acid, sulfonated higher fatty acids or salts of any of these.

Fire extinguisher. "POLEO" FEUERLÖSCHAPPARATE G. M. B. H. Fr. 636,714, June 28, 1927. See Brit. 273,713 (C. A. 22, 2038).

Fire extinguisher. EXCELSIOR FEUERLÖSCHGERÄTE A.-G. and HANS BURMEISTER. Swiss. 126,506, Apr. 7, 1928. The extinguishing means comprises 2 or more chemicals which, with water, evolve gas and form a foam. Thus, Na_2CO_3 and $\text{Al}_2(\text{SO}_4)_3$ can be employed.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

The plasticity of clay. B. S. SHVETZOV. *Trans. State Expt. Inst. Silicates* (Moscow) 1927, No. 21, 15–20.—S. analyzes the Auerbach formula (F. Auerbach, *Plasticität und Sprödigkeit*, *Ann. Phys. u. Chem.* 45, 277(1892)) for plasticity. J. S. JOFFE

The effect of thermal shock on the transverse strength of fireclay brick. C. W. PARMELEE and A. E. R. WESTMAN. Univ. of Ill. *J. Am. Ceram. Soc.* 11, 884–95 (1928).—An app. is described by which a firebrick, initially at 1100° , could be subjected to local stress by cooling the center of one face with an air blast, the remaining surface being protected. The effect on 20 com. brands of brick was thus detd. Stiff-mud brick were more affected than dry-press or handmold brick. The more porous bricks were less affected. Bricks of high transverse strength were more affected than weaker bricks. C. H. KERR

Effect of heat treatment on diatomaceous earth. HOBART M. KRANER. *J. Am. Ceram. Soc.* 11, 875–83(1928).—Samples from several com. deposits were studied. The

diatom structure may be destroyed by heating without any indication of deformation of the material. There seems to be a direct relationship between chem. purity and retention of diatom structure, the purest being least easily affected. An air-float sample which was quite pure showed little deterioration up to 1300°. C. H. KERR

Manufacture of stoneware and flower pots in a small plant. FRANK A. KIRKPATRICK. *J. Am. Ceram. Soc.* 11, 896-903(1928).—Plant descriptions and formulas are given. C. H. KERR

Economical lime burning. O. WOLCEN. *Tonind.-Ztg.* 52, 1652-5(1928).—A general discussion, with descriptions of the patents (DRP): 357,420 and 358,295, of the firm of Heinrich Koppers of Essen for the use of air under pressure; 358,587 of the Allgemeine-Vergassungs-Gesellschaft m. b. H., Berlin-Halensee covering a furnace of large cross section; 459,950, Ludwig Riedhammer of Nuremberg, for a furnace with constructed upper part; and 458,374, A. B. Helbig, Berlin, for the use of coal-dust firing. F. O. A.

Silica in 1927. ESTELLE R. PHILLIPS AND J. A. DORSEY. Bur. of Mines, *Mineral Resources of the U. S. 1927*, Pt. II, 51-5 (preprint No. 7 published 1928). E. H.

The physical structure of refractory materials. THOMAS S. CURTIS. *J. Am. Ceram. Soc.* 11, 904-16(1928).—12 color plates. Relations between phys. structure and performance characteristics, particularly of *mullite*, are pointed out. C. H. K.

Abrasive materials in 1927. A. T. COONS, B. H. STODDARD AND J. A. DORSEY. Bur. of Mines, *Mineral Resources of the U. S. 1927*, Pt. II, 91-8 (preprint No. 11, published Nov. 8, 1928). F. H.

Report of the Enamel Division, Standards Committee, of the American Ceramic Society, 1927-28. E. P. POSTE, et al. *Bull. Am. Ceram. Soc.* 7, 347-67(1928).

C. H. KERR

Determination of Fe in silicates (VICKERS) 7. Metallic lead in red lead (HEINRICKS) 7.

The Glass Packer (New Journal) Vol. I. No. 1, Oct., 1928. Published by Ogden-Watney Publishers, Inc., at 117 Liberty St., N. Y. City. Published Monthly. Subscription price, \$2.00 domestic, \$3.00 foreign.

Glass. FRANCIS J. O. HOWE and MYER MISENER. *Brit.* 290,144, Jan. 23, 1928; *Can.* 285,240, Dec. 4, 1928. Splinterless or safety glass formed with a layer of transparent colloidal material interposed between the glass layers (cellulose acetate or cellulose nitrate) is immersed in a bath contg. a solvent (AcOH, AcOMe, a mixt. of alc. and ether, or commercial acetone) which converts the colloidal substance at the edges of the glass into a gel that is readily removable. The groove left by the removal of the gel is washed and then sealed with a suitable material.

Method and apparatus for forming charges of molten glass. LEONARD D. SOUBIER (to Owens Bottle Co.). U. S. 1,692,589, Nov. 20.

Use of barium silicate as an initial ingredient of glass-forming batches. FRITZ ROTHE and HANS BRENEK (to Rhenania-Kunheim Verein Chemischer Fabriken A.-G.). U. S. 1,694,831, Dec. 11. Ba silicate (suitably in a proportion of about one-third the amt. of sand used) is incorporated in glass-forming batches which may also contain sand, Na₂CO₃ and CaCO₃.

Manufacture of glass with barium sulfide as a batch ingredient. E. E. FISHER. *Brit.* 288,273, April 6, 1927. Formulas of batches suitable for making window glass, bottle glass and the like are given; the use of barium sulfide facilitates the satisfactory use of a greater proportion of Ba in the batch than when BaSO₄ is used as a sole source of Ba in similar batches.

Manufacture of clear transparent glass with barium sulfate as a batch ingredient. E. E. FISHER. *Brit.* 288,267, April 5, 1927. Batches are described contg. up to 4% BaSO₄ (based on the wt. of sand used) which are free from carbonaceous material or other reducing agents that would interfere with the use of Se decolorizing agents. Cf. C. A. 22, 1835.

Apparatus for feeding mold charges of molten glass. RICHARD LA FRANCE (to Owens Bottle Co.). U. S. 1,692,553, Nov. 20.

Apparatus for feeding mold charges of molten glass. KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,692,464, Nov. 20.

Apparatus for forming mold charges from molten glass. KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,692,858, Nov. 27.

Forming mold charges and molding and blowing glassware. W. J. MILLER (to W. J. Miller, Inc.). Brit. 288,342-3-4-5, Oct. 16, 1925. Various app. and mech. features are specified.

Machine for the automatic feeding of glass to molds. ALFRED BOUCHER and JAMES BOUCHER. Fr. 639,404, Jan. 19, 1927.

Device for controlling flow of molten glass. CHARLES B. KINGSLEY. U. S. 1,692,306, Nov. 20. A flow spout gate is formed with nested conduits through which a cooling fluid may be passed.

Apparatus for forming parisons from molten glass and treating them with cooling air blasts. JOHN E. McLAUGHLIN (to Owens Bottle Co.). U. S. 1,692,680, Nov. 20.

Down-flow apparatus for making sheet glass. JAMES C. BLAIR (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,615, Nov. 20.

Apparatus for drawing sheet glass. ARTHUR E. SPINASSE. U. S. 1,692,585, Nov. 20.

Apparatus for drawing sheet glass. JOSEPH A. REECE (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,569, Nov. 20.

Apparatus for drawing sheet glass from a mass of molten glass. NESTOR NAMBOURG (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,673, Nov. 20. Structural features.

Drawing and flattening sheet glass. ENOCH T. FERNGREN (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,548, Nov. 20. Mech. features. An app. is described.

Apparatus for producing sheet glass in continuous lengths. JOSEPH A. REECE (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,702, Nov. 20.

Continuous process of making plate glass. EDWARD T. BROWN (to Ford Motor Co.). U. S. 1,692,813, Nov. 27. Mech. features.

Laminated sheet glass. WILBUR F. BROWN (to Libbey-Owens Sheet Glass Co.). U. S. 1,692,619, Nov. 20. Structural features.

Tank furnace for glass manufacture. GENERAL ELECTRIC CO., LTD., W. W. WARREN and J. F. HYSLOP. Brit. 288,668, Dec. 13, 1926. Structural features.

Tunnel leer for annealing glassware. E. FRAZIER and J. SYLVESTER. Brit. 289,017, April 20, 1927.

Annealing glassware. UNITED GLASS BOTTLE MANUFACTURERS, LTD., E. A. C. PRYOR and F. A. HURLBUT. Brit. 289,501, Oct. 29, 1926. In annealing glassware in a tunnel kiln, the ware is cooled rapidly and uniformly from temps. considerably above the lower crit. annealing temp. by first subjecting the ware to the upper crit. annealing temp. and then passing it through a part of the leer where it is surrounded or enclosed at top, bottom and sides by material such as metal which permits rapid dissipation of heat. A leer construction is described.

Glass threads. CHEMISCHE FABRIK STOCKERAU DR. F. POLLAK. Brit. 288,978, April 16, 1927. Elec. resistance heaters are used for fusing the glass, which may be prepd. from cullet, and the glass may be discharged from nozzles also elec. heated.

Glass opaque to x-rays. SOCIÉTÉ ANON DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE SAINT-GOBAIN, CHAUNY ET CIREY. Fr. 639,768, Feb. 8, 1927. See Brit. 284,648 (C. A. 22, 4750).

Glass surfaces. THE ASAHI GLASS CO., LTD. Fr. 639,594, Aug. 17, 1927. Glass surfaces are protected against the action of the atm. by treating them with gases contg. large quantities of acid gases such as SO_2 , SO_3 , HCl , Cl or CO_2 .

Machine for cutting glass lenses. HENRI SARRAZIN. Fr. 639,707, Jan. 24, 1927.

Forming tank blocks for glass-melting tanks or other molded clay articles. ELBRIDGE J. CASSELMAN (to Window Glass Machine Co.). U. S. 1,692,887, Nov. 27. A clay slip is confined in the desired form with one face of the material in contact with material such as a porous clay block which facilitates absorption of moisture from the contacting face while absorption from other faces is retarded by super-atm. pressure and impervious retaining walls.

Drying "sanitary pipes" or other clay goods. G. O. LAWTON, S. DOWTHWAITE and ALBION CLAY CO., LTD. Brit. 289,225, March 15, 1927. After molding, the goods are heated in front of a fire for a few min. before the usual drying on a drying floor.

Clay bricks. RICHARD BÖHLIG. Fr. 636,972, July 4, 1927. Bricks or tiles are made by mixing bituminous schist powder with a plastic mass of porous clay and baking.

Light molded bricks or similar articles. JOSEPH A. BABOR and WM. L. ESTABROOKE. U. S. 1,693,015, Nov. 27. Exfoliated zonolite is used with a binder such as Na silicate.

Sintered magnesite brick. KARL HARR. U. S. 1,694,540, Dec. 11. Relatively pure natural magnesite is mixed with aniline oil residues (which serve as a binder) and the mixt. is sintered.

Kiln for firing bricks, tiles, etc. J. Moss and J. W. Moss. Brit. 288,383, Jan. 15, 1927. Structural features.

Wall and floor tiles. A. FEIST and F. L. KOPF. Brit. 288,867, July 18, 1927. Cold-glazed tiles or slabs are formed by mixing burnt magnesite, fine sand, pulverized talc and a pigment, adding $MgCl_2$ soln. and stirring to obtain a pasty mass, then kneading with a hardening material which may contain bituminous substances and fluosilicates, and allowing the mass to set in molds which preferably have a base of glass or celluloid. An example is given with proportions of ingredients.

Refractory material. VITREFRAX Co. Brit. 289,560, Feb. 1, 1927. Mullite contg. 72% Al_2O_3 and 28% SiO_2 is prepd. in an elec. furnace from a mixt. of minerals such as cyanite, andalusite, sillimanite or pyrophyllite with a quantity of approx. pure Al_2O_3 as required to give the specified compn. of the product. Where the product is to be used as a refractory lining to resist glasses or enamels of alk. silicate character, the porosity may be reduced by the use of Al_2O_3 contg. K_2O and P_2O_5 such as the residue left as a by-product in the recovery of potash from alunite. Various details are given.

Refractory materials. LOUIS LONGCHAMON. Fr. 639,419, Jan. 20, 1927. Powd. moist siliceous material such as quartzite or sand, with or without amorphous SiO_2 , is mixed with 1 to 10% Al_2O_3 and a small quantity of an alkali salt, molded and baked.

Refractory material suitable for use in brick or other form. RUSSELL E. LOWE (to Doherty Research Co.). U. S. 1,694,924, Dec. 11. A graded refractory aggregate such as zircon or magnesite is bonded with less than 1% of a highly adherent bond formed by the chem. pptn. of a hydrate such as Fe hydroxide in intimate adhering contact with the particles of the aggregate, substantially free from other substances formed at the time of the pptn.

Making hollow stay-bolts by rolling billets on refractory core inserts. GEORGE H. MANSFIELD. U. S. 1,693,487, Nov. 27. Cores of refractory material such as C, sand or fireclay are inserted into heated billets and removed after rolling.

Ceramics. KURT SCHENKEL. Ger. 468,170, Feb. 20, 1927. Porous artificial stone is prepd. from gypsum or other water-solidified material by suspending finely divided binding material, such as starch, in the water.

Casting ceramic slip. ARTHUR O. AUSTIN (to Ohio Brass Co.). U. S. 1,693,429, Nov. 27. In casting elec. porcelain or similar articles, a mold of porous material is filled with a ceramic slip, hydraulic pressure is placed on the material in the mold to facilitate passage of water from the slip to the mold and a layer of ceramic material is permitted to be deposited on the inner wall of the mold; the slip is then removed from the mold and its interior is filled with oil, wax or other suitable fluid under pressure to compress the deposited layer and render it more nearly uniform. An app. is described.

Glazes for ceramic ware. J. W. MELLOR and CERAMIC PATENT HOLDINGS, LTD. Brit. 288,679, Jan. 4, 1927. A leadless or practically leadless glaze consists of Cornish stone and about half its quantity of borocalcite or an insol. or but very slightly sol. Ca borate. There may also be added whiting, cryolite or fluorspar, china clay or Na silicate. Ground flint or ground sand also may be introduced into the glaze together with a pigment or opacifying agent such as Sn oxide. The glaze may also contain a small quantity of a Pb compd. such as Pb silicate.

Glazed ceramic products. WILLIS O. PROWTV (to American Encaustic Tiling Co., Ltd.). U. S. 1,693,252, Nov. 27. In forming glazed ceramic products having a surface of variegated color, a coating of glaze material of selected color is applied to the bisque, and over this coating there is then applied a coating of a glaze mixt. of a different color and contg. an insol. material such as starch or sawdust which will be eliminated by the firing of the glaze; a third coating of glaze mixt. is sprayed on and the product is fired.

Ceramic articles resistant to acids and to heat. M. HAUSER. Brit. 289,031, April 28, 1926. Powd. Si or ferro-Si (which may contain 90-95% of Si) is added to usual ceramic materials and when a high proportion of Si or ferro-Si is used there are also added easily fusible compds., such as borates or H_3BO_3 . Si or ferro-Si also may be used as a coloring agent mixed with glaze to produce a blue-black color on porcelain or stoneware.

Kiln with internal shelves for firing ceramic articles. BARTHOLOMEW H. GREENE. U. S. 1,694,650, Dec. 11. Structural features.

Molding plastic ceramic material such as deflocculated clay mixtures in vibrating molds. DONALD W. ROSS and JAMES M. LAMBIE. U. S. 1,694,563, Dec. 11. Mech. features.

Valve or tap for casting china or slip. J. NEWTON and T. SIMPSON. Brit. 289,172, Jan. 25, 1927.

Pottery. ÉTABLISSEMENTS MALMA. Fr. 639,415, Jan. 20, 1927. A pottery, etc., compn. contains S 46, plaster 20, cement 14, bitumen or asphalt 6, very fine sand 6, powd. kaolin 2, and powd. asbestos 6%. The proportions which can be used are not limited.

Abrasive wheels containing chopper sponge and a binder of rubber. GILDEROY O. BURLEW. U. S. 1,692,329, Nov. 20.

Aluminous enamel. FRIED KRUPP GRUSONWERK A.-G. Ger. 467,408, Nov. 3, 1925. Addn. to 437,242. According to Ger. 437,242, clays rich in SiO_2 are treated to reduce their SiO_2 content to a permissible amt., for instance by treatment with HF, with CaF_2 and H_2SO_4 , or with silicide-forming metals and a reducing agent. This method is now applied to other materials contg. Al and SiO_2 , such as marl, kaolin, slag or coal ashes, with which materials the reduction of the SiO_2 content may also be effected by addn. of Al_2O_3 and CaF_2 . An addn. of calcareous materials may also be made.

Enameling furnace. RANDAL E. TALLEY. U. S. 1,692,060, Nov. 20.

Ornamenting cast-iron articles. L. NANQUETTE. Brit. 288,617, April 14, 1927. Coatings of enamels of different colors are applied and fired, and the successive coatings are selectively etched with acid (photographic methods being employed in some cases).

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Criticism of the standard cement specifications for the determination of strength. BERTEL GRITLIN. *Tekniska Föreningens i Finland Förhandlingar* 48, 181-7(1928).—Tests have shown that the strengths of 2 different cements according to the standard specifications do not run parallel. Greater uniformity of results is obtained with larger water content, such as corresponds to practice, provided the setting time is reduced to 2-3 days instead of 28. The same uniformity may also be obtained if the standardized stamping and mixt. consistency is retained by increasing the cement:sand ratio. The anomalies of the standard tests are explained on the supposition that the binding and hardening processes proceed at different speeds in different cements.

HANS C. DUUS

Hydrated portland cement as a colloid. ALFRED H. WHITE. *Fifth Colloid Symposium Monograph* 1928, 349-60.—Portland cement is a mixt. contg. rather indefinite cryst. compds. and amorphous slag. When hydrated, only the external surfaces of the cement particles tend to react with the water, so that when dried, the cement becomes porous, and re-wetting causes formation of some new gel at the exterior of the particles, before swelling of the old gel prevents more water from penetrating. The swelling and shrinking of cement blocks as they are alternately wet and dried have been followed for over 20 years on the same specimen. With a burned clay brick the changes were only 0.02%, which is less than 0.1 those of cement. A cement bar was immersed in benzene under treatment calcd. to replace the water, as far as possible and later on the benzene was replaced with water again. The bar swelled once more, as the still unhydrated nuclei began to hydrate. Heat effects cannot be used to det. amt. of compression of water in cement capillaries, for each immersion means renewed chem. action. From calcns. based on increase in sp. gr., the water seems to be compressed to the order of half its vol. The adsorption of water may produce high external pressures, e. g., in pavements and structures exposed to the weather. Freezing satd. cement bars shortened them a trifle; perhaps the water was solid before frozen, or else under high pressure. [Cf. work of P. W. Bridgman on water under high pressures.]

JEROME ALEXANDER

The abrasion of cement and cement raw materials during sieve tests and the proper sieving times. HAEGERMANN. *Tonind.-Ztg.* 52, 1766-72(1928).—Prolonged sieving, especially, with machine shaking, tends to produce some abrasion of the material; also many of the larger grains are apt to pass through. A procedure similar to that specified by the Am. Soc. Testing Materials is proposed for standard sieving.

F. O. A.

The limiting concentration for the formation of Sorel cement. L. JESSER. *Tonind.-Ztg.* 52, 1676-7(1928).—The concn. of the MgCl_2 soln. absorbed in the hardening magnesia cement approaches a minimum, which depends on the nature of the MgO . This limit lies between 17° and 20° Bé. for com. magnesias.

F. O. A.

Deterioration of concrete by means of aggressive carbonic acid. KARL BIEHL. *Beton Eisen* 27, 371-3(1928).—Superficial attack of the concrete lining of a canal was laid to aggressive carbonic acid. The interior of the concrete was found to be in good

shape. The p_H of the waters coming in contact with the concrete varied from 5.8 to 7.6. F. O. A.

Study of the failure of concrete under combined compressive stresses. FRANK E. RICHART, ANTON BRANDTZAEG AND REX L. BROWN. Univ. Illinois, *Bull.* 26, No. 12, 102 pp.(1928). E. H.

Retrogressions in strength. HEINRICH LUFTSCHITZ. Materialprüfung anstalt, Dresden. *Tonind.-Ztg.* 52, 1697-9(1928).—Speculations about the connection between the change in vol. and strength of concrete during drying and soaking.

F. O. A.

The chemical reaction between trass and lime. A. STROPOF. Materialprüfung-samt, Berlin-Dahlem. *Tonind.-Ztg.* 52, 1609-12(1928); cf. *C. A.* 22, 4755.—Trass and lime were ground together and mixed with a little water and molded into a suitable specimen which was stored in a satd. atm. After 7, 30 and 56 days of storage the 1-g. sample was ground up and added slowly to 60 cc. cold HCl (1.12). After 10 min. it was filtered through an acidified filter paper and the M_2O_3 and SiO_2 were detd. in the filtrate. In 4 types of trass, the bulk of the reaction was complete in the first 30 days. The M_2O_3 dissolved was not proportional to the SiO_2 brought into combination.

Mechanism of the burning process in rotary kilns. ERNST RISSEL. *Pit and Quarry* 17, No. 4, 76-80(1928).—See *C. A.* 22, 3970. E. J. C.

Colloidal ferric hydrate in molding sand. CLYDE C. DEWITT AND GEORGE G. BROWN. *Fifth Colloid Symposium Monograph* 1928, 313-48.—This paper deals with the influence of a surface film of hydrated iron oxide on the bond in sand-clay-water systems. The strength is increased, and "synthetic" sands were made to prove this. The paper has much information which cannot be well abstracted. J. A.

Modern roads. F. KOUDELA. *Paliva a lopeni* 10, 103-9(1928).—A review of utilizable materials, particularly hydrocarbons, for road construction. F. M.

Asphalt emulsions and their use in road construction. INGVAR PEDERSEN. *Tekniska Föreningens i Finland Förhandlingar* 48, 199-205(1928).—Description of the use of asphalt emulsions in road construction in Copenhagen since 1925. H. C. D.

Slate in 1927. A. T. COONS. Bur. of Mines, *Mineral Resources of the U. S.* 1927, Pt. II, 81-90(preprint No. 10, published Oct. 19, 1928). E. H.

Determination of Fe in silicates (VICKERS) 7.

Anweisung für Mörtel und Beton der deutschen Reichsbahn. Berlin: Wilhelm Ernst und Sohn. RM. 4, net. Reviewed in *Tonind.-Ztg.* 52, 1713-7(1928).

Cement compositions. E. C. PALM and H. T. THORSSON. Brit. 288,003, Sept. 28, 1927. A compn. for making building blocks, tiles or other articles comprises a mixt. of portland cement and a pulverized material (other than asbestos) contg. hydrated Mg silicate such as chlorite and serpentine. Coloring substances or metal dust or fillings which give a desired coloring when oxidized may be added as may also small pieces of metal or carborundum.

Quick-setting cement. JOHN MAYES (to Mayes Bros. Tool Mfg. Co.). U. S. 1,693,488, Nov. 27. PbO is mixed with 8 times its quantity of "molding plaster" to form a compn. which makes a quick-setting cement with addn. of water, suitable for cementing "vials" in levels.

High-alumina cement. JOHAN A. BOUTHON and TURE R. HAGLUND. Can. 284,109, Oct. 23, 1928. Products contg. Ca aluminates are produced by melting together raw materials contg. CaO and Al_2O_3 , resp., removing wholly or partially the content of silicic acid in the raw material contg. Al_2O_3 by melting said raw material with reducing agents in the presence of a smaller quantity of raw material contg. CaO than is to be contained in the end product, and adding the rest of the raw material contg. CaO after the intended reduction of silicic acid has been concluded. The compn. of the charging materials is so adapted that the slag obtained in the reduction process will contain less than 20% CaO.

Slag cements. SVEN NICHOLSEN. Ger. 467,829, Mar. 14, 1926. Gypsum or other S compd. is added to slag under reducing conditions to increase its reactivity by the conversion of its MnO content into MnS. The lime content is then adjusted.

Calcining cement or burning lime. O. LELLEP. Brit. 288,192, April 2, 1927. The pulverized raw material is granulated, without addn. of fuel, and the granules are sintered to clinker in a rotary kiln after preliminary heating by waste gases from the

kiln. Granulation may be effected in a rotary drum to which water is supplied by a perforated pipe. For limestone, however, the granulating drum is unnecessary. Various app. features are described.

Curing concrete. DOZIER FINLEY and WM. L. RHOADES (to The Paraffine Companies, Inc.). U. S. 1,694,588, Dec. 11. The surface is overlaid with a porous sheet contg. water and this is covered with an impervious sheet.

Preventing leakage in concrete reservoirs. EUGENE R. ODEN. U. S. 1,693,094, Nov. 27. The walls of the reservoir are subjected to the action of a chilling agent such as ice and salt suddenly to lower the temp. of the material with resultant opening up of the weak places in the material purposely to produce cracks and the cracks are then sealed with a filling material before introduction of water into the reservoir to put it into regular com. use.

Mortar. ALBERT FLEXER. Fr. 639,637, Aug. 18, 1927. Mortar resistant to acid is made by adding a few % of org. substances such as hydrocarbons or alcs. to S, whereby the solidification of the S is made slower and its adhesion to concrete, wood or Fe is increased. Baryta or talc may be incorporated in the S.

Mortar. ALEXANDER FLEXER. Fr. 639,639, Aug. 18, 1927. Lime or cement mortar is made impermeable by the progressive decompn. of an alkali silicate in its pores with the increasing concn. of a precipitant such as alc. or phenol, the mortar acting as a dehydrant. In an example a mixt. of aq. solns. of an alkali phenol and alkali silicate are used for mixing the mortar.

Artificial stone. CAMILLE LANGLAUDE. Fr. 637,100, July 6, 1927. A light artificial stone is made from 3 parts sawdust, 1 of cement and a binder such as starch paste.

Artificial stone. KURT SCHENKEL. Fr. 639,823, Aug. 19, 1927. See Brit. 285,-470 (C. A. 22, 4757).

Artificial stone compositions. G. CONOD and F. C. F. LÉCOULTRE. Brit. 288,202, April 4, 1927. Cryst. CaCO_3 powder 30 is mixed with CaSO_4 or other binder 50 and with colloidal silica soln. 5 parts, to produce an imitation marble or the like which may be veined in the usual manner. The cryst. CaCO_3 may be produced by baking limestone fragments at 1200° in an elec. oven under 100 atm. pressure and disintegrating the hot mass by immersion in water, or by dissolving CaCO_3 in water satd. with CO_2 and reprecip. with Na_2CO_3 . The colloidal silica is obtained by dialysis of a mixt. of Na silicate and HCl solns.

Building slabs. CHARLES E. McMANUS (to Crown Cork & Seal Co.). U. S. 1,692,783, Nov. 20. A semi-fluid batch including granular material such as cork and a plaster cement is brought into a mold cavity in intimate contact with a previously formed thin sheet composed of granular cork and a binder such as a glue or albumin compn. and subjected to light pressure during setting to effect bonding with the sheet.

Paving blocks faced with rubber or other elastic material. COMPAGNIE FRANÇAISE DU CAOUTCHOUC. Brit. 289,087, April 23, 1927. Structural features.

Paving blocks comprising rubber composition layers or other materials. J. S. COWPER. Brit. 288,896, Jan. 7, 1927. Structural features.

Building material. VICTOR M. GOLDSCHMIDT, ROLF KNUDSEN and KRISTOFFER STONVIK. Can. 285,241, Dec. 4, 1928. A building material consists of a mixt. of particles of natural olivine with materials which are capable of forming Mg_2SiO_4 . E. g., a powd. or granular mixt. which consists predominantly of olivine rock and also contains talc serpentine or the like and calcined caustic magnesite in proportions which are adapted for the formation of Mg_2SiO_4 , is thoroughly wetted or made plastic by incorporating water, if necessary also organic binding agents, as sirup, and is shaped by the aid of pressure. The shaped pieces are calcined at $1300\text{--}1500^\circ$.

Wall-texture composition. EDWARD E. STAHLHUT. Can. 283,881, Oct. 2, 1928. A wall-texture compn. comprises 37 lbs. of powdered natural clay (contg. SiO_2 60.50, Fe oxide 2.14, Al_2O_3 22.58, CaO 3.75 and MgO 1.87%), 37 lbs. of plaster of Paris, 21 lbs. of powdered whiting, 5 lbs. powdered casein glue, sufficient cold water to make a thick plastic mortar and 2.5 quarts of boiled linseed oil.

Laminated flooring material comprising layers of rubber, asbestos cement, etc. VICTOR LEFEBURE. U. S. 1,694,476, Dec. 11.

Filling and polishing the surfaces of cement-bonded asbestos articles such as asbestos board. JOHN C. MACILDOVIE (to Asbestos Wood and Shingle Co.). U. S. 1,695,253, Dec. 11. The surface interstices are filled with very finely comminuted material such as polishings of the same compn. as the cement-bonded asbestos surface.

Apparatus for seasoning wood with ozone. GUSTAVE LYON. U. S. 1,698,486, Nov. 27.

Impregnating wood. COMPAGNIE FRANÇAISE DES ÉTABLISSEMENTS GAILLARD. Fr. 639,100, Aug. 5, 1927. Wood is preserved by 2 successive injections, the first of an aq. soln. of CuSO_4 or the like, and then of an antiseptic such as creosote. An energetic drying in a closed vessel by warm air is made between the 2 injections.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Pulverized fuel and its various fields of application. GEO. E. K. BLYTHE. The Buell Combustion Co. *Mining Journal* 163, 975-6(1928); cf. C. A. 22, 3380.—B. reviews the principles behind combustion, especially of powd. coal. Its application to metallurgical heating has greatly increased the efficiency of certain processes. A certain furnace using 37.5 cwt. of coal and requiring 10 hrs. to complete the process by hand firing now uses only 11.5 cwt. of powd. coal and completes the process in 7 hrs. Another non-ferrous reverberatory furnace with a throughput of 9 tons of metal per 24 hrs. and consuming 4 tons of hand-fired coal now produces 15 tons per day using 3 tons of powd. coal. Installations for burning powd. coal are briefly described, particularly equipment for its transportation. Advantages of the drying of the coal are discussed.

ALDEN H. EMERY

Low-temperature carbonization at Dunston power house. R. P. SLOAN. *Engineer* 146, 411-3(1928).—Summary of a paper read before the World Fuel Conference, 1928. From 2240 lb. of coal costing 12s. can be obtained by distn. of volatile constituents 1.0 gal. (= vol. of 10 lb. H_2O) *motor spirit*, value 1s 2d.; 1.0 gal. *white spirit*, value 1s. 1d.; 1.43 gal. *paraffin*, value 5.36d.; 6.88 gal. *creosote*, value 4s. 8.76d.; 5.0 gal. *pitch*, value 2s. 2.90d.; 0.507 gal. *cresylic acid*, value 10.14d. *Semi-coke* and *gas* have a value of 9s. 1.44d. so that if the cash value of the raw coal is 100, the volatile constituents have a value of 87 and the non-volatile, 76. Also in *Engineering* 126, 787-8(1928).

D. B. DILL

Crystalline phenols of brown-coal tars. FERD. SCHULZ AND JEAN PRUNET. *Paliva a Topeni* 10, 61-7(1928).—During the study of tars and oils of coal from the mine Karel in Cukmantel, Bohemia, over 3.5% of crystallizable phenols were obtained from an oil fraction b. 200-300°. Besides pyrocatechol the fraction showed a yield of substances with a higher b. p. and lower m. p. These substances crystn. with difficulty from oil and were pptd. only by following a definite procedure. Washing with NaOH soln. is to be avoided. The substances were washed with dil. AcOH, and the washings were treated with $(\text{AcO})_2\text{Pb}$ and filtered. Pyrocatechol remained in soln. with the excess $\text{Pb}(\text{AcO})_2$. The ppt. was washed and redissolved in HCl. The PbCl_2 formed together with many liquid phenols which prevent crystn. are extd. The residue b. 250-60° and solidifies immediately into dendritic chalk-white forms which form a network. Fractional crystn. yielded a product m. 59° and b. 254-7°, indicating a mixt. of dihydroxybenzene and methylenedioxybenzene. Pyrocatechol crystallizes from unrefined oils into individual transparent crystals. Chemically, the residue reacts as pyrocatechol. S. considers it higher homologs of pyrocatechol.

FRANK MARESH

Present status of gas appliances and its significance for gas works. F. FREI. *Gas. u. Wasserfach* 71, 1064-70, 1084-90(1928).—Most dissatisfaction with gas is due to defective equipment. Burners must be adjusted to give the size and type of flame best adapted to the special purpose, and with a min. quantity of CO. Thin wooden plates were used to secure "pictures" of typical burner flames. Photographs of these are shown and discussed. Striking back of burners occurs when the velocity of ignition of the gas is greater than the rate at which gas leaves the burner. This velocity is especially high with water gas and the equipment should permit rather wide variations in the percentage of water gas without "striking back." Methods of testing the uniformity of baking ovens are given and curves for temp. shown. The use of gas at pressures above normal is also discussed.

R. W. RYAN

Use of gas in large industries. JEHNIGEN. *Gas u. Wasserfach* 71, 1090-5(1928).—The use of gas in the manuf. of wrought iron, hardening and tempering sheet steel and small parts is discussed and illustrated, with especial respect to continuous operation.

R. W. RYAN

Liquid purification (removal of sulfur from gas). FERBERS. *Gas u. Wasserfach* 71, 1133-7(1928).—Dry methods of removing sulfur from gas are comparatively expensive and require excessive ground space. The method described by Glauud and Schönfelder (C. A. 21, 3264) for purifying coal gas contg. ammonia depends on an Fe

hydroxide suspension in a weak NH_3 soln. In a plant erected at Waldenburg, Germany, purifying gas substantially free from NH_3 , this method, modified by the use of a Na carbonate suspension of Fe hydroxide has been used to purify daily about 2,500,000 cu. ft. of gas contg. about 0.2 g. H_2S per cu. ft. to a content of less than 0.0002 g. per cu. ft. In a 14-day trial the av. removal of H_2S was 99.97%, and the cost about 1¢ per 1000 cu. ft. of gas treated, without credit for the S produced in this way. This is about twice the cost of purifying gases contg. NH_3 , as previously estd. Itemized costs are given.

CHAPMAN, W. R., AND MOTT, R. A.: The Cleaning of Coal. London: Chapman and Hall. 680 pp. 42s, net. Reviewed in *Fuel Economist* 4, No. 37, 59; *Gas. J.* 184, 536 (1928).

Technical data on fuel. Edited by H. W. Spiers. London: World Power Conference. Reviewed in *Fuel Economist* 4, No. 37, 59 (1928).

Fuel. EDOUARD GOUTAL and HENRI HENNEBUTTE. Ger. 468,019, April 22, 1925. Briquets of a greater solidity are made from shrunken and crude lignite by mixing with pyroligneous acid and tar and heating to under 700°.

Fuel. WILHELM GROTH. Ger. 467,274, Jan. 1, 1925. Damp crude lignite is prepd. for fuel by treating it with colloidal mucilage, pressing and drying.

Fuel. SOC. ANON LE CARBONE. Swiss 126,647, April 22, 1927. Heavy liquid fuel is rendered more suitable for motors using light fuel by passing the liquid over a catalyzer such as C to decomp. it.

Fuels, ores, etc. EMIL KLEINSCHMIDT. Ger. 467,275, Nov. 7, 1926. The powd. materials are formed into briquets by causing a current of the powder to meet a stronger current of binding material, which carries the powder along to be subsequently dried and pressed.

Gaseous fuel. KENNETH GORDON (to the Imperial Chemical Industries, Ltd.). Can. 284,248, Oct. 23, 1928. Finely divided coke of good quality (i. e., low in ash and volatile matter) is blown together with steam through a "Staybrite" tube 30 ft. long and 1/4" diam. heated externally to about 1000°. The rate of flow of gas through the tube is about 30 ft. per sec. giving a time contact of about 1 sec. A slight excess of steam to coke is employed. A high-grade water gas is produced, contg. H 51, CO 48, and CO_2 1%. It contains no hydrocarbons.

"Smokeless fuel." CHEMISCH-TECHNISCHE-GES. Brit. 288,235, April 7, 1927. Small pieces or fine particles of anthracite or lean coals are mixed with bituminous fuel (such as a "swelling coal" contg. 30% of volatiles) and the mixt. is heated (at various temps. between 500° and 1200°) to form "smokeless fuel" in coarse lumps. Gas and tar may be recovered.

Liquid fuel for internal-combustion engines. P. G. SOMERVILLE and W. H. HOFFERT. Brit. 289,347, Oct. 27, 1926. Fuels such as "motor-benzole," benzine, gasoline, "petrol," "cracked petrol," heavy oils, "spirits obtained by low-temp. carbonization" and "synthol," contg. resin-forming constituents, have their resin-forming tendency inhibited by the addn. of a small proportion of substances such as phenols, cresols, aminophenols, PhNO_2 or RhNH_3 . About 0.05% of the added substance may

be effective. The fuel may be tested for stability by exposure to ultra-violet rays and the latter may be standardized and their effect estd. by their action on a KI soln.

Motor fuel. LESTER KIRSCHBAUM. U. S. 1,692,176, Nov. 20. A homogenized emulsion comprises gasoline or similar fuel, an org. acid NH_4 product such as NH_4 naphthenate as an emulsifying agent and water (the latter being in the dispersed phase). This fuel is stated to "reduce" deposition of C in the engine cylinders.

Hydrocarbon motor fuel. JOHN W. ORELUP and O. IVAN LEE (to Boyce-Itte Products, Inc.). U. S. 1,692,784, Nov. 20. About 0.1% of ethyl laurate, oleate, palmitate or stearate or other suitable ethyl esters of higher aliphatic acids are added as a C-removing agent.

Fuel briquets. JEAN M. P. SILVE. Fr. 639,792, May 27, 1927. Lime is slaked with water mixed with sawdust and small coal and powdered, molded and dried.

Filters especially for benzene or other fuels. SOCIÉTÉ DU CARBURATEUR ZÉNITH. Fr. 636,680, Oct. 23, 1926.

Thermostatic fuel supply device for "constant temperature" internal-combustion engines. ALEX TAUB (to General Motors Corp.). U. S. 1,694,759, Dec. 11.

Igniting composition for starting internal-combustion engines of the injection type. MOTORENFABRIK DEUTZ A.-G. Brit. 289,400, April 26, 1927. An igniting mixt. may be formed from KClO_3 , 6, S 1, and C 1 part, mixed with a glutinous soln. and dried on wood, paper or other slow-burning fibrous material which may be impregnated with KNO_3 or KClO_3 .

Carbonizing low-grade fuel such as peat, wood or shale. M. MIGEON. Brit. 288,335, April 8, 1927. The material is predried by the waste heat of the plant, distd. externally or internally or by both methods at low temps. while undergoing a mixing or kneading movement, and then distd. at a high temp. in vertical retorts, and the distillates of the different zones are collected separately. An app. and numerous details are described.

Conversion of carbonaceous substances into liquid products. MATHIAS PIER, MAX WILDHAGEN and WALTER SCHUNCK (to I. G. Farbenind. A.-G.). Can. 283,921, Oct. 9, 1928. Coal, tars and mineral oils are hydrogenated by preheating H to about 400° and then circulating it through the jacket of a reaction chamber, and elec. heating the H to a temp. above the reaction temp. before admitting it to the reaction chamber, admitting the carbonaceous material heated to a temp. approaching the reaction temp. and under pressure of 200 atm. into the reaction chamber to react with the H.

Combustible liquids. LES CARBURANTS ÉCONOMIQUE SOC. ANON. Swiss 126,586, Nov. 15, 1926. The combustibility of such liquids as animal, vegetable and mineral oils is increased by the addn. of a small quantity of such org. compds. as are contained in the essential oils. Thus, essence of terebenthine and cymene may be added to gasoline. Other examples are given.

Hydrocarbons by hydrogenation. STANDARD DEVELOPMENT CO. Fr. 639,681, Aug. 19, 1927. Carbonaceous materials contg. a large proportion of ash are very finely ground and mixed with a hydrocarbon oil and water, whereby the ash is sepd. with the water. The resulting material impregnated with oil is hydrogenated in the usual manner with a catalyst.

Apparatus for damping fuel before it enters heating furnaces. ERICH ROUCKA. Fr. 639,120, Aug. 5, 1927.

Burner for heavy fuels such as mazout. ALBERT FÈVRE and WILLIAM-ALEXANDRE SAINT-MARTIN. Fr. 639,417, Jan. 20, 1927.

Burner for heavy liquid fuels, particularly naphtha oils. RENÉ ZANTIOLI. Fr. 639,131, Aug. 5, 1927.

Fuel from pulverized coal. WALTER E. TRENT (to Trent Process Corp.). U. S. 1,693,356, Nov. 27. Pulverized coal having a substantial volatile content is heated to remove volatiles in sufficient quantity to entrain and carry in suspension fine carbonaceous particles.

Apparatus for powdering coal. WALTHER & CIE A.-G. Fr. 639,127, Aug. 5, 1927.

Apparatus for drying fuel, particularly coal dust. ROMAN TERDICH. Ger. 467,949, May 6, 1925.

Inclined rotary kiln and drier suitable for treating coal, slack, etc. FRED A. JONES. U. S. 1,694,708, Dec. 11.

Apparatus for drying coal or similar materials. REGINALD F. KRALL (to Woodall-Duckham (1920), Ltd.). U. S. 1,695,193, Dec. 11.

Berginization of coal. SOCIÉTÉ INTERNATIONALE DES COMBUSTIBLES LIQUIDES. Fr. 639,240, Aug. 9, 1927. The insol. substances are sepd. from the crude oil obtained

from the berginization of coal by adding naphthalene or like hydrocarbon. An absorbent such as fuller's earth may also be added.

Berginization of coal. SOCIÉTÉ INTERNATIONALE DES COMBUSTIBLES LIQUIDES. Fr. 639,241, Aug. 9, 1927. A higher yield of oils is obtained by berginizing different kinds of coal together.

Carbonization of coal. WALTER RUNGE (to The International Combustion Engineering Corp., to The International Coal Carbonizing Co.). Can. 284,065, Oct. 16, 1928. Pulverized coal is preheated for a period not exceeding 60 sec. by a gaseous medium of temp. between 500° and 700° F.; the preheated coal is then mixed with raw pulverized coal and the mixt. subjected for a period not exceeding 60 sec. to the carbonizing action of a hot gaseous medium the temp. of which is approx. 1000° F. Cf. C. A. 22, 2259.

Liquid products from coal, tar, etc. MATHIAS PIER and WILHELM RUMPF (to I. G. Farbenind. A.-G.). Can. 283,916, Oct. 9, 1928. Coals, tars, mineral oils, etc. are converted into liquid products by treatment with reducing gases contg. CO under elevated pressure and at high temp. in app. the surfaces of which coming in contact with the high-pressure gases are made of Al or alloy thereof, Cr, Mn, V or U or of special steels contg. a considerable percentage of Mn, Ti, Cr, W, V or Mo or of alloys corresponding to special steels contg. Ni or Co instead of Fe. For the moderately heated parts Cu, Ag or even low-melting metals as Sn, Zn, Pb or their alloys may be used. Since the app. is heated to temp. of at least 150° the metals used should be resistant to S.

Removing hydrogen sulfide from coal or water gases. WM. E. LEUCHTENBERG. U. S. reissue 17,162, Dec. 11. See original pat. 1,629,396 (C. A. 21, 2181).

Absorption of hydrogen sulfide and ammonia from gases. CHRISTIAN HANSEN (to I. G. Farbenind. A.-G.). Can. 284,390, Oct. 30, 1928. H₂S and NH₃ are absorbed from gases by washing in a first stage either with a thiosulfate soln. with the addition of SO₂ or gases contg. SO₂ or a polythionate soln. to remove the greater part of the H₂S and NH₃, and in removing the remainder of the H₂S in a second stage by washing with a neutral or weakly alk. NH₄ polythionate soln. or by washing with (NH₄)₂SO₄-NH₄HSO₄ soln. Cf. C. A. 22, 2830.

Gasifying coal, coke or other similar fuels. O. GROSS. Brit. 289,080, April 28, 1927. In order to produce a gas suitable for use in NH₃ synthesis, a mixt. of air, O and water vapor is used and a gas mixt. is obtained contg. H, CO, N and hydrocarbons. This mixt. is purified and its H content is increased by treatment with O, the hydrocarbons are converted into CO and H and the CO is removed. For treating the gases with O, a chamber is used filled with materials such as refractory substances carrying oxides of alk. earth metals, oxides of Fe, Cr or Mn, Pt or coke.

Oil by low-temperature distillation and hydrogenation. RICHARD FRIGE. Fr. 636,609, June 27, 1927. In a process for the production of oils by the distn. of coal and hydrogenation, part of the coke is used to produce an elec. current which is used for the electrolysis of H₂O, the other part is gasified by the electrolytic O, and the gas thus produced, with the tar and distn. gas, is hydrogenated by the electrolytic H.

Vertical retort and associated apparatus for obtaining gas and oil from waste. ALEXIS NAERT. U. S. 1,693,456, Nov. 27. An app. is specified suitable for treating wood shavings or waste paper.

Distillation apparatus. JOSEF PLASSMANN (to Chemisch-Technische Gesellschaft m. b. H.). Can. 285,352, Dec. 4, 1928. App. for the low-temp. distn. or coking of fuel is specified.

Apparatus for distilling carbonaceous material. EDOARDO M. SALERNI (to E. M. S. Industrial Processes, Ltd.). Can. 284,406, Oct. 30, 1928.

Distilling ammoniacal liquor. SOUTH METROPOLITAN GAS CO., P. PARRISH, F. C. SNELLING AND O. W. WEIGHT. Brit. 288,436, April 13, 1927. The waste gases from coal-carbonizing retorts are used for recovering the NH₃ from the ammoniacal liquor by passing them through a setting contg. a waste-heat boiler and a tubular heater. The ammoniacal liquor is preheated in the tubular heater and then passed through a still, where the NH₃ is distd. off by steam generated in the boiler with addition of milk of lime. The app. is described.

Recovery of ammonium salts and phenols from waste liquors. WALTER R. KNAPP (to The Semet-Solvay Co.). Can. 284,086, Oct. 16, 1928. Waste liquors from a coal-carbonization plant are treated to recover products therefrom by scrubbing the products of distn. evolved in the carbonization of coal with liquor, removing the tar from the scrubbing liquor, treating the tar-free liquor with benzene to ext. benzene-sol. material, distg. the phenol-free liquor to remove free NH₃, successively evapg. the aq.

condensate freed of volatile NH_3 from the aforesaid step to recover NH_4Cl , $(\text{NH}_4)_2\text{S}_2\text{O}_8$ and NH_4CNS , and returning any residual liquor after evapn. to a former step.

Montan wax from lignite. A. RIEBECK MONTANWERKE A.-G. Brit. 288,197, April 4, 1927. Moist or dried lignite is treated with a solvent such as benzene (suitably at a temp. of 90° and under 1.5 atm. pressure).

Montan wax from lignite. A. RIEBECK MONTANWERKE A.-G. Brit. 288,258, April 8, 1927. In extg. montan wax from lignite by a solvent, the preliminary drying of the material is assisted by treating it with the steam and solvent vapors obtained when the ext. is distd. and the residual solvent recovered from the lignite. The steam and vapors may be passed through a dust separator before they enter the dryer.

Vertical retort for distilling lignite or other carbonaceous material. R. W. EASTON. Brit. 288,700, Jan. 11, 1927. The retort is divided into chambers by longitudinal partitions which act as conductors of heat into the charge. Steam is withdrawn from outlets at the top and distillates are withdrawn at a lower level.

Purification of gases. FRIEDRICH SIEMENS A.-G. Fr. 639,693, Aug. 19, 1927. Gases such as coke-oven or producer gas are purified by passing them over metals which combine with S such as Fe, Ni, Co, Cu, Pb, Ag, or Mn, whereby the H_2S is converted into SO_2 and cyanogen compds. are converted into NH_3 . Cf. C. A. 22, 2457.

Thiocyanate of the alkaline earth metals. ROBERT R. FULTON (to The Koppers Co.). Can. 284,068, Oct. 16, 1928. Alk. earth metal thiocyanate from gas-purification liquor is obtained by treating the liquor with a sol. alk. earth metal salt, heating the liquor, cooling, and filtering, treating the filtrate with a reagent capable of pptg. colloidal and coloring matter, re-filtering the liquor to remove the ppt. thus formed, evapg. the filtrate to a sp. gr. of approx. 1.4, allowing it to cool, filtering and evapg. the filtrate.

Gas generator. JACQUES G. SCHULZ. Fr. 636,690, Oct. 25, 1926. A gas generator with reverse draft has an air feed coming into the center of the fuel and open toward the bottom.

Gas producer with solid fuel such as wood charcoal. ERNEST BOUCHER. Fr. 636,746, June 23, 1927.

Gas producer using wood, wood shavings or sawdust. JEAN LERAT. Fr. 637,140, Oct. 29, 1926. Constructional details to prevent formation of tar and to restrict the area of combustion are given.

Gas producer for finely divided fuels. PAUL JAWORSKI (to the Firm Bismarck-hütte). U. S. 1,693,483, Nov. 27. Structural features.

Gas producer construction. FREDERICK L. DUFFIELD. U. S. 1,692,724, Nov. 20.

Gas-producer construction and operation. W. M. CROSS. Brit. 289,491, April 28, 1927. Producer gas is generated by subjecting powd. carbonaceous material to a mixt. of air and steam-heated to above the reaction temp. (suitably to about 1100°). An app. is described.

Apparatus for use as a gas producer, burner, or for low-temperature carbonization or drying dust or granular materials. I. G. FARBENIND. A.-G. Brit. 288,491, Oct. 8, 1927. The app. comprises a narrow cylindrical chamber, to which, when operated as a gas producer a gas such as air is supplied tangentially through nozzles. A steam nozzle is also provided and powdered fuel may be fed into the chamber tangentially. When used as a burner, secondary air is supplied through other pipes. Solid residue and distillates may be passed successively to a cyclone separator, dust extractor, condenser and tar separator.

Apparatus for smoothing or leveling charges in gas producers or like apparatus. L. VAN GULCK and A. M. FOURLINNIE. Brit. 288,281, April 9, 1927.

Residual berginization gases. SOCIÉTÉ INTERNATIONALE DES COMBUSTIBLES LIQUIDES. Fr. 639,243, Aug. 9, 1927. The gases absorbed by the washing oils used to sep. H are evacuated from the oil and heated in the presence of catalysts to a temp. between 450° and 1000° to obtain valuable liquid hydrocarbons. Water gas, producer gas or NH_3 may be added to the gases.

Water gas. N. J. BOWATER. Brit. 288,797, March 17, 1927. In a continuous process, pulverized fuel such as coal or coke is showered from the top of an app. counter-current to steam introduced at the bottom and heat for the reaction may be supplied through a hollow heating cylinder extending vertically through the central portion of the gasifying chamber. Various details are described and an app. is illustrated.

Water gas. O. MISCH. Brit. 288,426, March 21, 1927. In generating water gas from bituminous fuel, the lower end of the preliminary distn. retort is heated externally by a compressed air-water gas burner with baffles or by oil or coal-dust burners or other means so as to effect an intensive local heating of the contents of the lower portion of

the retort to above 700° with the temp. decreasing to about 250° toward the charging hopper. An app. and various other details of operation are described.

Water gas; ammonia. IMPERIAL CHEMICAL INDUSTRIES LIMITED. Fr. 639,683, Aug. 19, 1927. Water gas is prepd. by treating carbonaceous material with steam, with or without air or O, the heat necessary being supplied externally through a heat-resisting metal such as "Staybrite," "Era/A. T. V." or V2A. If air is mixed with the steam a gas contg. CO, H and N is obtained, which after elimination of CO may be used for producing NH₃.

Water-gas apparatus. J. PINTSCH & DR. OTTO GKS. (to Chamber Ovens, Ltd.). Brit. 289,058, April 21, 1927. In operation of a vertical gas-producing chamber, steam is introduced through pipes and flexible connections which are described and thence through jets to a space between the bottom door and a protective hood provided with slots for even distribution of the steam to the charge.

Water-gas plant. POWER-GAS CORP., LTD., and N. E. RAMBUSH. Brit. 288,463, July 6, 1927. A tubular steam superheater is employed having its tubes covered with non-metallic protective material of high heat-storage capacity such as fire clay or terra cotta. During the "blow," gases from a generator are burned with air in the superheater and the combustion gases are used to heat a waste-heat boiler. During the "run" water gas passes through the superheater and waste-heat boiler to an outlet pipe and steam passes to the superheater and thence to the generator. Various details of construction of the app. are described.

Apparatus for the production of water gas from bituminous substances. HAROLD NIELSON and BRYAN LAING. Fr. 636,750, June 25, 1927.

Producing mixed coal gas and water gas. W. SCHWEDER. Brit. 288,336, April 6, 1927. Glowing coke from a coke oven is transferred to a water-gas generator in which it is gasified and the water gas thus produced is then mixed with the coal-distn. gas. An app. and details of procedure are described.

Purifying oil gas. C. CHILOWSKY. Brit. 288,305, April 8, 1927. The cloudy product or gas formed by partial combustion of heavy oils for supplying internal-combustion engines is suddenly cooled at the generator outlet to temps. below that of condensation of the tars. Cooling and purifying agents such as water or gas oil may be used to sep. condensed products and may be circulated through a cooler and returned to the washing app. An app. and various details of procedure are described. Cf. C. A. 22, 3523.

Removing acetylene from gases by catalytic treatment. GKS. FÜR LINDE'S EISMACHINEN A.-G. Brit. 288,216, April 4, 1927. Gases such as air or coke-oven gases are passed over catalysts such as Ni, Cu, Fe or Al or their oxides or partially dehydrated hydroxides of Fe or Al at temps. of 100–400°. In the presence of H, the C₂H₂ is hydrogenated mainly to C₂H₄ or may be polymerized into higher hydrocarbons, and in the absence of H the C₂H₂ may be decompd. into C and H. An app. with regenerative heat-exchange system is described.

Use of catalysts in carburetors. SOC. ANON. LE CARBONE. Brit. 288,588, April 13, 1927. A chem. decompn. of "volatile spirit" is effected by the action of a catalyst, such as tubes of active C exposed to exhaust heat or Cu wire or metal shavings, heated to 300–400°. An app. is described.

Benzene from coke-oven gas. GESELLSCHAFT FÜR LINDE'S EISMASCHINEN A.-G. Fr. 639,615, Aug. 17, 1927. In the recovery of benzene from gas by compression followed by expansion, glycol or isopropyl alc. is used as lubricant for the expansion app. to dissolve the solids which sep. Cf. C. A. 22, 2662.

Purifying benzene fractions. FIRM OF C. STILL. Brit. 288,591, April 13, 1927. Benzene fractions, directly after their production and before any oxidation can occur, are treated with caustic alkali to free them from S. An app. is described.

Horizontal gas-retort setting, etc. R. W. BROADHEAD. Brit. 289,123, Jan. 17, 1927. Structural features.

Distilling tar. S. P. MILLER (to Barrett Co.). Brit. 288,270, April 6, 1927. Tar to be distd. is sprayed into contact with hot coal gases as they pass from the retorts to a collector main and the resulting gases and vapors while still hot are purified by elec. pptn. and the oils are then condensed by cooling. An app. and various details of procedure are described. Cf. C. A. 22, 4779; 23, 266.

Distilling tar. S. P. MILLER (to Barrett Co.). Brit. 289,023, April 20, 1927. Tar is distd. by spraying it into contact with hot gases produced from a battery of coal ovens or retorts, and the gaseous products are scrubbed with tar or pitch to give clean gases from which the oils are subsequently condensed, while pitch is obtained from the scrubbing operation. An app. is described. Cf. C. A. 22, 4779; 23, 266.

Apparatus for dehydrating tar by steam-jet atomization. ROGER CRILLY. U. S. 1,693,549, Nov. 27.

Pitches from coal distillation. G. E. McCLOSKEY and W. B. WINGERT (to Barrett Co.). Brit. 289,378, April 25, 1927. Pitches with high and low free C content are separately obtained from coal-distn. gases by separately collecting the lean and rich gases leaving the retorts during the later and earlier stages, resp., and cleaning them as by elec. pptn. at a sufficiently high temp. to sep. the pitch while leaving a considerable part of the oils in vapor state for subsequent condensation. An app. is described.

Coking pitch. FREDERICK W. SPERR, JR. (to Koppers Co.). U. S. 1,694,800, Dec. 11. A mixt. of pitch, bauxite and coke breeze derived for the carbonization of coal is subjected to a coking temp. The resulting coke is suitable for making *electrodes for elec. furnaces*.

Coke. ALUMINUM COMPANY OF AMERICA. Swiss 126,574, Jan. 29, 1927. See U. S. 1,671,673 (C. A. 22, 2657).

Semi-coke. S. STERNBERG (to Chemisch-Technische Ges.). Brit. 288,264, April 6, 1927. In order to produce semi-coke with ash of a desired compn., the fuel is mixed with fluxes of such character that during heating no reaction takes place between them and the original ash constituents. Oxides of Fe, Al or Mn may be added and various types of fuels such as siliceous and calcareous coals may be mixed with each other. Fluxes used favorably affect the yield of tar, and distn. is effected at about 500–700°.

Vertical coke-oven construction. J. VAN ACKEREN (to Koppers Co.). Brit. 288,558, April 12, 1927.

Vertical-chamber coke-oven construction. CARL OTTO. U. S. 1,695,204, Dec. 11.

Coke-oven and gas-retort operation. J. PINTSCH & DR. OTTO GES. Brit. 288,337, April 7, 1927. The excess gas pressure in the lower part of freshly charged coke ovens or vertical retorts is relieved by connecting the ovens through pipes provided with valves so that the high gas pressure in one oven is relieved by the passage of gas through the pipes to another oven in which the charge has been nearly completely coked. When the coking in a retort has sufficiently proceeded, the valve from this retort is closed so that the retort then operates independently. Various structural features are described.

Coke-oven and regenerator construction. KOKSOFFENBAU UND GASVERWERTUNG A.-G. Brit. 288,538, April 11, 1927.

Coke-oven discharging apparatus. J. A. B. LOVETT (to Koppers Co.). Brit. 288,566, April 12, 1927.

Apparatus for leveling charges in horizontal coke ovens. J. I. THOMPSON (to Koppers Co.). Brit. 288,622, April 15, 1927.

Removing graphite incrustation from coke ovens and similar apparatus. G. CAPIAU, M. GAUQUIER AND L. LAHAUT. Brit. 289,308, Aug. 10, 1927. See Fr. 638,439 (C. A. 23, 266). The hot incrustation is subjected to a jet of compressed air carrying a hard powd. or granular material such as plumbago or crushed slag, and the incrustation is cut into blocks which can be readily loosened and knocked off.

Automatic control system for coke-quenching apparatus. CHARLES HYMAN. U. S. 1,695,105, Dec. 11.

Method of charging coke furnaces to avoid the escape of gas and smoke into the air. THE KOPPERS COMPANY. Fr. 636,604, June 27, 1927.

Vented storage receptacle for hot coke. J. S. HAUG (to Humphreys & Glasgow, Ltd.). Brit. 288,599, April 13, 1927.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

The petroleum industry in 1927. RICHARD KISSLING. *Fortschrittsber. Chem. Ztg.* 2, 118–24(1928); cf. C. A. 22, 4780.—A review with bibliography. E. J. C.

Oil analysis. B. HLAVICA AND E. TRČA. *Paliva a lopeni* 10, 101–3(1928).—Oil from a drilling 247 m. deep at Lurrooka, Czechoslovakia, shows a paraffin base and a large content of gasoline. The findings agree with earlier borings in this region. Oil from Hodonin drillings 338.8 m. deep shows a higher paraffin content but lower gasoline yield. H. predicts a higher gasoline content with deeper drilling. F. M.

The production of gasoline by cracking. F. KOUDELÁK. *Paliva a lopeni* 10, 67–75, 89–95, 109–13(1928); cf. C. A. 22, 4781.—A review of the Burton, Dubba, Cross, Fleming, tube and tank, Holmes-Manley, Emerson, etc. processes for cracking oils together with operating data and European installations. FRANK MARSH

Changes in the regulations proposed for tetraethyl lead gasoline. HUGH S. CUMMING, *et al.* U. S. Pub. Health Service, *Pub. Health Repts.* 43, 3147-9 (1928). E. H.

Manufacturing bituminous coal from petroleum. W. F. RITTMAN. *Mining J.* 163, 1016 (1928).—R. briefly describes the manuf. of petroleum coke of the compn. volatile matter 45, fixed C 51 and ash (lime) 5% as a final step in oil refining by pumping refuse oil through a pipe still. Also in *Ind. Eng. Chem. News Ed.* 6, No. 24, 1-2 (1928).

A. H. EMERY

Asphalt and related bitumens in 1927. G. R. HOPKINS AND A. B. COONS. Bur. of Mines, *Mineral Resources of the U. S. 1927*, Pt. II, 67-80 (preprint No. 9, published Oct. 20, 1928). E. H.

The dry distillation of gums from Beechwood. KAREL HRDLÍČKA. *Paliva a lopeni* 10, 81-9 (1928).—Using the unpublished method of Jedlička-Mašt to prepare 1 kg. of xylan, H. exts. beechwood sawdust with 2% NH_4OH and follows with water. This cleaned sawdust is extd. with 5% Na_2CO_3 , and the alk. ext. is pptd. under vigorous stirring with an aq. 30% CaCl_2 soln. The pptd. mass is spread upon linen cloth and pressed. The dry mass is ground with 85.90% alc., boiled, chilled in a salt-ice mixt. and decompd. by HCl with vigorous stirring. Xylan is extd. in a Soxhlet app. and dried at 80° . The product is a white powder contg. 17-20% H_2O . On a dry basis, the gum contains 1.6-2.4% ash with some Cl, 92-96.8% pentosans and 2.5% ethoxyl groups. These constituents represent 6% of a wood contg. 8.8% H_2O . The gum is distd. in a glass retort connected to an analytical train. The distn. began at 150° , most distd. over at 220° , and it ended at $300-310^\circ$. The products show a yield of gas 20%, liquid 48.5%, coal 31.5%. The gas contains 12.5% CO_2 , 7.5% $\text{CH}_4 + \text{CO}$; the liquid: 0.9% formic acid, 0.8% AcOH , 13.8% furfurole, 6.0% tar, 27.0% H_2O . Moist gums yielded less oily products than dry ones for some oils dissolve in H_2O . The acids were neutralized with BaCO_3 and identified by the reaction of arsenic anhydride upon the K salts of the above acids. The cacodyls were formed by reducing with HgCl_2 and HgCl . The Ca salts of the acids were distd. and also identified by acetone, HCHO , etc. In the oil, 63.4% furfurole, small amts. of furan, pyromucic acid, a mixt. of phenols, HCOOH and AcOH were found. The results verify those of Bergström. F. M.

Bleaching vegetable and mineral oils with clay (ELAKOV) 27. Swelling of aluminum soaps in various solvents (MARKOWICZ) 27. Apparatus for emulsifying oils (U. S. pat. 1,694,589) 1. Treating natural and synthetic oils and resins (Brit. pat. 289,414) 27. Apparatus for extracting oil from oil-containing materials (Ger. pat. 467,801) 1. Combustible liquids (Swiss pat. 126,586) 21.

Device for cleaning oil of internal-combustion engines by filtration and use of a cleaning liquid. LOWELL C. WEINBERG. U. S. 1,693,471, Nov. 27. Structural features.

Refining petroleum oils. F. B. THOLE, S. F. BIRCH and W. S. G. P. NORMAN. Brit. 288,931, Oct. 13, 1926. In refining kerosene, benzene or other hydrocarbon oils by alk. solns. of alkali or alk. earth hypochlorite, the concn. of free alkali is not substantially less than 1.5% so that "evil-smelling" S compds. are converted into other compds. which are less offensive and which can be removed by subsequent refining. The material may also be redistd. and treated with H_2SO_4 , caustic alkali and water. Details are given.

Fractional distillation of petroleum oils, etc. T. E. PERKS. Brit. 289,394, April 26, 1927. The liquid is caused to flow in a continuous passage which is progressively heated, and vapors produced at sep. points are separately collected and condensed. An app. is described.

Cracking oils and reducing ores simultaneously. W. H. SMITH. Brit. 288,193, April 4, 1927. The oil is passed through a series of heated closed chambers or retorts through which a stream of ore is continuously fed. The retorts are preferably heated by elec. resistances, and with Fe ore the ore acts as a catalytic agent but the retort walls may also be lined with catalytic material or a catalyst may be mixed with the ore; Cr, Ni, magnetite or reduced Fe sponge are suitable catalysts. A temp. of about $1000-1100^\circ$ at the hottest part of the app. is suitable. CH_4 and CO are formed in the process by union of C, H and O set free during the reaction. An app. is described.

Cracking and rectifying petroleum oils. JAMES M. WADSWORTH. U. S. 1,692,476, Nov. 20. Oils are cracked under pressure by heating, to produce a mixt. of gasoline hydrocarbons, lighter and heavier hydrocarbons than those of gasoline, and residuum, the mixt. is rectified to sep. sharply the gasoline hydrocarbons and lighter hydrocar-

bons from heavier hydrocarbons and residuum, and the gasoline hydrocarbons and lighter hydrocarbons are then further rectified and the gasoline is sepd. from uncondensed gases. The pressure developed in the cracking stage is used for effecting the second rectification under super-atm. pressure, at temps. of about atm. temp. or higher. An arrangement of app. is described.

Apparatus (with a top-heated still having agitators) for simultaneously dehydrating and distilling emulsified petroleum oils. GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,694,643, Dec. 11.

Fatty acid mixture derived from petroleum. GELLERT ALLEMAN (to Sun Oil Co.). U. S. 1,694,461, Dec. 11. Fatty acids of a m. p. range below -30° and substantially free from mineral oil and petroleum resins, which are suitable for making soaps, are obtained by treating an aq. mixt. contg. soap, petroleum resins and oil with gasoline and alkali metal sulfate or chloride, followed by sepn. and acid treatment.

Petroleum jelly. FRANÇOIS LAVIROTTE. Swiss 126,409, Sept. 19, 1925. Pure petroleum jelly is obtained by treating suitable hydrocarbon mixts., with H_2SO_4 at a sufficiently high temp. and for a sufficient time to convert the impurities into insol. carbonaceous substances, with evolution of gas. The initial material, which may be crude petroleum jelly, petroleum residues, etc., may be treated with oleum at 70° for 24 hrs. and then at $160-70^{\circ}$ for 48 hrs., the product being then sepd. and worked up as usual.

Cracking hydrocarbons. M. B. SCHUSTER. Brit. 289,556, Jan. 31, 1927. Cracking of materials such as black asphalt crude oil, kerosene, gas oil, lubricating oil or tar residuum is promoted by adding a colloidal substance such as bentonite or hydrated lime. The bentonite may be preliminarily treated with acid. A distn. residue similar to natural asphalt is obtained.

Cracking hydrocarbons. HENRI CARROLL. Fr. 639,740, Jan. 28, 1927. Hydrocarbon oils are continuously cracked to obtain products of lower b. p. by heating the oil in coils to slightly less than cracking temp., sepg. the vapor produced from the liquid portion in a dephlegmator, passing the liquid portion to a converter and delivering the cracked vapors up through the dephlegmator from which the mixed vapors are passed to the usual rectifiers, dephlegmators and condensers. An app. is described in detail. Cf. C. A. 22, 4788.

Cracking heavy hydrocarbons. PAUL GRENFÉ. Fr. 639,436, Jan. 22, 1927. C compds. such as coke, activated charcoal or lignite are used as catalysts. The app. used has no joints, cocks or valves in the heated region.

Cracking hydrocarbon oils. R. T. POLLOCK. Brit. 287,344, April 29, 1927. See U. S. 1,688,830 (C. A. 23, 273).

Fractionating hydrocarbon oils. JOHN C. BLACK. U. S. 1,692,072, Nov. 20. Oil such as crude petroleum or crude naphtha is distd. and fresh oil is supplied to the still to replace the vaporized portions; the condensate is passed to a sep. still, a portion of the condensate is redistd. and the vapors are partially condensed by heat exchange with the fresh oil supply and residual vapors are subjected to a further final condensation. An app. is described. Cf. C. A. 22, 865.

Oil-distillation apparatus. WARREN K. LEWIS (to the Standard Oil Development Co.). Can. 285,385, Dec. 4, 1928.

Desulfurizing hydrocarbon oils. ROBERT C. MORAN (to Vacuum Oil Co.). U. S. 1,692,756, Nov. 20. The oil is subjected to the action of Hg and the latter is simultaneously treated with an aq. soln. of an alkali sulfide. An app. is described.

Treating hydrocarbon oils with aluminum chloride. GUSTAV EGLOFF. U. S. 1,692,203, Nov. 20. Oil such as petroleum residue, "spruce turpentine" or a high-b. p. coal-tar oil is heated in a substantial liquid body in the presence of $AlCl_3$, while maintaining a temp. within the body above the m. p. of $AlCl_3$ and sufficient to vaporize portions of the oil; the unvaporized oil and $AlCl_3$ are withdrawn from the lower portion of the liquid body and are reintroduced into the upper portion of the liquid body in an atomized condition. An app. is described. (Note: The application on which this pat. was granted was filed July 19, 1918.)

Pump and valve system for pumping heavy hydrocarbon oils. IRA E. SMITH. U. S. 1,693,061, Nov. 27.

Bridge-wall furnace containing heating tubes, and associated apparatus for continuously refining hydrocarbon oils. JOHN PRIMROSE (to Foster Wheeler Corp.). U. S. 1,693,156, Nov. 27.

Apparatus for filtering liquid hydrocarbon materials and revivifying the filtering material (such as fuller's earth) by use of benzene, etc. LESLIE W. NAYLOR (to Continental Oil Co.). U. S. 1,693,207, Nov. 27.

Cracking oils. A. D. SMITH and J. PERL. Brit. 289,673, July 12, 1927. An app. is described in which oil heated in liquid phase while passing through pipes in a furnace is allowed to expand in a still whence unvaporized residue passes to a heat-exchanger, where it is cooled by heat exchange with the raw oil to cause pptn. of the heavy polymerized products and the latter are sepd. by gravity in a settling chamber. The lighter fractions are further treated and cracked in cracking tubes and mixed with cracked products from the heating pipes first mentioned.

Cracking and hydrogenating oils. P. HAHN. Brit. 289,482, April 28, 1927. The method described in Brit. 235,625 (C. A. 20, 987) is applied to the conversion of heavy hydrocarbon oils into light hydrocarbons by passing the gaseous mixt. obtained through condensers where the light hydrocarbons are condensed.

Distillation of oils. LEO STEINSCHNEIDER. Fr. 639,081, July 26, 1927. See Brit. 264,476 (C. A. 22, 163).

Purifying oils. G. PETROFF. Brit. 289,561, Feb. 1, 1927. Naphtha distillates, petroleum, cracked oils and oils obtained by the dry distn. of bituminous fossils are decolorized by passing air or other gas contg. free O through a series of vessels contg. the oil; heavy-metal salts of fatty, naphthenic or resin acids are dissolved in the oil in the first vessel and metal turnings or powder are placed in the other vessels. Salts of Pb, Mn, Co, Cu, Zn, Fe, Ca or Cr may be used, and an example is given of the purification of acid- and alkali-treated petroleum oil by use of Mn stearate and Cu turnings and Pb turnings. The oil may subsequently be further treated with acid and alkali.

Decolorizing and neutralizing oils. DAVID R. MERRILL (to Union Oil Co. of Calif.). U. S. 1,695,198, Dec. 11. Oils such as petroleum lubricating oil are treated with a mixt. of clay and an acid such as oxalic acid and, in a sep. treatment, are treated with clay and an alkali soln. such as NaOH and Na oxalate or NaF.

Emulsifiable oil. DAVID R. MERRILL (to Union Oil Co. of Calif.). U. S. 1,695,197, Dec. 11. An emulsifiable oil mixt. suitable for *treating wool* or *prepg. sprays for fruit trees, sheep dips, lubricants*, etc., comprises a naphthenic soap, a mineral oil and a substantially anhyd. aliphatic alc. such as BuOH.

Fuel oil. RALPH T. GOODWIN (to the Standard Oil Development Co.). Can. 285,386, Dec. 4, 1928. Fuel oil is prepd. by mixing pressure tar with acid oil and allowing the mixt. to stand to ppt. the carbonaceous sediment, and then withdrawing the clear oil. E. g., 13.3° A. P. I. pressure tar having a furfurole viscosity of 17, is treated with 20% by wt. of 32.2° A. P. I. acid oil contg. 0.4% free H₂SO₄. The mixt. is heated to 200° F. and agitated for 2 hrs. The mixt. is allowed to settle, thereby depositing C-forming material. The clear oil is sepd.; it is suitable as a fuel oil.

Treating spent clays used for oil refining. ROBERT A. DUNHAM (to Union Oil Co. of Calif.). U. S. 1,694,971, Dec. 11. In order to effect "de-oiling" of spent clay such as that which has been used for refining oil, the clay is treated with "an experimentally detd. optimum quantity" of water, which effects a greater sepn. of the oil than either a greater or a less quantity of water.

Cracking mineral oils. ARTHUR E. PEW, JR., and HENRY THOMAS (to Sun Oil Co.). U. S. 1,692,786, Nov. 20. A system is described in which Hg vapor is used as a heating medium for the oil. Various details of app. and of handling and recondensation of the Hg are specified.

Mineral oil derivatives. GELLERT ALLEMAN (to Sun Oil Co.). U. S. 1,694,463, Dec. 11. A compn. contg. mineral oil, petroleum resins and a fatty acid soap, such as the ppt. produced in the alkali treatment of acid-treated mineral oil lubricating stock, is treated to effect a substantially complete sepn. of the oil from the soap and resins, by adding water and heating under pressure, cooling under sufficient pressure to prevent substantial boiling and re-entry of the oil, resins and soap into an emulsion, and then sepg. the oil.

Water-insoluble soaps from mineral-oil derivatives. GELLERT ALLEMAN (to Sun Oil Co.). U. S. 1,694,462, Dec. 11. Salts such as CaCl₂, Pb(NO₃)₂ or CuSO₄ are used for pptg. insol. soaps from water-sol. soaps derived from mineral products substantially free from unchanged mineral oil and contg. only a reduced quantity of petroleum resins. The insol. soaps thus formed may be used for *waterproofing* or as *wood fillers, adhesives*, etc.

Oil filter suitable for use on engines. FRED C. MORRIS. U. S. 1,692,852, Nov. 27.

Separating benzene and oil. JULIUS REINHARD. Swiss 126,547, Feb. 8, 1927. A device for sepg. oil and benzene from washings of garages and chemical works has an ascending pipe with an overflow and collecting gutter.

Retort construction and associated apparatus for producing oil gas. ALVIN J. BASSETT (to Bruce MacBeth Engine Co.). U. S. 1,694,910, Dec. 11.

Gas from heavy oils. CONSTANTIN CHILOWSKY. Fr. 637,032, Oct. 27, 1926. An

app. is described in which heavy oil is submitted as a vapor to a partial combustion with air in a region in front of the catalyst, the combustion being completed in an incandescent container contg. the catalyst. Cf. *C. A.* 22, 4243.

Hydrogenation of gaseous products from heavy hydrocarbons, etc. SOCIÉTÉ INTERNATIONALE DES PROCÉDÉS PRUDHOMME-HOUDRY. *Fr.* 637,022, Oct. 26, 1926. In the hydrogenation of heavy hydrocarbons, crude petroleum or the like, after gasification and purification, vapors of a solvent are introduced continuously or from time to time into the catalyzer to remove deposits which tend to cover the catalyst. The solvent may be the first runnings from the fractional distn. of the hydrocarbons collected by condensation from the catalyzer.

"Natural gasoline." HAROLD E. THOMPSON (to Carbide & Carbon Chemicals Corp.). U. S. 1,695,162, Dec. 11. A liquid mixt. of hydrocarbons such as may be obtained from natural gas is treated by rectification to obtain a liquid gasoline and vaporous portion and the vaporous portion is brought to a temp. below the normal b. p. of the liquid gasoline and used for cooling the latter. An app. is described.

Absorption tower for obtaining gasoline from natural gas, etc. MEINHARD H. KOTZEBUE. U. S. 1,695,192, Dec. 11. Structural features.

Absorption and fractionation system for separating gasoline from gas. EDWIN R. COX AND DEXTER A. CUSHMAN. U. S. 1,695,139, Dec. 11. Part of a body of absorbent oil at atm. temp. is refrigerated to a considerably lower temp. and passed downwardly through an absorption tower through which wet gas is passed upwardly and through a portion only of which the oil at atm. temp. is also passed. An app. is described.

Laminated filter for gasoline, etc. VICTOR R. HEFTLER. U. S. 1,694,939, Dec. 11. Structural features.

Decolorizing kerosene, gasoline and similar petroleum distillates. VLADIMIR A. KALICHEVSKY (to Union Oil Co. of Calif.). U. S. 1,695,251, Dec. 11. Distillates contg. coloring substances not readily adsorbable by clay are treated with sufficient alkali, such as a 10% NaOH soln., to convert these coloring substances into more adsorbable form, and the distillate is then treated with acid and clay.

Shale retort. EDWARD B. ROTH. *Can.* 285,300, Dec. 4, 1928.

Shale retort. EDWARD B. ROTH. *Can.* 285,299, Dec. 4, 1928.

Distilling bituminous materials. TROCKNUNGS- VERSCHWELUNGS- UND VERGASUNGS GES., L. HONIGMANN AND F. BARTLING. *Brit.* 289,137, Jan. 18, 1927. In distg. fine granular coal or other bituminous material, the material is spread on a surface in a layer 1-3 mm. thick and distd. by heating in a furnace, which is described.

Bituminous emulsions. J. A. MONTGOMERIE. *Brit.* 288,821, April 23, 1927. Aq. emulsions of materials such as Mexican asphalt are prepd. by directly admixing the material in molten form with a hot dil. aq. soln. of an alkali carbonate or bicarbonate or mixt. of such salts.

Lubricants. C. BREWER. *Brit.* 288,796, March 17, 1926. A lubricating grease is formed by mixing the lubricating distillate from a paraffin or other suitable base crude oil with stearin or a stearin compd., tallow, soap or like material, distg. the mixt. in superheated steam with a current of O, thus producing a second distillate, treating the residue to sep. asphaltic substances (as by dissolving the other constituents in benzene and then distg. the benzene) and then mixing the de-asphalted residual material with the second distillate.

Reclaiming used lubricating oil. PHILIP F. MILLER (to De Laval Separator Co.). U. S. 1,694,478, Dec. 11. An app. is specified for reclaiming used oil by centrifuging and heating and treatment with reagents such as Na_2PO_4 .

Asphalt. ALEXANDRE FLEXER. *Fr.* 639,638, Aug. 18, 1927. An artificial asphalt is made by submitting coal tar to incomplete oxidation or nitration and adding an alkali material, or glue or gelatin dissolved in an oil. A degree of hardness may be given by melting with S.

Apparatus for melting bitumen or asphalt. AUGUSTE FRANÇOIS. *Fr.* 639,519, Aug. 13, 1927.

Furnace for the carbonization of wood. JEAN BONELLO and VICTOR-CONSTANT LAURENT. *Fr.* 639,385, Jan. 17, 1927.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

The determination of α -cellulose. C. G. SCHWALBE. *Papier-Fabr.* 26, 189-98 (1928); cf. *C. A.* 20, 283, 502.—A critical review of the literature on this subject, followed by a report of the results of a comparative test of the Jentgen (J) and Bubeck (B) methods, details of which are given. The 2 methods differ in the use of 5% and 9% NaOH, resp., for the first washing, and use of thermostatic temp. control in B. Mean values obtained on the same pulp sample in 7 labs. by the J. and B. methods are: 1925, 87.37, 86.63%; 1927, 86.54, 85.69%; difference of highest and lowest values, 1.92, 1.55. The slightly lower accuracy of J. does not warrant its abandonment in favor of B.

R. H. DOUGHTY

Constitution of flax cellulose. GEORGE W. RIGBY. *Mass. Inst. Tech. J. Am. Chem. Soc.* 50, 3364-70(1928).—Flax bast fibers consist of cells composed of pure cellulose and an intercellular material contg. a furfural-yielding constituent. The glucose residues in cellulose are joined together in positions 1 and 4 by glucoside linkages, as are those in cotton. Cellobiose is obtained from flax cellulose in yields equiv. to those from cotton. This assures that at least 2 glucose residues are combined in the cellulose and suggests that probably at least 3 are combined in a unit from which the cellulose mol. is constructed. Acetates of a trisaccharide and of an anhydrotrissaccharide may be obtained from flax cellulose. These results point to the chem. identity of cotton and flax cellulose, without reference to the relative states of polymerization.

C. J. WEST

Plasticity and solvation of cellulose esters. S. E. SHEPPARD, E. K. CARVER AND R. C. HOUCK. *Fifth Colloid Symposium Monograph* 1928, 243-52.—The authors discuss the nature of solvents for cellulose esters in relation to their influence on plasticity without, however, touching on their relationship between mech. structure and plasticity.

JEROME ALEXANDER

The falling-ball method for the measurement of apparent viscosity of nitrocellulose solutions. JOHN K. SPEICHER AND G. H. PFEIFFER. *Fifth Colloid Symposium Monograph* 1928, 267-72.—By the falling-ball method, and calcn. of the results by Stokes' law as modified by Ladenberg, nitrocellulose solns. yield mutually consistent results. This is true even with low-viscosity types, where the same relation obtains between the falling-ball and capillary-tube methods, as with castor oil. With higher-viscosity nitrocelluloses, a change in shearing stress leads to a divergence between the nitrocellulose and castor oil. As the capillary-tube instrument was not refined enough, the results cannot be interpreted in terms of abs. values.

JEROME ALEXANDER

The cellulose nitrates. JAMES CRAIK. *Fifth Colloid Symposium Monograph* 1928, 273-86.—Following an historical review, expts. are reported on nitrating, denitrating and "nitrating-up," with the results on the solubilities of the nitro cottons obtained. 12% cotton is sol. in ether-alc., whereas 8% and 13+% cottons are not. Nitration on the surface with a sol. or an insol. deriv. detcs. the soly. behavior of the product. The results are consistent with the view that there are 3 cellulose nitrates.

J. A.

New formula for the constitution of cellulose. GIUSEPPE ODDO. *Reale Univ., Palermo. Gazz. chim. ital.* 58, 301-9(1928).—A critical review of the literature on cellulose shows that only the following can be regarded as established facts: (1) its compn. is $C_6H_{10}O_5$; (2) its mol. is $(C_6H_{10}O_5)_n$ or a multiple of this; (3) it is very resistant to the hydrolytic action of acids and enzymes and to alkalies and other reagents; (4) it can be hydrolyzed completely to *d*-glucose by concd. HCl and to cellobiose octaacetate by concd. H_2SO_4 and Ac_2O and thence to cellobiose by alc. KOH; (5) it forms levo-glucosan by distn. *in vacuo*; (6) it forms bromomethylfurfural by the action of HBr in $CHCl_3$; (7) it contains 3 free OH groups for each $C_6H_{10}O_5$, which are in the 2-, 3- and 6-position in the glucose mol., one of these 3 OH groups being more easily attacked than the others, and (8) it forms hydrocellulose, cellulose hydrate and oxycellulose, which gives hydrazones, with no alteration of the fibrous structure. A study of the formulas proposed by Tollens (*Handbuch d. Kohlenhydrate* 2 Aufl., 565(1914)), Vignon (*Bull. soc. chim.* 21, 500(1900)), Green and Irvine (1907), shows that none

Green
Irvine

satisfies all these properties, the first 6 leaving unsettled the size of the mol., none explains the great resistance to reagents, Tollens, Vignon, Cross and Bevan and Green do not explain the formation of cellobiose, Cross and Bevan show 4 OH groups for each glucose residue, and Tollens, Vignon, Green and Euler show 3 OH groups disposed

otherwise than in the 2,3,6-positions. The following formula explains simply and completely all known phys. and chem. properties. It originates from 4 mols. of glucose

with elimination of 4 mols. of H_2O . The mechanism of this formation is that of all polysaccharides (cf. O., C. A. 9, 789), *i. e.*, by the addn. of 1 mol. of glucose through the alc. group of the C in the 5-position to the next mol. in its CHO group with formation of an alcoholate or semiacetal, and with subsequent closure of the hydrofuran nucleus in the sugar mol. (where the addn. occurs) by elimination of 1 mol. of H_2O between the OH groups of the 1,4-C atoms. This continues until the alc. OH of the C in the 5-position of the 4th glucose mol. adds similarly to the CHO group of the 1st mol., closing the nucleus:

The 4 primary alc. groups at the angles are relatively easily attacked by reagents and thus protect the 4 acetal groups, so that in the formation of tetranitrocellulose, viscose, oxycellulose, the fibrous structure is preserved. The various other features of the structural formula are explained in their relation to the phys. and chem. properties of cellulose. Thus partial hydrolysis in the I and III or in the II and IV locations divides

the mol. into 2 equal parts, giving cellobiose, while complete hydrolysis at I, II, III and IV gives 4 mols. of *d*-glucose.

C. C. DAVIS

Investigations and patents by Leon Lilienfeld. WILHELM A. DYES. *Kunstseide* 10, 401-7(1928).—A review of L.'s work on cellulose products.

FREDERICK C. HAHN

History and patents in connection with the development of the cellulose acetate industry. R. A. KÖLLIKER. *Kunstseide* 10, 409-10(1928).—A general discussion.

FREDERICK C. HAHN

Chemical engineering in the viscose process of artificial-silk manufacture. ANON. *Ind. Chemist* 4, 449-60(1928).—A description of the Branston Artificial Silk Co.'s Works, near Burton-on-Trent.

E. J. C.

Rayon. ROSS M. STRIBLING. Clemson College, S. C. *Textile Colorist* 50, 596-9(1928).—A brief discussion is given of the early history and present processes of fiber manuf., raw-product sources, and uses and applications of rayon.

R. K. W.

Most recent improvements in the rayon industry. WALTER OBST. *Kunstseide* 10, 337-8, 502-3(1928).—A review of recent patents and journal articles having a bearing on improvements in the manuf. of rayon.

FREDERICK C. HAHN

The processing of rayon. THOMAS F. HUGHES. *Textile Colorist* 50, 820, 826-7(1928).—General.

RUBY K. WORNER

Cellulose acetate rayon. WILHELM A. DYES. *Kunstseide* 10, 441-5, 484-90(1928).—Technical processes for the production of Celanese, Rhodiaseta, Aceta and other types of cellulose acetate rayon are described, and investigations and patents relating to them are discussed.

FREDERICK C. HAHN

A short survey of nitrocellulose rayon. FRED. GROVE-PALMER. *Textile Colorist* 50, 484-5(1928).

RUBY K. WORNER

Use of carbohydrates to increase durability of cuprammonium rayon. K. MELKUS. *Kunstseide* 10, 446-7(1928).—The use of carbohydrates to inhibit the oxidation of cellulose in cuprammonium soln. is described in patents. M. studied a no. of carbohydrates with the object of detg. those which were the most favorable with reference to the working up of cellulose cuprammonium solns. into rayon. Sugars showing strong reducing power in weak concns. at ordinary temp. inhibit oxidation the best. Results indicate that lactose and maltose are satisfactory for the purpose.

F. C. H.

Chemistry of sulfite pulping. XII. The use of relief liquor in pulping. ERIK HAGGLUND. Inst. für Holzchemie, Akademie Åbo (Finland). *Papier-Fabr.* 26, 657-61(1928); cf. *C. A.* 22, 3291.—A series of exptl. cooks were made on spruce in bomb tubes, using both fresh liquor and a mixt. of $\frac{2}{3}$ fresh liquor and $\frac{1}{3}$ waste liquor from a com. mill. Both liquors contained 40 g. per l. SO_2 and 10 g. per l. CaO . Good circulation was necessary to the best results with mixed liquor, and even then the pulps were not up to the usual standard of color. The lignin content of the pulps cooked with mixed liquor was noticeably higher and the cooking time longer regardless of yield. It has already been shown experimentally that aldoses in the cooking liquor accelerate change of SO_2 to SO_3 . The use of waste liquor exaggerates this effect. The increased acidity thus caused tends toward overcooking and to degradation of the pulp. Waste liquor should not be used in cooking when high-grade pulp is desired.

R. H. DOUGHTY

A rapid method for measuring pulp consistence. AUGUST NOLL. *Papier-Fabr.* 26, 673-9(1928).—The use of a small centrifuge is recommended, the damp pulp cake being weighed directly. On pulps ranging from 1 to 7% consistence, a fairly const. neg. error 5% (abs.) was found, as checked by dry wt. detns.

R. H. DOUGHTY

Methods for determining the constitution of wood. ERICH SCHMIDT. *München. Papier-Fabr.* 26, 673-9(1928).—An address. The work of S. and his associates (cf. *J.* 21, 144, 1829, 3375) is described and discussed. This work leads to the conclusion that the various components (cellulose and hemicelluloses) of the skeletal substance are present in stoichiometric proportions and in chem. rather than mech. combinations.

R. H. DOUGHTY

nical lignin determinations, wood investigations, etc. ERICH RICHTER. *Papier-Fabr.* 59, 767-71(1928).—The modified Hempel-Seidel method for lignin previously described (*C. A.* 8, 2945) has been tested in use and improved. The method are described in detail. Briefly, the sample of wood or pulp is heated with HNO_3 , the N_2O_5 formed is detd., and the lignin present calcd., standardized on material of known lignin content. Very good results are obtained. The unhydrolyzed residue, gives an approx. measure of the pulp yield obtainable from the tree, and also of pulps, are given.

R. H. DOUGHTY

Conversion of spruce wood by means of sulfites. C. G. SCHWALBE AND

WERNER LANGE. *Papier-Fabr.* 26, 641-4(1928); cf. *C. A.* 22, 3295-6.—A no. of exptl. cooks have been made with Na_2SO_3 (I) and Na (II), Ca (III) and Mg (IV) bisulfites. Using I alone at 145° gives a 56% yield of imperfectly softened chips, and requires a long cooking time (48 hrs.). Impregnating with II at 110° , blowing off free SO_2 and pulping at 145° gives a better cook (70% yield) in a shorter time (20 hrs.). Thorough penetration is important, and must be carried out at or below 110° . The beneficial effect of bisulfite is probably due to acceleration of the penetration (cf. *C. A.* 22, 3295). Impregnating 5 hrs. at 110° , draining off liquor and cooking 1 hr. at 145° with direct steam, gave the following results: pulping agent, yield of screened pulp, and yield of screenings are given: II, 75, 17%; III, 60, 11%; IV, 70, 7%. The pulps contain 23-26% lignin and about 8% pentosans; IV gave the best pulp. The steaming treatment seems to result in more phys. than chem. change of the fibers. The results are discussed in some detail.

R. H. DOUGHTY

The dependence of sizing strength upon degree of beating. ANON. *Papier-Fabr.* 26, 561-5(1928).—Report of exptl. work by Johannes Berger. Papiertechn. Inst. der Gewerbehochschule Köthen-Anh. Unsized hand sheets prepd. from pulp ranging from unbeaten to very highly beaten (10-94 Schopper-Riegler degrees) were tested for sizing strength and compared with groundwood-free printing paper ranging from unsized to fully sized. Degree of sizing was detd. by the flotation method, NaOH-phenolphthalein (I), $\text{NH}_4\text{CNS-FeCl}_3$ (II), tannin- FeCl_3 (III), and ink (IV) being used. The unbeaten pulp showed less water resistance and the highly beaten pulp much more, as measured by these methods, than the unsized and fully sized papers, resp. There seems to be no regular relation between the results of the several methods. Values given by I and IV agree fairly well; I seems best, though it is suggested that the NaOH may have an undesirable effect on the results, because of chem. action on the cellulose or sizing agents.

RANDALL H. DOUGHTY

Hydrogen-ion determinations on paper. BRUNO SCHULZE. Staatl. Material-Prüfungsamt Berlin-Dahlem. *Papier-Fabr.* 26, 625-9; *Wochbl. Papier-Fabr.* 59, 1087-93(1928).—The p_H values of a no. of papers have been detd. directly on the paper electrometrically (I) or with indicator papers (II) (cf. Behrens, *C. A.* 22, 1745); also on the aqueous ext. electrometrically (III), with Merck's universal indicator (IV), and with Wulff indicator foils (V) (*C. A.* 21, 3855). Many papers are so well buffered that the effect of atm. CO_2 during extn. is small, and all methods give equally good results. For tech. use with such papers V is recommended as most convenient. Weakly buffered (nearly neutral) papers give low values, and parchment gives high values by extn.; I gives best results with these papers, though II can be used on parchment. Details of prepn. of indicators used in II are given.

R. H. DOUGHTY

The bleaching of sulfite pulp. RAGNAR BERGQVIST. *Papier-Fabr.* 26, 593-604 (1928); cf. *C. A.* 22, 4798.

R. H. DOUGHTY

Recovering resinous products in the manufacture of wood pulp (U. S. pat. 1,693,586) 26. Denitrating waste acids (Fr. pat. 639,641) 18. Apparatus for drying fabrics and paper in endless webs (U. S. pat. 1,692,129) 1. Protective layer on photographic films (Can. pat. 284,233) 5.

Artificial silk. I. G. FARBENIND. A.-G. Brit. 287,553, March 24, 1927. The extensibility, tensile strength, dyeing properties, etc., of artificial silk are controlled by reducing the tension on the threads during the coagulation stage, and applying tension to the threads at the thread guide which is so arranged as to cause the threads to make one or more changes in direction during passage. An app. is described.

Wood pulp. GEORGE A. RICHTER (to the Brown Co.). Can. 284,216, Oct. 23, 1928. The spent cooking liquor resulting from the alk. treatment of unbleached pulp may be used as make up liquid, instead of water, in the production of a sulfite liquor for production of sulfite pulp, either by passing it and SO_2 in counter-current flow through a mass of inert interstitial material, or through a lime tower, or else by employing it for slaking the lime in case the sulfite cooking liquor is formed by passing SO_2 through milk of lime. The spent liquor contg. the sol. salts or other org. compds. of Na or Ca may be employed in the production of a sulfite cooking liquor having either Na or Ca, or Na and Ca as its basic constituent material or materials.

Elimination of silica from residual lyes of cellulose factories. ANDRÉ THIRIET (to The Papeteries Navarre), Can. 284,259, Oct. 23, 1928. Lyes are exposed to the action of CO_2 or of NaHCO_3 , or to both at a temp. of 15° so that the dissolved silica is pptd. The SiO_2 ppt. is sepd. and the CO_2 is recovered from the soln. by heating.

Cellulose. EMIL PRIFFNER. Swiss 126,658, Dec. 23, 1926. Insulating layers of acetylcellulose are formed by soaking them in oil in the absence of air, drying them, and then allowing the atm. O to oxidize the oil.

Cellulose. NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIK. Swiss 126,588, Nov. 27, 1926. Acetylcellulose soln. with a higher viscosity is prepd. by the reaction of Ac_2O on cellulose in the presence of a catalyzer and a diluent. The constituents must be at least partially dehydrated. Thus Ac_2O is mixed with glacial acetic acid and allowed to stand. Sulfuryl chloride is added as condensing agent and the cellulose added after some hrs.

Cellulose. SOCIÉTÉ BARBOU ET C^{IE}. Fr. 639,426, Jan. 21, 1927. The quantity of water used in cellulose manuf. is reduced by dilg. the pulp before it enters the presses, using the water pressed out for adding to the pulp coming from the bleachers and using the water from the thickening cylinders for washing the cellulose after defibering. Fr. 639,427 describes a process for leaching cellulose with sulfite lye in which CaCO_3 is added to the lye to transform the Na_2SO_4 formed into Na_2CO_3 .

Cellulose. WOLFF & CO. AND R. WEINGAND. Brit. 288,997, April 19, 1927. Cellulose which has been freed from hemicellulose, wholly or in part, by treatment with alkali, is treated with a salt soln. or other suitable liquid prior to washing with water, in order to avoid further formation of hemicellulose. NaCl , K_2SO_4 or alcs. may be used.

Hydrated cellulose. I. G. FARBENIND. A.-G. Fr. 636,803, June 29, 1927. The tendency of hydrated cellulose to expand is reduced by impregnating it, as freshly pptd. or dried, with resins sol. in water or alkalies and then treating with a substance to render the resin insol. Phenol-sulfur or phenol-formaldehyde-sulfur resins are suitable with an after-treatment with formaldehyde to render them insol. Condensation products of urea and formaldehyde may also be used.

Nitrocellulose. I. G. FARBENIND. A.-G. Brit. 289,387, April 25, 1927. Unstable nitrocelluloses which yield highly viscous solns. are converted into nitrocelluloses which yield solns. of low viscosity by heating to above 100° with water and an insol. basic compd. such as magnesia.

Cellulose derivatives. I. G. FARBENIND. A.-G. Fr. 639,150, Aug. 6, 1927. Alkali cellulose is esterified or etherified in the form of pressed sheets or boards. The sheets may be sepd. by Fe netting.

Figured or multi-colored products of cellulosic derivatives. I. G. FARBENIND. A.-G. Brit. 288,592, April 13, 1927. Products resembling cork or ivory or having other figured or multi-colored effects, suitable for making cigarette mouthpieces or other articles, are produced by applying to a supporting surface a layer of the substances producing the figured or multi-colored effect and pouring, spraying or spreading over this layer a soln. of the cellulose deriv. Examples of the use of various coloring substances, cellulose acetate, etc., are given.

Apparatus for making films of cellulose derivatives. I. G. FARBENIND. A.-G. Brit. 288,223, April 9, 1927. Supports for film manuf. are made from a soln. of a cellulose deriv. which still contains free OH groups and is therefore free from tendency to swell or dissolve in the solvent for the "dope;" e. g., the surface of a drum on to which a soln. of acetylcellulose is to be flowed may be coated with nitrocellulose of 8% N content by evapg. a soln. of the nitrocellulose in a mixt. of acetone, ethylene chlorohydrin and water.

Support for making films. I. G. FARBENIND. A.-G. Fr. 637,012, July 5, 1927. A support for making films by causing substances such as cellulose acetate dissolved in org. solvents to flow upon them is made of cellulose derivs. modified on the surface by sapon., reduction, etc., to such a point that it neither swells nor is sol. in the solvent used, or the support may be made of a cellulose deriv. contg. free hydroxyl groups which, without further treatment, neither swells or dissolves in the solvent.

Cellulose esters. BRITISH CELANESE, LTD., H. DREYFUS and C. I. HANEY. Brit. 288,657, Oct. 8, 1926. Cellulosic materials such as unmercerized cotton or alkali-treated wood pulp are rendered more easily esterifiable by treatment with small quantities of liquid formic acid preferably of 70-90% strength and by using 10-20% of the acid it is not necessary to remove residual acid before acetylation or other similar esterification.

Cellulose esters. I. G. FARBENIND. A.-G. Fr. 639,119, Aug. 5, 1927. Cellulose before acetylation is given a preliminary treatment by passing it in the form of endless bands of paper, into glacial AcOH .

Products from cellulose esters, etc. I. G. FARBENIND. A.-G. Brit. 289,068, April 22, 1927. Cellulose esters of the higher aliphatic acids which are insol. in the

usual org. solvents, and the sol. cellulose esters of such acids which may be prep'd. as described in Brit. 283,181 (C. A. 22, 3988) and also the mixed esters and ether-esters are formed into molded articles, coatings or the like without use of solvents by subjection to mech. pressure while heated (suitably at 100–150°) to plastify the material. Fillers and other substances may be added for making floor coverings and various other articles.

Films and other products from cellulose esters and ethers. I. G. FARBENIND. A.-G. Brit. 289,523, Jan. 26, 1927. Glycerol monoformal or other acetal type comp'd. of a polyhydric alc. is used as a solvent and other suitable solvents and modifying ingredients also may be added.

Coating objects with cellulose esters or ethers. CAMILLE DREYFUS. Fr. 637,113, July 6, 1927. Threads, cloth, films or other objects made of or contg. cellulose acetate or other ethers or esters of cellulose or having a surface of cellulose acetate, etc., are coated with a soln. of cellulose acetate or other ether or ester of cellulose in a solvent which is not a solvent for the ester or ether in the object to be coated. Substances such as metallic powders, paints or dyes may be added to the soln. A metallic effect is obtained by rubbing polished surfaces with oxychloride of Bi or Sb, etc., and covering with a transparent layer of cellulose acetate, etc., with different soly. characteristics from that of the base. Cf. C. A. 22, 3788.

Cellulose acetate. JAMES W. BULMER. U. S. 1,692,622, Nov. 20. Cellulose is prep'd. for acetylation by mixing it with HOAc of such strength that the acid crystallizes when cooled and then cooling the mixt. until crystn. of the acid is effected throughout the mass.

Cellulose acetate. SOCIÉTÉ CHIMIQUE DES USINES DU RHÔNE. Swiss 126,204, Mar. 9, 1927. See Brit. 274,814 (C. A. 22, 2272).

Treatment of cellulose acetate. VEREIN FÜR CHEMISCHE INDUSTRIE A.-G. Swiss 126,410, Apr. 12, 1927. Pptd. cellulose acetate is pressed to remove AcOH and then washed and pressed to remove wash water. An app. is described in which the material is treated in band form and washed in countercurrent.

Articles of cellulose nitrate or other cellulose ester or similar material. ALFRED S. DONALDSON (to Du Pont Viscoloid Co.). U. S. 1,694,847, Dec. 11. Mirror backs or other decorated machinable articles are formed of united sheets of material, one of which carries decorative material on an interior surface.

Coating composition. ARTHUR W. BURWELL (to The Alox Chemical Corp.) Can. 283,892, Oct. 2, 1928. A coating compn. suitable for use in the production of *artificial leather* comprising 50–5 parts by wt. of nitrocellulose and 50–95 parts by wt. of a softening agent consisting essentially of the water-insol. carboxylic acids substantially identical with those obtainable by contacting an O-contg. gas with a petroleum hydrocarbon mixt. consisting of a 48–43° Bé. petroleum distillate in liquid state at reacting temp. and at a pressure greater than atm., producing thereby water-insol., saponifiable carboxylic acids which are sol. in the hydrocarbon mixt., sapong. the acids, sepg. the resulting soaps from the hydrocarbon mixt., decomp. the soaps by treatment with H₂SO₄, and sepg. the free acids thus obtained from the reaction mixt.

Artificial masses from cellulose esters. OSKAR LOEHR (to I. G. Farbenind. A.-G.). Can. 285,360, Dec. 4, 1928. Soft and pliable masses are manuf'd. from cellulose esters, in particular nitro- and acetylcellulose, by incorporating with the cellulose ester an ester of a polyglycol or of a monoalkyl or aralkyl ether thereof or a mixt. of such compds. E. g., 100 parts of nitrocellulose together with 50 parts of a mixt. of the BzOH esters of polyethylene glycol monoethyl ethers (boiling between 315 and 355°) is dissolved in 300 parts of AcOBu, 150 parts of alc. and 150 parts of benzene. The soln. on pouring out and evapg. the solvent yields a film of excellent properties. The product is suited to the manuf. of artificial masses, *lacquers*, *artificial leather* and the like.

Sized xanthated cellulose fiber. WM. W. CARTER (one-half to Henry T. Nelson). U. S. 1,693,573, Nov. 27. Fiber such as ordinary paper stock is permeated with a rosin size or other suitable sizing material prior to xanthation and subsequently xanthated. The product is suitable for use in making a waterproof paper.

Saccharification of lignocellulose. JEAN ARCHIMANDRITI and JACQUES A. É. CARRIÈRE. Fr. 639,075, July 8, 1927. Lignocelluloses, particularly vine shoots, are saccharified by very dil. acids and the sugar solns. are concd. by using the same acid soln. for several charges of cellulose.

Saccharification of wood. LES DISTILLERIES D'ALSACE. Fr. 637,107, July 6, 1927. Wood is saccharified by a treatment with concd. (40%) HCl and HCl gas in quantities insufficient to complete the saccharification which is completed by a less concd. (30%) acid. The less concd. acid serves to sep. the sugar soln. from the solid residue.

Precipitation of viscose solutions. I. G. FARBENIND. A.-G. Fr. 636,725, June 28, 1927. Pptg. baths for viscose, particularly for the manuf. of artificial silk, are satd. with respect to Na_2SO_4 (33–50%) and contain a high % of H_2SO_4 so that on crystn. trisodium H sulfate first separates. Examples give 16% H_2SO_4 at 20°, 18% at 46° and 19% at 60°.

Desulfuration of viscose silk. I. G. FARBENIND. A.-G. Fr. 636,848, June 30, 1927. Viscose silk is desulfurized in a bath comprising a soln. of an alkali salt which is more or less hydrolytically dissocd. Solid soap, Marseilles soap or Turkey red oil or a 2–4% soln. of Na_2CO_3 may be used.

Artificial silk. MAX J. THEUMANN (to Société pour la fabrication de la soie "Rhodi-aseta"). Can. 284,275, Oct. 23, 1928. To 100 l. of a soln. contg. cellulose acetate 1, AcOH 9, and water 5 parts and H_2SO_4 is added gradually 8.5 l. of a soln. contg. $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ 20, AcOH 20 and water 60 parts. The mixing takes 5 min. The whole is then pptd. into a large quantity of water, the pptd. product is washed, dried and from the product so obtained, a cellulose acetate collodion for spinning is prepd., filtered and spun by the usual methods. The silk obtained contains approx. 20% BaSO_4 and 80% cellulose acetate. It has a very matt white appearance and is supple to the touch. This silk can be subjected to repeated washing in water, cold or hot, without any loss of BaSO_4 . The silk can be dyed by any of the processes currently used for cellulose acetate silk.

Artificial silk. HENRY DREYFUS. Fr. 637,468, July 11, 1927. Threads, cloth, etc., of acetate silk are composed of fibers or threads of lustrous cellulose acetate and fibers or threads of cellulose acetate partly or entirely delustered. The silk may be dyed by the usual solubilized dyes for acetate silk, or dyes such as basic dyes which dye the lustrous threads differently from the delustered may be used.

Artificial silk. ANTONIO BERIA. Ger. 468,315, July 5, 1926. A method and device for drawing out an unbroken thread from a bundle of silk fibers on a spinning-machine is described.

Artificial silk. COURTAULDS LIMITED. Fr. 637,130, July 6, 1927. The proportion of solvent vapor in a spinning chamber is maintained const. by a valve which regulates the inlet or outlet of the atm. to the chamber, and a hot-wire gas-testing app. arranged inside the chamber or connected to the outlet piping through which the evaporative atm. leaves the chamber. One testing app. may be used for two or more spinning chambers.

Artificial silk. COURTAULDS, LIMITED. Fr. 639,235, Aug. 9, 1927. In dry-spinning artificial silk a sudden increase of pressure is applied to the soln. so that the filaments form at the spinning nozzles. The increase of pressure may be obtained by an auxiliary pump between the spinning pump and the nozzles.

Artificial silk. DEUTSCHE ZELLSTOFF-TEXTILWERKE. Ger. 467,241, Dec. 22, 1925. So called air- or light-silk is produced from viscose by causing electrolytic gas, such as H_2 , to be formed in the viscose immediately in front of the spinning holes.

Artificial silk. GRUNERT & GIANNETTI. Ger. 468,272, Feb. 6, 1927. A device for spinning silk from cuprammonium-cellulose soln. is described. Cf. C. A. 22, 3777.

Artificial silk. G. BONWITT. Brit. 288,222, April 7, 1927. In producing artificial silk with reduced luster as described in Brit. 285,066 (C. A. 22, 4816) and Brit. 285,863 (C. A. 23, 278), the spinning soln. contg. the added substance is homogenized before spinning in the case of filaments of less than 6 deniers. The size of the particles of the added substance must be decreased progressively as the denier number is reduced (according to a formula which is given).

Artificial silk. T. IWASAKI and K. HAGIWARA. Brit. 288,655, Oct. 8, 1926. The dispersed particles in a soln. to be used for the spinning of artificial silk are caused to arrange themselves in chain formation by the action of an elec. field produced by a high-voltage elec. discharge. The chain formation persists during ripening and extrusion and the process is applicable to solns. of viscose, ammoniacal-Cu cellulose, nitrocellulose, cellulose acetate, gelatin, albumin and natural silk solns.

Artificial silk. INOXI (Soc. A RESPONSABILITÉ LIMITÉE). Fr. 639,197, Jan. 14, 1927. The stretching of artificial silk is prevented by sizing the silk before submitting it to torsion with sizes usually employed for wool and cotton such as animal or vegetable glue. A "crêpe" appearance is obtained on the silk.

Treating artificial silk. PIERRE JOLIOT. Fr. 639,196, Jan. 14, 1927. Artificial silk is dipped in a bath contg. albumins and gelatin and AcOH, and afterward treating with CH_2O to render the gelatin insol. The appearance of the silk is improved and it becomes more absorbent to weighing salts and more easily woven.

Spinning artificial silk. I. G. FARBENIND. A.-G. Fr. 636,976, July 4, 1927. The

silk thread issuing from the spinning nozzle is bent either not at all or only slightly. The method may be employed for spinning viscoses of high viscosity and low cellulose content and it may be used for the spinning of fine filaments, i. e., below 3 deniers. The bath is preferable H_2SO_4 and the length of immersion may be reduced to a few cm. and in a vertical direction.

Spinning artificial silk. SCIENTIFIL (Charles Sandoz, inventor). Fr. 639,289, Aug. 10, 1927. In dry-spinning acetone-sol. acetate silk the filament coming from the spinning nozzle is sucked down through an appropriate tube such as a constriction between 2 inverted cones by the current of air used for recovering the solvents and guided toward the winding spools. The spools are arranged to be replaced when full without altering the speed of spinning.

Receiver for artificial silk spinning. I. G. FARBERIND. A.-G. Fr. 636,893, July 1, 1927. Receivers which are resistant to acids, particularly HNO_3 , are made from an alloy of Fe 70, Cr 19, Ni 6.6 and Mo 3.6%.

Apparatus for making rayon filaments by the dry-spinning method. SOC. POUR LA FABRICATION DE LA SOIE "RHODIASETA." Brit. 288,618, April 14, 1927.

"Spinning pump" and other apparatus for making artificial silk. H. KINDERMANN. Brit. 289,497, Nov. 23, 1926. Structural features.

Apparatus for making artificial silk by the "dry-spinning" method. NICOLAS B. GRILLET (to Société pour la fabrication de la soie "Rhodiaseta"). U. S. 1,695,094, Dec. 11. Devices for control of temp. and pressure are specified.

Apparatus for manufacture of artificial silk from cellulose derivatives. JOSEPH E. G. LAHOUSSE (to Société pour la fabrication de la soie "Rhodiaseta"). U. S. 1,695,111, Dec. 11.

Filtering or straining material for use in making artificial silk, etc. WILLIAM H. FURNESS (to Cellocilk Co.). U. S. 1,692,824, Nov. 27. Thin metallic sheets which may be formed of Sn are embedded in a wax-like block, which may comprise paraffin or material of similar properties, the block is shaved, and the wax-like material is removed from the metallic shavings and the clean shavings are balled.

Apparatus (with a liquid seal at the outlet) for dry or semi-dry spinning of "acetate silk," etc. O. SILBERRAD. Brit. 289,233, March 23, 1927.

Paper-making apparatus. E. A. OHLIN and F. O. CARLSSON. Brit. 288,286, April 9, 1927. Structural features.

Control system for paper-making apparatus. HAROLD F. DUNBAR. U. S. 1,694,704, Dec. 11.

Suction roll for paper-making apparatus. EARLE E. BERRY (to Beloit Iron Works) U. S. 1,694,698, Dec. 11. Structural features.

Paper stock from straw. LEWIS GRAFFLIN (to Ball Bros. Co.). U. S. 1,692,774, Nov. 20. Paper is formed contg. straw fibers and the residue of a weak Na_2SO_4 liquor in which the straw has been disintegrated.

Strainer for paper-stock. JOHN D. HASKELL and MORTIMER R. RUST (to Dilts Machine Works, Inc.). U. S. 1,693,560, Nov. 27.

Paper. ERIK L. RINMAN. Can. 284,182, Oct. 23, 1928. Straw, esparto, reed and similar raw material is boiled with NaOH at a temp. not exceeding 140° , whereby glutinous substances present in the raw material are not destroyed; the waste liquor is sepd. from the cellulose after the boiling is completed at a temp. not exceeding 50° , whereby the glutinous substances are not dissolved from the cellulose; the cellulose is ground in beaters so that the fibers are not cut or torn and a pulp is obtained having a degree of grinding of 65 to 80 degrees Schopper-Riegler, from which parchment paper or grease proof paper can be produced in a suitable machine. If it is desired to produce thicker paper the cellulose is heated to about 30° but not above 40° before it is transferred to the wire apron of the paper machine.

Centrifugal pulp strainer. P. ERKENS. Brit. 289,397, April 26, 1927. Structural features.

Beating engine for paper pulp. GEORGE S. WITHAM, JR. U. S. 1,692,602, Nov. 20.

Paper and pulp making cylinder mold. TOM HARVEY. U. S. 1,692,733, Nov. 20. Structural features.

Rotary apparatus for screening paper pulp, etc. ERNEST W. LINDQUIST. U. S. 1,694,622, Dec. 11.

Indicating moisture condition of paper webs during manufacture. T. KÄLLÉ. Brit. 288,598, April 13, 1927. An app. is described by which the variation in plasticity or resistance to bending of paper or the like, varying with the moisture content, is used to indicate the latter.

Apparatus for drying paper. ALVIN E. MONTGOMERY. U. S. 1,691,930, Nov. 20.

Refining paper. AUGUSTE AVOR. Fr. 639,713, Jan. 25, 1927. In conical refiners for paper pulp an agitator is placed at the entry to keep the pulp stirred while facilitating the deposition of heavy substances.

Material for bottle closures, etc. HENRY P. SHOPNECK (to John J. Daly). U. S. 1,694,399, Dec. 11. Long and short fibers such as are suitable for paper making are felted together and impregnated with a thermo-plastic stiffener such as a mixt. of rosin and montan wax.

Safety paper with a dye coloring coating and compressed portions serving as identification marks. LOUIS GAILER (to E. E. Lloyd Paper Co.). U. S. 1,692,645, Nov. 20.

Newsprint paper. W. H. MILLSPAUGH. Brit. 288,212, April 4, 1927. See C. A. 22, 3045.

Liberation of fiber from bagasse or like fibrous stalks. GEORGE A. RICHTER (to Brown Co.). Can. 284,219, Oct. 23, 1928. Bagasse or like fibrous stalks are steeped at about room temp. in a highly concd. alk. liquor until such liquor has diffused into and penetrated the stalks, then the liquor is dild. to an alky. equiv. to about 7-12% NaOH, and the stalks are cooked in such dild. liquor at atm. pressure.

24—EXPLOSIVES AND EXPLOSIONS

C. E. MUNROE

Production of explosives in the United States during the calendar year 1927. WILLIAM W. ADAMS. Bur. of Mines. *Tech. Paper* 435, 49 pp (1928). E. H.

Safety of liquid-air explosives in coal dust. MATTHIAS. *Z. ges. Schiess-Sprengstoffw.* 23, 297-302 (1928).—Tests were made to det. the length and duration of flame from charges of approx. 120 g. each of 2 coal-mining explosives, 1 rock-mining explosive and 5 explosives comprising liquid air absorbed in various mixts. of wood meal, chalk, kieselguhr, and NH_4 salts. The charges, both unstemmed and stemmed with 200 g. coal dust, were fired from a mortar, and the flames photographed on both stationary and moving films. The photographs show that all of the liquid-air explosives ignited the coal-dust stemming, producing flames several m. high. Without stemming, the coal-mining powders gave flames of 0.5 to 0.7 millisecc. duration and 0.37 to 0.6 m. height; the liquid-air explosives, 1.2 to 3.24 millisecc. duration and 0.86 to 1.08 m. height. The liquid-air explosives are regarded as unsafe for use in coal mines. C. G. STORM

Determination of velocity of detonation of explosives. H. HENKEL. *Z. ges. Schiess-Sprengstoffw.* 23, 314-5 (1928).—A theoretical discussion is given of the possible sources of error in the detn. of rate of detonation by the *Dautriche method* (with TNT fuse) and by the *spark chronograph method*. C. G. STORM

Initial impulse and detonation. H. HENKEL. *Z. ges. Schiess-Sprengstoffw.* 23, 296-8 (1928).—The total quantity of heat liberated is the same, whether the explosive burns or is detonated. The mech. equiv. of heat calcd. from detn. of min. height of fall of a 2-kg. wt. required to produce explosion (impact test), is always much less than the heat capacity calcd. from the sp. heat and ignition temp. of the explosive. This demonstrates that shock energy is more effective than heat energy in producing detonation. The sensitiveness of molecular explosive compds. to shock is in inverse relation to their heat capacities. The most important factors for obtaining max. rate of detonation are intensity of initial shock wave and sensitiveness of the explosive. Increased fineness of solid ingredients is favorable to high rate, while high content of liquid ingredients is unfavorable. C. G. STORM

Laws governing the combustion of colloidal powders. HENRI MURAOUR. *Z. physik. Chem. Abt. A, Haber Bd.* 139, 163-8 (1928).—See C. A. 22, 4250. E. J. C.

Rock-dusting by hand method. D. HARRINGTON AND C. W. OWINGS. Bur. of Mines, *Information Circ.* No. 6087, 7 pp. (1928).—This is recommended. E. H.

Construction and use of hand grenades. K. REICHERT. *Z. ges. Schiess-Sprengstoffw.* 23, 224-8, 273-6, 311-4 (1928).—The article reviews the history of the development and the uses of hand grenades, classifies various types as to methods of use, function, and method of ignition, enumerates the essential requirements of satisfactory grenades, and describes and illustrates various types used during the World War with charges comprising high explosives, gas and incendiary compns. C. G. STORM

Denitrating waste acids (Fr. pat. 639,641) 18. Liquid air (Fr. pat. 639,702) 13.

Explosives. FRANK H. BERGEIM (to E. I. du Pont de Nemours & Co.). U. S. 1,691,955, Nov. 20. Explosives which are suitable for various purposes contain nitroisobutylglycol dinitrate or other suitable compd. comprising a branched-chain hydrocarbon to which is attached a nitro group and 2 nitrate groups, and may contain also other substances such as nitroglycerin, NaNO_3 , wood meal, CaCO_3 , and nitrocellulose.

Priming and igniting explosives. WILHELM ESCHBACH. Fr. 636,605, June 27, 1927. A mixt. of thermite fastened in a sleeve and provided or not with a fuse is used for priming and igniting explosives such as dynamite.

Storing explosive gases. AUTOGEN GASACCUMULATOR, A.-G. (Edmund Steil, inventor). Ger. 467,881, May 23, 1924. Silica gel is used as filling material for containers for explosive gases, particularly C_2H_2 .

Priming mixture for small-arms ammunition. HARLEY T. PECK (to Peters Cartridge Co.). U. S. 1,694,890, Dec. 11. A priming mixt. comprises Hg fulminate, $\text{Ba}(\text{NO}_3)_2$, Ph chromate and $\text{Ph}(\text{CNS})_2$.

Erythritol tetranitrate. FRANK H. BERGEIM (to E. I. du Pont de Nemours & Co.). U. S. 1,691,954, Nov. 20. Erythritol is dissolved in H_2SO_4 and HNO_3 is then added.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Census of dyes and of other synthetic organic chemicals, 1927. U. S. Tariff Commission, *Tariff Information Series No. 37*, 191 pp. (1928). E. J. C.

Interesting sources of natural dyestuffs. C. D. MELL. *Textile Colorist* 50, 602-4 (1928).—The fruit of the genipap (*Genipa americana*) of tropical America furnishes a dye, considered absolutely indelible on cotton and linen, which is being used industrially for marking laundry. A red dye used chiefly for dyeing the sticks used in the manuf. of mats in the Far East is obtained from rang (*Peristrophe tinctoria*). Raicilla (*Calliandra anomala*), a Mexican shrub, furnishes tannin and dye. Dyeing woods the color of mahogany with a mixt. contg. powd. alkanet root, aloes and dragon's blood is described.

RUBY K. WORNER

Color specification—physical, physiological and psychological. WALTER M. SCOTT. *Am. Dyestuff Rept.* 17, 773-8 (1928).—In this paper color "is the general name for all sensations arising from the activity of the retina of the eye and its attached nervous mechanisms." Accordingly black, gray and white are considered colors as well as the spectrum tints. By the physical factors are meant the stimuli which are transmitted by the colored pigments to the eye, physiological factors are the excitations in the eye which result from the color stimuli and the psychological factors are the visual sensations produced by such color excitations. A review of the more important contributions to the science of color is given; these contributions are classified according to the factors mentioned above.

L. W. RIGGS

Sulfur and the dye industry. H. C. MEAGHER. *Textile Colorist* 50, 769-71 (1928).—General.

RUBY K. WORNER

The use of substantive colors in printing. J. STEPHEN HEUTHWAITE. *Textile Colorist* 50, 809-12 (1928).—A general article, dealing with the different methods at the disposal of the calico printer, use and prepn. of thickenings for the mordant or mixt. of mordant and dyestuff, formation of the color lake, steaming process, applicability and use of substantive colors, cross dyeing and discharge agents.

RUBY K. WORNER

Some points as to the use of the basic dyes on silk. J. F. TELFER. *Textile Colorist* 50, 470 (1928).—If 2 or more basic dyes are to be used, sep. dyeing operations are advisable. Such dyeings show the shade of the combination in transmitted light, but chiefly that of the topping color in reflected light. Dyes should be chosen which dye at the same temp. Temps. higher than 149° are unnecessary for the actual dyeing, except in such a case as fuchsin, where $158-176^\circ$ is the best temp. In general, the basic dyes are rather poor light resistors. Methylene blue and Capri blue are mentioned as exceptions.

RUBY K. WORNER

A yellow dye from the English saw wart. C. D. MELL. *Textile Colorist* 50, 827 (1928).—Before the introduction of synthetic dyes, the saw wart (*Serratula tinctoria*) was used extensively as a substitute for weld. Its herbage furnished a good permanent yellow with alum mordants, and was also used for dyeing green.

RUBY K. WORNER

Pale and mode shades on wool, silk and cotton. WM. PANCROFT. *Textile Colorist* 50, 543-4 (1928).—The selection of the bleaching method is discussed from the practical viewpoint.

RUBY K. WORNER

Mesquite as a source of dyes and tans. C. D. MELL. *Textile Colorist* 50, 845-6 (1928).—Mesquite (*Prosopis juliflora*) flourishes chiefly in Mexico. Its wood, bark and pods contain tannin and a dye of khaki-yellow color. RUBY K. WORNER

The root bark of the Morinda trees. C. D. MELL. *Textile Colorist* 50, 531-2 (1928).—Morindin is obtained from the root bark of *Morinda citrifolia* and *M. tinctoria*. Practically all desired shades of colors may be obtained with it by the use of proper mordants. RUBY K. WORNER

The light that fades. WM. T. ANDERSON, JR. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 273-5; *Am. Dyestuff Rept.* 17, 753-5.—The variations in sunlight and the differences between sunlight and artificial lights are discussed. L. W. RIGGS

Progress in the standardization of tests for fastness to light. WM. D. APPEL. Bur. of Standards. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 275-81; *Am. Dyestuff Rept.* 17, 755-61; cf. *C. A.* 22, 3048.—The work of the past 4 years is reviewed. L. W. RIGGS

Dyeing in its relation to chemistry. PAUL RABE. *Textile Colorist* 50, 614-8 (1928).—"A brief outline of the great advance in dyeing made possible by the reciprocal relations between chemistry and dyeing since the historical year 1856." R. K. W.

Color chemistry and dyeing from the academic view. F. M. ROWE. Dept. Tinctorial Chemistry of Leeds Univ. *Chem. Age* (London) 19, No. 489, *Dyestuffs Monthly Supplement*, 35-6(1928).—An address. E. H.

Modern apparel dyeing industry assuming important proportions. GEORGE RICE. *Am. Dyestuff Rept.* 17, 779-81(1928).—Improved methods and results in garment dyeing together with the demand for changes in color have led to an increase in this business. L. W. RIGGS

The A B C of hosiery dyeing. XIII-XIV. NOEL D. WHITE. *Cotton* 92, 867-9, 975 7(1928).—A continuation of *C. A.* 23, 280. RUBY K. WORNER

Silk dyeing. E. W. PIERCE. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 283 9; *Am. Dyestuff Rept.* 17, 783-9.—An address with discussion. L. W. RIGGS

Silk dyeing and boiled-off liquor. JAMES FITZGERALD. *Textile Colorist* 50, 472 (1928).—The use of boiled-off liquor and H_2SO_4 in the dye-bath is described. RUBY K. WORNER

Acid and resorcinol dyeings on cotton. HORACE FLEMING. *Textile Colorist* 50, 471 2(1928).—Although acid dyestuffs are, in general, unsuited for vegetable fibers, certain selected dyes give good color effects which are fast to light but not to washing. Methods and formulas are given. RUBY K. WORNER

Snags in rayon-yarn dyeing. FRED. GROVE-PALMER. *Textile Colorist* 50, 529-31, 599 602(1928).—A general article, dealing with the bleaching and dyeing of rayon yarns. The process is "a very serious series of operations, each of which requires knowledge and judgment for its successful conclusion." "What is done cannot be undone with rayon." RUBY K. WORNER

Dyeing of piassava. FRED. GROVE-PALMER. *Am. Dyestuff Rept.* 17, 749-50 (1928).—Piassava is a fiber obtained from *Leopoldina piassaba*, a species of palm tree growing in Brazil. The fiber is used for brooms, brushes, matting and screens. The fiber may be dyed with basic colors without a mordant. L. W. RIGGS

Acid dyeings on wool developed by metallic salts. WM. PERRY. *Textile Colorist* 50, 541(1928).—Representative practice is described. RUBY K. WORNER

Some points on matching colors. JAMES STAPLE. *Textile Colorist* 50, 468(1928); cf. *C. A.* 23, 520.—Spectroscopic analysis of 2 dyestuffs will show whether or not a perfect match can be made. RUBY K. WORNER

Color matching: the drawing up of specifications and the fixing of allowances. L. BLIN DESBLED. *Textile Colorist* 50, 447-50, 538-9(1928); cf. *C. A.* 21, 2821; 22, 4822.—By means of the photoelec. photo-colorimeter, any color may be represented by a curve detd. by 6 points, each giving, resp., as a % of white, the intensity of the Violet, Blue, Green, Yellow, Orange and Red radiations constituting the color in question. By using the sample to be matched instead of the white as standard and plotting intensity of tone vs. colorations, the resulting curve becomes a "matching curve," and gives exact data defining (1) the mean tone with reference to the standard denoted by 100 and (2) the difference in each tone of each coloration. On the basis of such studies, specifications can be drawn up making allowances in color matching in *mean tone* and in *coloration tone difference*. Such an "allowance limit rule" is proposed. RUBY K. WORNER

Advances in the chemical technology of textile fibers in the years 1919-1927. RICHARD LOEWENTHAL. *Fortschrittsber. Chem. Ztg.* 2, 105-18(1928).—A review with bibliography. E. J. C.

What scientific research has done to standardize and improve the textile industry. H. D. MARTIN. *Textile Colorist* 50, 738-40(1928). RUBY K. WORNER

Progress in textile mechanical engineering reviewed by textile division of A.S.M.E. JAMES W. COX, JR. *Textile World* 74, 3126-7, 3171(1928). RUBY K. WORNER

Critical theory of the examination of textiles. ADOLF ROSENWEIG. *Kunstseide* 10, 360-1(1928).—See C. A. 22, 2276. FREDERICK C. HAHN

Lubricating textile machinery. FRED. GROVE-PALMER. *Textile Colorist* 50, 622-4(1928). RUBY K. WORNER

Care and maintenance of leather belting in the textile mill. ROY C. MOORE. Chas. A. Schieren Co. *Textile Colorist* 50, 624-6(1928). RUBY K. WORNER

Testing instrument for yarns and fibers. WM. S. DENHAM AND THOMAS LONSDALE. *J. Sci. Instruments* 5, 348-54(1928).—Descriptions of a ballistic instrument for measuring the work done in breaking a thread or bundle of filaments and of an extensometer. E. J. C.

The preparation of yarn for the knitter. B. F. MITCHELL. Am. Yarn and Processing Co., Mt. Holly, N. C. *Cotton* 92, 1011-2(1928).—An outline of the pretreatment, mercerization, and after-treatment of yarn is given. RUBY K. WORNER

The measurement of luster and sheen. L. BLIN DESBLEDS. *Cotton* 92, 1007-9(1928).—The photoelectric photometer furnishes a simple and accurate means for measuring sheen. The method is described. RUBY K. WORNER

Methods of boiling off silk. W. W. BRAY, J. B. CROWE AND S. MEEKER. *Am. Dyestuff Rept.* 17, 743-8(1928).—Various methods of boiling off silk are described. The advantages of the double bath counter-current system are presented. L. W. RIGGS

Improvement in the durability of weighted natural silk. KARL GUTOWSKY. *Kunstseide* 10, 460(1928).—Deteriorated portions, brittle edges, stains, etc., which occur frequently in highly weighted silk fabrics may be attributed to chem. and atm. influences. The detrimental action of these influences is inhibited by treating the silk with substances which act simultaneously as reducing and neutralizing agents, i. e., HCO_2NH_4 , NH_4CNO , NH_2OH . FREDERICK C. HAHN

Washing of silk materials. KARL MICKSCH. *Kunstseide* 10, 334-7(1928).—Detailed directions are given for efficient cleaning of different types of rayon, silk goods and mixts. of these with wool. FREDERICK C. HAHN

The copper number of cotton. A. KOEHLER AND M. MARQUEYROL. *Ann. chim. anal. chim. appl.* 10, 349-51(1928).—The method of Schwalbe consists in detg. the reducing power by heating 15 min. with Fehling's soln. The practice in the French munitions lab. has been to boil for 15 min. with a soln. of CuCO_3 contg. Na_2CO_3 and NaHCO_3 . The question as to whether the time of treatment should be increased was studied and it was found that higher nos. were obtained on prolonging the treatment. At first the change is quite marked but after a time, when the cellulose begins to be attacked the change is slow and becomes proportional to the time. The slow but steady increase takes place at the end of 3 hrs. It is important also to bear in mind, although the fact is not easy to explain, that the concn. of Cu and the relative quantities of Cu and cotton present affect the results. The following procedure is recommended. Dissolve 350 g. of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ and 50 g. of NaHCO_3 in water to make 1 l. Pour a boiling soln. of 95 cc. of the above reagent and 5 cc. of 10% CuSO_4 soln. upon 2.5 g. of carefully sampled cotton in a 100-cc. Erlenmeyer flask. Stir up the cotton in the liquid and heat on a steam bath for 3 hrs. with the flask covered with a watch glass. Remove the cotton and pptd. Cu_2O . To accomplish this use 2 funnels, one over the other. Place a porcelain filter plate in the upper funnel and a filter paper in the lower one. Pour the bulk of the liquid through the paper filter and then transfer the cotton to the upper funnel. Wash somewhat with dil. soda soln. Squeeze out the liquid from the cotton and transfer the latter to a 250-cc. beaker contg. 50 cc. of recently boiled, cold water. Into the original flask introduce 5 cc. of soln. prepd. by dissolving 50 g. of $\text{Fe}_2(\text{SO}_4)_3$ crystals and 250 g. of H_2SO_4 in water to make 1 l. Dil. somewhat and pour through the filter paper contg. the Cu_2O ppt., catching the filtrate in the vessel contg. the cotton. Rinse out the flask and filter the washings. Titrate the reduced Fe^{+2} with KMnO_4 soln. contg. 1.25 g. per l. Add a slight excess of the KMnO_4 , then remove the cotton, wash it and titrate the excess MnO_4^- with standard FeSO_4 soln. The values obtained in this way for some 9 samples of cotton and similar materials are between 0.075 and 2.46. It is not altogether clear how valuable this index is but if it is to be used in practice for evaluating cotton, perhaps 0.3 may be taken as the max. permissible value. W. T. H

The prevention of mildew in cotton goods. JOHN V. KILHEFFER. *Textile Colorist* 50, 519-25(1928).—A preliminary investigation is reported of the action on cultures of black mold, of various antiseptics, particularly certain brominated β -naphthols and

their derivs., Neomerpin, Neomerpin O and Hexalin. Of these, only Neomerpin and Neomerpin O inhibited fungus growth under the conditions selected, and these apparently are not effective until the mold growth has started. Except with regard to cost, both of these substances fulfil the requirements of an ideal antiseptic as set forth by L. E. Morris of the British Cotton Industry Research Assocn. The cost may be offset by their greater efficiency.

RUBY K. WORNER

Mercerizing cotton. WM. B. NANSON. *Cotton* 92, 348-51, 917-9, 1123-4, 1207-8 (1928); cf. *C. A.* 22, 1856.—A general article, dealing with the various factors affecting mercerization and describing in detail the processes and machinery for mercerizing cotton yarns and piece goods.

RUBY K. WORNER

Boiling out of cotton is unnecessary. G. S. McCARTY. *Am. Aniline and Ext. Co. Textile Colorist* 50, 483(1928).

RUBY K. WORNER

Bleaching cotton warps and yarn. RICHARD CAMERON. *Textile Colorist* 50, 469-70 (1928).—A brief discussion and description are given of the procedure.

R. K. W.

Strength of cotton fibers. F. F. CHANDLER. *Bur. Agr. Economics. Textile World* 74, 3024, 3030(1928).—The method of detg. fiber strength developed by the Cotton Division of the Bur. of Agr. Economics is described. Cf. *C. A.* 21, 4077.

R. K. W.

A continuous cold bleach for piece goods. THOMAS F. HUGHES. *Cotton* 92, 1231-2(1928).—An illustrated description of the process is given.

RUBY K. WORNER

Testing of rainproof cloths. H. MALDWYN WILLIAMS. *Wool Record* 33, 1299, 1301(1928).—The application of the "drop" test is limited. Exposure to rain is not satisfactorily imitated by allowing a sequence of drops to impinge on one spot of the fabric. Many cloths, satisfactory to the wearer, show penetration with much less treatment than that prescribed by this test.

RUBY K. WORNER

Defects in weaving piece-dye goods. ALEX. J. BENNETT. *Textile Colorist* 50, 528-9(1928).—Stains occurring during the weaving which show up on dyeing may be due to lubricating-oil splashes, tin coating from wire healds, web bobbins (when new, may cause tannic stain), mixing different qualities or counts of yarn, mildew, or over-application of size.

RUBY K. WORNER

Strength of single wool fibers. P. KRAIS. *Textile World* 74, 3139-41(1928).—See *C. A.* 22, 4254.

RUBY K. WORNER

Penetration and weight added in sizing. JOHN W. CARD. *Cotton* 92, 1112-4 (1928).—The desirability of "perfect penetration" of size is questioned. In calcg. the weight added, the moisture content of the sized and unsized yarn must be taken into account.

RUBY K. WORNER

New abrasion machine controls temperature, humidity, pressure, tension and rate of rubbing. W. R. BRACKETT, E. V. FLOYD AND A. C. DENNEN. *Kansas State Coll. Textile World* 74, 3019-20(1928).—This app. for testing the resistance of fabrics to wear is described in detail and illustrated. Tests were carried out on 3 materials commonly used for coat linings. Under the temp. and relative humidity conditions selected, the wear was found to be: rayon longest, crêpe de chine next, and satin crêpe poorest in the ratio of 1:0.7:0.5.

RUBY K. WORNER

Differentiation of rayons. OTTO ALDEN. *Kunstseide* 10, 497-8(1928).—The difficulties of identifying different types of rayon, especially in colored fabrics, are pointed out, and the need of satisfactory methods of identification is emphasized.

F. C. H.

Identification of rayons by means of ultra-violet rays. M. NOPITSCH. *Kunstseide* 10, 321-4(1928).—All types of undyed rayon exhibit characteristic lighting colors when examd. in filtered light from a quartz lamp, and can readily be identified by this means. A method of procedure is described and the various distinctions are given. The various behaviors of rayons under the quartz lamp after treatment with boiling aq. alk. solns. or after extrn. with Et₂O-petroleum ether mixt. or alc. also are described.

F. C. H.

American methods for testing rayon. ANON. *Kunstseide* 10, 361-5(1928).—American and German methods are compared with reference to defining, testing and differentiating between the different types of rayon.

FREDERICK C. HAHN

Microscopic examination of rayon in a dark field. ALOIS HERZOG. *Kunstseide* 10, 281-3(1928).—A simple app. for the microscopic examn. of rayon in a dark field is described, in which an arc light is used as the source of light. By means of this app., viscose and cuprammonium rayons may be readily distinguished from one another. These rayons show a special ultra structure, the viscose rayon having a striking no. of granular and fine split particles which show a very strong light in the ultramicroscopic field, and the cuprammonium rayon having a structure identical with that of the coarse cuprammonium rayon formerly manufd. The foregoing method, which is more advantageous than chem. methods, is not intended to replace the finer ultramicroscopic methods.

FREDERICK C. HAHN

Photomicrography of rayon. G. HEINK. *Kunstseide* 10, 378-80(1928).—A description of the arrangement of equipment for obtaining clear photomicrographs of rayon.

FREDERICK C. HAHN

The future of acetate rayon. HELLMUTH SCHUPP. *Kunstseide* 10, 283-8(1928).—Various properties of cellulose acetate rayon are discussed with the thought of detg. whether the widespread confidence which this rayon enjoys in the textile world is really justified. Although this type of rayon is more expensive than viscose rayon, its advantages over other rayons from the standpoint of appearance, feel, water-resistance, salt-water-resistance, typical dyeing properties, etc. have increased enormously the demand for acetate rayon. The patent situation on cellulose acetate rayon is discussed.

FREDERICK C. HAHN

Washing and other wet treatments of rayon. O. FAUST. *Kunstseide* 10, 324(1928).—Cellulose hydrated rayon swells less in water and alk. liquids at higher temps., on the basis of which it is recommended that these treatments be conducted hot.

FREDERICK C. HAHN

Swelling of aluminum soaps in various solvents (MARKOWICZ) 27. The identification of coloring matters (HOFMAN) 7. Emulsifiable oil (for treating wool) (U. S. pat. 1,695,197) 22. Dispersion of solids [dyes] (Fr. pat. 639,069) 13. Compounds of indene and phenols [for use in the manufacture of lakes and dyes] (Fr. pat. 636,606) 10. Printing celluloid (Swiss. pat. 126,212) 26. Apparatus for drying fabrics and paper in endless webs (U. S. pat. 1,692,129) 1.

NASMITH, FRANK: **Artificial Silk Handbook**. 2nd ed. revised. Manchester: John Heywood, Ltd. 3s. 6d., net. Reviewed in *Textile Recorder* 45, 95(1927).

Dyes. BRITISH DYESTUFFS CORP., LTD., H. M. BUNBURY, H. EVANS and A. SHEPHERDSON. Brit. 289,191, Feb. 9, 1927. Vat dyes obtained, as described in Brit. 29,352 of 1910, by treating dibenzoyl-4,4'-(or 4,5'-)-diamino-1,1'-dianthrimides with H_2SO_4 , are treated with oxidizing agents, such as $NaOCl$, Na perborate or Na persulfate.

Dyes. BRITISH DYESTUFFS CORP., LTD., J. BADDILEY, P. DOOTSON, A. SHEPHERDSON and S. THORNLEY. Brit. 289,188, Feb. 8, 1927. Flavanthrone derivs. contg. amino groups such as the products obtained from flavanthrone by nitration and reduction, or the products obtained by the reaction of hydroxylamine on flavanthrone as described in Brit. 282,852 (C. A. 22, 3994) are condensed with polynuclear aromatic halogen compds. having a ring system of 3 or more fused nuclei such as chloroanthraquinones, haloacenaphthenequinones, haloflavanthrones or halopyranthrones. The products are vat dyes, or, if they contain carboxylic or sulfonic groups, acid dyes for wool or silk. The reaction product of hydroxylamine and flavanthrone when condensed with dibromopyranthrone forms a vat dye giving brown dyeings on cotton.

Dyes. J. E. G. HARRIS, B. WYLAM, J. THOMAS and SCOTTISH DYES, LTD. Brit. 288,673, Dec. 31, 1926. Sol. products are obtained by treating vat dyes with pyrosulfuryl chloride in the presence of a metal and a tertiary org. base, e. g., by treating dimethoxydibenzanthrone with pyrosulfuryl chloride in the presence of Cu and pyridine, with or without $EtBr$, and extn. with Na_2CO_3 soln. The products are used for dyeing or printing by impregnating textiles with their solns. and developing by hydrolysis and oxidation. Pyrosulfuryl chloride may be made from CCl_4 and H_2SO_4 or chlorosulfonic acid (suitably by heating in the presence of kieselguhr and distg. under reduced pressure).

Dyes. I. G. FARBENIND. A.-G. Brit. 288,214, April 4, 1927. Dyes which have good copying properties and are suitable for use in the manuf. of copying inks and pencils, copying printing pastes and typewriter ribbons are made by the interaction of the diazo compd. of a safranin with a β -diketone. Several examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 288,291, April 9, 1927. Dyes derived by treating haloanthrones or their derivs. with aminoanthraquinones or their derivs. as described in Brit. 286,669 (C. A. 23, 523) are converted into new vat dyes by a further condensing treatment (suitably by use of H_2SO_4 , chlorosulfonic acid or $AlCl_3$ alone or mixed with $NaCl$, or alkali hydroxides) and the products may be further subjected to the action of an oxidizing agent. Several examples are given of dyes of different colors.

Dyes. I. G. FARBENIND. A.-G. Brit. 288,788, March 2, 1927. Monoazo and polyazo dyes are made by use as diazo components of such derivs. of 2,5-diaminodiphenylsulfone as are substituted in the 5-position by acetyl or alkyl groups, and in the non-amino-substituted nucleus by a hydroxy group and a carboxylic group in α -position

to each other. (The manuf. of these derivs. is described in Brit. 267,366 (C. A. 22, 1242).) Numerous examples and details are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 288,983, April 16, 1927. Azo dyes adapted for after-treatment with metal salts such as salts of Cu or Cr are formed in substance or on the fiber by coupling with an arylide of 2,3-hydroxynaphthoic acid a diazotized aminoazo compd. obtained by coupling an *o*-hydroxydiazo compd. or a substitution product with a substituted or unsubstituted amine; *e. g.*, cotton is impregnated with the 2-naphthylamide of 2,3-hydroxynaphthoic acid and developed with a diazo soln. of the dye formed from 2-aminophenol and aminohydroquinone dimethyl ether to obtain a deep black dyeing, the fastness of which is increased by after-treatment.

Dyes. I. G. FARBENIND. A.-G. Brit. 289,092, April 23, 1927. Diaminotriphenylmethane dyes are made by condensing a benzaldehydesulfonic acid such as benzaldehyde-2, 4-disulfonic acid with 2-mono-1'-methylpropylamino-1-methylbenzene or other suitable propylated or higher alkylated arylamine. The dye may be salted out after oxidizing the leuco compd. formed.

Dyes. I. G. FARBENIND. A.-G. Brit. 289,135, Jan. 18, 1927. *p*-Aminobenzene-azosalicylic acid is diazotized and coupled with salicylic acid, and the resulting diazo dye is then sulfonated by heating with oleum. The product gives a yellow-orange shade fast to soaping and to light when chrome-printed on cotton. Other *o*-hydroxycarboxylic acids of the benzene series or their substitution products may be used instead of salicylic acid for producing similar dyes.

Dyes. I. G. FARBENIND. A.-G. Brit. 289,564, Feb. 1, 1927. Triarylmethane dyes are prepd. by joint oxidation in alk. soln. of a *p*-methylated aromatic hydroxy compd. such as a *p*-hydroxydiarylmethane or the corresponding hydrol and a hydroxyaromatic compd.; *e. g.*, methylenedi-*o*-cresotinic acid and 2-hydroxynaphthalene-3,6-disulfonic acid are oxidized with air in the presence of an O carrier such as CuSO₄ (the resulting dye dyes wool with after-chroming reddish blue). Various other examples are also given.

Dyes. I. G. FARBENIND. A.-G. Brit. 289,692, Sept. 6, 1927. Naphthostyryl or a substitution product is condensed with a tertiary aromatic amine or with a phenol by use of an acid condensing agent. The products are themselves dyes and further yield acid wool dyes by sulfonation. Several examples are given of the production of dyes giving various-colored dyeings.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,253, Aug. 9, 1927. Sulfuretted dyes are prepd. by heating 2-nitro- or 2-amino- or 3-nitro- or 3-amino-4-acetyltoluidines with S in the presence of 2 or more mols. of benzidine. The 2-nitro and 2-amino compds. give orange, and the 3-nitro and 3-amino yellow colors on cotton fast to boiling.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,649, Aug. 18, 1927. Monoazo dyes of a pure yellow and very fast to light are prepd. by diazotizing 2,5,6-trichloro-3-amino-1-methylbenzene-4-sulfonic acid and coupling it with 1-sulfophenyl-3-methyl-5-pyrazolone, or with 1-sulfophenyl-5-pyrazolone-3-carboxylic acid or an ester thereof, or substitution products or derivs. of these compds.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,818, Aug. 19, 1927. Fast dyes are obtained on cellulose acetate by forming in a neutral bath monoazo dyes which do not contain more than one acid group such as sulfonic, carboxylic or oxalic, diazotizing them on the fiber and developing with coupling components such as β -naphthol, β -hydroxynaphthoic acids, aminonaphthols, etc. Thus, *p*-aminobenzeneazosalicylic acid diazotized and coupled on the fiber with β -naphthol gives a red color. A long list of coupling components and dyes is given.

Dyes. I. G. FARBENIND. A.-G. Fr. 639,852, Aug. 20, 1927. Arylazodiarylamines

the formula, $\text{aryl-N} = \text{N-aryl-N-aryl}$ in which the aryl groups may contain

the formula, $\text{aryl-N} = \text{N-aryl-N-aryl}$ in which the aryl groups may contain sulfo, carboxyl, nitro or other groups and in which X represents a sulfo or carboxyl group, are prepd. by condensing by boiling in aq. medium monoaminoazo dyes with bidinitroaryl compds. contg. at least one replaceable H and at least one sulfo or carboxyl group. In examples, *p*-aminoazobenzene is boiled in water with 1-chloro-2,6-dinitrobenzene-4-sulfonate of K, with the addn. of NaOAc. Reddish yellow crystals are obtained which dye acetylcellulose. *p*-Aminoazobenzenesulfonic acid is condensed with K 1-chloro-2,6-dinitrobenzene-4-sulfonate giving a product which dyes wool deep shades.

Dyes. I. G. FARBENIND. A.-G. (Oswald Meyer, inventor). Ger. 468,181, July 6, 1928. A compd. is prepd. from the triarylmethane dye base by combining it with hydroxynaphthoic acid. Thus, hydroxynaphthoic acid and NaOH are dissolved in water

and stirred with methyl violet in the form of the hydrochloride. Benzal green, in the form of the oxalate, or fuchsin-HCl may also be stirred with the hydroxynaphthoic acid.

Dyes. I. G. FARBENIND. A.-G. (Fritz Günther and Otto Friedrich Jordan, inventors). Ger. 468,200, Mar. 20, 1925. Addn. to Ger. 446,495. Azo dyes obtained from unsulfonated *p*-nitroaniline or its derivs. are reduced in alk. soln., thereby linking 2 mols., and then sulfonated. Thus, an azo dye formed from *p*-nitroaniline and salicylic acid is reduced in alk. soln. and the 2 mols. so linked sulfonated with fuming H_2SO_4 .

Dyes. SOC. ANON. POUR L'IND. CHIM. À BALÉ. Ger. 467,861, April 12, 1925. Addn. to 463,800. New dyes are prepd. by treating the mordant dyes obtained by coupling hydroxynaphthalenepolysulfonamide and *o*-hydroxydiazocompds. with metal-yielding compds. They dye wool from an acid bath fast shades of reddish violet to blue and dark green. In examples, the dye obtained from diazotized 4-chloro-2-amino-1-hydroxybenzene with 1-hydroxynaphthalene-3,8-disulfonamide, and the dye from diazotized 1-hydroxynaphthalene-2-amino-8-sulfonamide-4-sulfonic acid and 1-hydroxynaphthalene-4,8-disulfonamide are treated with Cr formate or $CuSO_4$.

Dyes. R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 289,103, Oct. 13, 1926. A vat dye which is probably a diaminoisodibenzanthrone, dyeing cotton reddish blue which on treatment with bleaching powder becomes bright blue, is obtained by treating with alk. condensing agents the amino-*B*₂-1-chlorobenzanthrone, m. 280-1°, described in example 7 of Brit. 256,281 (C. A. 21, 2989). The dye may be formed by fusion with alc. KOH or a mixt. of KOH, EtOH or BuOH and *p*-thiocresol (or other mercaptans such as thiophenol) or with NaOEt. Cf. C. A. 23, 285.

Dyes. B. WYLAM, J. E. G. HARRIS, J. THOMAS and SCOTTISH DYES, LTD. Brit. 288,358, Dec. 29, 1926. Substantially dry powders of dyes and their derivs. including leuco compds. and their salts and including derivs. of vat dyes which can be employed for dyeing without vatting such as the vat dye derivs. described in Brit. 186,057 (C. A. 17, 343), Brit. 202,630 (C. A. 18, 333), Brit. 202,632 (C. A. 18, 333), Brit. 203,681 (C. A. 18, 756), Brit. 212,546 (C. A. 18, 2254), Brit. 218,649 (C. A. 19, 579), Brit. 220,964 (C. A. 19, 1058), Brit. 231,889 (C. A. 19, 3597), Brit. 245,587 (C. A. 21, 328), Brit. 247,787 (C. A. 21, 654), Brit. 248,802 (C. A. 21, 825), Brit. 251,491 (C. A. 21, 1360), Brit. 258,626 (C. A. 21, 3132), Brit. 260,638 (C. A. 21, 3467), Brit. 260,647 (C. A. 21, 3467) and Brit. 261,139 (C. A. 21, 3468) are made by adding to the wet paste of the dye or deriv. a substance capable of combining with the water present to form a solid cryst. or other hydrated compd. contg. water of hydration and preferably yielding an alk. or neutral product. Anhyd. Na_2CO_3 is suitable for this purpose and buffers such as Na_2HPO_4 or NaOAc may be added. Several examples are given.

Dyes and insecticides. I. G. FARBENIND. A.-G. Brit. 288,307, April 6, 1927. Cu ammine complex azo compds. suitable for use as dyes or as insecticides are obtained by coupling a diazo, diazoazo or tetrazo compd. contg. one or more substituted or unsubstituted alkyloxy, aralkyloxy or aryloxy groups in *o*-position to one or more azo or diazo groups, with a coupling component in the presence of a water-sol. complex Cu compd. contg. N such as tetrammine Cu sulfate. Several examples are given.

Dyes and intermediates. COMPAGNIE NATIONALE DE MATIERES COLORANTES ET MANUFACTURES DE PRODUITS CHIMIQUES DU NORD REUNIES ÉTABLISSEMENTS KUHLMANN. Brit. 288,572, April 12, 1927. 4-Chlorobenzenediazo oxide is made by the action of alkalis such as an alkali metal or alk. earth metal carbonate or a salt of an org. acid such as NaOAc on diazotized 2-nitro-4-chloroaniline. By coupling it with azo components (various examples of which are given) in the absence of free alkali, dyes of purer shades are obtained than when free alkali is present. The dyes are fast and may in some instances be changed in shade by after-chroming and yield compds. with metal salts such as those of Cu and Cr.

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 288,215, April 4, 1927. 4-Methyl-5-halohydroxythionaphthene is prepd. by ring closure of a 3-methyl-4-halo-1-thioglycolic acid substituted in the 2-position by CN, $CONH_2$ or $COOH$. Thioindigo dyes are obtained by oxidizing the resulting hydroxythionaphthene or by condensing the latter or its 2-deriv. with usual indigoid components. Similar dyes are obtained by halogenating 4,4'-dimethylthioindigo. Several examples are given.

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 288,554, April 11, 1927. 3,5,6-Trimethylbenzene-1-thioglycolic acid or a substitution product having a carboxy, cyano or a carboxylic acid amino group in the 2-position is treated with a ring-closing agent in order to produce the corresponding hydroxythionaphthene, which, by oxidation gives 4,6,7',4',6',7',-hexamethylbisthionaphtheneindigo. The 4,6,7-trimethylhydroxythionaphthene or its active 2-derivs. also may be condensed with the usual

indigoid components to produce vat dyes. Examples are given, including the production of 3,5,8-trimethylbenzene-1-thioglycolic-2-carboxylic acid nitrile.

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 288,985, April 16, 1927. Benzanthrone-*peri*-dicarboxylic acid, its derivs. and substitution products, are obtained by treating 4-benzoyl-1,8-naphthalic acid or its anhydride, or a deriv. or substitution product, with or without a diluent or fluxing agent, with a metal chloride such as AlCl_3 , NaAl chloride or FeCl_3 , either alone or in the presence of an oxidizing agent such as mol. O or MnO_2 . Examples are given of the production of benzanthrone-*peri*-dicarboxylic acid and its anhydride, chlorobenzanthrone-*peri*-dicarboxylic anhydride, benzanthrone-*peri*-dicarboxylic-*N*-phenylimide, an orange-red dye from 4-benzoyl-1,8-naphthylenebenzimidazole and a fast brown dye from 4-benzoyl-1,8-naphthoylene-1,2-naphthyleneimidazole.

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 288,986, April 16, 1927. Arycarboxylic acid amide-*o*-thioglycolic acids are converted into hydroxythionaphthenes by heating with aq. alkalis; e. g., 2-carboxylic acid amide-3-methyl-5-chlorobenzene-1-thioglycolic acid is heated with aq. NaOH and Na_2CO_3 . The resulting hydroxythionaphthene and hydroxythionaphthenecarboxylic acid may be oxidized to the 4,4'-dimethyl-6,6'-dichloroindigo without first isolating them.

Dyes and intermediates derived from dibenzopyrenequinone. GEROG KRÄNZLEIN, KARL ZAHN, PAUL OCHWAT and MARTIN CORELL (to Grasselli Dyestuff Corp.). U. S. 1,693,447, Nov. 27. The *Bz*-2-aroylehydroxybenzanthrenes and their substitution products which possess free *peri*-positions in the naphthalene nucleus are converted into hydroxy compds. of dibenzopyrenequinone by treating them with acid condensing agents, e. g., *Bz*-2-benzoylhydroxybenzanthrone is melted with AlCl_3 . Some of the products are themselves useful as dyes and others may be used as intermediates for dye manuf. Several examples are given.

Dye intermediates. BRITISH DYESTUFFS CORP., LTD., W. H. CLIFFE, F. W. LINCH and E. H. RODD. Brit. 289,571, Feb. 5, 1927. Condensation products are produced by treating alkali metal derivs. of 4,4'-tetraalkyldiaminodiarlylketones (as described in Brit. 272,321 (C. A. 22, 1859)) with aromatic compds. contg. at least one methyl or methylene group, which may be present in a side chain or in a ring. On treating the resulting products with water carbinols are obtained which yield ethylenic compds. by removal of water. Examples are given of the production of tetramethyldiaminodiphenylstyrene, octamethyltetraaminotetraphenylethylene, tetramethyldiaminodiphenyldiacenaphthylcarbinol, 4,4'-tetramethyldiaminodiphenylmethylenecacenaphthene, 4,4'-tetramethyldiaminodiphenylmethylenefluorene and similar products.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 288,927, Nov. 22, 1927. 2,3-Dichloro-1,4-naphthoquinone is nitrated with a mixt. of HNO_3 and H_2SO_4 . The product crystallizes in 2 different forms when glacial HOAc and alc. are used as solvents and is probably 2,3-dichloro-8-nitro-1,4-naphthoquinone.

Dye intermediates (anthracyl and anthraquinonyl alkyl ketones). I. G. FARBENIND. A.-G. Brit. 289,585, Feb. 16, 1927. Anthracyl alkyl ketones are made by the treatment of anthracene or its derivs. with a fatty acid halide in the presence of AlCl_3 , FeCl_3 , ZnCl_2 or other agent facilitating the removal of HCl . On oxidation, the products yield the corresponding anthraquinonyl alkyl ketones. By using "mild conditions" for the condensation, the *meso* alkyl anthracyl ketones are produced, while with "stronger conditions" mixts. of α - and β -derivs. are usually obtained. Examples are given of the production of methyl and ethyl anthracyl ketones, the corresponding anthraquinonyl alkyl ketones, *meso* methyl anthracyl ketone and 2-methyl anthracyl ketone.

Phenyl- α -naphthyl ketone (a dye intermediate). H. A. E. DRECHSER, J. THOMAS and SCORRISH DYES, LTD. Brit. 289,544, Jan. 28, 1927. Ca α -naphthoyl-*o*-benzoate is heated in the presence of Ca(OH)_2 under reduced pressure; phenyl α -naphthyl ketone distils over.

1,5-Dinitro-8-chloroanthraquinone. SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 126,195, Feb. 10, 1927. A new product, probably 1,5-dinitro-8-chloroanthraquinone, is obtained by treating 1,8-nitrochloroanthraquinone with concd. HNO_3 . The product melts with decompn. at 357° and is useful as an intermediate for dyes.

Azo dye. I. G. FARBENIND. A.-G. Swiss 126,200, April 27, 1927. Diazotized *p*-aminoacetanilide is coupled with *p*-cresol. The product is a yellow powder suitable for dyeing cellulose esters and ethers.

Azo dye. I. G. FARBENIND. A.-G. Swiss 126,408, April 27, 1927. A yellow azo dye suitable for dyeing acetate silk is obtained by coupling diazotized *p*-nitroaniline with 1-nitro-2,4-diaminobenzene.

Azo dyes. I. G. FARBENIND. A.-G. Fr. 636,982, July 4, 1927. Azo dyes are

prepd. by uniting 2 mols. of the dyes obtained from diazotized 5-nitro-2-aminobenzoic acid and azo components by careful reduction of the nitro groups by means of the azoxy and azo group, resp. Diazo or polyazo dyes are thus obtained which may be treated on the fiber with heavy metallic salts. In an example 5-nitro-2-aminobenzene is diazotized and coupled with 2-amino-8-naphthol-6-sulfonic acid. The product is reduced by means of glucose. The diaminoazo dye is diazotized and coupled with 2,4-diaminoacetanilide giving a dye which dyes cotton black, which is rendered resistant to light and washing by treatment with metallic salts. Other examples are given.

Azo dyes. I. G. FARBENIND. A.-G. Fr. 639,283, Aug. 10, 1927. Azo dyes insol. in water and fast to light are prep'd. by coupling diazo compds. of unsulfonated aminofluorenones or their derivs. with components such as naphthols, arylides of 2,3-hydroxynaphthoic acid, hydroxynaphthocarbazoles, or diacetylacetoarylates. In examples colors are developed on cotton from the following components (1) a red from 2,3-hydroxynaphthoic anilide and monoaminofluorenone; (2) a brownish red from 2,3-hydroxynaphthoic dianisidide; (3) a red from monoaminofluorenone and β -naphthol; (4) a violet from 2,7-diaminofluorenone and 2,3-hydroxynaphthoic anilide; (5) a deep black from 2,7-diaminofluorenone and 7-hydroxynaphthocarbazole.

Azo dyes. I. G. FARBENIND. A.-G. Fr. 639,284, Aug. 10, 1927. Diazotized aminonaphthol ethers are coupled with arylamides of 2,3-hydroxynaphthoic acid. In an example a clear violet color is obtained by coupling diazotized 7-methoxy-1-aminonaphthalene with 2,3-hydroxynaphtho- β -naphthylamide.

Azo dye containing chromium. I. G. FARBENIND. A.-G. Swiss 126,407, Mar. 31, 1926. The complex compd. obtained by treating with a Cr compd. the azo dye from *p*-nitro-*o*-aminophenol-*o*-sulfonic acid and β -naphthol is reduced to the corresponding NH_2 compd. with Na_2S . The product dyes wool blue.

Basic dyes. I. G. FARBENIND. A.-G. Fr. 639,469, Aug. 12, 1927. Fastness to light of basic dyes is increased by a final treatment with reduction products of compds. of W and Mo. In an example rhodamine B extra on a mordant of Sb and tannin is treated with a reduction product of a compd. of Mo, W and P.

Anthraquinone dyes. WILFRED M. MURCH (to National Aniline & Chemical Co.). U. S. 1,692,854, Nov. 27. Ni-Fe-alloy vessels (which may be formed of Ni steel contg. 0.1-0.25% each Cr, Mn and Si and Ni 3-4%) are used in effecting reactions between caustic alkalies and aminoanthraquinone compds. such as those employed for producing dyes by fusion.

Indigoid dyes. I. G. FARBENIND. A.-G. Brit. 289,154, Jan. 21, 1927. Reactive α -derivs. of 2,3-naphthisatins halogenated in the nucleus are condensed with monoethers of 1,4-dihydroxynaphthalene, to produce dyes giving fast green shades on cotton from the vat.

Mordant dye. I. G. FARBENIND. A.-G. Swiss 126,199, April 16, 1927. The diazo compd. from 2-amino-1-phenol-4-sulfonic acid is coupled with 2,6-dihydroxynaphthalene-3-carboxylic acid. The product imparts olive-green shades to wool in a single-bath chrome process.

Sulfuretted dyes. I. G. FARBENIND. A.-G. Brit. 289,241, March 29, 1927. An amino- or hydroxyaryl-compd. is treated with free thiocyanogen or compds. yielding the latter and the resulting thiocyano deriv. is converted into the corresponding thiophenol or disulfide; e. g., 2-hydroxy-1,2-naphthophenazine is converted into its thiocyano deriv. by treatment with sulfuryl chloride and Pb thiocyanate in the presence of CCl_4 , and the leuco dye or the dye itself is then obtained by boiling with Na disulfide or NaOH and pptg. by passing in air or adding HOAc or other acid. Other examples also are given. Cf. C. A. 22, 4833.

Triarylmethane dyes. I. G. FARBENIND. A.-G. Fr. 636,600, June 27, 1927. One of the aryl groups of triarylmethane dyes is the residue of a 4-alkoxydiphenylamine. In examples, 4-methoxydiphenylamine is condensed with 4,4'-tetramethyldiaminobenzophenone by means of POCl_3 and the resulting basic dyestuff is sulfonated. 4-Amino-1-ethoxybenzene is heated with Guinea green 2G in the presence of HCl. The dyes dye wool in a feebly acid bath clear blue tints fast to light.

Vat dyes. I. G. FARBENIND. A.-G. Fr. 636,860, June 30, 1927. Vat dyes giving deep blue and clear red shades are obtained by condensing the dihalogen derivs. of alkylisatins or their α derivs. capable of reaction, with compds. contg. a ketomethylenic group in cyclic connection, such as naphthols, anthrols, hydroxythionaphthenes, hydroxynaphthothiophenes, indoxyls and naphthindoxyls. The α -derivs. mentioned give on reduction tetrahalodialkylindigos which are also valuable dyes. Thus, 6-methyl-5,7-dichloroisatin is condensed with 6-chloro-4-methyl-3-hydroxythionaphthene. Other examples are given.

Vat dyes. J. R. GEIGY AKT.-Ges. Fr. 638,964, Aug. 4, 1927. Stable leuco compds. of vat dyes are prepd. by intimately mixing the dye with a dihydric alc. or an aldehyde, reducing and drying. In an example Tinon scarlet G extra is mixed with ethylene glycol and NaOH soln. and reduced with NaHS, Na_2SO_4 is added and the mixt. evapd.

Metal compounds of dyes. HANS KRZIKALLA and WERNER MÜLLER (to Grasselli Dyestuff Corp.). U. S. 1,693,448, Nov. 27. In producing metal compds. of dyes such as various azo dyes which are difficultly sol. in water, the dye is treated with an aq. soln. of a metal compd. such as Cr formate capable of reaction with the dye in the presence of alc. or other suitable org. solvent capable of dissolving the dye and miscible with water.

Chromium compounds of dyes. SOC. ANON. POUR L'IND. CHIM. À BAËLE. Brit. 289,094, April 23, 1927. An *o*-hydroxyazo dye obtained by coupling diazotized 5-nitro-2-aminophenol with an *N*-alkyl, *N*-aryl, or *N*-alkylene or *N*-arylene deriv. of 2,5,7-acid is converted into a sol. Cr compd. by boiling with Cr fluoride or otherwise suitably treating with a chromium compd. The products dye fast blue from a neutral or slightly alk. bath. Cf. C. A. 22, 3305.

Compounds derived from triarylmethane dyes. I. G. FARBENIND. A.-G. Fr. 636,991, Jul. 4, 1927. Compds. are derived from basic dyes of the triarylmethane series by decompn. with a hydroxynaphthoic acid compd. which does not contain a sulfonic group. In examples, the hydrochloride of fuchsin or of methyl violet is treated with 1,3-hydroxynaphthoic acid or 2,3,6-naphtholdicarboxylic acid, and malachite green as the oxalate is treated with 2,6-naphtholcarboxylic acid.

Anthraquinone-1,8-dinitrile. I. G. FARBENIND. A.-G. Swiss 126,712, Nov. 8, 1926. Addn. to Swiss 125,469. CuCN is heated with 1,8-dihaloanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and dil. HNO_3 added. The substance dissolves in concd. H_2SO_4 with a red color and gives a green *vat dye*.

2-Chloroanthraquinone-1-nitrile. I. G. FARBENIND. A.-G. Swiss 126,713, Nov. 8, 1926. Addn. to Swiss 125,469. CuCN is heated with 1-halo-2-chloroanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and warmed with dil. HNO_3 . The substance gives a blue-green *vat dye*, but is red in concd. H_2SO_4 .

3-Chloroanthraquinone-1-nitrile. I. G. FARBENIND. A.-G. Swiss 126,714, Nov. 8, 1926. Addn. to Swiss 125,469. CuCN is heated with 1-halo-2-chloroanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and warmed with dil. HNO_3 . The substance gives a blue-green *vat dye* and is red in concd. H_2SO_4 .

2,3-Dichloroanthraquinone-1,4-dinitrile. I. G. FARBENIND. A.-G. Swiss 126,715, Nov. 8, 1926. Addn. to Swiss 125,469. CuCN is heated with 1,4-dihalo-2,3-dichloroanthraquinone in the presence of a compd. in which a nitrile group is linked with an aliphatic residue, and treated with dil. HNO_3 . The product gives a green *vat dye*, but is red in concd. H_2SO_4 .

Fixing dyes. A. HOLTSMANN & Co. Ger. 467,337, May 30, 1925. Dyes, prints, etchings and reserve-style prints, on fibers or fabrics are fixed by steam. The fabric is moistened and passed through a steamer over rollers into a vat where the neutralizing and fixing substances are applied as vapor.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,580, Feb. 16, 1927. In the prepn. of *p*-diazophenylsulfamic acid, *p*-phenylenediamine is sulfonated in the presence of a tertiary base, and the product diazotized. The substance is a colorless crystal giving a red dye sol. in water when coupled with β -naphthol.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,581, Feb. 16, 1927. In the prepn. of *p*-diazophenylsulfamic acid, *p*-nitrophenylsulfamic acid is reduced in a neutral soln., and the product diazotized.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,582, April 9, 1927. A dye contg. a naphthosultam ring is prepd. by condensing 3-phenylamino-1,8-naphthosultam-6-sulfonic acid with 4-nitrosodimethylaniline. The dye is red-violet in water.

Dyeing. I. G. FARBENIND. A.-G. Swiss 126,584, Jan. 18, 1926. Insol. and slightly sol. dyes and color lakes are given a high wetting-out quality by finely dividing them in the presence of sulfo acids or their salts. Thus, the diazotization of 2,4-dinitroaniline and β -naphthol produces an orange-red dye, which is then mixed with the Na salt of isopropynaphthalenesulfonic acid and ricinoleic acid. The strength of the dye is thus increased. The aromatic sulfo acids with side chains in the mol. are preferred.

Dyeing. I. G. FARBENIND. A.-G. (Otto Siebert and Max Raack, inventors). Ger. 468,210, Feb. 10, 1927. Addn. to Ger. 467,036. Cellulose esters and ethers are

further dyed by diazo compds. Thus, the straw-yellow color produced on acetate silk by aminobenzeneazo-2,4-diaminophenylmethanesulfonic acid is turned to yellow-brown by further treatment with 4-nitro-1-diazobenzene. The orange color produced by 1-aminonaphthaleneazo-2,4-diaminophenylmethanesulfonic acid is turned to a red-brown. Cf. C. A. 23, 527.

Dyeing. PAUL RABE, HERMANN STÖTTER, BERTHOLD WENK and WILHELM SCHEPSS (to Grasselli Dyestuff Corp.). U. S. 1,694,562, Dec. 11. In dyeing fibers such as cotton or "acetate silk," a complex acid contg. at least one metal of the group including Mo and W is pptd. on the fiber by the action of an org. fixator such as phenol or benzhidine hydrochloride to facilitate fast dyeings with acid and basic dyes.

Dyeing. SOC. ANON. POUR L'IND. CHIM. À BAËLE. Brit. 288,306, April 9, 1927. Compact vegetable fabrics, yarns, etc. are dyed throughout by use of vat dyes by treating them at high temp with a protective colloid such as glue or sulfite waste liquor and then, without washing, dyeing with a vat dye (such as Cibacone 3G or Indanthrene blue green B) in the presence of glue, sulfite cellulose lye or other suitable protective colloid.

Dyeing and printing. SOCIÉTÉ ALSACIENNE DE PRODUITS CHIMIQUES. Fr. 636,665, Oct. 21, 1926. For direct dyeing or printing, a mixt. of a sulfurized phenolic substance and an acid dye in soln. in an alkali is used, the sulfurized phenol in such a mixt. being capable of fixing in one operation the acid dye on cellulose fibers and artificial textiles.

Dyeing animal fibers, etc. S. W. WILKINSON. Brit. 289,578, Feb. 12, 1927. The absorptive capacity of animal fibers and fabrics of protein character is increased by preliminarily treating them with ozone together with compds. such as HNO_2 or HOCl which are capable of undergoing oxidation to produce other acid compds.

Dyeing cellulosic fibers. ALBERT BODMER (to Heberlein & Co. A.-G.). U. S. 1,694,526, Dec. 11. Cellulosic fibers such as cotton yarn are treated with alkali and PCl_5 or other P compd. which is capable of rendering the fibers immune to substantive dyes and relatively attractive to basic dyes.

Dyeing cellulose derivatives. HENRY DREYFUS. Fr. 639,825, Aug. 19, 1927. Cellulose acetate is dyed, printed or stenciled by nitro derivs. of compds. contg. 2 or more aryl groups joined by any means other than a single N linkage, as, e. g., nitro derivs. of the following classes: $\text{R}'\text{—R}^2$, $\text{R}'\text{—NH—CH}_2\text{—R}^2$, $\text{R}'\text{—O—R}^2$, $\text{R}'\text{—CH}_2\text{—R}^2$, $\text{R}'\text{—CO—R}^2$, $\text{R}'\text{—NH—R}^2$, in which R' and R^2 are the same or different aryl groups. The compds. may be solubilized in the manner described, e. g., in Fr. 602,603, Fr. 627,427, or Fr. 568,655. Examples among others are given of dyeing with 3,3'-dinitro-4,4'-diaminodiphenyl, 2,4-dinitrophenylbenzylamine, 3-nitro-4-aminodiphenylether and 3,3'-dinitro-4,4'-diaminodiphenylmethane. Cf. C. A. 23, 288.

Dyeing cellulose esters and ethers. HEINZ EICHWEDE, ERICH FISCHER and CARL E. MÜLLER (to Grasselli Dyestuff Corp.). U. S. 1,692,492, Nov. 20. Monoazo dyes are used such as may be formed by coupling the diazo compd. of 2-chloro-1-aminobenzene-5-sulfonic acid or other diazo compd. contg. not more than one sulfo group with an *o*-aminophenol ether such as 3-amino-4-cresol methyl ether. U. S. 1,692,493 specifies dyes similarly formed except that instead of the *o*-aminophenol ether there is used a monoacyl-*m*-phenylenediamine such as *m*-aminoacetanilide.

Dyeing cellulose acetate. GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,694,413, Dec. 11. A Twitchell reagent is used for solubilizing azo dyes or other coloring substances. U. S. 1,694,414 specifies dyeing cellulose acetate materials with unsulfonated stilbene coloring compds. such as azo stilbene dyes. Cf. C. A. 23, 528.

Dye vat. CHARLES CLARK, ROBERT CHARLES CLARK and ARTHUR BERNARD CLARK. Ger. 468,016, Oct. 13, 1926. The vat has curved walls with compressed air and steam pipes to one side of the bottom.

Complex iron compounds forming color lakes. I. G. FARBENIND. A.-G. (Winfrid Hentrich and Ludwig Zeh, inventors). Ger. 467,423, Dec. 23, 1925. Compds. giving blue lakes are obtained by treating isonitroso compds. of acetylacetamides with ferrous salts. In an example, the Na compd. of isonitrosoacetoacetyl-2-anisidide is stirred with FeSO_4 soln., the corresponding ferrous compd. being pptd. The Na compd. of isonitroso-acetoacetyl-2-anisidide is prepd. by running a soln. of the calcd. amts. of acetoacetyl-2-anisidide, NaOH and NaNO_2 into ice-cooled 20% H_2SO_4 .

Colored compounds. I. G. FARBENIND. A.-G. Fr. 639,166, Aug. 8, 1927. Compds. for coloring paints or for the production of stable dyes are prepd. by treating mono- or poly-nuclear aromatic compds. which contain one or more amino groups and which are not basic dyes, or mixts. of such compds. with basic dyes, or dyes which contain acid as well as basic groups, with complex acids or their salts or substances forming complex acids. In examples, 4,4'-tetramethyldiaminodiphenylmethane is treated in concd. HCl

soln. with Na phosphotungstomolybdate. A deep blue ppt. is obtained with NaOH. In the same way 4,4'-tetramethyldiaminobenzophenone gives an orange-brown compd., and *p*-aminobenzaldehyde an orange compd. Other examples are given.

Designs on mixed goods of cotton and wool. J. MAHLER. Brit. 289,700, Sept. 20, 1927. A pattern is printed on the fabric with NaOH or with H_2SO_4 according to whether the wool or cotton threads are to be etched out.

Metallic effects on fabrics comprising cellulose derivatives. RENÉ CLAVEL. U. S. 1,694,466, Dec. 11. See Can. 276,359 (C. A. 22, 2068).

Immersion apparatus for bleaching, dyeing or washing cloth. JOSEPH M. CLERC-RENAUD. Fr. 639,742, Jan. 29, 1927.

Washing, bleaching or dyeing hanks or cakes of artificial silk. F. KÜTTNER A.-G. Brit. 288,990, April 16, 1927. An app. is described.

Roller apparatus for printing on hanks of yarn. W. BAMFORD. Brit. 289,576, Feb. 10, 1927.

Card grinding rollers for use in the textile industry. T. WAREING. Brit. 289,577, Feb. 12, 1927. Metal rollers are coated with a varnish or soln. of synthetic resin, then sprinkled with powdered emery or other abrasive and heated (suitably to about 105° and then gradually to about 175°) to effect hardening.

Drying drum and associated apparatus for yarn-sizing machines. PAUL GREVE. U. S. 1,692,373, Nov. 20.

Apparatus for treating silk cloth in quantity with liquids. SOCIÉTÉ CLERTIN (Société immobilière et de participations industrielles et commerciales à responsabilité limitée). Fr. 639,772, Feb. 3, 1927.

Treatment of fabric. ROBERT R. FULTON (to the Koppers Co.). Can. 285,372 Dec. 4, 1928. Cellulosic pulp is spread over fabric which is then pressed and dried and the fabric and superposed layer of cellulose is immersed in a soln. of $Ca(CNS)_2$ and CH_3O . The treated fabric is then removed and pressed to remove the excess soln. and the fabric is allowed to stand until gelatinization of the pulp occurs. When the desired degree of gelatinization is obtained the material is sprayed with water or subjected to the action of steam or otherwise treated to dil. the gelatinizing agent and the fabric is passed through squeezing rolls. The fabric is then washed and dried in the usual manner.

Treating cloth. HEBERLEIN & Co. A.-G. Fr. 639,374, Aug. 8, 1927. A woollen appearance is given to cloth of vegetable origin by treating the crude cloth still contg. its natural incrustations with swelling agents. An app. is described.

Treatment of cloth containing cellulose derivatives. CAMILLE DREYFUS. Fr. 636,608, Jun. 27, 1927. Cloth contg. fibers of cellulose derivs. and other fibers is treated with a carbonizing soln. to remove vegetable fibers. The carbonizing soln. may contain $AlCl_3$ and Glauber salts may be added to protect the luster.

Treating spun rayon yarns. JAMES J. BOYLE. U. S. 1,692,717, Nov. 20. The moistened yarn is subjected to a reverse twisting after it has been completely spun, in order to improve the luster.

"Delusterizing" artificial silk. HENRY A. GARDNER. U. S. 1,692,372, Nov. 20; Brit. 290,263, May 13, 1927. Artificial silk such as that formed from cuprammonium cellulose, nitrocellulose, viscose or cellulose acetate is treated with a dil. aq. soln. of a Ti salt such as Ti sulfate which is decomposable by heat in the presence of water and the impregnated fibers are heated to deposit in and on them a water-insol. Ti compd. The concn. of the salt soln. used is such as to cause an increase in wt. of the artificial silk of about 0.5% or somewhat more.

Silk. RENÉ CLAVEL. Ger. 468,017, Sept. 18, 1926, and Ger. 468,018, Sept. 18, 1926. Acids or acid salts are added to the baths contg. metal compds. used for making artificial or natural silk heavier. The silk, after immersion, is treated without washing, with an alk. soln. contg. a tannin dye. A suitable bath contains $Al_2(SO_4)_3$ and anhyd. $SuCl_2$ and $ZnCl_2$ or concd. H_3PO_4 . Cf. C. A. 22, 3997.

Composition for softening silk. ROBERT E. ROSE (to E. I. du Pont de Nemours & Co.). U. S. 1,691,994, Nov. 20. A guanidine salt of sulfonated castor oil such as the di-*o* tolylguanidine salt is used.

Decreasing raw wool. RUDOLF BRAUCKMEYER. U. S. 1,693,106, Nov. 27. The wool is preliminarily freed from water except for about 2-3% of moisture which is left in the wool and is then treated with a water-sol. mild grease solvent such as MeOH.

Apparatus for damping or oiling threads before weaving or knitting. PRAXERA (Société anon. pour la fabrication de la bonneterie). Fr. 639,564, Aug. 16, 1927.

Ventilating and dust-collecting system suitable for cotton mills. T. ANDREW. Brit. 288,798, March 17, 1927.

Protecting animal fibers from injury by alkaline liquids. PAUL ONNERTZ and

BENNO SCHWÄRZEL (to Grasselli Dyestuff Corp.). U. S. 1,692,950, Nov. 27. In order to protect them from the action of Na_2CO_3 solns. or similar alk. liquids, animal fibers such as woolen yarn are treated with the alk. liquid in the presence of a sulfurized phenol which does not possess dyeing properties and which is sol. in Na_2CO_3 with only a slight color.

Resists on animal fibers. I. G. FARBERIND. A.-G. Fr. 639,326, Aug. 11, 1927. To obtain resists on animal fibers or cloth contg. them, they are suitably treated with synthetic tanning agents, such as the condensation products of ketones, ethers or aldehydes with aromatic compds., the products being solubilized by sulfonation.

Preservation of colors in washing. HENKEL & CIE. G. M. B. H. Fr. 639,379, Aug. 11, 1927. To prevent running of colors during washing of cloth, urea is added to the wash-water or incorporated in the soap.

Composition for cleaning and bleaching clothes, etc. LEVER BROS., LTD., and R. THOMAS. Brit. 288,654, Oct. 4, 1926. A compn. which may be formed into powder, flakes or cakes and which is stable during storage is obtained by mixing soap, NaOCl and Na_3PO_4 (or substances which react suitably to form a mixt. of these constituents). Various details, modifications and proportions are given.

Detergents, bleaching agents, lubricants, etc. R. VIDAL. Brit. 289,001, April 19, 1927. In producing detergents, washing and bleaching agents, or lubricants for use in the textile industry as described in Brit. 280,193 (C. A. 22, 3052) and Brit. 285,473 (C. A. 22, 4854), the oleic acid is replaced by ricinoleic acid and the hypochlorite is added in stages.

Material for loom pickers. H. PERCIVAL. Brit. 289,218, March 10, 1927. To avoid necessity of steeping loom pickers in oil they are made from buffalo hide impregnated with glycerol after removal of the hair and lime and neutralization of residual lime with "spirits of salts."

Stiffening material for use in shoe manufacture. BRITISH UNITED SHOE MACHINERY CO., LTD., W. J. LUND and L. P. MELLERIO. Brit. 289,496, Oct. 30, 1926. Fibrous material is used which may be gelatinized by use of solvents such as fibers of nitrated cellulose or acetylated cellulose which are gelatinizable by acetone. A felted fabric may be formed from the fibers and sufficient solvent is applied to at least retain them in the desired formation and shape.

Waterproofing. FIRMA C. A. MÜLLER. Ger. 467,326, Nov. 4, 1925. Waterproof cords are made from degummed silk threads by steeping the threads in a soln. of silk and gelatin, drying and twisting them, and coating them with a soln. of Cr salts. The cord is then exposed to the action of steam at $110-115^\circ$, dried, and vulcanized with rubber under pressure.

Waterproofing felt hats and caps. N. VILLA. Brit. 288,431, March 30, 1927. The material is immersed for a few min. in a bath which may comprise a soln. or emulsion of lanolin, Pb acetate and alum in "petrol," then pressed in a hydraulic press, and treated in a second bath formed of Para rubber dissolved in "petrol" and mixed with NH_4 sulforicinate. Proportions are given.

Stain remover. CHARLES X. JOTHAUD. Fr. 636,618, Oct. 16, 1926. A mixt. of alc. and benzine in equal parts, with a small quantity of boric acid to facilitate their mixing, is used to remove grease and paint stains from cloth.

Clarifying soiled solvent from "dry-cleaning" plants. A. F. HATFIELD and ACHILLE SERRE, LTD. Brit. 289,581, Feb. 15, 1927. The process described in Brit. 260,850 (C. A. 22, 876) is applied to the cleaning of soiled liquid from laundry washing-machines. After filtering, the liquid is returned to the washing-machine, so that the process is cyclic.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Analysis of red lead. J. F. SACHER. *Farbe u. Lack* 1928, 547-8.—S. offers the following modification for the detn. of Fe in red lead. One g. is moistened with 2-3 drops of water, dissolved in 2 cc. HNO_3 (1.2), evapd. to dryness, redissolved in 15-20 drops HCl (1.19), and again evapd. to dryness on the steam bath. One cc. H_2SO_4 (1.84) is added and the beaker heated until the HCl is driven off. After cooling, the sample is dild. to 50 cc. and 2 cc. KSCN (10%) added. Comparison is made with 50 cc. water contg. 2 cc. KSCN soln. to which ferric soln. (0.00002 g. Fe per cc.) is added to match the color of the sample.

G. G. SWARD

The decomposition of oil paints by bacteria and molds. W. VAUREL. *Farben-*

Ztg. 34, 505(1928).—The free fatty acids are attacked more than the glycerides, oxidized acids sometimes more than the original, the unsatd. more than the satd. and the *cis* form more than the *trans*., e. g., oleic more than elaidic. O is necessary; moisture and metals, such as Cu, Zn and Fe promote the attacks. Many bacteria and molds will live on paints contg. red lead, white lead, iron oxide, zinc oxide and lithopone.

G. G. SWARD

Boiling wood oil. HANS HADERT. *Farbe u. Lack* 1928, 558.—Wood oil when heated below 200° for about 12 hrs. and subsequently at 250–300° with addn. of various agents, such as oxidizers, reducers, terpenes, halogen compds., acetates, phthalic compds. and aldehydes, does not gel in the usual manner and dries clear.

G. G. SWARD

Micrometer for measuring the thickness of varnish films. ANON. *J. Sci. Instruments* 5, 323–4(1928).

E. H.

Swelling of aluminum soaps in various solvents (MARKOWICZ) 27. Metallic lead in red lead (HEINRICHS) 7. Emulsions, paints, etc. (Brit. pat. 289,122) 18. Treating natural and synthetic oils and resins (Brit. pat. 289,414) 27. Colored compounds [for paints] (Fr. pat. 639,166) 25. Treating metals before painting (Fr. pat. 636,734) 9.

BROWN, BRUCE KEITH, AND CRAWFORD, FRANCIS M.: *A Survey of Nitrocellulose Lacquer*. New York: The Chemical Catalog Co., Inc. 368 pp. Reviewed in *Can. Chem. Met.* 12, No. 11, 52(1928).

Lithopone paints. I. G. FARBENIND. A.-G. Brit. 289,153, Jan. 21, 1927. White oil paints made from lithopone are prevented from thickening by adjusting the content of free fatty acid in the linseed oil used to the ZnO content of the lithopone (suitably by addition of free fatty acids derived from linseed oil, wood oil or wool fat, preferably as a colloid or in suspension or dispersion).

Binding agent for paints. JULES DREHER. Fr. 636,827, June 29, 1927. A mixt. of equal parts of a resinate lacquer and trichloroethylene with the addn. of hexalin or tetralin is used as a binding agent for paints. Sand or powd. marble may also be added.

Painting with successive coats. FIRM OF H. FRENKEL. Brit. 288,624, April 14, 1927. Each successive coat is applied before the preceding coat is dry and a fatty oil treated with S chloride is used as a binding medium. The finishing coat may contain any suitable binder such as an oil or nitrocellulose compn. The paints may contain pigments, driers, thinners such as turpentine substitute, high-b. p. hydrocarbons or esters (to prevent rapid surface drying), ethereal oils, org. amines, etc.

Rendering paint "weatherproof." DEUTSCHE GASGLÜHLICHT-AUER-GRS. Brit. 288,601, April 13, 1927; Fr. 639,905, Aug. 23, 1927. Paints such as those with an oil vehicle contain small quantities of added fungicide substances such as compds. of Cu, Zn, Cd or Hg. Fe ores contg. Ti and Cu may be used and when the paint contains ZnO or lithopone complex Cu compds. which will not react with the pigment to form colored products must be used.

Sprayers for liquids such as paint. JEAN BRIZON. Fr. 636,653, Oct. 20, 1926. A liquid is forced through a very narrow passage by the vacuum created by a jet of compressed air, the liquid and air being intimately mixed at the outlet.

"Color-binding" composition. EDUARD SCHWARZ. U. S. 1,692,389, Nov. 20. A compn. suitable for use with various pigments as a waterproof paint or varnish comprises casein 5.3, glue 0.3, flour 0.3, linseed oil 2.4, China wood oil 3.7, "ammonia" 0.1, thymol 0.03, benzene 0.1 and cobalt drier 0.01 part.

Printing celluloid. MAX ERNST. Swiss 126,212, Mar. 5, 1927. Printing compns. for celluloid comprise a pigment, camphor and an oil. A suitable compn. comprises 1000 parts of pigment mixed with 30 parts of a 20% soln. of camphor in lavender oil; a small quantity of siccativ may be included.

Coating compositions containing cellulose esters. GLASURIT-WERKE M. WINKEL-MANN A.-G. Brit. 288,221, April 9, 1927. Paints or varnishes contg. undissolved cellulose esters are prepd. by grinding or otherwise mixing cellulose esters such as acetate or nitrate (which may be moistened with alc.) with oil, varnishes, lacquers, oil or knifing colors, enamels or the like or by adding these latter to concd. solns. of the ester to effect pptn. After applying the resulting coating compns. the coating may be treated with a solvent for the ester which it contains to cause soln. or swelling.

Adhering undercoating for paint, varnish, etc. FABRICE R. HERVE, MAXIME HERVE AND ANDRE HERVE. Can. 284,196, Oct. 30, 1928. An albuminoid substance (casein) is dissolved in a soln. of an alk. salt (NaHCO₃) so as to obtain a sirupy consistency. The quantity of alk. salt soln. should be slightly in excess of that necessary to dissolve

the albuminoid substance. Powd. Al or other metal or alloy having similar properties is added to the soln., H is liberated, and there is formed caseinate of Al or a corresponding substance according to the albuminoid and metal employed. The new substance constitutes an adherent undercoating to be applied to the surface of any material to be varnished or painted.

Polymerization of oil of turpentine. ÉMILE A. L. ROUXVILLE and PAULINE A. M. CREUZILLET. Fr. 639,726, Jan. 27, 1927. Polymers of turpentine hydrocarbons of the general formula $C_{10}H_{16}$ for use in the rubber and varnish industry are prep'd. by pouring H_2SO_4 into the oil with stirring and cooling. The first portion of acid is dild. and the addn. is continued till 1 of acid to 4 of oil has been added, and the mixt. is finally heated. $K_2Cr_2O_7$ (5-10%) may be added to the acid.

Treating oils, resins, etc., for making varnishes, linoleum compositions, etc. L. AUER. Brit. 289,415, April 26, 1927. Materials contg. unsat'd. compds. such as mineral or fatty oils, resins, asphalts, "goudrons," tar-distn. residues, rubber and rubber-like products or styrene are treated to modify their properties by use of a soln. or colloidal soln. of electrolytes in an org. solvent. A sulfurizing treatment with S or S chloride may be effected at the same time or subsequent to the electrolyte treatment and accelerators may be added. A moldable product may be formed by treating Chinese wood oil with a soln. of Na in AmOH and then heating the product with Fe oxide and S to a temp. of 160° . Masticated rubber may be treated with C_6H_6 and alc., β -naphthol and $NaClO_3$. Rosin in alc. soln. may be treated with an alc. soln. of NaI. Chinese wood oil and ether are treated with a mixt. of stannic tetraphenyl and alc., the solvent is dist'd. off and the product is emulsified with water with the addn. of the reaction product of a fatty oil and Na cresylate. The emulsion thus prep'd. is suitable for use with rubber latex for various purposes. Asphalt in C_6H_6 soln. is treated with trichloroacetic acid.

Varnish. PAUL BRAUN. Ger. 468,314, July 18, 1925. Varnish is prep'd. from unrefined resin by dissolving the molten resin in a hydrocarbon, such as sangaj oil, and after cooling, an oxidizing agent, such as permanganate and HCl, together with a distributing agent such as silicic acid, is stirred in. After removal of the dirt, a softening agent, such as castor oil is added.

Collodion or nacreous varnishes. PIERRE CHESTAKOFF. Fr. 636,627, Oct. 18, 1926. Aq. "essence d'Orient" is mixed with a little alkali salt of sulforicinoleic acid, or of the sulfonic acids from naphtha refining, or sulfonated octahydroanthracene, or other dispersing agents. To the mixt. thick collodion or a varnish in a solvent not miscible with H_2O is added and mixed for a short time and H_2O is then added. By agitating very fine grains of collodion contg. brilliant particles of the essence are obtained.

Black varnish for metals. SOCIÉTÉ MARITIME ET INDUSTRIELLE. Fr. 636,759, June 27, 1927. A mixt. of bitumen, resin and wax or gum lac is heated to $80-100^\circ$, an oil from heavy coal, a refined tar, solvent naphtha or alc. is added in quantities sufficient to produce the consistency of a varnish when cooled.

Reviving colors and regenerating varnishes. FRANÇOIS E. HEPP. Fr. 639,060, Jan. 12, 1927. A compn. consisting of oleoresinous gums rich in resinic acid and resins, comp'd. tincture of benzoin and essential oils on a basis of linseed oil and turpentine is used for reviving colors and regenerating varnishes.

Brushing lacquers. STANLEY D. SHIPLEY (to Atlas Powder Co.). U. S. 1,692,584, Nov. 20. A solvent for use in making nitrocellulose brushing lacquers comprises glycol 40, "gum soln." (suitably gum and toluene) 25 and gasoline 35%.

Vehicles or thinners for pyroxylin lacquers. J. G. DAVIDSON (to Carbide & Carbon Chemicals Corp.). Brit. 289,373, April 23, 1927. A solvent of low b. p. such as EtOAc with or without EtOH is used with solvents of higher b. p. such as the monoethyl ether and the acetate of the monoethyl ether of ethylene glycol and with diluents and gum solvents such as toluene and xylene and their mixts. or petroleum naphtha.

Phenol resin. FRASIER GROFF (to Bakelite Corp.). U. S. 1,693,112, Nov. 27. A phenol such as PhOH is caused to react with furfural in proportion to yield an infusible resin, the reaction is arrested before the infusible stage is reached and the mass is heated to dehydrate the resin and further advance it and a methylene-contg. hardening agent such as $(CH_2)_6N_4$ is added.

Articles of artificial resin. ÉDUAUD REDHAMMER & SÖHNE. Fr. 639,331, Aug. 11, 1927. The resin is introduced into the molds in a semi-liquid state obtained by pressure, so as to give after hardening a brilliancy to the article. Glass or ceramic molds having a coeff. of expansion as close as possible to that of the resin are used.

Recovering resinous products in the manufacture of wood pulp. EDWARD H. FRENCH. U. S. 1,693,586, Nov. 27. In the treatment of resinous woods with alk. liquor such as Na_2S and NaOH impure rosin is liberated from the alk. liquors by passing

an acid gas such as SO_2 through the liquor, the liberated rosin is removed from the liquor and is dissolved in a hydrocarbon solvent such as C_6H_6 , toluene or gasoline, the soln. of rosin and solvent is distd. under a high vacuum and condensation and sepn. of the rosin from the solvent are effected. An app. is described.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Liver-fat of the sperm whale. MITSUMARA TSUJIMOTO AND KANESUKE KIMURA. *Imp. Inst. Chem. Tech. Tokyo, Japan. Chem. Umschau Fette, Oele, Wachse u. Harze* 35, 317-8(1928).—The 6% oil, obtained from a portion of a 13 m. long male sperm whale, contained 69.3% acids and 16.4% unsaponifiable matter, the remainder being water-sol. substances, etc. The acids had the following consts.: m. 32-33.5°, d_4^{40} 0.8877, neutralization no. 194.1, I no. (Rosenmund-Kuhnnehn) 141.3, n_D^{40} about 1.4610; ether-insol. bromide 38.5%, Br content 70.47%, blackens at 250° without melting. The liquid acids (75.4%) had an I no. of 175.5 and a neutralization no. 188.9, while the solid acids (24.6%) showed 11.8 and 209.5, resp., and m. 52-53°. The unsaponifiable matter contained 48% cholesterol, apparently no cetyl nor olein alc. but contained an unsatd. hydrocarbon of the probable formula $\text{C}_{25}\text{H}_{48}$, probably a homolog of squalene; the unsaponifiable gives color reactions similar to vitamin A. P. ESCHER

Determination of unsaponifiable matter in oils and fats. E. LESTER SMITH. *Analyst* 53, 632-41(1928).—The following method is offered for the detn. of unsaponifiable matter. It gives results accurate to 1% of the unsaponifiable content. To 20 g. of oil in a 300-cc. flask add 40 cc. of alc. and 10 cc. of 40% NaOH soln. Heat under a reflux for 1 hr., rinse into a 1. separatory funnel with 150 cc. of water, cool and shake with 300 cc. of pure ether. Ext. the soap soln. twice more with 150 cc. of ether, wash the combined ext. into 20 cc. of water from the ext., remove most of the ether by heating in a distg. flask. Meanwhile ext. the soap soln. 3 times more with 250-cc. portions of ether. Wash these exts. with the same water that was used for the first washing, distil to small vol. and carefully rinse into a 250-cc. separatory funnel with 100-150 cc. of ether. Place 75 cc. of ether in another small sepg. funnel and use this to wash all the liquors from the first separator. This prevents loss of unsaponifiable matter in the soapy washings and in the portions of the upper layer which may be emulsified in or run off with the lower layer. Wash the ext. with 5-cc. portions of wash liquor, using water twice, then 2 N NaOH in 10% alc. followed by 2 water washes. This sequence of washing should be repeated at least once. Wash with 0.5 N HCl to decompose any remaining soap and to remove basic impurities often present in fish oils. Then wash with 100 cc. of water to remove alc. from the ether layer. Finally pour the ethereal ext. into a tared flask, rinsing the first separator with the ether from the second, distil off ether, remove water globules if necessary by evapn. with alc. or CHCl_3 and take to const. wt. in a vacuum, hot-plate desiccator. Add about 10 cc. of alc. (neutralized to phenolphthalein), heat and titrate with 0.025 N NaOH. A second method recommended is similar but with fewer extns. It is not quite as accurate but better than any method hitherto published. W. T. H.

Bleaching vegetable and mineral oils and animal fats with clay. I. S. ELAKOV. *Lehr. State Expt. Inst. Silicates (Moscow)*, 1927, No. 21, 67-72.—E. tested a number of variously treated clays for their adsorption power and concludes: (1) The presence of MgO has no relation to the adsorbing power of the clay, as claimed by some. (2) Cryst. clays have lower bleaching qualities than colloidal clays. (3) Clays suspended in water show a higher power of bleaching than the original clay. (4) A hindrance in the use of clays as a decolorizing agent is the water in the clay. (5) The finer the clay the higher is the decolorizing power. J. S. JOFFE

Development of the theories of the drying process of fatty oils. H. WOLFF. *Chem. Umschau Fette, Oele, Wachse u. Harze* 35, 313-7(1928).—A brief review followed by a record of W.'s work. The cardinal question whether a chem. reaction, oxidation or a colloidal phenomenon jellying is the primary cause of the drying of oils, and whether the latter requires preliminary oxidation is still unanswered. W. together with G. Zander spread boiled oil plus drier and raw linseed oil, and wood oil with acid without drier upon Fe and Zn plates. The boiled oil plus drier on Fe and Zn and the raw oil on Fe resembled each other in behavior, varying slightly in time and in weight-increase; but raw oil on Zn, while drying the same time, dries irregularly with liquid spots on an

otherwise dry film, these spots drying exceedingly slowly; O_2 absorption is also much retarded. Wood oil plus drier on Zn and Fe resemble each other, the greater wt. increase occurring after the film is dry. This wt. increase becomes less marked when Zn powder is added to the wood oil plus drier, either on Fe or on glass; when Fe powder is added instead of Zn, the retarding of wt. increase is so pronounced as to make the plotted curve convex instead of concave toward the abscissa denoting wt. increase. In some of the tests a distinct wt. decrease was observed at the beginning. The work leaves the question of chem. or colloidal reaction during drying still an open one.

P. ESCHER

Determination of the cold test of oils. AUG. C. ORTHMANN AND WM. J. ARNER. Pfister & Vogel Leather Co., Milwaukee, Wis. *J. Am. Leather Chem. Assocn.* **23**, 595-9(1928).—Cold tests of 6 samples of neatsfoot oil and 5 samples of other oils were measured (1) by the Tentative Method of the A. S. T. M. and (2) by a method in which cooling is accomplished by drawing dry air through Et_2O in a special 3-walled Dewar flask in which the oil tube is supported. The entire app. is transparent and readings, except the final one, are made without removing the oil tube from the cooling bath. Results obtained by the 2 methods agreed within $1^\circ F$. The temp. of the Et_2O cooling bath can be regulated more accurately and much more easily than that of ordinary mixts.

H. B. MERRILL

Chemical processes in oil mills. I. YELAKOV. *Masloboino Zhirovoe Delo (Oil and Fat Ind. (Russia))* **1928**, No. 3, 22-5.—A review.

A. A. BOEHTLINGK

A color reaction to establish the purity of olive oil. MARIO CUCCURULLO. Reale Stazione Chim.-Agraria Sperimentale, Roma. *Ann. chim. applicata* **18**, 297-9(1928).—Fifty samples of pure and mixed olive oils and other oils were used to det. whether the color reaction of Milani (cf. *C. A.* **22**, 1489) gives consistently reliable results in lab. practice. Of 20 oils, only 8 were decolorized to a yellow on heating, while the others, though pure olive oils, were not decolorized at all. Mixed oils remained red. These results were at variance with those of Milani and accordingly the cause was investigated. Eosin is pptd. by strong acids and is decolorized by weak acids and since the oils contained no strong acids, the decolorization was probably due to weak acids. The acidity (as oleic acid) of all the oils was detd. and enough oleic acid was then added to each to make the acidity 4% in each case. All these acidified oils gave a rose color which vanished on heating. Therefore some olive oils decolorize eosin not because of a reaction with a substance which is present in olive oil and not in other oils, but because of the acidity. This is further confirmed by the fact that pure *oleic acid* decolorizes the Milani reagent. Com. olive oils, particularly of inferior quality, have a much higher acidity than that of other vegetable oils, not infrequently reaching 4 or even 7-8%. There may be another minor cause of the decolorization for some oils decolorize when their acidity is only 4%, whereas other oils have this power only when their acidity is raised to 6%. The Milani test is, therefore, not a test of the genuineness or purity of olive oil.

C. C. DAVIS

Comparative oxidations in free air of cod-liver, linseed and olive oils. P. DELORE. *Compt. rend. soc. biol.* **99**, 805-7(1928).—The oils were exposed to the air and the gains in wt. were in the ratios olive oil 1 : linseed oil 13.31 : to cod-liver oil 66.75 in 50 days. It appears remarkable that linseed oil with its higher iodine index should absorb but $\frac{1}{6}$ as much O as cod-liver oil. **Influence of previous irradiation upon the oxidation in free air of cod-liver, linseed and olive oils.** *Ibid* 807-10.—Previous irradiation of the oils by means of the Hg-vapor ultra-violet rays for 30 hrs. caused the O absorption by olive oil in 50 days to increase from 1.6 to 55.6, linseed oil from 39.3 to 184 and cod-liver oil from 124 to 272.6; the figures 1.6, 39.3 and 124 representing the O absorbed by the resp. oils in 50 days *without* previous irradiation.

L. W. RIGGS

Clays as adsorbents. P. N. GRIGOR'EV. *Trans. State Expt. Inst. Silicates (Moscow)* **1927**, No. 21, 59-66.—A review of the use of clays as adsorbents in the oil industry with data on a bentonite substance found in Georgia (Caucasia), which does not, however compare favorably with the adsorption capacity of floridin.

J. S. JOFFE

Acetone as solvent in the rapid iodine number determination for factory control. B. M. MARGOSCHES, B. KRAKOWETZ AND F. SCHNABEL, assisted in expts. by F. SCHÖNATZ AND MARIA BÖHM. *Techn. Hochschule Brunn. Chem. Umschau Fette, Oele, Wachse u. Harze* **35**, 300-5(1928).—Expts. with acetone in the rapid method for I no. detn. lead to the following conclusions: Acetone can be used to advantage as a fat solvent in place of alc.; 2 cc. acetone suffice for 0.1 g. of fat; soln. occurs at room temp.; the I required by the 2 cc. acetone is negligible, but when 5-10 cc. is used it must be detd. by a blank test. Sunlight does not influence the results. For scientific investigation alc. should be used instead of acetone. Comparative I no. detns. with

alc. and acetone gave practically identical results and they were also in close agreement with results by the Hanus method. P. ESCHER

Experimental tests of fireproofing oleins by means of β -naphthol. H. POMERANZ. *Seifensieder Ztg.* 55, 370-1(1928).—Davidsohn has published (*Allg. Oel Fett Ztg.* 1928, 400 and *C. A.* 22, 1697, 4847) some expts. in which addn. of β -naphthol to oleins greatly diminished their inflammability when tested in Mackey's app. P. questions the correctness of D.'s conclusion and thinks the reagent is quite inefficient at temps. above 100° and that a longer exposure in Mackey's app. might lead to a rise in temp. P. E.

Determination of halogen numbers in aqueous solutions. ALBERT HANSEN. Polytech. Lehranstalt, Copenhagen. *Z. anal. Chem.* 75, 257-88(1928).—Winkler's method for detg. halogen nos. has distinct advantages over the procedures of V. Hübl, Hanuš, or Wijs but has been criticized by several investigators. The purpose of this paper was to det. the sources of error so that the usefulness of the method would be increased. To this end, many expts. were made with samples of olive oil (halogen no. 84.5) of linseed oil (175) and of cod-liver oil (157.5). Particular attention was paid to the effect of light upon the results and it was found that during the first stages of the reaction light has little effect but toward the end and particularly when KI is added, the photochemical effect is very marked. The addition of KI to the reaction mixt. served to diminish this effect of light but the total result was not altogether favorable. The use of 5 cc. of ether and 5 cc. of CCl_4 instead of 10 cc. of CCl_4 and a reaction mixt. of 25 cc. of 0.2 N KBrO_3 contg. 0.3 g. of KBr and 0.415 g. of KI made the method practically insensitive to light but in this case the excess of halogen must be regulated more closely than is otherwise necessary. As the final outcome of the investigation the following modification of the Winkler method is offered. Of the oil, take a wt. equal to 33/assumed halogen no. Dissolve the oil in 10 cc. of CCl_4 using a bottle such as is commonly used for detg. I nos. To the soln. add 5 g. of KI dissolved in 15 cc. of water, 25 cc. of 0.2 N KBrO_3 soln. and finally 10 cc. of 10% HCl. Quickly stopper the bottle, rotate the contents a little and place the bottle in a box which is painted black and is lined with plush in such a way that no light can enter. For a non-drying oil, allow the mixt. to stand in the dark for 2-3 hrs. but allow 20 hrs. for a drying oil. Then, before taking the bottle out of the box, quickly add 10 cc. of 10% KI soln. and after 2-3 min. add 150 cc. of water and titrate the free I_2 with 0.1 N $\text{Na}_2\text{S}_2\text{O}_3$ adding starch toward the end. W. T. H.

Specific gravity of glycerol. L. W. BOSART AND A. O. SNODDY. *Ind. Eng. Chem.* 20, 1377-9(1928).—Tables are given showing that the International Critical tables for glycerol are unsatisfactory as a working basis where accuracy in the 4th decimal place is necessary. E. SCHERUBEL

Application of castor oil in soap manufacture. N. SPASSKII. *Masloboino Zhirove Delo* (Oil and Fat Ind. (Russia)) 1928, No. 2, 34-5.—The use of castor oil increases the lathering ability of soap and improves its soly. in cold water. Castor-oil soap resembles coconut-oil soap in being but slightly hydrolyzed and giving a clear soln. with cold water; it is salted out with 27% of salt as compared to 24% for coconut-oil soap. The upper limit of lather is raised by mixing castor oil with hydrogenated vegetable-oil soap. The admixt. of castor oil soap in curd soap to replace liquid oils increases the hardness. An increase in the concn. of the salting out electrolyte gives a soap with a smaller proportion of water. S. succeeded in obtaining a soap with 62.6% instead of 59-60% of fatty acids with a concn. of 10% of salt in the caustic liquid as compared to the usual 5-6% for animal fats. When using 80% of fatty acids present in the "T. E. ZH. E." soap and 20% castor oil, 62% of curd soap with a 38° titer, 20% niger with 30% of fatty acid with a 37.4° titer and 18% caustic of 12° Bé. with 0.2% of fatty acids were obtained. This soap was of the same hardness as the original curd soap regardless of the 20% of castor oil admitted. A. A. BOEHLINGK

Swelling of aluminum soaps in various solvents. E. MARKOWICZ. *Farben-Ztg.* 34, 326-8, 414-8, 503-5(1928).—Dibasic Al palmitate contg. up to 2% Na_2SO_4 and 1-2% H_2O does not swell in water, alc., drying oils or paraffin oils to any appreciable extent. The gels in aliphatic hydrocarbons are soft opaque pastes, in chlorinated and aromatic hydrocarbons are transparent elastic gels, and in terpenes are transparent or translucent thin gels which flow readily. In the aliphatic hydrocarbons, the speed of setting and firmness of the gel pass through a minimum for fractions boiling around 100°. The viscosities of the gels decrease with age, the most with chlorinated deriva. and the least with turpentine. The presence of impurities in either the solvent or the gel increases the degree of swelling. The gels are used in mat-finish varnishes non-settling paints, thickened lubricating oils, waterproofed fabrics, etc. In order to avoid lumps etc., thorough mixing of the gel is stressed. G. G. SWARD

The distribution of soap and electrolytes in the soap body, niger and lye. E. L. LEDERER. *Seifensieder Ztg.* 55, 383-6(1928).—On account of insufficient analytical data L. uses Perrin's expt. on the distribution of sedimentary colloids as a basis to derive a formula for calcg. the soap content of a kettle charge of finished soap at different heights of the kettle, and the size and wt. change of the ultimate particles of the soap. The result confirm McBain's view on the constitution of soap solns. P. ESCHER

The significance of alcohol in the determination of the saponification number. F. POLLMANN *Seifensieder Ztg.* 55, 375-6(1928)—A clear soln. of oil in alc. KOH is not proof of complete sapon., since the oil forms an ester with the alc. which is sol. in KOH. Expts. with Et esters required 5-10 min. boiling before sapon. was complete; 50% excess of KOH is essential for rapid reaction. MeOH in place of EtOH is out of the question because sapon. is incomplete even after 1-2 hrs.' boiling. P. ESCHER

Apparatus for emulsifying oils (U. S. pat. 1,694,589) 1. Water-insoluble soaps from mineral oil derivatives (U. S. pat. 1,694,462) 22. Fatty acid mixture derived from petroleum (U. S. pat. 1,694,461) 22. Mineral oil derivatives (U. S. pat. 1,694,463) 22. Apparatus for extracting oil from oil-containing materials (Ger. pat. 467,801) 1. Preservation of colors in washing (Fr. pat. 639,379) 25.

Separation of fatty acids from glycerides. ALFRED EISENSTEIN. Swiss 126,202, Feb. 26, 1926. See Austrian 108,701.

Apparatus for rendering animal fats and oils by cooking with steam. ROBERT McTAVISH (to Cincinnati Butchers' Supply Co.). U. S. 1,695,254, Dec. 11.

Degreasing bones, etc. BRITISH GLUES & CHEMICALS, LTD. and R. B. DREW. Brit. 289,569, Feb. 3, 1927. Bones and other material contg. fat and water are degreased by vapors of a solvent such as benzine so that the water is vaporized and the mixed vapor formed is used for further degreasing. An app. is described.

Detergents from fatty acids, etc. R. VIDAL. Brit. 289,002, April 19, 1927. A modified acid is obtained by treating oleic acid with alk. hypochlorite or hypobromite, and decomp. the product with acid such as by dil. H_2SO_4 . When this modified acid is again treated with hypochlorite or hypobromite a thick paste is obtained which is transparent when hot and is sol. in water and may be used for solubilizing hydrocarbons, halogenated hydrocarbons, ethers, esters, animal and vegetable oils, fats and waxes, and alcs. and phenols, for prepg. compns. for use in the textile industry, tanning, perfumery, regeneration of used rubber, lubrication of machinery, washing painted or varnished surfaces or for other purposes.

Centrifugal apparatus suitable for separating fatty substances from emulsions by use of a volatile solvent. SOC. FRANCAISE DE CENTRIFUGATION AND J. A. L. ROZIERES. Brit. 289,350, Oct. 25, 1927.

Rotating extractor for dissolving fatty substances from seeds, etc. CHARLES LEMALE. Fr. 639,211, Jan. 15, 1927.

Extraction of fatty acids from dilute aqueous solutions. SOC. ANON. DES DISTILLERIES DES DEUX-SÈVRES. Fr. 636,825, June 29, 1927. Fatty acids, such as AcOH or BuOH, are extd. from aq. solns. by acetic esters, such as AcOEt, AcOBu or AcOPr, alone or mixed. The acid and ester contg. a certain quantity of H_2O are distd. The first fraction contains the H_2O and some of the ester, which form a binary mixt., and the ester and acid then distil separately.

Extracting oils, fats or waxes by solvents. L. J. SIMON and SIMON EXTRACTING MACHINE SYNDICATE, LTD. Brit. 288,670, Dec. 14, 1926. In the extn. of oils, fats and waxes from raw materials by subjecting them (in a basket rotating in a closed extractor) to successive flushings with progressively purer solvent, as described in Brit. 255,923 (C. A. 21, 2995), the flushing with each grade of solvent is repeated before the next purer grade of solvent is applied. An app. is described.

Apparatus for the continuous distillation of solvents in connection with the extraction of oils, fats, waxes, etc. LOUIS JOHN SIMON and SIMON BROS. (ENGINEERS), LIMITED. Fr. 636,703, June 13, 1927.

Refining vegetable oils. ALEXANDER SCHWARZMAN (to Spencer Kellogg and Sons). U. S. 1,692,226, Nov. 20. A body of oil such as linseed oil is agitated with an aq. caustic

alkali soln. in about the quantity corresponding to the free fatty acids present, the mixt. is allowed to stand quiescent for a time less than required to effect settling but sufficient to permit agglomeration of the solid soaps formed by the agitating action; the temp. of the oil is then raised to a point slightly below 100° and hot water is passed through it in finely subdivided form until the oil is rendered neutral and the aq. soln. is sepd. An app. is described.

Treating natural and synthetic oils and resins. L. AUGER. Brit. 289,414, April 26, 1927. Materials contg. unsatd. C compds. such as fatty or mineral oils or resins are treated with a metal, metal oxide or hydroxide or an org. base and this treatment is combined with a sulfurizing treatment which may be effected simultaneously or successively. S or S chloride may be used in CS₂ or "white spirit" and accelerators such as (CH₂)₆N₄, PhNH₂ or diphenylguanidine may be added. Fillers may be added for making plastic compns. An example is given in which castor oil is treated with Fe oxide, PhNH₂ and S, heated successively to 140° and 160° and molded under pressure. The treatment of rosin with stannic oxide and S chloride to obtain a varnish ingredient is also described.

Soap. A. E. HATFIELD and ACHILLE SERRE, LTD. Brit. 289,582, Feb. 15, 1927. In making a soap suitable for "dry cleaning," a fatty acid such as purified oleic acid, with a setting point below 2° (and preferably below 0°) is partially sapond. (suitably to the extent of 65-75%) with aq. solns. of NH₃ or of carbonates or hydroxides of Na or K, and an emulsifying agent is incorporated comprising chlorinated hydrocarbons such as perchloroethylene, trichloroethylene or C₂HCl₃ or free fatty acids and alc. Cyclohexanol may also be added.

Soap. ADOLF WELTER. Swiss 126,587, Oct. 25, 1926. Free fatty acid is intimately mixed with not more than double the necessary quantity of calcined soda for sapon. The soap is mixed with soap obtained in another way and pressed. Thus, palm oil or coconut oil is mixed with calcined soda and sapond. Before the sapon. is over, tallow or bone fat curd soap is pumped in and stirred. The homogeneous mixt. is then pressed.

Soap powders. A. LETTERMANN. Brit. 288,584, April 12, 1927. Soap masses which are to be converted into powders are obtained directly by mixing fatty oils such as a mixt. of peanut and coconut oils with caustic alkali soln. and with Na₂CO₃, potash or other water-absorbing substance and allowing the mixt. to stand. Perfumes, org. solvents such as benzine or chlorinated hydrocarbons, etc., also may be added.

Cleaning compound. BENJAMIN W. LIGHTY. Can. 285,283, Dec. 4, 1928. Soap is heated in 3.5 parts its wt. of water, and flaked ammonia is dissolved in 2.5 parts its wt. of water, and the solns. are admixed by stirring and then an essential oil is added. The resulting product is a soft, semi-plastic homogeneous demulcent detergent.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Saving money in the making of sugar through p_H control. R. T. BALCH. U. S. Dept. Agr., Bur. of Chemistry and Soils. *Food Industries* 1, 127-9(1928).—In the clarification of sugar-cane juice by the use of lime and heat, the degree of pptn. of Ca₃(PO₄)₂ is greatest at p_H 7.5-8.5. If these limits are exceeded, the wt. of ppt., or mud, remains practically const. For controlling the loss of sucrose by inversion the p_H must be kept at approx. 7 or slightly above because hydrolysis begins at p_H 7. The use of H ion app. instead of old titration methods is now rapidly taking place in both cane and beet sugar-mfg. plants. C. R. F.

The bacterial content of raw and commercial sugars. L. H. JAMES. U. S. Dept. Agr. *Food Industries* 1, 65-9(1928).—Bacteriological examns. of 197 samples of sugars showed the presence of aerobic saprophytes, putrefactive anaerobes and spoilage thermophiles in all types of sugars examd. *B. coli* was isolated from only 2 samples of raw sugars but the "flat sour" types were abundant. "Sulfur or hard swell" types were likewise found in many samples of raw sugar. The findings are important from the food canners' and confectioners' viewpoints inasmuch as these organisms cause certain well defined types of spoilage. C. R. F.

Some aspects of the sugar-beet problem. A. W. LING. *Agr. Progress* 5, 56-60 (1928).—NaNO₃ and superphosphate are the best forms of N and P, resp., for the sugar beet. Beets covered with earth and left for 9 months lost only 1.3% sugar without any change in the H₂O content. Loss of sugar was steady after an increase of nearly 1% during the first month in storage. K. D. JACOB

The solubility of carbon dioxide in sugar solutions and its combination with amino acids. VLADIMIR MAJER. *Listy Cukrovar.* 47, 123-36(1928).—M. describes a new app. for measuring the soly. of CO_2 in solns. at higher temps. Carbamides of aspartic and glutamic acids form in favorable media not only at 40° , but even at $80-90^\circ$. The amt. of CO_2 bound by an amino acid is a typical function of the alky. of the soln.; its course is indicated by an internal linkage between the carboxyl and NH_2 group, opening with an increase in the alky. at 40° . The soly. of CO_2 was detd. for diffused, limed and satd. liquors of various alkalinities. The absorption powers show them to act like amino acid solns. After absorption the CO_2 is bound as a bicarbonate in slightly alk. solns., in phys. soln. or as a salt bound by alkalies by non-alk. constituents of the liquors which increase with the alky. Amino acids are concrete examples which bind the CO_2 in labile forms as carbamides. The absorption of CO_2 at 80° was lowered in the presence of aspartic and glutamic acids and hydrolytic products of sucrose and pectin. The amt. of CO_2 in phys. soln. and that bound by amino groups are lower at 80° .

FRANK MARESH

Modern processing revives a long-dormant industry. Sorghum sirup now made successfully under strict technical control. J. J. WILLAMAN. Univ. of Minn. *Food Industries* 1, 107-9(1928).—A new factory at Cedar Rapids, Ia., utilizes 20,000 tons of sorghum cane annually, the products being a purified sorghum sirup, seed, ground cattle feed and bagasse. The *Pfund honey grader* is used to grade the sirup as to color. The refined sirup is of a very mild flavor and light color.

C. R. F.

The 1927-28 fertilizer constituent tests at Western Pampanga (ROXAS, *et al.*) 15. Comparing various quantities of mixture of ammophos and NH_4 sulfate plus filler (LOCSIN, *et al.*) 15. Germination of sugar-cane pollen in artificial culture media (DUTT, AYYAR) 11D. Liberation of fiber from bagasse, etc. (Can. pat. 284,219) 23.

Sugar. HENRY W. DAHLBERG. Fr. 639,581, Aug. 16, 1927. Sugar is extd. from molasses by means of a complex ferrite of Ba prep'd. by heating BaCO_3 with oxides of Fe. The sucrate of Ba is decompd. by CO_2 .

Crystalline dextrose. WM. B. NEWKIRK (to International Patents Development Co.). U. S. 1,693,118, Nov. 27. In obtaining substantially pure dextrose in granular form, 90% of which is in the form of individual crystals, the procedure is carried out in 3 stages: (a) the soln. is concd. to about the point of supersatn. at any temp. or rate of boiling; (b) formation of crystals is induced (preferably with addn. of small quantities of seed crystals), which may ordinarily require from a few min. to 45 min. or under adverse conditions possibly 2-3 hrs. (the amt. of crystals to be induced depending on the size of crystals desired in the finished batch); and (c) growth of the already formed crystals, which may require 6-12 hrs. The entire process may cover 36-48 hrs. Numerous details are described.

Preventing deterioration of sugar. HENRIK MAUTNER. Fr. 636,731, June 28, 1927. The water usually found in sugar particularly glucose is replaced by EtOH either by adding EtOH to the concd. soln. before crystn. or by recrystn. from EtOH. Fermentation on keeping is thereby prevented.

Sirup. WM. F. COLE. Fr. 639,687, Aug. 19, 1927. See U. S. 1,647,082 (C. A. 22, 329).

Purifying and clarifying corn-sirup and corn-sugar liquors. CLARENCE H. CHRISTMAN (to National Aluminate Corp.). U. S. 1,692,817, Nov. 27. The solns. are neutralized with Na aluminate, which serves to sep. nitrogenous and other impurities.

Starch. R. O. MCCOY (to Corn Products Co., Ltd.). Brit. 288,546, April 11, 1927. Disintegrated material such as maize is subjected in water to sepg. operations yielding a mixt. of starch and gluten; the mixt. is tabled and the effluent from the tabling is reused with the gluten it contains for subsequent sepn. The table effluent is used for coarse slop sepn., and water from washing the starch after tabling is used for germ and fine slop sepn. An app. and various details are described. Cf. C. A. 22, 2680.

29—LEATHER AND GLUE

ALLEN ROGERS

Extraction of solid tanning materials by the Koch and Procter apparatus under identical conditions. J. GORDON PARKER. London Leather Industries Lab., London, Eng. *J. Am. Leather Chem. Assoc.* 23, 590-5(1928).—The new international method for tannin analysis differs from the former official method in employing the closed Koch

extractor instead of the open Procter extractor for extg. raw and spent tanning materials, in employing 2 l. instead of 1 l. H_2O for extn., and in specifying 5 hrs. extn. instead of 3. Data are given showing (1) use of 2 l. H_2O gives more complete extn. with either app.; (2) under identical conditions slightly more material is extd. with the Procter than with the Koch app.; (3) as much material is extd. in 4 hrs. as in 5 hrs., with either app., and (4) the ratio of tans to non-tans in the ext. is the same with the new method as with the old.

H. B. MERRILL

Sulfite cellulose extracts (as tanning materials). A. DEFORGE. *Halle aux cuirs* 1928, 292-8.—A review of recent work.

H. B. MERRILL

Tannin from the trumpet tree. C. D. MELL. *Textile Colorist* 50, 466-7 (1928).—Many interesting uses are described for different parts of the trumpet tree (*Cecropia peltata*) which flourishes in tropical America. The strong inner bark referred to as imbauba, is generally made into rope. The bark of the older tree, which contains a high percentage of tannin, is used for tanning leather.

RUBY K. WORNER

Tizrah wood and tizrah extract (as tanning materials). WILHELM VOGEL. *Gerber* 54, 171-3 (1928).—Tizrah is a tanning material very similar to quebracho and was introduced as a substitute during the war shortage of tanning materials. The plant (*Rhus pentaphylla*), a member of the sumac family, is a thorny shrub, which grows in the dry regions of north Africa and Sicily. Growth is extremely slow; hence culture is not practicable. The wood, especially that of the trunk and upper roots contains slightly more tannin than does quebracho. The tannins are exclusively of the pyrogallol type, and give all the qual. tests of quebracho, but may be distinguished by the color of the phlobaphenes, which are dark brown instead of red-brown. Tizrah ext. is marketed as a liquid contg. either 32 or 40% tannin. Reduced to a 22% H_2O basis, the ext. contains slightly more tannin and sol. non-tannin, and considerably less insol. matter than solid quebracho ext. Sulfitation is superfluous. Color of the leather produced is practically the same as that of quebracho leather.

H. B. MERRILL

South African tanning materials. The black wattle. C. O. WILLIAMS. School of Agr. Cedara Natal. *Union S. Africa Dept. Agr. Science Bull.* 63, 68 pp. (1928).—This paper reports the results of an extensive investigation on the compn. and chem. properties of the bark of the black wattle, which is the common name usually applied in S. Africa to *Acacia mellissima*. The mature green bark of the black wattle contains approx. 53% H_2O , the greatest proportion usually being present in bark from the middle portion of the tree. No appreciable difference was noted in the yield and compn. of bark stripped from trees of the same age from the same plantation in summer and in winter. The % of tannin in the bark decreases as the tree is ascended the bottom third of the trunk usually contg. more than half the tanning matter obtainable from the entire tree. The av. % tannin content for any particular thickness of bark seems to be greatest in young trees but in general, the % tannin in bark from trees 3 to 12 years old increases with the thickness of the bark. No appreciable loss of tanning matter results from drying the bark artificially at temps. up to about 150° F. When wattle bark is ground the coarser fibrous material is lowest in sol. matter and particularly in tannins, the finest powder being the richest. The various portions of very young trees, about 1 year old, are very low in tannins, the bark contg. only about 4% while the bark of more mature trees contains about 25 to 40%. Bark from the larger branches of mature trees contains approx. as much tannin as the bark from the top portion of the main stem, i. e., about 30%, while the twigs and leaves contain only about 4%. The amts. of tannins and sol. non-tannins in areas of bark affected with the "mottle" disease are usually appreciably less than in the sound bark in the immediate vicinity, and the color of the ext. is also invariably darker. When the bark is exposed to wet weather the loss of sol. matter due to leaching is chiefly non-tannins. Growth of molds on the bark causes loss of non-tannins and results in marked deepening of the color of the ext. but does not appreciably affect the total tannin content. "Sweating" deepens the color of the ext. but does not depreciate the compn. of the bark. Wattle wood contains less than 1% tannin. Boiling the ext. under atm. pressure causes deterioration in the color and decreases the tannin and non-tannin content of the infusion. When stored in open vessels, wattle exts. gradually deposit insol. matter, chiefly non-tannins, but they may be preserved for some time, without deterioration, in clean sealed cans provided the cans are not pitted. Addn. of alum to the ext. ppts. some of the sol. matter and decreases the tannin content, but does not cause sufficient improvement in the color of the ext. to be of practical value. Good qualities of solid wattle ext. contain approx. 60% tannin. In a cycle of 8 years, the total mineral matter taken from the soil by wattle trees is approx. 430 lb. CaO , 320 lb. K_2O and 30 lb. P_2O_5 per acre, 170, 60 and 10 lb., resp., being removed by the bark. The ash of spent wattle bark contains approx.

70% CaCO_3 , 4% K_2O and 1% P_2O_5 . The original paper contains numerous tables of analytical data. K. D. JACOB

Recent investigations on fat-liquoring leather. A. DEFORGE. *Halle aux cuirs* 1928, 329-33.—A review of recent American work. H. B. MERRILL

Basicity of chrome liquors. O. DRYAIDIN. Tannery School, Liege, Belgium. *Halle aux cuirs* 1928, 301-7.—Different methods of expressing basicity are described and the quantities of acid, Na_2CO_3 and $\text{K}_2\text{Cr}_2\text{O}_7$ or $\text{K}_2\text{SO}_4 \cdot \text{Cr}_2(\text{SO}_4)_3$ required to produce liquors of different basicities are tabulated. H. B. MERRILL

Leather belting has kept step with industrial progress. H. J. PAYNE. Am. Leather Producers, Inc. *Textile Colorist* 50, 761-3(1928). RUBY K. WORNER

Water absorption and penetration tests for sole leather. L. M. WHITMORE AND G. V. DOWNING. Leas & McVitty Inc., Salem, Va. *J. Am. Leather Chem. Assocn.* 23, 603-6(1928).—The rate of satn. of sole leather blocks immersed in water is measured by detg. gain in wt. (1) after 2 hrs.' immersion and (2) after 24 hrs.' immersion, the latter value being taken as complete satn. The % satn. after 2 hrs. is a measure of the permeability of the sole to water. The relative permeability of different leathers detd. by this test is the same as that detd. by measuring the time required for complete penetration of the leather by water under the pressure of a column and the % satn. test is much easier to perform than the time-of-penetration test. H. B. M.

Mesquite as a source of tans (MELL) 25. Care and maintenance of leather belting in the textile mill (MOORE) 25. Coating composition [for artificial leather] (Can. pat. 283,892) 23.

Synthetic tanning agents. J. R. GEIGY A.-G. Fr. 639,097, Aug. 5, 1927. Tanning agents free from mineral acids are obtained by mixing the products resulting from aromatic hydroxysulfonic acids and CH_2O in the form of their salts with salts of H_2SiF_6 . In an example the tanning agent prep'd. from cresolsulfonic acid in known manner is neutralized with NaOH and dried, and 100 parts are mixed with 50 of Na_2SiF_6 .

Apparatus for making tanning extracts. BUSS A.-G. Swiss 126,188, Mar. 22, 1927. Constructional improvements are described in app. of the type comprising digesters in which the bark is packed on sieves and a pump for circulating water through the digesters.

Apparatus for treating hides or skins with tanning or other solutions. MATTHEW M. MERRITT (to United Shoe Machinery Corp.). U. S. 1,694,447, Dec. 11.

Leather-belt dressing. ALBERT KRUEGER. Can. 285,281, Dec. 4, 1928. A leather-belt dressing comprises 10 parts of linseed oil, 12 parts of chlorinated lime and 2 parts each of CaCO_3 and eucalyptus oil.

Ornamenting fish skins. H. V. ANDREW and G. BETJEMANN & SONS, LTD. Brit. 289,213, March 7, 1927. Fish skins such as those known as "shagreen" when finished are ornamented to produce the effect of the natural markings which disappear in the cleaning process, by applying color through a suitable stencil to the back of the skin and mounting it on a light-colored background and then grinding down the skin to reduce its thickness so that the pattern shows through because of the translucence of the skin.

Imitation leather. H. W. ROWSELL, W. JANVIER and SHAMMY CO., LTD. Brit. 289,592, Feb. 24, 1927. A soft absorbent fabric such as flannelette is dyed and finished and then treated with a soln. of an albumin and a tanning soln. such as tannic acid. The tanning may be repeated.

Thickener for animal glue, particularly veneering glue. LUDWIG ZINSSER. Swiss 126,201, Dec. 30, 1926. The thickener comprises an intimate mixt. of wood meal and powd. mineral substances such as chalk.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Modern developments in the rubber testing laboratory. T. L. GARNER. *India Rubber J.* 76, 705-9(1928).—Various types of app. are described and illustrated.

C. C. DAVIS

Determination of the specific gravity of rubber mixtures. ST. REINER. *Gummi-Ztg.* 43, 371(1928).—Comments on a paper by Stoll (cf. *C. A.* 23, 544). The methods

suggested by R. are claimed to be convenient and satisfactory. Reply. L. STOLL. *Ibid* 371.

C. C. DAVIS

Determination of the specific gravity of rubber mixtures. P. ZILCHERT. *Gummi-Ztg.* 43, 310, 312(1928); cf. Stoll, C. A. 23, 544.—A convenient method for detg. the d. of small samples (e. g., 0.05–0.10 g.) is the use of a series of I-KI solns. of different concns., i. e., of different d., in which the samples can be immersed. For larger samples (e. g., 3–5 g.) the well-known method of using a Jolly balance is recommended.

C. C. DAVIS

Critical comments concerning carbon black for rubber mixtures. F. KIRCHHOFF. *Gummi-Ztg.* 43, 309–19(1928).—A discussion of the chem. compn. of com. blacks, in which recent papers of Esch (cf. C. A. 23, 306) and Beaver and Keller (cf. C. A. 22, 3802) are discussed critically.

C. C. DAVIS

Absorption of the vapors of liquids by rubber. WLČECK. *Gummi-Ztg.* 43, 310 (1928).—In view of recently published expts. of Reiner (cf. C. A. 23, 544) brief reference to similar but unpublished expts. of W. is made. In an atm. satd. with benzene or with benzine, rubber absorbed up to about 300 and 150%, resp., of its own wt. at ordinary temp.

C. C. DAVIS

Absorption of the vapors of liquids by rubber. ST. REINER. *Gummi-Ztg.* 43, 870 (1928).—Comments on a paper by Wlček (cf. preceding abstr.).

C. C. DAVIS

Vulcanization of latex. PHILIP SCHIDROWITZ. *Rubber Age* (N. Y.) 24, 263–4 (1928).—The process embodied in a recent patent of S. (cf. U. S. Patent 1,682,857, C. A. 22, 4008) is described in detail, with examples of its application.

C. C. D.

Paving blocks comprising rubber composition layers or other materials (Brit. pat. 288,896) 20. Paving blocks faced with rubber or other plastic material (Brit. pat. 289,087) 20. Polymerization of oil of turpentine [for use in the rubber industry] (Fr. pat. 639,726) 26. Waterproofing (Ger. pat. 467,326) 25. Sulfur compounds [for rubber vulcanization] (Can. pat. 284,056) 10.

SOARES, JOSE CARLOS DE MACEDO: *Le Caoutchouc: Etude Economique et Statistique*. Paris: A.-D. Cillard. 164 pp. Reviewed in *Rubber Age* 24, 205(1928).

Treating rubber latex. J. MCGAVACK and R. A. SHIVE (to Naugatuck Chemical Co.). Brit. 288,268, April 8, 1927. Latex having a p_H of 4.5 to 7 is stabilized by sulfonic alkyl aryl reaction products such as the product obtained in the presence of H_2SO_4 or chlorosulfonic acid from cinnamic acid and $BuOH$, or p -cresol and oleic acid, or anthracene or naphthalene and $PROH$ or the like. "Twitchell compds." may be used. Details are given, and the product is stated to dry more rapidly than alk. latex and to be more rubbery and more plastic on the mill.

Preserving latex. I. G. FARBERIND. A.-G. Brit. 289,022, April 20, 1927. Premature coagulation of latex is prevented by addn. of water-sol. neutral or alk. salts of ester acids such as Na dicresylphosphate, K methylsulfate or NH_4 diphenylphosphate. Other preservatives such as NH_3 , amines and alcs. also may be added. Cf. C. A. 22, 1705.

Spray-drying latex. J. E. NYROP. Brit. 289,583, Feb. 15, 1927. Latex is sprayed into a heated gaseous medium by app. such as that described in Brit. 259,922 and anti-coagulating or anti-agglutinating agents such as soap are simultaneously sprayed without being previously mixed with the latex. Softeners, fillers, vulcanizing agents, etc., may also be added by spraying.

Rendering rubber resistant to aging. ALBERT M. CLIFFORD (to Goodyear Tire & Rubber Co.). U. S. 1,694,529, Dec. 11. Rubber is incorporated with a small proportion (suitably about 1–5%) of β,β -dinaphthylamine or other suitable compd. of the general formula $RR'NH$, in which R and R' are similar naphthylene radicals.

Ornamenting sheet rubber with a printing apparatus. IOCO RUBBER & WATER-PROOFING CO., LTD., A. RYAN and J. KIRKWOOD. Brit. 288,411, Feb. 21, 1927. An unvulcanized rubber sheet is backed with a glazed or faced sheet and treated in a printing app. of the calico-printing type and then passed over steam-heated drying plates. This treatment is suitable for material used for making hot-water bottles or the like.

Thin-walled rubber articles. I. DOROGI, L. DOROGI and DOROGI ES TARSA GUMMIGYAR R.-T. Brit. 288,541, April 11, 1927. The extensibility of dolls or other toys or thin-walled rubber articles is reduced by applying to them a flexible lacquer-like coating (either on the exterior or interior of the articles) preferably contg. a cellulose deriv. which reduces the stretching capacity by at least half. Various details are described.

Puncture-filling composition. B. G. HARRINGTON and R. S. MASON. Brit. 288,917, Nov. 3, 1927. Finely powd. silica 40, alumina 40, mica 10 and soapstone

10% are uniformly mixed with water and evapd. crushed and sifted. Coarse mica, ocher or "gilt dust" may be added.

Rubber composition for sealing joints in can ends, etc. AMERICAN CAN CO. Brit. 289,270, May 28, 1927. Latex is mixed with NH_4 alginate or other suitable "alginic material" and with a "body material" such as calcined Al_2O_3 . Other substances such as sapond. beeswax and NH_3 may also be added.

Liners for use between rubberized fabrics. L. B. SEBRELL (to Goodyear Tire & Rubber Co.). Brit. 288,244, April 6, 1927. Material suitable for use between freshly prep'd. rubber coated fabric such as that used for making pneumatic tires consists of fabric coated with nitrocellulose compn. contg. a softening agent such as diethyl phthalate, dibutyl phthalate, diamyl phthalate, tricresyl phosphate or castor oil. The softening agent may be applied to the fabric after the nitrocellulose coating is applied by spraying or dipping.

Preserving the interior surfaces of air bags formed of rubber. STEWART S. KURTZ JR. (to Goodyear Tire & Rubber Co.). U. S. 1,694,879, Dec. 11. A soln. contg. glycerol and a drying oil such as rapeseed or linseed oil is introduced into the interior of bags such as those used in vulcanizing pneumatic tires.

Rubber sheet material. H. BROOMFIELD. Brit. 288,354, Dec. 7, 1926. A sheet material suitable for use in the manuf. of footwear is formed of raw rubber, fillers such as ground vulcanized rubber, lithopone, ZnO , vulcanizing agents and fibers, with a cell-producing agent such as water or $(\text{NH}_4)_2\text{CO}_3$, without use of naphtha or other softening agent which would cause rupture of the cells. A compn. is specified which may be vulcanized at atm. pressure at a temp. of 90–120°. Various details and modifications are described.

Recovery of used rubber. MAURICE DIT RENÉ GATTEFOSSÉ and SOC. FRANÇAISE DE PRODUITS AROMATIQUES (Anciens établissements Gattefossé). Fr. 636,641, Oct. 20, 1926. Used rubber is boiled with an ester such as an acetate, butyrate, or formate of an alc. such as cyclohexanol, or an ether such as benzyloxy-amyl- or -butylcineole, and filtered. The ether is recovered by washing with an alc. or other solvent in which the ether is sol. but not the rubber.

Reclaiming rubber. JOHANN TENGLER. Can. 284,014, Oct. 16, 1928. Pulverized old rubber is mixed with hydrogenated hydrocarbons, *e. g.*, hydronaphthalene, and is subjected to pressure and heat, whereby the H in the hydronaphthalene combines with the S in the vulcanized rubber deposit and is removed as H_2S . Further hydrocarbon is added, *e. g.*, benzine and high pressure and heat are applied and the complete soln. of the mass is obtained. The naphthalene formed from the hydrogenated naphthalene is removed by freezing out. Vulcanization is then effected with natural S by subjecting the mass for a long time to high pressure and heat, whereby hardening of the mass occurs. The mass recovered is suitable as a binding medium for colors, varnishes, cements, etc.

Vulcanizing rubber latex. I. G. FARRENIND. A.-G. Brit. 288,206, April 4, 1927. Latex is vulcanized by successive treatment with SO_2 and H_2S (coagulation being prevented by a medium such as a condensation product from C_{10}H_8 , CH_2O and H_2SO_4 or sulfonic acids of alkylated naphthalenes or sulfonation products of oils, naphthenic or fatty acids or the like).

Vulcanizing rubber. RUBBER SERVICE LABORATORIES CO. Brit. 286,749, Oct. 6, 1926. Accelerators are produced by combining mercaptans or mercapto compds. with org. bases other than guanidines, *e. g.*, with aldehyde-ammonia reaction products such as $(\text{CH}_2)_6\text{N}_4$, which gives a resinous product when heated with mercaptobenzothiazole. Biguanide, guanyl ureas, isoureas, thioureas, and isothioureas may be used, and various examples are given. Cf. C. A. 23, 310.

Vulcanizing rubber. RUBBER SERVICE LABORATORIES CO. Brit. 287,001, Oct. 6, 1926. Vulcanization accelerators are produced by combining the reaction product of a mercaptan or mercapto compd. and an org. base with an aldehyde, *e. g.*, mercaptobenzothiazole is heated with di-*o*-tolylguanidine and the product cooled and ground and treated in a closed vessel or under reflux with crotonaldehyde, aldol, acetaldehyde, propionaldehyde or heptaldehyde. Other examples of the manuf. and use of the accelerators also are given. Cf. C. A. 23, 310.

Apparatus for vulcanizing rubber articles. R. W. SNYDER (to Goodyear Tire & Rubber Co.). Brit. 288,248, April 7, 1927. The articles are carried by a conveyor through an approx. U-shaped chamber holding liquid heated by a steam-jacket. Various structural details are described.

Apparatus for vulcanizing rubber articles in successive procession. HARRY E. WANER (to B. F. Goodrich Co.). U. S. 1,693,264, Nov. 27.

CHEMICAL ABSTRACTS

Vol. 23.

FEBRUARY 20, 1929

No. 4

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Balance-stand for U-tubes. GERHARD PIATKIEWICZ. *Chem. Ztg.* 52, 842(1928).
J. H. MOORE

The shape of socket-joints and clamps. WILHELM VOLKMANN. *Chem. Fabrik* 1928, 631-3.—Proposed new forms are shown.
J. H. MOORE

Laboratory drainage. ALAN E. MUNBY. *Nature* 122, 773(1928).—Glazed ware is generally used, while research is being carried on with certain alloys of Ni, and with vulcanite.
R. J. H.

Electrofilter in the chemical industry. NACHTWEH. *Chem. Fabrik* 1928, 645.—
Cf. *C. A.* 23, 1. J. H. MOORE

The diameter of the pores and the manner of operation of the Berkefeld filter. H. HORK. *Chem. Fabrik* 1928, 645-6.—Tests were made by measuring the air and H_2O forced through at known pressures and calcg. the diams. by the formulas of Einstein (*C. A.* 18, 1) and of Bechhold (*Z. physik. Chem.* 64, 331). In 1 filter the max. diam. was 3.3μ , and the mean diam. 1.1μ . Since filters with a mean pore diam. of 2μ will safely remove bacteria below 1μ diam. it is concluded that the principal action is one of adsorption.
J. H. MOORE

Ultra-filtration. P. DICKENS. *Chem. Fabrik* 1928, 633.—D. claims Wasmuth has copied features of his filter (cf. *C. A.* 22, 4011).
J. H. MOORE

Increase in efficiency of evaporators and heat exchanging apparatus. HANS WOLLENBERG. *Chem.-Ztg.* 52, 915(1928).—When small spirals are placed in pipes used for conveying fluids, gases and vapors through boilers, condensers, feed-heaters, etc., the exchange of heat is improved. This is due to the fact that a whirling movement is imparted to the particles of the material, thus bringing them into intimate contact with the walls of the pipe. Another advantage is that on account of the whirling movement the deposition of dirt and boiler scale in the pipes is prevented.
G. SCHWOCH

The re-use of evaporator tubes that are corroded at the lower end. BERTHOLD BLOCK. *Korrosion* 3, 41-2(1928).—The corroded portion is cut off and a new piece welded on.
J. H. MOORE

A new device in glass apparatus. I. E. I. LEWIS. *Chemistry & Industry* 47, 1238-41(1928).—An app. in glass or silica devised by Max Haas is described. It is a tight, non-rigid joint made on the ball and socket principle. The advantages are the slight danger of fractures even when different glasses are used, easy erection and dismantling of app., interchangeable joints, and the easy handling of dangerous gases.
ARTHUR FLEISCHER

Titration flask with side compartment to prevent over-titration. J. LINDNER. *Chem.-Ztg.* 52, 868-9(1928).—An Erlenmeyer flask with a closed side-tube attached about half way up and inclined downward at about 45° . Part of the soln. is held in the side-tube as a precaution against over-titration.
J. H. MOORE

A cheap universal siphon. GEORG BEETZ. *Chem.-Ztg.* 52, 868(1928).—There is a cock near the bottom of the outside arm and just above this cock is a short side-arm, with a cock, to which is attached a small injector pump operated by blowing with the mouth to fill the siphon.
J. H. MOORE

New viscometer with double-row radiator system. ERNŐ LASZLÓ. *Chem.-Ztg.* 52, 869(1928).—The app. resembles the Engler app., but attached to the inner walls of the bath are vertical fins that extend inward almost to the sample cup, and under it. This cup also has fins on the outside and bottom to pass between those on the outer vessel. The fins transmit heat uniformly and eliminate stirring.
J. H. MOORE

A new electric heater for extractions, etc. ANON. *Chem.-Ztg.* 52, 869(1928).—The heating element is protected by a casing with openings for air circulation and by standing the flask in a pan to catch the contents if broken. The heat is regulated by a rheostat.
J. H. MOORE

Results of comparative tests of the Hanau ultra-violet ray analysis lamp and the one constructed by Muller. J. WERDER AND C. ZÄCH. *Mitt. Lebensm. Hyg.* 19, 339-40 (1928).—The advantages and disadvantages of both app. are given. The main drawback of the Muller lamp is a deficiency in light intensity, which makes it useless for certain work where a very strong luminescence is an abs. necessity. J. C. JURRGENS

An improved gas-analysis apparatus according to Carpenter. FR. STRIECK. Univ. Würzburg. *Biochem. Z.* 202, 1-4(1928).—An adaptation of the usual gas-analysis app. is described which permits the performance of a duplicate detn. within 15 min. S. M.

Manometers for orifice (gas) meters. M. SCHAAK. *Gas. u. Wasserfach.* 71, 1137-43(1928).—The mechanism of indicating, recording and transmitting (distant recording or indicating) manometers for use with orifice gas meters is described and illustrated. R. W. RYAN

Gas measurement by orifice and proportional meters. WÜNSCH. *Gas. u. Wasserfach* 71, 1107-12(1928).—Various German gas-flow meters are described and illustrated, especially those which depend on by-passing a proportional part of the gas around an orifice, and measuring this gas flow by means of an orifice or other gas meter. Methods of compensating for changing density are illustrated. R. W. RYAN

Apparatus for automatically measuring hydrogen-ion concentration. ARNOLD LASSIEUR. Lab. Municipal de Paris. *Chimie et industrie* 20, 819-22(1928).—An app. has been devised and is described, which is based on the method of Beans and Oakes (C. A. 15, 8). In carrying out the detn. the condenser is first charged from the cell of which the e. m. f. is to be measured, the condenser is discharged through a ballistic galvanometer, the deflection of which measures the e. m. f. of the cell, the oscillations of the galvanometer are dampened by shunting through a suitable resistance (about 7000 ohms) and the two plates of the condenser are short-circuited to remove any residual charge. A special contactor has been devised for carrying out these operations either manually or automatically. A. PAFINEAU-COUTURE

New combustion meter. ANON. *Instruments* 1, 531(1928).—The app. records CO₂ in flue gas, together with either furnace draft or flue gas temp., or both. C. Z. R.

Research air flow indicator. ANON. *Instruments* 1, 527-8(1928).—A portable orifice or Venturi meter app. is described, for use in tests of internal-combustion engines. A motor-driven blower supplies air at low pressure, and the usual water manometer indicates the flow by the pressure drop across the orifice or Venturi tube. The app. is self-contained and adaptable to widely different test conditions. C. Z. ROSECRANS

Research fuel flow indicator. ANON. *Instruments* 1, 528-9(1928).—The flow meter, used for liquid fuel measurement in engine tests, is of the float type. Ranges available are 10 and 12 gallons per hr. C. Z. ROSECRANS

Research twin buret fuel system. ANON. *Instruments* 1, 529-30(1928).—Calibrated burets are described for measurement of liquid fuels used in road or lab. tests of internal-combustion engines. C. Z. ROSECRANS

Flue ashes eliminator. MAX BERGER. *Apparatebau* 40, 270-1(1928).—The "Deuca-Räumer" is made of a special heat-resisting alloy and of such shape that when placed in the flue it gives the gases an increased velocity and spiral motion, thus preventing deposition of ashes in the flue and giving higher heat utilization. J. H. MOORE

Catalytic hydrogenation apparatus. ANON. *Instruments* 1, 537-8(1928).—A flint glass bottle in which the reaction proceeds is shaken by an elec. motor. A H₂ tank equipped with a pressure gage is mounted on the base, and supplies H₂ for the reaction during the shaking. Rates of oscillation are 200, 250, or 300 per min. C. Z. R.

Standardization of chemical heavy apparatus. A. TRAUB. *Chem. Fabrik* 1928, 629-30.—T. favors standardization of app. used in all well-established processes. J. H. MOORE

Steam apparatus. M. GRELLERT. *Apparatebau* 40, 217-8, 231-2, 241-2, 253-6, 265-6(1928).—A discussion of steam generators, engines, turbines, exhaust steam heating, pipes and heating coils, super-heating, de-watering lines, with data on generators and H₂O-heaters to operate at 0.5 at. pressure. J. H. MOORE

The steam turbine in the chemical industries. H. STRAUSS. *Chem. Fabrik* 1928, 607-9, 630-1.—A discussion of the most important differences in turbines and the principal conditions affecting a choice. J. H. MOORE

Frame dialyzers. HEIBIG. Société des Filtrés Philippe, Paris. *Russe* 3, 1291-7 (1928).—A polemical discussion of their merits, particularly for the recovery of spent alk. liquors from viscose manuf. A. PAFINEAU-COUTURE

A useful micro-electro dialysis apparatus. ERICH BAHR. *Kolloid.-Z.* 46, 176-8 (1928).—The method is given of constructing and using a micro-electro dialyzing app. having a parchment membrane at the cathode and a chrome-gelatin membrane at the

anode. Construction is simple and from common lab. material. The app. is useful for various types of colloidal materials and has been used in physiol. studies. L. F. M.

The "Drayton" differential humidity regulator. ANON. *Engineering* 126, 635 (1928).—Controlling humidity under varying conditions of temp. is the task of the "Drayton" differential humidity regulator made by the Drayton regulator and Instrument Co., Ltd., West Drayton, Middlesex, England. The regulator is constructed so that the setting of a wet-bulb control is altered in a definite relation to any variations in the dry-bulb temp. which may occur, thus maintaining const. relative humidity at all temps. (illustrated with view and diagram). W. C. EBAUGH

The influence of a dust film on the efficiency of regenerators. A. SCHACK. *Z. tech. Physik* 9, 390-8 (1928).—In an ideal regenerator (perfect heat conduction by bricks, high brick weight or sp. heat) the heat recovered per hr. is $Q = k(t - t')$ with the heat transfer value $k = 1/[(1/\alpha) + (1/\alpha')]$; α and α' are, resp., heat transfer coeffs., for waste gas-brick and brick-air, t and t' are time averages of waste gas and air temp. If the time averages of the brick temp. t_s and t'_s during gas and air periods, resp., are unequal $Q = k(t - t_s) + (t_s - t')$. This holds for an actual regenerator and can be represented by a smaller value of k : $k_s = k\{1 - [(t_s - t'_s)/(t - t')]\}$. In the original equation $Q = k_s(t - t')$. The customary assumption of sinusoid temp.-time curve in a regenerator is unreal; it would give the ideal condition $t_s = t'_s$. For the case of a dust film, covering the regenerator brick, sp. heat of the film being zero, and the brick having a conduction $\lambda = \infty$, is calcd. the influence on k_s . The expression found for the efficiency is $k_s/k =$

$$\frac{(cs\gamma/\alpha\tau_0)}{1 - e^{-\alpha\tau_0/cs\gamma(1 + \alpha\delta/\lambda)}} - 1/2$$

The two factors $\alpha\tau_0/cs\gamma$ (I) and $\alpha\delta/\lambda$ (II) (c is sp.

heat of brick in kg. cal. per kg. per degree centigrade, s thickness of brick in m., γ is sp. wt. of brick in kg. per cu. m., α heat transfer coeff. in gas period or air period, to length of full reversal cycle in hrs., δ thickness of dust film in m., λ heat cond. of film in kg. cal. per m., hr. and degree) which det. the quotient k_s/k have been used to plot a set of curves for the efficiency (I from 0 to 2.0, II from 0 to 0.5) and numerical examples are worked out. For $\delta = 0.002$ m., $\lambda = 0.1$, $\alpha = 10$, $c = 0.25$, $s = 0.06$, $\gamma = 1500$, $\tau = 1$ hr., $k_s = 0.81 k$, i. e., a drop in efficiency of 19%. For a 5-mm. film the drop would be 34%. High values of I tend to lower the quotient even if $\delta = 0$. For a value of I = 1.5 (practical for blast-furnace stoves) the quotient $k_s/k = 0.85$, because of the approach of gas and brick temp. at the end of the cycle. The values derived from the equation are in reality a little too high due to finite conductivity of the brick; for other reasons, however, they might be on the low side. For unequal gas and air reversal periods the same results can be used if ϵ is substituted for k , ϵ or ϵ_s being defined by $\epsilon = 1/[(1/\alpha\tau) + (1/\alpha'\tau')]$ and $Q = \epsilon_s(t - t')$ for an actual regenerator.

B. J. C. VAN DER HOEVEN

Apparatus for the production and mixing of solutions by electrical control. F. PETZOLD. *Chem. Fabrik* 1928, 668-9.—An automatic control for a process involving the mixt. of 2 fluids in predetd. amts. is described. J. H. P.

High-temperature automatic regulator with alternating-current relay. MARCEL ANTRUC. *Arts et métiers* 99, 463-8 (1928).—The instrument is based on expansion properties and on the properties of a. c. electromagnets, more particularly on the fact that in a. c. electromagnets with adjustable air gap the intensity of the current is a function of the air gap and within certain limits is proportional to the value of the air gap. The construction, characteristics and operation of the instrument are described.

A. PAPINEAU-COUTURE

Cylinder testing and I. C. C. regulations. H. E. STÜRCKE. *Bull. Compressed Gas Manufacturers Assoc., Tech. Series* 1928, 324-30.—This is the first of a series of articles on the general subject of cylinder testing and regulations pertaining thereto. "The principal objection to the present test methods is the lack of a scientific basis and the failure to correlate pressures, stresses and strains in a satisfactory manner." A principle overcoming these deficiencies is applied in the Linde acceptance tests. A two-fold application on this principle is summarized. (1) A cylinder of given water capacity, ratio of diams., fixed form of ends (top and bottom) must at a given pressure give a specific amt. of elastic volumetric expansion. If 4 of these factors are known together with certain consts. the fifth value can be calcd. Thus the elastic volumetric expansion is a reliable criterion for the form strength of the cylinder. The expansion tells the story and its proportionality to the pressure eliminates the need of stressing a cylinder to or near the elastic limit to get an est. of its form strength. (2) This accurate information about form strength permits detn. of the wall fiber stress that equals or ex-

ceeds the elastic limit of the material. Variations in wall thickness are a serious problem. When the water-jacket test can be conducted so as to avoid an error in excess of 1% the Linde acceptance test is practicable. The water-jacket test measures directly the elastic volumetric expansion of a cylinder. "A complete change of the regulations about the hydrostatic test seems inevitable. The inconsistencies and the hazardous character of the allowance of 10% permanent expansion, the inaccuracies of the data supplied by the water-jacket test as practiced today, and the failure to gain any real worth while information from this test, are too glaring to be tolerated indefinitely."

W. H. BOYNTON

Device for identifying colors. W. C. HOLMES. *Chemicals* 30, No. 21, 31 (Nov., 1928).—Investigations made by the Color and Farm Waste Div. of Dept. of Agr. in coöperation with the Comm. on Standardization of Biological Stains disclose the fact that the spectrophotometer gives better results than the colorimeter. Detn. of suitable spectrophotometric ratio affords an extremely convenient means for disclosing the nature of the sample when the dyes under examn. are of closely related structure; e. g., 4 homologs of basic fuchsin. Relative proportions of each homolog can be ascertained. An attempt to prep. an Al lake for quant. consideration as well as a colored B compd. was not entirely satisfactory. Spectrophotometric analysis of gases evolved in the reaction of HCl and HNO₃ furnished promising results. Detn. of p_H and dissocn. consts. of indicators have been studied by the method advocated. H. maintains that the spectrophotometer has proved more convenient and accurate than the colorimeter, even in instances when the latter is reasonably reliable. Further, it proves reliable in many cases in which the colorimeter is misleading.

FREDERICK G. GERMUTH

Oils, greases and high vacua (BURCH) 22. Apparatus for separating CH₄ from natural gas or other gases from mixtures by regulated liquefaction (U. S. pat. 1,694,308) 13. **Ultrafilter membrane (U. S. pat. 1,693,890) 23.**

STOTT, VERNEY: Volumetric Glassware. London: H. F. & G. Witherby. 20s. Reviewed in *Intern. Sugar J.* 30, 609; *Pharm. J.* 121, 454 (1928).

Thermometer tubes. ALFRED T. HESPE. U. S. 1,696,400, Dec. 25. Mech. features.

Thermocouple and electric system for indicating temperatures. FERNALD S. STICKNEY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,867, Dec. 18.

Electric apparatus for temperature control. ALBERT W. HULL (to General Electric Co.). U. S. 1,694,264, Dec. 4. An app. is specified suitable for regulating the temp. of furnaces, ovens, etc.

Electric temperature-indicating system suitable for attachment to pipes. EDWARD A. ROLLINS. U. S. 1,695,295, Dec. 18.

Temperature-indicating device suitable for automobile radiators. STANLEY F. BARKER. U. S. 1,695,838, Dec. 18.

Heat-indicating device for indicating the temperature of internal-combustion engines, etc. HENRY C. HEBIG (to Harrison H. Boyce). U. S. 1,693,984, Dec. 4.

Thermoelectric pyrometer. J. L. ORCHARD and CAMBRIDGE INSTRUMENT CO., LTD. Brit. 290,493, Sept. 14, 1927. Structural features.

Electrical recording device suitable for use with balances, manometers, etc. WILLIBALD SIEBERS. U. S. 1,695,668, Dec. 18.

Air filter and moistener. GEORG SUPANZ. Austrian 109,250, Nov. 15, 1927. Constructional details.

Oil filter. EUGENE M. SCOVILLE (one-half to Floyd L. Swanberg). U. S. 1,696,735, Dec. 25. Structural features.

Cylindrical filtering apparatus for milk or other liquids. ANDREW WUEST. U. S. 1,693,741, Dec. 4. Structural features.

Filter for benzene, oils, etc. SVENSKA ACKUMULATOR AKTIEBOLAGET JUNGNER. Fr. 639,923, Aug. 23, 1927.

Rotating filtering drums. R. WOLF A.-G. Fr. 640,551, Aug. 27, 1927.

Filter grids. SOCIÉTÉ ANON. DES ÉTABLISSEMENTS THUILLIER-LEFRANT. Fr. 640,458, Sept. 5, 1927.

Apparatus for separating impurities such as oil and water from air. CLYDE C. FARMER (to Westinghouse Air Brakes Co.). U. S. 1,693,646-7, Dec. 4.

Apparatus for separating mineral substances by stratification on an air-pervious table. E. DAVIS (to R. Peale and W. S. Wallace). Brit. 290,276, May 12, 1927.

Extrusion press for expressing liquids from solids. H. J. L. DUNLOP and A. J. SIBBALD. Brit. 289,954, Feb. 4, 1927. A press is described which may be used for expressing oil from palm kernels.

Apparatus for separating oil, gas, sand and water by settling and scrubbing. DAVID G. LORRAINE. U. S. 1,693,849, Dec. 4.

Electric discharge devices. VEREINGTE GLÜHLAMPEN- UND ELEKTRICITÄTS A.-G. Brit. 289,762, April 30, 1927. Cathodes for discharge tubes such as radio valves, rectifiers and Röntgen-ray tubes are coated with alk. earth metals or their oxides by introducing into the tube an alloy of the alk. earth metal not oxidizing in air (*e. g.*, a Ba-Mg alloy) and decomposing the alloy *in vacuo* and vaporizing it partially or completely to form a thin deposit on the core wire of the cathode. A method of producing the alloys used from fused baths electrolytically is also described. Brit. 289,763 specifies cathode cores of Pt, Ni, Cu, Cr-Ni or the like coated with Ba or of W or Mo coated with Th. The coating may be formed from metal vaporized by elec. heating of a mixt. of oxide or hydroxide of Ba or Th with Mg in the evacuated device, or an aq. colloidal soln. of Ba(OH)₂ or Sr(OH)₂ may be coated on the anode and reduced by vaporization of a fragment of Mg positioned adjacent. If the anode cannot be heated sufficiently directly addnl. heat may be furnished by an exothermic reaction such as that of Fe oxide with Al or Mg.

Electric discharge tubes containing rare gases and suitable for use as lightning arresters, etc. DR. G. SEIBT FABRIK ELEKTRISCHER UND MECHANISCHER APPARATE and A. SALOMON. Brit. 290,561-2, May 14, 1927. Structural features.

Mercury-arc discharge device. VLADIMIR K. ZWORYKIN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,696,023, Dec. 18.

Cathode for discharge tubes. ERICH F. HUTH G. M. B. H. Ger. 467,675, Sept. 1, 1921. The cathode is made from a mixt. of a refractory material with one or more oxides or chlorides of metals of the 2nd and 8th periodic groups. In an example, the cathode is made from a mixt. of SrO 60, BaO 30 and PdCl₂ 10% mixed with 19 times its wt. of a refractory such as W or Mo.

Filaments for electron discharge devices. FREDERICK HOLBORN (to De Forest Radio Telephone & Telegraph Co.). U. S. 1,695,687, Dec. 18. Cathodes are used comprising Fe and Li.

Oxide cathodes for electron tubes. RADIOWERK F. SCHRACK. Austrian 109,261, July 15, 1927. The oxide film is brought on to its support from a mist produced by atomizing a soln. or suspension of a suitable alk. earth compd., *e. g.*, an alc. suspension of SiCO₃, from which the oxide is then produced by heating *in vacuo*.

Cathodes for electron tubes. GEORG SEIBT, FRITZ SEIDEL and HELLMUTH BLEY. Ger. 466,075, Aug. 5, 1924. A metal wire or grid is coated with one or more preheated alk. earth sulfides; a mixt. of CaS and BaS with 20-50% BaS is mentioned.

Electron-emitting elements. LEON McCULLOCH (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,899, Dec. 18. Filaments are coated with an aq. soln. of at least one compd. contg. an alk. earth metal (*e. g.*, Ba or Sr nitrate) and subsequently heated to ignition temp. in CO₂. An app. is described.

Stereoscopic Röntgen-ray apparatus. F. BORNHARDT. Brit. 290,619, May 18, 1927.

X-ray shield. PHILLIP E. HARTH (to The National Pigments and Chemical Co.). Can. 284,593, Nov. 6, 1928. A compd. composed of 75 to 95% of a mixt. of powd. BiSO₄, 73% of which will pass through an 800-mesh screen and 100% through a 325-mesh screen, and 25 to 5% of powd. bakelite, 98% of which will pass through a 200-mesh screen, is heated under pressure to mold the desired articles. A temp. of 800° F. and a pressure of 25 tons per sq. inch are suitable. Boards composed of sheets of fabric impregnated with bakelite and layers of the above compound may be built up to the desired thickness and heated under pressure and such boards used to line x-ray rooms. Powd. bismuth and finely ground metallic lead may also be used and other binders such as hard rubber or China wood oil, after being boiled at 660° F., in order to polymerize it, may be used.

Thermionic valves. NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLÜHLAMPENFABRIKEN. Brit. 289,975, Feb. 9, 1927. To prevent the deposition of a "getter" such as Ca or other electropositive metal, on the electrodes, a screen is interposed between the latter and a device, such as a W helix, contg. or coated with the metal which is to be evolved when the helix is heated (the helix acting as a cathode).

Thermionically active cathodes. GEORGE W. HALLOCK (to Westinghouse Lamp Co.). U. S. 1,695,845, Dec. 18. Cathodes for thermionic discharge devices are formed with an elec. conductive core comprising an alloy of Ni and Si (suitably in the proportions of 97 and 3%, resp.). Some Mn also may be present.

Thorium-coated filaments. JOHN W. MARDEN, JOHN E. CONLEY and THOMAS P.

THOMAS (to the Canadian Westinghouse Co., Ltd.). Can. 284,951, Nov. 20, 1928. Filamentary material of W, Mo or other similar material has applied thereto a pure coating of Th. Cf. C. A. 22, 2860.

Photosensitive cell. SAMUEL RUBEN. U. S. 1,694,189, Dec. 4. An elec. discharge tube with a cathode and anode contains a control element of cuprous oxide which is used as a grid coating. U. S. 1,694,190 specifies a photoelec. cell with a control element comprising a metal body such as Ag or Mo carrying on its surface a photosensitive compd. of the O series of the sixth periodic group, such as Mo sulfide, Ag sulfide or Ag selenide.

Evaporators. AKTIEBOLAGET SVENSKA MASKINVERKEN. Fr. 640,772, Sept. 12, 1927. An evaporator for liquids, particularly waste cellulose lye and salt solns., consisting of a hollow heater turning on a horizontal axis in a vessel contg. the liquid, is described. Cf. C. A. 23, 313.

Inclined evaporator with cylindrical shell and steam-heated internal tube system. J. HOLMES and H. A. KINGCOME. Brit. 289,717, Nov. 1, 1927. Structural features.

Apparatus for crystallizing salt, etc. F. JEREMIASSEN. Brit. 290,369, Feb. 14, 1927. A circulating soln., supersatd. by evapn. or cooling, flows down through a channel passed through a collection of granules, near the bottom of which there is directed upwardly from a pipe a portion of the soln. which is not more than slightly supersatd. so that the soln. then flows in an upward direction through the granules to deposit the crystals. Various details of construction are specified.

Crystallization apparatus and the like. AUGUST GRÄNTZDÖRFFER. Fr. 640,014, Aug. 25, 1927. The leading-in pipe for liquids in crystn. or vacuum boiling pans ends in several vertical tubes under the surface of the liquid and the outlets are facing outwardly so that added liquid becomes heated to the temp. of the liquid in the pan before mixing, and is then thoroughly mixed.

Mixer for two or more substances such as coal and ore. HJALMAR ERIKSSON. Fr. 640,351, Sept. 1, 1927.

Driving means for vibrating sieves, particularly for coal and ores. WILHELM SELTNER. Austrian 109,217, Nov. 15, 1927. Constructional details.

Centrifugal grinder. FIRMA KITTAY & Co. Austrian 109,241, Nov. 15, 1927. Constructional details.

Colloid mill. ANDREW FRASER. U. S. 1,696,083, Dec. 18. Structural features.

Cooler for liquids. ANNE TIPPMAR (NÉE VOSS). Ger. 466,132, Nov. 13, 1927. An app. for air-cooling liquids comprises an arrangement of grids and riffles; the cooling of beer is mentioned.

Apparatus for pasteurizing and cooling milk or other liquids in bulk. G. ROTTGER. Brit. 290,615, May 17, 1927.

Apparatus for sterilizing milk or other liquids in containers carried in perforated baskets. NAAMLooZE VENNOOTSCHAP HUYGEN & WESSEL'S INGENIEURS-BUREAU. Brit. 290,555, May 14, 1927.

Device for delivering liquids. ALFRED HOCHSTRASSER. Austrian 109,262, Sept. 15, 1926. A device for delivering predetd. amts. of liquid at predetd. intervals of time is described, the device being operated by the pressure generated by heating the liquid in a closed container.

Apparatus for supplying boiler feed water or other liquids in regulated quantities regardless of variations in level in the supply tank. ERICH ROUCKA. U. S. 1,695,471, Dec. 18.

High and low water alarm device for boilers, etc. J. GORDON & Co., LTD., and C. H. ARMSTRONG. Brit. 290,114, Nov. 8, 1927.

Surface condenser for large quantities of vapors. ALLGEMEINE ELEKTRICITÄTS GRS. Ger. 466,029, May 12, 1926. Constructional details.

Device for immersion in liquids to take samples of the liquids. H. L. R. BELL. Brit. 290,758, Feb. 23, 1927. Structural features.

Drying apparatus. N. G. WEISBRUT. Russ. 3615, Sept. 30, 1927. A drying oven is heated by circulating hot air. The dried goods are sorted out by sieves of different mesh placed in the oven.

Inclined rotary drying apparatus for treating cotton or other materials. SHERWOOD GREEN. U. S. 1,695,652, Dec. 18.

Roller press for briquet manufacture. HUGO APFELBECK. Austrian 109,225 and 109,236, Nov. 15, 1927. Constructional details.

Roller press for briquet manufacture. MASCHINENBAU A.-G. VORM. BREITFELD, DANEK & Co. and WILLIBALD GELINER. Austrian 109,218, Nov. 15, 1927. Constructional details.

Apparatus (with a series of troughs and rotary scoops) for drying coal, cereals or other materials. J. H. RICE. Brit. 290,776, March 14, 1927.

Electric control system for regulating heating, filling and emptying of containers or similar operations. LEWIS B. SWIFT (to Taylor Instrument Companies). U. S. 1,693,877, Dec. 4.

Apparatus for testing hardness of materials. C. H. WILSON. Brit. 290,729, Feb. 18, 1927. A generally automatic app. is specified similar to that described in Brit. 277,517 (C. A. 22, 2497) but especially suitable for dealing with large or heavy objects.

Apparatus (and system of utilizing electric resistance) for determining and indicating hardness of materials. R. ESNAULT-PELTERIE. Brit. 289,960, Feb. 4, 1927.

Apparatus for casting in refractory molds. ERLE J. BYERLEIN. U. S. 1,696,670, Dec. 25.

Mold for high-temperature casting of refractory materials. KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,696,688, Dec. 25. Fused silica 80-85 (of which a material portion is amorphous and which is comminuted to a fineness of at least 20 mesh) is mixed with comminuted lime 20-15 parts, sufficient water is added for dry pressing, the mixt. is molded by dry pressing and is hardened by heat in the presence of steam.

Apparatus for gas analysis. SOC. L'AIR LIQUIDE (SOC. ANON POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE). Brit. 290,259, May 11, 1927.

Cover construction (and apparatus for handling the covers) for gas purifiers. WHES-SON FOUNDRY & ENGINEERING CO., LTD. and R. L. CHAMBERS. Brit. 290,793, April 1, 1927.

Apparatus (with stirrer blades and water vapor injectors) for purifying furnace gases or other gases. D. RADULESCU. Brit. 289,825, May 2, 1927. The stirrers may comprise 3-6 pairs and may exert suction and may be oppositely disposed to produce eddy effects.

Gas burner construction. HARRY E. DICKINSON. U. S. 1,696,840, Dec. 25.

Gas burner construction. ERNEST A. HALL and GORDON E. BURNS (to Hall Mfg. Co.). U. S. 1,695,548, Dec. 18.

Gas burner construction. JOHN HARRIS (One-half to James R. Rose). U. S. 1,695,587, Dec. 18.

Automatic cut-off for gas burners. J. TUREK and W. TIROCKE. Brit. 289,738, Dec. 19, 1927. A device is described which cuts off the gas by the action of clockwork when the flame is accidentally extinguished.

Heater. THEODOR POPESCU, ALEXANDER PAIS and CONSTANTIN PAIS. Austrian 109,213, Nov. 15, 1927. Constructional improvements are described for a heater (for use in the explosives, oil and alc. industries) which comprises 2 metal blocks provided with a system of interconnected passages charged with a heated volatile liquid.

Heat-exchange apparatus. D. W. BERLIN. Brit. 290,868, Aug. 18, 1927. Structural features of an app. with interlocked corrugated walls.

Heat-exchange apparatus. J. KARMAZIN. Brit. 290,471, July 26, 1927.

Heat-exchange device. C. W. STANCLIFFE. Brit. 289,912, Jan. 6, 1927.

Heat exchanger. ALLGEMEINE ELEKTRIZITÄTS GES. Ger. 466,199, Feb. 18, 1927. Means is described for steadying the tubes of a heat exchanger of the type comprising tubes passing loosely through intermediate supports.

Heat exchangers. COMPAGNIE DES SURCHAUFFEURS. Fr. 640,090, Aug. 27, 1927.

Furnaces. AUGUSTE WINKLER & SOC. WILTON POUR L'EXPLOITATION DES PROCÉDÉS CHIMIQUES ET FOYERS BREVETÉS S. G. D. G. Ger. 467,426, Dec. 25, 1924. Constructional improvements are described in the means for admitting an air-steam mixt. to the fire chamber of a smoke-consuming furnace.

Furnace with several compartments for the distillation of coal, etc., at low temperatures. SOCIÉTÉ DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Fr. 640,770, Sept. 12, 1927.

Furnace for the distillation of coal, etc., by treating it with gas or superheated steam. SOCIÉTÉ DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Fr. 640,771, Sept. 12, 1927.

Charging furnaces. DEMAG AKT.-GES. Ger. 468,706, Mar. 1, 1927. The charging app. for tilting furnaces, particularly elec. fusion furnaces, is so arranged that it engages with the furnace opening and is tilted by tilting the furnace.

Muffle furnace. V. E. GRUM-GRZHUJMALO. Russ. 3995, Nov. 30, 1927.

Rotating furnace. MAX GENSBAUR. Fr. 639,920, Aug. 23, 1927. The charge of cement or ores mixed with fuel is introduced in pieces, preferably sausage-shaped, instead of as powder. The mouth of the furnace is suitably enlarged.

Rapidly rotating furnace and accessory plant. GOTTFRIED TRUMPLER. Swiss 126,066, May 1, 1927. Constructional details.

Continuously operating rotary furnace. LUIGI TOCCO and MICHEL LANDI. Swiss 126,067, June 12, 1926.

Rotary-hearth furnace with tiltable trays. ORA A. COLBY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,883, Dec. 18.

Shaft furnaces. PAUL KESKAMP. Can. 285,440, Dec. 11, 1928. Charging materials are crushed and have intimately mixed therewith furnace dust, and the mixt. is blown by non-oxidizing gases into a shaft furnace above the smelting zone.

Automatic feed for shaft ovens, particularly for gas generators. RUDOLF MOLLER. Ger. 466,229, Mar. 6, 1927. Constructional details.

Burner for vaporized liquid fuel. LOKOMOTIVFABRIK KRAUSS & CO. AND OSTERREICHISCHE EISENBAHN VERKEHRANSTALT. Austrian 109,212, Nov. 15, 1927. Constructional details.

Atomizing burner for liquid fuels. GEORG MULLER. Ger. 466,227, Mar. 18, 1927. Constructional details.

Atomizing burner for heavy liquid fuels. FRANÇOIS GRANDMAGNAC. Ger. 466,226, Feb. 10, 1927. Constructional details.

Burners for heavy oils. AGNAN DURAND. Fr. 640,301, Aug. 31, 1927.

Oil burner. D. D. SOROKIN. Russ. 3694, Sept. 30, 1927.

Oil burner. G. A. BIRYUKOV. Russ. 3695, Sept. 30, 1927.

Mechanical oil burners. A. I. KOTLYARENKO, P. I. KOTLYARENKO and V. I. KOTLYARENKO. Russ. 4072, Nov. 30, 1927.

Furnace burning pulverized solid or liquid fuel. GASIFIED FUEL LIMITED. Fr. 640,555, Sept. 1, 1927.

Retort. DOUGLAS RIDER (to The Thermal Industrial Chemical Research Co., Ltd.). Can. 284,810, Nov. 13, 1928. A vertical retort having a vertical conveying screw of shallow thread to ensure approximation to film distn. conditions and allow of even heat treatment of all particles of material between the threads is specified.

Sintering apparatus. THOMAS M. ALEXOVITS (to John E. Greenawalt). Can. 285,230, Nov. 27, 1928.

Lamp for heating thermo-batteries. A. I. IOFFE. Russ. 3626, Sept. 30, 1927.

Mechanical stoker. JOSEF MUCHKA. Austrian 109,467, Dec. 15, 1927. A reciprocating trough is provided for the removal of ash.

Electric control (responsive to pressure and temperature changes) for feeding fuel to furnaces. CHARLES H. QUINN. U. S. 1,695,606, Dec. 18.

Apparatus for feeding powdered solids in predetermined amounts. I. G. FARBERIND. A.-G. (Waldemar Berger, inventor). Ger. 467,636, June 5, 1927. The app. comprises a vertical container closed at the bottom by a peripherally perforated plate adapted to slide on a disk having openings of variable size which can be made to register with the perforations in the plate.

Mechanical coal feed for annular kilns. HARRY KLOSTERMEYER and ALBERT KLOSTERMEYER. Ger. 467,458, Aug. 14, 1927. Constructional details.

Fuel-feeding means for annular kilns having an oscillating shovel under the fuel container. ANTON CHMELICEK. Ger. 466,192, Feb. 22, 1927. Constructional details.

Kilns for lime, cement, etc. LUDWIG RIEDHAMMER. Ger. 466,191, July 15, 1927. The kiln is divided into compartments by walls passing through its principal axis, and is constructed with stationary upper and lower parts and a rotary intermediate part.

Shaft kiln for lime or cement manufacture or for roasting ores. GEOFFREY MARTIN. Ger. 466,190, May 6, 1927. The materials fall in powder form through a stream of gases ascending a shaft, the shaft having a comparatively wide upper or preheating zone and a comparatively narrow lower or roasting zone built asymmetrically beneath the upper zone.

Device for the better utilization of hot gases in furnaces of all kinds. LUDWIG BORBELY. Austrian 109,473, Dec. 15, 1927. Oppositely acting vanes are arranged in the gas conduits so as to produce eddies in the gas stream.

Draft regulator for furnaces. ÖSTERREICHISCHE MASCHINENBAU A.-G. KÖRTING. Austrian 109,215, Nov. 15, 1927. Constructional details.

Interconnected system of apparatus for controlling combustion in furnaces. ERICH ROUCKA. U. S. 1,695,470, Dec. 18. U. S. 1,695,472 also relates to an app. for furnace combustion control.

Electrically controlled combustion control system for steam-boiler furnaces. FRED H. LINDLEY. U. S. 1,695,431, Dec. 18.

Supporting and sealing devices for cyanide pots used in furnaces. FREDOLF J. PETERSON. U. S. 1,695,467, Dec. 18. Structural features.

Traveling grate of the endless-chain type. L. and C. STEINMULLER. Ger. 466,076, Feb. 13, 1926. Constructional details.

Traveling grate of the endless-chain type. JOHANN PLACZEK. Ger. 466,125, June 25, 1926. Constructional details.

Traveling grate of the endless chain type. MAX BIRKNER. Ger. 467,654, Oct. 14, 1924. Constructional details.

Gas-heated sectional boiler. FRITZ DRECKMANN. Ger. 467,424, Oct. 4, 1927. Constructional details.

Sectional boiler with wrought iron tubes of oval shape. SEVERIN VORENT. Ger. 467,425, Dec. 28, 1926. Constructional details.

Insertion for the smoke conduits of furnaces. HEDWIG BALTZER (NÉE RIETH) and BERTA GOERTZEN (NÉE PFLUGMACHER). Ger. 467,427, July 21, 1926. Addn. to 430,739. An insertion for promoting combustion in the smoke conduits of furnaces comprises a plate oscillated by mech. means and resiliently attached to a ring made fast to the conduit.

Apparatus for heating by an electric arc superposed on a combustion flame. GEORGE T. SOUTHGATE. Ger. 466,102, Apr. 23, 1925. The flame and the arc have independent sources, the arc being directed in the line of the flame by a gas stream with a sufficiently great velocity to prevent the arc from striking back to the source of the flame.

Portable high-pressure acetylene generator. RICHARD MÜTSCHLE. Ger. 467,497, Oct. 13, 1925. Constructional details.

By-pass valve. M. D. BONDAREV. Russ. 4194, Dec. 31, 1927.

Apparatus for exothermic reactions at high temperatures and pressures. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE). Swiss 126,815, Feb. 21, 1927. A reaction chamber heated by an elec. resistance and with ducts to convey the hot gases generated to a heat absorber is provided.

Method of fusing metal caps on to vessels or tubes of glass. SIEMENS SCHUCKERT-WERKE A.-G. Ger. 466,049, Feb. 26, 1925. Manipulative details.

Chart recording apparatus suitable for use with conveyers, etc. HERBERT L. MERRICK. U. S. 1,693,701, Dec. 4.

Apparatus for ozonizing air. LOUIS GRAS and GEORGES CREPIN. Fr. 640,211, Aug. 27, 1927.

Emulsifying machine. INGEMANN LARSEN. Fr. 639,984, Aug. 26, 1927. Constructional details.

Apparatus for cleaning and reclaiming sand after use for sand-blasting, etc. HARRY W. TITGEN. U. S. 1,696,064, Dec. 18.

Sorting according to color. ARTHUR WEIGL. Fr. 640,593, June 8, 1927. In an app. for mech. sorting natural or artificial substances according to color or shade as described in Ger. 331,077 the Se cells are replaced by photoelec. elements coupled with strengthening tubes.

Misch metal as clean-up material. JOHN W. MARDEN and MALCOLM N. RICH (to The Westinghouse Lamp Co.). Can. 285,038, Nov. 20, 1928. Misch-metal wire as a clean-up material for lamps and like evacuated devices is specified.

Thermostat. PORTER H. BRACE (to The Canadian Westinghouse Co., Ltd.). Can. 284,559, Nov. 6, 1928. A bimetallic thermostat has one member formed of irreversible Ni steel (i. e., a Ni steel in which the Ni content is below 30%) heat treated above the A₁ transformation point, and a second member of reversible Ni steel (i. e., a Ni steel in which the Ni content is above 30%). Other metals such as Co, Cr, W, Mo, Si, Al, Mn, Ta, or V may be incorporated in the respective alloys and the percentage of such auxiliary elements should not exceed 15% and will usually be below this value.

Thermostat. PORTER H. BRACE (to The Canadian Westinghouse Co., Ltd.). Can. 284,560, Nov. 6, 1928. A bimetallic thermostat has one member formed of Mo and the second member formed of a Cr-Co alloy contg. approx. 80% Co and 20% Cr, the thermostat being coated with a deposit of electrolytic Cr to protect the Mo from oxidation. A second member formed from an alloy 22% Co, 22% Cr and 56% Fe may be employed.

Thermostat. HOWARD D. MATTHEWS (to The Canadian Westinghouse Co., Ltd.). Can. 284,558, Nov. 6, 1928. A bimetallic thermostat has one member composed of a Cu-Ni alloy (Monel metal), and the other member of a Cr-steel alloy contg. 10-15% Cr, with admixtures of P, Si, C and S, the latter being present in relatively small amts. only. Cf. C. A. 22, 517.

Thermostat. THEODOR KLÖTZL. Swiss 126,847, Mar. 7, 1927. A moving contact thermometer is described.

Thermostats. METALLO-CHEMISCHE FABRIK DR. LEOPOLD ROSTOSKY, Ger. 468,824, May 17, 1927. Halogen salts of metals of the Ag group, such as AgI, are used as material with allotropic transition points for elec. thermostats.

Thermostatic control devices. A. G. S. SANDISON and ELECTROFLO METERS CO., LTD. Brit. 290,402, March 17, 1927.

Thermostatic device for control of electric circuits. EARL K. CLARK (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,879, Dec. 18. Structural features.

Thermostatic device for control of electric circuits. JULIAN G. GOODHUE (to trustees of The Electric Thermostatic Control Co.). U. S. 1,695,546, Dec. 18.

Thermostatic electric switch. INTERNATIONAL GENERAL ELECTRIC CO. Brit. 290,260, May 11, 1927. Structural features.

Thermostatic (mercury) electric switch. SOC. ANON. HEWITTIC and M. DEMONT-VIGNIER. Brit. 290,597, May 16, 1927. Structural features.

Thermostatic device for controlling air-admission shutters, etc. F. W. MILLER. Brit. 290,698, Jan. 19, 1927.

Thermostatic device and mode of adjustment and operation for regulating steam supply. DAVID N. CROSTHWAITE, JR. (to C. A. Dunham Co.). U. S. 1,694,164, Dec. 4.

Thermostatic device for regulating the supply of gas to burners. A. J. THOMAS and A. A. STOW. Brit. 290,423, April 11, 1927.

Thermostatic valve for controlling fuel supply to burners of water heaters. FRANK L. O. WADSWORTH. U. S. 1,696,222, Dec. 25. Structural features.

Thermostatically controlled valve for liquids. JOHN V. O. PALM (to Bishop & Babcock Mfg. Co.). U. S. 1,696,410, Dec. 25. Structural features.

Thermostatic valve for controlling the flow of heating or other fluids. JAMES J. LAWLER (to Direct-Control Valve Co.). U. S. 1,695,809, Dec. 18. Structural features.

Thermostatic and electric system for controlling the temperature of various apparatus. ROLLO B. LINCOLN (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,853, Dec. 18.

Temperature alarm device controlled by a thermostatic electric switch. SIEMENS BROS. & CO., LTD., and E. R. GARROD. Brit. 290,024, April 19, 1927.

Bimetallic element and associated device for thermostatic devices, etc. PORTER H. BRACE (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,877, Dec. 18. Structural features.

Thermostatically controlled heating plug and liquid containers such as hot water bottles. ERNST G. K. ANDERSON (to Appleton Elec. Co.). U. S. 1,696,146, Dec. 18. Structural features.

Spark plug with thermostatic adjustment of the points. H. SCHLAICH. Brit. 289,758, April 30, 1927. The size of the spark gap reaches its max. at a temp. of about 300° by the use of terminals, one of which may be formed of Ni 36 and steel 64% ("Invar"), and the other of which may contain C 0.50, Mn 0.70, Si 0.75, Cr 8.00, Ni 22.00, Cu 2.00, Co 1.00 and Fe 64.05 parts. Structural details are described.

2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Marcelin Berthelot. L. ILOSVAY. *Természettud. Közöny* 60, 49-57(1928).—A memorial lecture, delivered before the Hungarian Academy of Sciences, Nov. 28, 1927.

Ira Remsen, 1846-1927. JAMES F. NORRIS. *J. Am. Chem. Soc.* 50, (Proc.) 67-79 (1928).—An obituary, with portrait, followed by a bibliography of Remsen's work compiled by J. C. W. FRAZER.

Theodore William Richards, 1868-1928. H. B. D. *Proc. Roy. Soc. (London)* 121 A, xxix-xxxiv(1928).—Obituary.

Some experiences of Dr. Edgar F. Smith as a student under Wöhler. ANON. *J. Chem. Education* 5, 1554-7(1928).

The chemist and his message. W. HUBBALL. *Chemistry and Industry* 47, 1110-13 (1928).—An address.

Some random thoughts on chemical themes. HERBERT H. HODGSON. *Chemistry and Industry* 47, 1179-82(1928).—An address.

An old colonial manuscript volume relating to alchemy. C. A. BROWNE. *J. Chem. Education* 5, 1583-90(1928).

The most recent investigations of the antecedents of alchemy. EDMUND O. VON LIPPMANN. *Chem.-Ztg.* 52, 973-4(1928).

Ammonium chloride in the history of alchemy. JULIUS RUSKA. *Z. angew. Chem.* 41, 1321-4(1928). E. H.

The correlation of high-school chemistry with first-year college chemistry. LOUIS W. MATTERN. *J. Chem. Education* 5, 1627-33(1928). E. H.

The place of physics in the modern world. JOHN ZELENY. Yale Univ. *Science* 68, 629-35(1928). E. H.

The indexing of chemical compounds. A contribution to the problem of organization of the literature. H. REUMUTH. *Z. angew. Chem.* 41, 1264-7(1928).—A special form of card index is described which, by means of a series of tabs, permits the subject matter to be classified in several ways at once. In applying the system to org. arsenicals the author arranges the compds. by empirical formulas, but the tops of the cards are also so trimmed that projecting tabs show whether the compd. is aliphatic, isocyclic or heterocyclic, whether it is a deriv. of AsH_3 , an oxide, an arsenous acid, etc. A. M. P.

The undulatory mechanics of an alkali atom in the electric field. I. F. RASSETTI. *Atti. accad. Lincei* [6] 7, 839-44(1928).—Mathematical, dealing with theoretical calcns. and deductions of the perturbation of an external field on an atom of an alkali metal. C. C. DAVIS

The absorption of light and mode of linkage of molecules of gases and vapors. (MISS) H. SPONER. *Z. Elektrochem.* 34, 483-9(1928).—By detns. of absorption the energy corresponding to the beginning of the continuum or convergence of absorption bands is found. The energy of dissocn. is detd. from available chem. data or by other methods so that the degree of excitation of the dissocn. products by the light becomes known. From this the mode of chem. linkage is deduced. Mols. like H_2 , O_2 and the halogens dissociate into a normal and an excited atom. They are called *at. mols.* because in the fundamental state of these compds. atoms vibrate against each other. Since compds. like AgI , $AgBr$ and $AgCl$ have proved spectroscopically to be *at. mols.*, polar and non-polar *at. mols.* must be distinguished. Mols. in the fundamental state of which ions vibrate against each other are *ionic mols.* Ionic mols. not only dissociate into a normal and an excited atom but also, at the lowest dissociation level, into 2 normal atoms. The latter process has proved to be characteristic of ionic mols. Conversely the energy of dissocn. can be obtained from the absorption data. A comparative table of values of the energy of dissociation from available chem. data and from absorption data is given. A. P. SACHS

Transitions between various modes of linkage based on absorption of light in the dissolved condition. G. SCHEIBER. *Z. Elektrochem.* 34, 497-502(1928).—The absorption spectrum of a substance gives us information with respect to the difference in energy content of two states of the absorbing mol. In the visible and ultra-violet range the energy differences are due to change of orbit of an electron or to the complete, even if temporary, loss of an electron. The absorption spectra of gaseous substances permit in many cases the calcn. of the individual quantized states of the mol. but in soln. and in the liquid or solid condition more or less masking occurs. In solvents with a large dipolar moment, such as alcohol and water, the masking is generally considerable. The extinction in these latter solvents generally occurs in a few continuous curves, each of which probably belongs to one electron. The curves are parallel in the various solvents although displaced by an amt. which is nearly const. for a given chromophore regardless of the mol. in which it is present. There are three classes of effects: (1) The mol. contains a chromophore which does not directly participate in the changes of linkage. This occurs chiefly in complex org. compds. (2) The chromophore is directly involved in the linkage and its changes, as in the case of the alkali halides. (3) The chromophore, although not directly concerned in the change of linkage, undergoes a subsequent rearrangement as in keto-enol isomerism. A study of ZnI_2 , CdI_2 , and HgI_2 in various solvents leads to the conclusion that homopolar and heteropolar linkages exist in soln. in equal A. P. SACHS

Calculation of intermolecular forces in organic compounds. MANFRED DUNKEL. I. G. Farbenind. A.-G. *Z. physik. Chem., Abt. A* 138, 42-54(1928).—Using data from the literature, D. shows that the mol. cohesion of org. compds. is an additive property, and can be calcd. by means of a series of increments. The mol. cohesion increases with mol. wt.; many polar groups, like OH, have a very strong positive effect on the mol. cohesion. The data used to calc. the increments (heat of vaporization at $0^\circ K.$) is considered preliminary and should be replaced by data on the heat of sublimation at $0^\circ K.$ for accurate calcns. ALBERT L. HENNE

Selenium cells as colorimeters. A. MICKWITZ. Univ. Dorpat, Estland. *Z. anorg. allgem. Chem.* 176, 271-82(1928); cf. C. A. 22, 4046.—A Se cell was used to measure the absorption of light by freshly prepd. suspensions of PbS . The soly. of

amorphous PbS found in this way was $6.81 \times 10^{-8}\%$ Pb. The light-absorption curve shows a point of inflection which corresponds to the change of the PbS from the amicroscopic to the submicroscopic state. *Selenocolorimetric detns. of Pb at concns. from 1×10^{-4} to $1.89 \times 10^{-8}\%$ of Pb were made.* The mean error of each detn. was $\approx 4.5\%$.

H. F. JOHNSTONE

Dielectric constant as a function of temperature. H. A. STUART. Univ. Koenigsberg. *Z. Physik* 51, 490-510 (1928); cf. *C. A.* 22, 2863.—The dielec. consts. of gaseous Et_2O , Me_2O , AcH and Me_2CO were detd. in the temp. range from 20° to 180° . The elec. moments are, resp., 1.14, 1.29, 1.88 and 2.84×10^{-18} . A few measurements of d. are given.

GEO. GLOCKLER

An interferometer method for the determination of refraction in crystals. PETER WULFF. *Z. Elektrochem.* 34, 611-16 (1928).—An immersion method was used with crystals of 0.5-10.0 mm. length. The interferometer was the Haber-Löwe form of the Raleigh instrument and was without a compensator. The crystal is held firmly in a clamp which can be rotated about two axes at right angles to each other and to the path of the light rays. The interference bands show a sharp angle unless the liquid has the same refractivity as the crystal. When this compn. is attained the refractivity of the liquid is obtained in the cell itself (which contains the liquid and crystal) by the Pulfrich method for which the necessary auxiliaries are attached to the instrument. The manipulations necessary to det. the several indices of refraction of birefringent crystals are described. With crystals of 1 to 2 mm. in diam. n of liquid can be adjusted to within 0.00003 of n of crystal, while the Pulfrich method can be made accurate to 0.00001. Perfect crystals are quite unnecessary but internal inhomogeneities should be absent. Measurements on KCl and K_2SO_4 prove the great accuracy of the method as compared to the finest precision results recorded.

A. P. SACHS

The importance of the crystalline form in the formation of solid solutions. I. Thermal analysis of the system: anhydrous $\text{LiCl}_2\text{-CoCl}_2$. A. FERRARI AND A. BARONI. Reale Univ. Milano. *Atti accad. Lincei* [6] 7, 848-53 (1928).—The discovery that the elementary cells of MgCl_2 and LiCl have the same geometric form (cf. Bruni and F., *C. A.* 20, 1344) coupled with the fact that these salts form solid solns. raised the question whether identity of geometric form is not more important than similarity of chem. behavior in deciding the formation of solid solns. CoCl_2 and NiCl_2 have elementary cells identical in form with that of MgCl_2 and LiCl (cf. F., *C. A.* 22, 189), and therefore the possibility of forming solid solns. of CoCl_2 and LiCl was studied. In this case there is no chem. similarity. A suitable *app. and technic* had to be developed to overcome the hygroscopicity of the salts and the difficulty of fusing CoCl_2 . Contrary to Sandonnini (*C. A.* 8, 2659), CoCl_2 fuses at ordinary pressures. A fusion curve of the system: LiCl-CoCl_2 was obtained for all proportions of the 2 salts, from which several facts were evident. The solidification curve showed a max. at a compn. corresponding to 50% CoCl_2 (by mol.), indicating the probable existence of the *compd.* Li_2CoCl_4 . On each side of this max., the curve has a continuous course, with 2 min. which indicate soly. for all proportions of the *compd.* in the 2 components. This type of curve is unusual, and resembles that of Au-Mn (cf. Hahn and Kyropoulos, *C. A.* 11, 2443). In the system LiCl-CoCl_2 , all cooling curves have intervals of crystn. which are practically 0, which has also been observed in other systems of bivalent and univalent chlorides with similar elementary cells. On the other hand, as will be shown in a forthcoming note, systems of bivalent chlorides with similar cells show very great intervals of the type of solid solns. This indicates that in systems of chlorides with different valences, the liquid phase always has the same compn. as the solid phase, i. e., the curves of liquid and of solid are coincident. Another explanation of the absence of an interval of crystn. is that the solid phase is formed by entrance of the elementary cell of the univalent chloride into the lattice of the bivalent chloride, and *vice versa*, in which case the cells would keep their individuality. The *m. ps.* of CoCl_2 and of FeCl_2 are 724° and 673° , resp.

C. C. DAVIS

Mixed crystals, solutions and melts in the system $(\text{K}, \text{NH}_4)(\text{Cl}, \text{NO}_3)$. E. JÄNECKE. *Z. angew. Chem.* 41, 916-24 (1928).—The reciprocal salt pair $(\text{K}, \text{NH}_4)(\text{Cl}, \text{NO}_3)$, embracing the 4 salts given by the equation $\text{KCl} + \text{NH}_4\text{NO}_3 = \text{NH}_4\text{Cl} + \text{KNO}_3$ is studied from 0° to a condition of fusion. The absence of hydrates and double salts simplifies the system somewhat. Equil. diagrams of the binary systems $\text{KNO}_3\text{-KCl}$, $\text{NH}_4\text{NO}_3\text{-NH}_4\text{Cl}$, $\text{NH}_4\text{Cl-KCl}$, $\text{NH}_4\text{NO}_3\text{-KNO}_3$ are given and discussed. In the system $\text{NH}_4\text{NO}_3\text{-NH}_4\text{Cl}$ the complexity of NH_4NO_3 leads to mixed crystals in different ranges. In the system $\text{NH}_4\text{Cl-KCl}$ there are 2 types of mixed crystals, *crystg. in different lattices*. Those rich in NH_4Cl crystallize in the CsCl lattice and those rich in KCl crystallize in the NaCl lattice. In the system $\text{NH}_4\text{NO}_3\text{-KNO}_3$ the large zone of rhombic mixed

crystals is of interest. In these NH_4NO_3 takes up almost equimol. quantities of KNO_3 . The transformation temp. of NH_4NO_3 is raised by addition of KNO_3 , in contrast to the general rule. Soly. curves are shown in which isotherms at 0, 60, 100 and 200° are plotted in the system $\text{NH}_4\text{Cl}-\text{KCl}-\text{H}_2\text{O}$ and at 0, 20, 40 and 60° in the system $\text{NH}_4\text{NO}_3-\text{KNO}_3-\text{H}_2\text{O}$. In the entire system isotherms are plotted at 0, 20, 40 and 60°. In each case there are 4 different zones, each zone limited by 2 binary salt lines and each diagram showing 2 ternary salt points. With increasing temp. the soly. of KCl and mixed crystals contg. KCl decreases, the reverse being true of the nitrate. The stable salt pair is always NH_4Cl and KNO_3 . The soly. of the various salts and salt mixts. in relation to H_2O content and temp. is given in both tables and curves. The equil. diagram of these systems in a state of fusion is given, the existence of quaternary salt points being shown; 4 ternary salt curves run from each point.

H. STÖRRTZ

Crystallographic identity of the two forms of mercuric oxide. G. R. LEVI. Reale Univ. Milano. *Gazz. chim. ital.* 58, 417-8(1928).—In spite of expts. by L. (cf. C. A. 19, 424) showing that the red and yellow forms of HgO are identical crystallographically being confirmed by Fricke (C. A. 22, 705) and by Zachariassen (C. A. 21, 3777), Kolkmeijer (C. A. 22, 1066) has challenged the correctness of the results. The contention of K. is based on the fact that Andrews was unable to detect Ni in Fe (cf. *Phys. Rev.* 17, 261(1921)), but this is a misinterpretation of the results of A., since the absence of Ni lines results from the solid soln. with a lattice of the Fe type. There is little to support the further contention of K. that even high proportion of impurities cannot be detected by x-rays, for it has already been shown by L. (cf. *Gazz. chim. ital.* 54, 598(1924)) that x-ray analysis is more sensitive than gravimetric analysis in detecting Ag in Ag_2O . Further expts. by L. in which single crystals of red HgO were examd. by x-rays confirmed the fact that crystallographically they are identical with those of yellow HgO . Detns. of the d. of the red and yellow forms showed 11.19 and 11.24, resp., compared with a calcd. value of 11.22.

C. C. DAVIS

Symmetrical and antisymmetrical hydrogen and the third law of thermodynamics. Thermal equilibrium and the triple-point pressure. W. F. GIAUQUE and H. L. JOHNSON. Univ. Cal. *J. Am. Chem. Soc.* 50, 3221-8(1928).—The triple-point pressure of ordinary H has been found to be 5.38 ± 0.01 cm., while that of H kept at liquid air temp. for 197 days is 5.34. No source of error accounting for this difference has been found and it is concluded that this difference in values is evidence for the existence of symmetrical and antisymmetrical H_2 mols.

J. H. PERRY

The compressibility of sodium, barium and beryllium. T. W. RICHARDS, L. P. HALL and B. J. MAIR. Harvard Univ. *J. Am. Chem. Soc.* 50, 3304-11(1928).—Coefficients of compressibility were measured at 25° and between 100 and 500 megabars as follows: Na, $\beta = 15.6 \times 10^{-6}$; Ba, $\beta = 10.48 \times 10^{-6}$; Sr, $\beta = 7.22 \times 10^{-6}$; Be, $\beta = 0.93 \times 10^{-6}$. The results for Sr are only preliminary. The ds. of the specimens used were as follows: Ba, 3.66; Sr, 2.74; Be, 1.85. Special methods used in weighing and handling Ba and Sr are described. A new type of pycnometer for measuring the ds. of solids is also described.

R. E. GIBSON

The compressibility of thallium, indium and lead. THEODORE W. RICHARDS and JOSEPH D. WHITE. Harvard Univ. *J. Am. Chem. Soc.* 50, 3290-3303(1928).—Using Richards' well-known app., the authors det. the following compressibilities at 25° between 100 and 500 megabars: 2.40×10^{-6} for Pb, 2.83×10^{-6} for Tl, 2.55×10^{-6} for In and 2.51×10^{-6} for an alloy of 97% In and 3% Zn. The compressibility of the last named is less than would be expected for the rule of mixts. Special precautions were taken in prep. the metals pure—these are presented in detail. The compressibilities of the 3 elements agree with previous detns. by Richards. That of Tl differs considerably from Bridgman's. This is because Tl is anisotropic. A very useful table comparing 12 physical properties including internal pressures and lattice patterns of 15 metallic elements (Cu, Zn, Ga, Ge, As, Ag, Cd, In, Sn, Sb, Au, Hg, Tl, Pb and Bi) is given in the paper.

R. E. GIBSON

Recrystallization phenomena of aluminum. A. E. VAN ARKEL and M. G. VAN BRUGGEN. Philips' Lampworks, Eindhoven, Holland. *Z. Physik* 51, 520-33(1928).—Al subjected to a very considerable deformation recrystallizes in exceedingly small crystals. Since a system of many very small crystals has a higher potential energy than one composed of larger crystals (presenting a smaller sp. surface), a second recrystn. in larger crystals takes place subsequently. This second recrystn. varies with the previous condition of the piece of metal. Both very pure Al and ordinary technical Al show the same phenomena, but in different degrees. The behavior of pure Al is the more complex.

GEO. GLOCKLER

Dissociation of pure mercury. R. S. BRADLEY. *Nature* 122, 573(1928).—By

applying Summerfeld's expression to the conductivities of dil. amalgams κ for pure Hg can be calcd. without l . The equation obtained for Cd amalgam does not agree in the coeffs. with that of Williams. Assuming a fraction, q , of the Hg to be ionized accounts for the discrepancy. For Cd amalgams $q = 0.13$; for Zn amalgams $q = 0.12$.

L. D. ROBERTS

Definition, importance and determination of hydrogen-ion concentration. J. GRÖH. *Természettud. Közöny* 60, 194-201(1928).

S. S. DE FINÁLY

The present data on vapor pressures at high temperatures. C. ZWIKKER. *Physica* 8, 240-50(1928).—The values measured for the vapor pressures of metals at high temps. are well represented by an equation $\log p = -(A/T) + B$, in which B has a value approx. the same for many metals. From Sackurs' equation it follows that $B = 5/2 \log T - (1/2.30 R) \int (E/T^2) dT + 1.29 + 3/2 \log M$, which on applying Debye's sp. heat theory reduces to $B = -1/2 \log T + 3/2 \log T_m - \log V + 7.25$ for T_m , the m. p. temp., V the at. vol. It is shown that for 15 metals B is from 8.66 to 10.19, av. 9.33, whereas from exptl. data for 20 metals B has an av. value of 9.7. The semi-empirical rule of const. B is useful in judging the consts. of newly detd. p - T curves; faulty results on Zr (*C. A.* 20, 2785) and on alk. earth metals have been traced by it. In a graph all curves so far detd. ($\log p$ vs. $1/T$) are drawn; their common intersection point is marked. It appears that the same result ($B = 9.33$) holds for salts. A bibliography of 40 titles is attached.

B. J. C. VAN DER HOEVEN

The vapor density of formic acid. H. C. RAMSPERGER AND C. W. PORTER. *J. Am. Chem. Soc.* 50, 3036-8(1928).—A graphical comparison of the existing data on the vapor d. of formic acid is presented and briefly discussed.

DON BROUSE

Internal friction of gases and vapors. I. Air and bromine. H. BRAUNE, R. BASCH AND W. WENTZEL. *Tech. Hochschule, Hanover. Z. physik. Chem., Abt. A.*, 137, 176-92(1928).—A quartz app. is described, capable of measuring the internal friction of gases and vapors between room temp. and 650° . It is substantially a disk oscillating between 2 fixed plates. In order to test the device, the internal frictions of air and bromine were measured. The results agree with the data of previous expts. II. Mercury, cadmium and zinc. *Ibid* 447-57.—The internal friction of Hg, Cd and Zn vapors were measured with the app. described in the preceding paper. The consts. of the Sutherland equation are: Hg, 942 (between 490° and 880° K.); Cd, 1053 (between 790° and 900° K.); Zn, 876 (between 880° and 950° K.). From these values, the thermal cond. coeffs. were calcd. The at. radii ($\times 10^8$) are: Zn, 2.33; Cd, 2.46; Hg, 2.53. These radii are 0.8 times those indicated by x-ray analysis and a similar ratio holds for A. The results are discussed from the point of view of Debye's theory of mol. forces.

ALBERT L. HENNE

The expression for the refringent power. R. DE MALLEMANN. *Compt. rend.* 187, 888-90(1928); cf. *Compt. rend.* 187, 536, 720.—The internal field of a fluid is best evaluated by the direct or mol. method based on the fine discontinuous structure of the substance. This method also permits the refringent (and rotatory) power of an isotropic liquid to be expressed as a function of the refringent (and rotatory) power of the gas, of the mol. diameter and of the d. of the liquid. R. gives the mathematical analysis, which incidentally shows that the Lorentz equation is really empirical and that it is impossible for the current formulas to be rigorously exact. Improvement is to be found by adding terms of the type of $(n^2 - 1)^2$.

A. P. SACHS

Molten salts. III. W. HERZ. *Breslau Univ. Z. Elektrochem.* 34, 682-4(1928).—The capillary consts., a^2 , of the molten alkali halides at the m. p. and the b. p. are calcd. from the equation: $a^2 = 2\gamma/d$ (γ = surface tension, d = density). The ratios of a^2 at the two points are found to be approx. const., the av. for the 18 halides being 1.37. The principle of corresponding states holds. The consts. in Walden's and in Kistiakovskii's equations, which give the relations, resp., between the m. p. a^2 and the mol. wt., and the b. p. a^2 and the mol. wt., are calcd. The change in the degree of association from the m. p. to the b. p. is concluded to be the same for all the alkali halides. W.'s consts. increase with increasing at wts. of the anions and cations, and salts with about the same mol. wts. have about the same consts. It may be assumed that the lightest ions show the greatest and the heaviest ones the smallest tendency to form associated complexes. Similar relations could not be obtained from Kistiakovskii's quotients.

J. BALOZIAN

Dilatometric measurement of the thermal expansion of unstable crystalline salts. WILHELM KLEMM, WOLDEMAR TILK AND SIGELIN V. MÜLLENBERG. *Techn. Hochschule, Hanover. Z. anorg. allgem. Chem.* 176, 1-22(1928).—The thermal coeff. of cubic expansion (α) is detd. for various cryst. salts by a dilatometric method, in which the fused or sintered salt is placed in a small flask, which is highly evacuated and then

filled with clean Hg. The flask is equipped with a capillary tube, the level of the Hg in this tube being read as the app. is heated in a paraffin oil bath. The expansion of the salt can then be calcd. from the difference between the observed vol. change and that of the Hg and flask material. Quartz is used for BeCl_2 , ZnCl_2 , CdCl_2 , MgCl_2 , CaCl_2 , CaI_2 , LaCl_3 , ThCl_4 , potash glass for ZrCl_4 , and ordinary Thüringian glass in all other cases. The manipulation of the app. is described in detail. Before any measurements are made, it is heated for several hrs. at the highest temp. to be attained, traces of H_2O and gases being removed from the salt. The heating velocity used in the test is 1° in 1 to 2 mins. The results are as follows, expressed as $\alpha \times 10^3$, in most cases being the av. of several tests: naphthalene (temp. range -20 to $+70^\circ$), ~ 280 ; anthracene ($20-180^\circ$), ~ 213 ; camphor ($20-150^\circ$), ~ 484 ; benzoic acid ($20-110^\circ$), ~ 90 ; salicylic acid ($20-120^\circ$), ~ 100 ; KCl ($20-100^\circ$), ~ 113 ; BaCl_2 ($20-170^\circ$), ~ 60 ; LaCl_3 ($20-190^\circ$), ~ 48 ; CuCl ($40-140^\circ$), ~ 30 ; CuBr ($20-120^\circ$), ~ 56 ; CuI ($20-120^\circ$), ~ 67 ; TiCl ($20-120^\circ$), ~ 168 ; TiBr ($20-120^\circ$), ~ 172 ; PbCl_2 ($20-120^\circ$), ~ 93 ; PbI_2 ($20-120^\circ$), ~ 108 ; CdI_2 ($20-140^\circ$), ~ 107 ; HgCl ($20-120^\circ$), ~ 103 ; ZnF_2 ($20-120^\circ$), ~ 34 ; CdF_2 ($20-120^\circ$), ~ 80 ; MgF_2 ($20-120^\circ$), ~ 32 ; AlCl_3 ($20-170^\circ$), ~ 60 ; AlBr_3 ($20-80^\circ$), ~ 283 ; AlI_3 ($20-160^\circ$), ~ 182 ; BiCl_3 ($20-120^\circ$), ~ 167 ; SbCl_3 (-20 to $+60^\circ$), ~ 239 ; TiBr_4 (-20 to $+30^\circ$), ~ 283 ; TiI_4 (-30 to $+125^\circ$), ~ 222 ; BeCl_2 ($0-160^\circ$), ~ 113 ; ZnCl_2 ($20-120^\circ$), ~ 87 ; CdCl_2 ($20-120^\circ$), ~ 73 ; MgCl_2 ($10-190^\circ$), ~ 74 ; CaCl_2 ($20-190^\circ$), ~ 67 ; CaI_2 ($20-160^\circ$), ~ 91 ; ThCl_4 ($10-200^\circ$), ~ 30 ; ZrCl_4 ($20-100^\circ$), ≤ 90 ; LiOH ($20-120^\circ$), ~ 80 ; NaOH ($20-120^\circ$), ~ 80 ; KOH ($30-130^\circ$), ~ 190 . In prep. the samples the salts are as a rule fused in Pt crucibles in an elec. furnace. LaCl_3 is prepd. by chlorinating La_2O_3 in a Cl_2 - S_2Cl_2 stream. CuCl , CuBr , CuI , TiCl , TiBr , PbCl_2 , PbI_2 , CdI_2 , and HgCl are prepd. in the wet way, chiefly by pptn., and are dried in a vacuum and fused, except HgCl which is pressed into tablets in a hand press. ZnF_2 and CdF_2 are fused in a Pt crucible with a cover of NH_4F . MgF_2 is pptd. by action of HF upon a MgSO_4 soln., and is also fused under NH_4F . AlCl_3 , AlBr_3 , AlI_3 , BiCl_3 , and SbCl_3 are prepd. by reaction of the metal with the H halide gas or the halogen, followed by distn. TiBr_4 and TiI_4 are prepd. by the action of HBr or HI upon TiCl_4 ; BeCl_2 , ZnCl_2 and CdCl_2 by combustion of the metal in Cl_2 ; MgCl_2 , CaCl_2 , CaI_2 by slowly heating mixts. of the halide hydrate and the corresponding NH_4 salt in a H halide stream in quartz app.; ZrCl_4 by action of a stream of Cl_2 - CCl_4 upon ZrO_2 followed by sublimation. The alkali hydroxides are heated to 100° above the m. p. for 1 hr. to remove traces of H_2O . Some d. measurements are made and given as follows as d_4^{25} , H_2O being used for anthracene and camphor, Hg for TiBr_4 and TiI_4 , and petroleum for the others: anthracene 1.283, camphor 0.992, TiBr_4 3.37, TiI_4 4.40, PbI_2 6.06, MgF_2 3.13, ZnF_2 4.95, CdF_2 6.11, ZnCl_2 2.92, LiOH 1.43, NaOH 2.02, KOH 2.12. Anion vols. are calcd. from mol. vol. extrapolated to -273° , with the following results: TiBr_4 19.8, TiI_4 24.2, PbI_2 28, MgF_2 6.4, ZnF_2 5.8, CdF_2 5.7, ZnCl_2 18.4, LiOH 10.4, NaOH 8.0, KOH 3.6.

H. STOERTZ

The interferometer measurement of particles of $200\text{m}\mu$ diameter made visible in the ultramicroscope. O. VON BAEYER AND U. GERHARDT. *Landwirtschaftl. Hochschule, Berlin. Fortschritte Chem., Physik, phys. Chem.* 20, Ser. B, 1-23(1928).—The Michelson interferometer method for measuring the angular distance between the components of a double star is applied to measure the diameter of particles in the dark field of the ultramicroscope by illuminating them so that the ends of a diam. act as interfering sources of light. This is accomplished by using a Siedentopf and Szegvari azimuth diaphragm in the diaphragm holder of the Abbé illuminator.

A. P. SACHS

The determination of the agglomeration temperatures. G. TAMMANN AND A. YA. SYORVKIN. Univ. Göttingen. *Z. anorg. allgem. Chem.* 176, 46-8(1928).—The agglomeration temps. of several salts, oxides and silicates were detd. by an indirect method in which a blast of air was passed over the powdered substances, and the temp. at which the powder ceased to fly was taken as the temp. of agglomeration. For the salts and oxides, the ratio of agglomeration temp. to melting temp. on the abs. scale was about 0.5, while for the silicates the ratio was 0.88.

H. F. JOHNSTONE

The resistance to bending of easily deformable materials, especially of vulcanized rubber. R. ARIANO. Società Italiana Pirelli. *Il Politecnico* 1928, No. 7-8; *India Rubber J.* 76, 935-9(1928); cf. *C. A.* 22, 2855; 545.—By abandoning many of the restrictive assumptions usually made in the theory of flexion, and in particular by substituting a more general stress-strain relationship in place of Hooke's law, general equations for the bending of easily deformable bodies have been obtained, which accord with exptl. data. The theoretical equations are less convenient but more significant than empirical formulas.

C. C. DAVIS

Electrical conductivity of deformed crystals of rock salt. Z. GYULAI AND D. HARTLY. Univ. Szeged (Hungary). *Z. Physik* 51, 378-87(1928).—Crystals of rock

show an intermittent increase in elec. cond. The added cond. The crystals assume a permanent set in several seconds. Under can be seen that the mech. deformation takes place in sudden incre-
GEO. GLOCKLER

sion and heat of vaporization. H. SIRK. *Z. Physik* 52, 21-6(1928).—

energy $u = \gamma - T\left(\frac{d\gamma}{dT}\right)$; γ = surface tension, T = abs. temp. The mol. vol. v , the b. p. ($= V$) and the mol. heat of vaporization ($= \lambda$) are related as follows: $\lambda = uV^{2/3} \times \text{const.}$ (const. = 2.26×10^8 expt. and 2.71×10^8 theory). G. G.

Equilibrium in systems consisting of both volume and surface phases in connection with the spontaneous surface-increase of microscopic particles. N. V. RASHEVSKY. Westinghouse Co. *Z. Physik* 51, 571-83(1928).—The monomol. layer of Langmuir is treated as a sep. phase. The equil. existing between such a surface phase and a vol. phase is studied thermodynamically. The total free energy of the system, F , depends upon the surface free energy and therefore upon the total surface area. F may pass through a min. at a characteristic surface area; the equil. then depends upon the surface area. At the characteristic surface area the capillary pressure becomes zero and a free liquid may assume other than spherical shapes. The changes are studied which a system would undergo during slow variations of the total masses of its components. It is shown that, as a consequence of the relation between F and surface area, the surface may increase spontaneously, bringing about a stretching or a sepn. of the whole system.

G. G.

The ζ -potential and the lyotropic series. DAVID R. BRIGGS. Univ. of Minn. *J. Phys. Chem.* 32, 1646-62(1928).—The ζ -potential, H , of a cellulose-water boundary was measured in the presence of the chlorides of K, Na, Li, Cs, H, Ba, Sr, Al, Th^{IV}, NH₄, and of NH₄OAc at the following normal concns.: 0.0, 0.00005, 0.0001, 0.0002, 0.0004, 0.0008, and 0.0016. The method of measurement was the streaming potential (cf. C. A. 22, 3571). Chlorides of univalent cations, except HCl, increase the value of H with increasing concn. up to 0.00005 or 0.0001 N and then decrease the value of H . Bivalent ions decrease the value of H more rapidly than univalent ions, but in no case does the value reach zero. Tervalent Al reduces H to zero, and quadrivalent Th in increasing concns. first decreases the value of H , then reverses the sign of the double layer and increases the potential at an almost uniform rate. The effects of the ions of a series are in the same order as their mobilities. The mobilities are in the inverse order of the lyophilic capacities of these ions in water. It is from the relative lyophilicity of the ions for the phases of the system (cellulose and water in this case) that the ζ -potential arises and it is in this property of the ions that the lyotropic effect of the ions has its theoretical foundation. When NH₄OAc is substituted for NH₄Cl slightly greater effects on H are produced for equal concns. The effect that a salt soln. has upon H is a function not alone of the ion carrying the charge opposite to that of the colloid, but also of all ions present in the system to which the interface is accessible. When kH/P is plotted against log of concn., straight lines result in the cases of Th, Al and H. The potential varies with the concn. of the salt soln. in the same manner as the variation of the partial molal free energy of a substance dissolved in a solvent varies with its concn. in that solvent, $C = ae^{b\zeta}$; and $c = e^{\bar{P}/RT}$ being the equations defining these similar phenomena. The total surface energy is lowered by adsorption, but ions of Th continue to be adsorbed and build up a comparatively large p. d. There must be other forms of energy in the interface which are being decreased. The change of ζ -potential is, in some cases at least, secondary to other free surface energy changes.

F. E. BROWN

Capillary electrical phenomena and membrane formation on liquid gallium. A. FRUMKIN AND A. GORODETZKIL. *Z. physik. Chem.* 136, 215-27(1928).—Since Ga melts at 29.75° and exhibits passivity it is suitable for the investigation of the relation between passivity and the condition of the surface. A double U-tube electrometer was used. It consisted of a wider reference tube connected to two capillary tubes so arranged that one capillary was in contact with various acidic and basic salt solns. and the other was fitted with an elec. connection by which varying p. ds. could be produced between the Ga and a normal calomel electrode. Surface tensions were measured when the solns. were (a) N KOH, and (b) N KCl + 0.1 N KOH, (c) N KCl + 0.001 N KOH, (d) N KCl + 0.001 N HCl, and (e) N KCl + 0.1 N HCl. The highest surface tension found was 592 abs. units when the soln. was N KCl + 0.1 N HCl and the p. d. was 0.9 v. $592 - \gamma = 120 (\phi - 0.9)^2$ approximately expresses the relationship between ϕ , voltage imposed and γ , surface tension in absolute units. Strong acid or weak acid with higher voltage (0.001 HCl and 1.8 v.) reacts with the Ga, producing an evolution of H₂ and an oxide layer on

the Ga. The voltage was varied from 0.8 to 2.0 with the solns. named above. The presence of OH-ions strongly depressed the value of γ . The depression increases with time unless the voltage is above 1.4. A solid but extensible membrane forms between the salt soln. and the Ga. After long standing the Ga may form a tongue-like projection into the salt soln.

F. E. BROWN

Friction constant and surface layer. I. J. TRAUBE AND SIAR-HONG WHANG. *Techn. Hochschule, Charlottenburg. Z. physik. Chem., Abt. A*, 138, 102-22(1928).—T. and W. measure the time of flowing of H_2O through a capillary tube set at a small angle with the horizon. Then, by means of an ethereal soln. of oleic acid, they form an inside film in the capillary and measure the flowing time again. Depending on the angle at which the tube is set, the flowing velocity is increased 4 times or more. Other polar substances, as AmOH, octyl alcohol, AmOAc, tripropylamine, or polar oils have the same film effect. Films of non-polar materials (paraffin, C_6H_6 , CCl_4) have no effect or only a negligible one. Stearic acid, lacs, rubber and solid benzene derivs. have a marked effect. If the capillary tube is nearly vertical, or if the water is forced through under pressure, none of the above compds. shows any effect on the flowing time. Several equations (Einstein-Smolukowski, Helmholtz) related to the friction const. should be modified. In biology, the theories of permeability, narcosis, resorption, etc., should take this fact into account. It is desirable to det. whether these films have the same effect on boats or airplane wings. Fish-swimming or bird-flying is probably helped by similar films.

ALBERT L. HENNE

Artificial membranes selectively permeable to anions. RUDOLF MOND AND FRIEDRICH HOFFMANN. *Univ. Kiel. Arch. ges. Physiol. (Pflüger's)* 120, 194-202(1928).—Collodion membranes, impregnated with the basic dyestuff rhodamin B, were used. With these the anions exhibited the sequence $SCN^- > NO_3^- > I^- > Br^- > Cl^- > acetate, SO_4^{--}$.

G. H. S.

The influence of a second liquid upon the formation of soap gels. HARRY N. HOLMES AND RALPH N. MAXSON. *Fifth Colloid Symposium Monograph* 1928, 287-300.—Small traces of H_2O greatly aid in the dispersion of K stearate in turpentine, and the formation of a gel on cooling. The prepn. of pure anhyd. soaps is described—Na stearate, Na oleate, K stearate, K oleate and Ca stearate. The addn. of small definite quantities of H_2O increases the ability of Na stearate to hold turpentine, but the contrary is the case with Na oleate. With K stearate a max. is speedily reached. K oleate does not readily disperse in turpentine; a trace of H_2O helps, but the clear sols do not gel on cooling. Relatively small amts. of oleic acid help Na oleate or Na stearate to hold turpentine; but a max. is soon reached. If paraffin oil be substituted for turpentine, oleic acid depresses gel formation with Na stearate, but helps it with Ca stearate, as does stearic acid. With Na stearate and benzene, small quantities of oleic acid aid dispersion; with stearic acid, there is a critical zone, above which no gels are formed. But no gels are formed without stearic acid. The joint action of small quantities of H_2O and stearic acid in Na stearate dissolved in turpentine, gave better results than either separately.

JEROME ALEXANDER

The formation of Liesegang rings as a periodic coagulation phenomenon. ERNEST S. HEDGES AND ROSALIND V. HENLEY. *J. Chem. Soc.* 1928, 2714-26; cf. *C. A.* 22, 4314.

"The production of periodic structures of $Ag_2Cr_2O_7$ and of $Mg(OH)_2$ in gelatin, and also of PbI_2 in agar, was studied. In each case, by mixing equiv. quantities of the reactants in the gel, and then superimposing a strong soln. of the diffusing electrolytes, it was possible to sep. the chem. reaction from the formation of the ppt. Since the rings produced in these expts. are comparable with those produced by chem. reaction, it follows that the formation of periodic structures is a coagulation phenomenon taking place after the chem. reaction. Periodic structures are to be distinguished, therefore, from periodic reactions. The critical concn. of $AgNO_3$ required to coagulate colloidal $Ag_2Cr_2O_7$ was found to be 0.29%. A chem. anal. of a periodic structure of $Mg(OH)_2$ in gelatin showed that the ratio of $Mg(OH)_2$ contained in the bands to that in the clear spaces is about 12:1; the corresponding ratio for NH_4Cl is about 1:3. Periodic coagulation of sols of As_2S_3 was effected by diffusing solns. of $FeCl_3$ and $Al_2(SO_4)_3$ into the sol contained in 1% agar gel, and similar results were obtained in the coagulation of colloidal $Fe(OH)_3$ by Na_3AsO_4 and by $(NH_4)_2CO_3$. In these cases, there is an optimum concn. of colloid, and band formation is favored by a dil. diffusing electrolyte." F. L. BROWNE

The formation of gels. Vulcanized oils. B. C. J. G. KNIGHT AND P. STAMBERGER. *J. Chem. Soc.* 1928, 2791-8.—Previously (*C. A.* 22, 506.) S. showed that an insol., tough, elastic substance is formed by heating triolein with S and that the reaction takes place in 3 stages: (1) combination of triolein with S, (2) polymerization to double mols., and (3) polymerization to still larger mols. Examn. of the reaction products with

x-rays is now shown to give the ring pattern for amorphous structures, the diam. of the ring being const. at the different stages of the reaction, showing that no change takes place in the nature of the mol. Thin films of triolein, its vulcanization products, and the fatty acids obtained by sapon. of the products spread on water in films one mol. thick. The films are of the expanded type. The dimensions of the mols. measured in this way are changed only slightly by vulcanization. The thickness of the films remains practically const. It is concluded that in the first stage of the reaction S enters the mol. at the unsatd. linkages of the oleic acid chains. The dimer then forms by linking together of two mols. side by side, an atom of S acting as the link and attaching itself to the ends of the glyceryl groups of the mols. thus joined. On sapon. this part of the S remains with the glycerol. Higher polymers are formed in the same way, producing long chains in a definitely oriented manner. Such oriented chains are considered responsible for the elastic properties of the solid polymers.

F. L. BROWNE

General theories of rapid coagulation. The coagulation of rod- and plate-shaped colloids; the theory of any polydispersed system and of motion coagulation. HANS MÜLLER. *Kolloidchem. Beihefte* 27, 223-50(1928).—A mathematical discussion of the theories of coagulation. M. postulates that the general theory of rapid coagulation involves the following: (1) contact of the surfaces is necessary for the cohesion of two micelles; (2) the frequency of collisions depends upon the effect of temp. on the motion of the particles and on the velocity of motion of the particles; (3) only the momentary particle distribution immediately surrounding a single particle influences its coagulation. The application of these theories to monodisperse systems leads to a theory of the coagulation of plate- and rod-shaped particles. This indicates that plate-shaped particles coagulate fairly rapidly as do sols with spherical particles, whereas rod-shaped particles may coagulate much more rapidly. By investigating the influence of a polydispersed condition of a sol a relationship between the particle size distribution curve of a colloid with spherical particles and the initial rate of coagulation is established. Systems approx. monodisperse coagulate within the limit of error of Smoluchowski's measurements, while polydisperse systems coagulate more rapidly. The influence of sedimentation and stirring are discussed in the light of Stokes' law. It is shown that this effect influences the coagulation of large particles only and formulas are given for the min. particle size, below which the effect is not noticed.

L. F. MAREK

Colloidal gold. HUGH NICOL. *J. Soc. Chem. Ind.* 47, 343T-4T(1928).—Expts. are described with a new method using "hyperol" for the production of a pure red Au sol which is very sensitive to electrolytes and well adapted for use in cerebrospinal fluid examn. A modified method for the use of "hyperol," a comly. produced equimolar compd. of carbamide and hydrogen peroxide, is recommended. L. F. M.

The preparation of a lead sulfide hydrosol and its combination with phosphate ions. J. BROOKS. Univ. of Liverpool. *J. Phys. Chem.* 32, 1717-24(1928).—PbS was prepd. by bubbling an excess of H_2S into vigorously stirred solns. of $Pb(OAc)_2$ contg. 0.5% gelatin as a protective agent. Solns. contg. 0.25, 0.50, 0.75, 1.00, 1.25, 1.50 and 1.75 g. of Pb as $Pb(OAc)_2$, per 100 cc. yielded, resp., 97, 96, 88, 52, 21, 7 and 3% of the Pb as colloidal PbS. The markedly greater coagulation at the higher concns. is ascribed to a decrease in the velocity of formation of nuclei, the rate of growth remaining unchanged. PbS sol was added to an aq. phosphate soln. of such concn. that PO_4 ions were always present in excess. At intervals, the mixt. was ultrafiltered and the uncombined PO_4 --- detd. by a colorimetric method. The p_H of the soln. was about 7.2. The ions present included K^+ , Na^+ and Cl^- . The black, colloidal particles became white. The total PO_4 --- which disappeared was sufficient to form $Pb_3(PO_4)_2$. The rate of the reaction was extremely slow in comparison with the rate of diffusion of the colloidal particles, and independent of the concn. of the PO_4 --- up 0.0025 M, which was the highest concn. used. At 15° the rates of reaction were proportional to the surface of the unchanged particles. At higher temps. coagulation reduced this surface. A probable explanation of the zero order of the reaction is that combination takes place between the surface and adsorbed PO_4 ---, the number of adsorbed PO_4 ions per unit area being independent of the PO_4 --- concn. over a wide range.

F. E. BROWN

Influence of lyophilic colloids on the stability and the electric charge of lyophobic sols. I. Influence on gold sols. W. REINDERS AND W. M. BENDIEN. *Rec. trav. chim.* 47, 977-88(1928).—Lyophilic, N-contg., amphoteric colloids (albumin, for instance) react on Au sols at a p_H lower than the isoelec. point like high-valence cations. Very small quantities discharge the Au sol and cause its pptn., but larger quantities charge it positively and stabilize it. With decidedly higher concns. some substances again exhibit a flocculation zone. The explanation is probably that the added substance is not completely sol. in solns. of the given acidity, and that a part of it flocculates, bring-

ing Au along mechanically. In solns. which are a little less acid than the isoelec. point, and in which the Au sol remains negatively charged in the presence of any amt. of the added colloid, it is sometimes possible (although not easy) to demonstrate the flocculating action of small quantities of added colloid. For large amts. the protective action predominates and the sol is stabilized, in spite of the small charge of its particles. The quantities of added colloid required to change the red color of the Au sol into a purple one depends on the p_H . The smaller the p_H , the smaller are the quantities required to produce the color change. Non-amphoteric colloids, as dextrin, gum arabic and tannin, do not cause flocculation in acid or basic soln. They are able to decrease but not to reverse the charge of the Au sol.

A. L. HENNE

Deposition of carbon from carbon monoxide or benzene in the presence of iron.

II. Crystalline carbon with high adsorptive power. ULRICH HOFMANN. Univ. Berlin. *Ber.* 61B, 2183-94(1928); cf. *C. A.* 22, 4289.—C obtained from CO or benzene by the method previously described or pptd. in the presence of $Fe(CO)_5$, although cryst., is highly adsorptive. The adsorptive power cannot be attributed to the presence of amorphous C. It is due to a very loose cryst. structure, presenting an enormous surface.

ALBERT L. HENNE

Phenomena of mixing inorganic salts in ammonium hydroxide. A supplement. ERNST JANECKE. *Z. Elektrochem.* 34, 786(1928); cf. *C. A.* 22, 904. MALCOLM DOLE

The absorption capacity of clays for neutral salts. A. M. TANKHILEVICH. *Trans. State Expt. Inst. Silicates* (Moscow) 1927, No. 21, 53-7.—T. tested the adsorptive capacity of a particular type of clay for anions and cations of NaCl, $MgSO_4$ and $CaCl_2$. The strengths of soln. used were 0.2, 0.1 and 0.05 N. Adsorption of cations but not of anions occurred.

J. S. JOFFE

Adsorption and constitution. The adsorption of organic acids on animal charcoal. KENNETH M. GRIFFIN, HENRY L. RICHARDSON AND PHILIP W. ROBERTSON. Victoria Univ. College, Wellington, N. Z. *J. Chem. Soc.* 1928, 2705-9.—The adsorption by animal charcoal of 49 carboxylic acids from C_2H_5OH soln. was measured. The concn. of acid was $N/20$. The relative adsorptions ($AcOH = 1$) varied within wide limits, e. g., isovaleric acid 0.21, *p*-nitrobenzoic acid 17. The relative adsorptions tended to increase with mol. wt., but the increase was subject to marked constitutive effects. Aromatic acids were much more strongly adsorbed than aliphatic. Substitution, especially in the para position, increased the adsorption. The relative adsorption values were found to be almost independent of the activity of the charcoal.

R. L. DODGE

The adsorption of electrolytes by crystalline surfaces. A. PINKUS AND L. DE BROUCKÈRE. *J. chim. phys.* 25, 605-40(1928).—See *C. A.* 22, 2092. E. H.

Hydrolysis of tin chloride and chlorostannate. LENNART SMITH. Univ. of Lund. *Z. anorg. allgem. Chem.* 176, 155-80(1928).—The concns. of H ions and Cl ions in H_2O solns. of $SnCl_4$ were measured by colorimetric (malachite green and HCl), electrometric (quinhydrone electrode) and polarimetric methods. Cond. and f.-p. detns. were made at the same time. In dil. solns. the concn. of (H) and (Cl) is about equal, but above 0.1 mol. (Cl) concn. is slightly greater. Even the presence of NH_4Cl does not suppress the Cl ions. In old solns. cond. and f. p. as detd. agree well with the values obtained by calcn. from ion concns., if the existence of a positive Sn complex is assumed. In freshly prepd. solns. (0.10 M and 0.40 M) cond. as detd. is 15-20% lower than the calcd. values. This is attributed to the dispersion of colloidal nonelectrolytes which are present in fresh solns. To a soln. of $SnCl_4$ (0.1074 M) NaCl and KCl solns. are added and their effect upon hydrolysis is measured. Addition of N NaCl to a $SnCl_4$ soln. 2 wks. old in which (H) = 0.365, gives (H) = 0.16, while N KCl gives (H) = 0.28 and 3.5 N KCl gives (H) = 0.12. Na ions therefore suppress the hydrolysis more strongly than K ions. The effect of addn. of acids and salts in greater concn. is studied by means of soly. and distribution detns. (Et_2O and H_2O). In distribution expts. it is found that only pure $SnCl_4$ is taken up by the ether, rather than the complex compd. $SnCl_4 \cdot 2HCl + aq$. In N HCl the concn. of $SnCl_4$ as well as $SnCl_6^{--}$ is small, but even in 4.0 N HCl, a complete suppression of hydrolysis does not occur. The concn. of $SnCl_4$ and $SnCl_6^{--}$ are of the same order of magnitude. The effect upon the degree of hydrolysis by the addn. of various chlorides is much different, the suppressive action increasing in the order NH_4 , K, Ba, Na, Mg, equiv. quantities being compared. Comparative values are given by the ratios $K/NH_4 = 1.2$, $Na/NH_4 = 5$, $Mg/NH_4 = 9$.

H. STOMARZ

Solutions. T. M. LOWRY. *J. Soc. Chem. Ind.* 47, 1233-8, 1260-5(1928).—The soly. of sugar in H_2O is explained on the basis of the mutual attraction of H_2 and O_2 . The existence of hydrates of sucrose cannot be demonstrated since anhyd. sucrose crystallizes from its soln. The soly. and properties of salt solns. are discussed from the

standpoint of the theory of complete dissoen. Solns. of H_2SO_4 in H_2O are discussed chiefly on the basis of Pickering's work on the hydrates and the f.-p. curve. A. F.

Relation between the deviation of the vapor pressure of binary mixtures of normal compounds from the straight line, and the heat of mixing in the liquid state. J. J. VAN LAAR. *Z. physik. Chem., Abt. A*, 137, 421-46(1928).—Mathematical discussion of a paper by Schmidt (cf. *C. A.* 20, 3120). ALBERT L. HENNE

A new method for measuring osmotic pressure. R. V. TOWNEND. Johns Hopkins Univ. *J. Am. Chem. Soc.* 50, 2958-6(1928).—The method is applicable to dil. solns. in a non-volatile solvent. The vapor phase, which is permeable to the solvent only, is used as a diaphragm to sep. the pure solvent from the soln. A sketch of the app. and a description of its operation are included. DON BROUSE

Directions for preparing a universal indicator which gives the colors of the spectrum over a p_{H} range of 3-11.5. H. W. VAN URK. *Pharm. Weekblad* 65, 1246-9(1928).—Universal indicators previously described, e. g., those of Carz, Bujnid and Geerligs, are not recorded in sufficient detail with regard to the exact proportions of the ingredients used. The following mixt. is claimed to be a satisfactory universal indicator, the colors following the order of the spectrum from red orange at p_{H} 3 to red violet at p_{H} 11.5: methyl orange 0.1 g., methyl red 0.04 g., bromothymol blue 0.4 g., naphtholphthalein 0.32 g., phenolphthalein 0.5 g., cresolphthalein 1.6 g., 70% EtOH to make 100 cc. A. W. DOX

The ionic concentrations and activity coefficients of weak electrolytes in certain salt solutions. HERBERT S. HARNED AND ROBERT A. ROBINSON. Univ. of Pennsylvania. *J. Am. Chem. Soc.* 50, 3157-78(1928).—E. m. f. measurements were made on cells of the types: $\text{H}_2 | \text{AcOH} (m_1), \text{MCl} (m_2), \text{AgCl} | \text{Ag}; \text{H}_2 | \text{HCl} (m_0), \text{MCl} (m_3), \text{AgCl} | \text{Ag}$, where MCl represents KCl, NaCl, LiCl or BaCl_2 , and $\text{H}_2 | \text{BOH} (m_1), \text{NaCl} (m_2) | \text{NaCl} (m_2), \text{AgCl} | \text{Ag}; \text{H}_2 | \text{NaOH} (m_0), \text{NaCl} (m_2) | \text{NaCl} (m_2), \text{AgCl} | \text{Ag}$, where BOH is a weak hydroxide. Five weak bases were used: NH_4OH , mono-, di- and trimethylamines, and $\text{N}(\text{CH}_3)_3\text{OH}$. A method is given for computing the activity coeffs. and dissoen. of weak acids and bases in salt solns. from such e. m. f. measurements. The dissoen. const. of a weak electrolyte in a given solvent or in salt solns. in this solvent, is given by $K = C_{\text{C}}C_{\text{A}}/C_{\text{CA}}(\gamma_{\text{C}}\gamma_{\text{A}}/\gamma_{\text{CA}}) = K_{\text{C}}\gamma^2$, where γ represents the activity coeffs. When the electrolyte is at infinite diln. so that γ^2 equals unity, $K = K_{\text{C}}$. Thus, K is a const. which measures the dissoen. of the weak electrolyte in the pure solvent. γ^2 is a measure of the effect of the presence of the attractive and repulsive forces of the elec. field produced by the addn. of the salts on the elec. potentials of the ions of the weak electrolyte. K_{C} is an abs. measure of the dissoen. of the weak electrolyte under varying conditions of salt concn. Although the change of K_{C} upon salt addn. depends upon the variation of γ^2 , its abs. value does not. This is shown clearly by the behavior of the methyl derivs. of NH_3 . Thus, K_{C} increases in the order NH_3 , tri-, mono-, dimethyl-amine, whereas, at a given salt concn., γ^2 increases in the order tri-, di-, monomethylamine, NH_3 . The results of the sp. relative salt actions are generalized by the following rules. A.—The ionic activity coeffs. of AcOH, mono- and dichloro-acetic acids are less in the soln. of a given strength of that salt which possesses the higher activity coeff. in pure H_2O . B.—The same is true for NH_3 and NH_4CH_3 . It is probable that it would also be true for $\text{NH}(\text{CH}_3)_2$ and $\text{N}(\text{CH}_3)_3$. This order agrees with that found for the ionic activity coeffs. in H_2O , and is the reverse of the order found for the activity coeffs. of halide acids in salt solns. The results show that a 0.01 *M* soln. of $\text{N}(\text{CH}_3)_3\text{OH}$ contg. 0.1 *M* NaCl has a slightly lower OH-ion concn. than that of an identical salt soln. contg. NaOH. At higher salt concns., however, NaOH is about 6% less dissociated. The effect of the change in the solvent caused by large quantities of the undissociated mols. is discussed and computed approx. The method employed, as well as the results, should prove useful for studying salt effects in org. and biological media. It is more sound from a kinetic or a thermodynamic point of view than the usual method which employs single electrodes and salt bridges. E. R. S.

Conductivities of strong electrolytes for currents of high frequency. H. ZAHN. Univ. Kiel. *Z. Physik* 51, 350-4(1928).—KCl and MgSO_4 solns. are compared at a frequency corresponding to $\lambda = 1$ meter. In accord with theoretical calcs. of Debye and Falkenhagen (*C. A.* 22, 3573), the cond. of MgSO_4 soln. is found to be about 11% greater than it is for the low frequencies usually employed. GEO. GLOCKLER

The equilibrium of silver oxide and silver chloride with aqueous potassium chloride and potassium hydroxide. ROY F. NEWTON. Purdue Univ. *J. Am. Chem. Soc.* 50, 3258-61(1928).—The equil. of AgCl , Ag_2O , KOH, KCl and H_2O previously studied by Noyes and Kohr has been redetd. with Ag_2O prepd. in various ways; the chloride was detd. by electrometric titration. The mean activity ratio is given as 0.00893. This

result is somewhat below that of Noyes and Kohr but not beyond exptl. error. The method of prepn. of the Ag_2O has no significant effect on the equil. ratio of the chloride to hydroxide. Within exptl. error the equil. ratio is the same in 0.05 M soln. as in 0.1 M soln.

R. E. GIBSON

The determination of solubility curves of mixed crystals at small concentrations and the re-distribution of the boundary substance by heating. G. TAMMANN AND A. HEINZEL. Univ. Göttingen. *Z. anorg. allgem. Chem.* 176, 147–51(1928).—If the soly. of one metal in another decreases with falling temp. it should be possible to find for each temp. the concn. at which the grain boundaries just show no accumulation of the first metal, and below which the solid is homogeneous. The values for a series of temps. would thereby establish the soly. curve. Experimentally, it was found that the soly. of Pb in Cd at 270° is greater than 0.1% Pb but falls below this value at lower temps. The soly. of Cu in Cd at 270° is between 0.05% and 0.1% Cu and falls below the former value at lower temps. If a solid consisting of mixed crystals be recrystd. at a temp. below that of the polyeutectic, there is no change in the concn. of the grain boundaries accompanying the natural grain growth. On the other hand, if the temp. is above that of the eutectic, the grain boundaries become more concd. by drawing from the eutectic. The eutectic temps. found in this way for binary Cd systems contg. Bi, Pb, Sb and Cu, are, resp., 149° , 249° , 292° and 310° .

H. F. JOHNSTONE

The solubility and transition points of ferrous chloride hydrates in aqueous solution. FR. SCHIMMEL. *Z. anorg. allgem. Chem.* 176, 285–8(1928).—The temp.-compn. diagram for $\text{H}_2\text{O}-\text{FeCl}_2$ shows a eutectic between ice and $\text{FeCl}_2 \cdot 6\text{H}_2\text{O}$ at -36.5° corresponding to a content of 30.4% FeCl_2 . A soln. contg. 35.5% FeCl_2 may be under-cooled to -60° without the sep. of a solid phase. On warming to -50° , ice is caused to form as the metastable solid by seeding or scratching the surface of the contg. vessel. On further warming, the hexahydrate begins to sep. as the stable solid. The transition point at which the hexa- and tetrahydrates exist in equil. with soln. lies at 12.3° , while that between the tetrahydrate and dihydrate lies at 76.5° . The boiling point of the satd. soln. at atm. pressure lies at 117.5° . The liquid phase at this point has a compn. of 50.4% FeCl_2 .

H. F. JOHNSTONE

Reaction regions and their practical application. W. P. JORISSEN. Univ. de Leiden. *Chimie et industrie* 20, 807–12(1928).—A brief review of the work carried out here by J. and co-workers and reported in C. A. 21 and 22. A. PAPINEAU-COUTURE

The mechanics of the reaction between hydrogen peroxide, iodine and iodide ion. E. ABEL. *Z. physik. Chem.* 136, 161–82(1928).—The reaction involves the formation of HIO . $\text{I}_2 + \text{H}_2\text{O} \longrightarrow \text{HI} + \text{HIO}$ (1); $\text{HIO} + \text{H}_2\text{O}_2 \longrightarrow \text{HI} + \text{H}_2\text{O} + \text{O}_2$ (2). Equation (1) is catalyzed by H_2O_2 . The relationship is expressed by $[\text{H}^+]^2 [\text{I}^-]^2 / [\text{I}_2] = L + A [\text{H}^+]$. At 25° , $L = 1.4 \times 10^{-12}$ and $A = 1.3 \times 10^{-7}$ for concns. about 0.8. Theoretical equations are worked out for the speed of reaction for the evolution of O_2 and of I_2 , which are shown to agree with exptl. results.

F. E. BROWN

Revision of the kinetics of the iodic acid-hydriodic acid reaction. II. E. ABEL AND K. HILFERDING. *Z. physik. Chem.* 136, 186–94(1928); cf. C. A. 21, 3621.—The previous treatment of this reaction is modified. At very small concn. of I^- , the reaction velocity is proportional to the first rather than to the second power of the concn.

A. L. HENNE

The ethyl acetate equilibrium. R. C. CANTELO AND R. D. BILLINGER. Univ. of Cincinnati. *J. Am. Chem. Soc.* 50, 3212–6(1928).—This is part of an investigation of the change in the equil. const. of the reaction $\text{CH}_3\text{COOH} + \text{C}_2\text{H}_5\text{OH} \rightleftharpoons \text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O}$ by alteration of the thermodynamic environment. In particular this paper deals with the effect of the salts NaCl, NaI and NaCNS on the above equil. In absence of salts the equil. const. at 78° is 3.7. The presence of the salts causes the equil. const. to rise. With NaCl the rise is a linear function of the salt concn. With the other salts the relation is more complex. There is no trace of a Hofmeister series effect. R. E. GIBSON

Decomposition of formic acid by sulfuric acid. II. ERNEST R. SCHIERZ AND T. WARD. Univ. of Wyoming. *J. Am. Chem. Soc.* 50, 3240–3(1928); cf. C. A. 17, 1422.—The velocity of decompn. of HCO_2H by means of H_2SO_4 has been measured as follows. H_2SO_4 concn. in %: 96.69, 94.40, 92.78, 91.49, 89.53, 85.52. Velocity const. ($K_s = 0.4343K \times 10^3$) at 15° : 28.5, 10.4, 5.1, 2.7, 1.2, 0.24. At 25° : 91.7, 33.5, 16.6, 8.9, 4.0, 0.78. At 35° : 312, 106, 53.5, 28.7, 13.1, 2.5. At 45° : 810, 280, 159, 86.2, 41.4, 7.8. From the above figures, the temp. coeffs. are calcd.; they decrease in magnitude as the velocity const. increases. The values for E (critical increment) have been calcd. and found to be nearly equal to 20 for all concns. at the temp. intervals: $25-15^\circ$, $35-25^\circ$, and $45-35^\circ$. For equal H_2SO_4 concns., the effect of small quantities of

H₂O becomes more marked with increase in temp. No irregularities in velocity const. or temp. coeffs. are observed in the temp. and concn. ranges studied. A. L. HENNE

Monochloramine and hydrazine. I. Decomposition of monochloramine in acid solution. MAX BODENSTEIN. Univ. Berlin. *Z. physik. Chem.*, Abt. A, 137, 131-41 (1928).—The decompn. of NH₂Cl is investigated in weakly ammoniacal solns., which become slightly acid during the expts. The reaction follows a very remarkable course: it starts as an autocatalytic reaction, nearly stops after completing the first half of the reaction, then starts again in a similar way and finally ends very slowly. Consequently, the Raschig equation $3\text{NH}_2\text{Cl} = \text{NH}_4\text{Cl} + 2\text{HCl}$ represents only the first half of the decompn. and its very end. In the second half, HCl fails to appear before the reaction is nearly finished. A qual. interpretation is proposed, calling for the formation of NHCl₂ and NCl₃, but this does not give a satisfactory explanation of the abnormal behavior of the reaction velocity. In a soln. satd. with borax and boric acid, the decompn. is a bimol. reaction. ALBERT L. HENNE

Decomposition of nitrosotriacetoneamine in the presence of hydroxyl ions. A. W. GOODAL AND W. C. M. LEWIS. Univ. of Liverpool. *Z. physik. Chem.*, Abt. A, 137, 45-62 (1928).—The decompn. of nitrosotriacetoneamine is a complex reaction, the observed velocity of decompn. in dil. KOH being detd. by the activity of the OH ion, while in concd. KOH it is detd. by the H ion. The rate of decompn. in the drift region (intermediate alkali concn.: 0.05-0.5 N) is quant. accounted for by the theory of consecutive reactions, one reaction being catalyzed by the H ion, the other by the OH ion. Each reaction has its own characteristic critical increment or energy of activation. ALBERT L. HENNE

Kinetics of the hydrolytic decomposition of α -bromopropionic acid. JAN ZAWIDZKI AND JAN G. ZAWIDZKI. Polytechnikum, Warsaw. *Z. physik. Chem.*, Abt. A, 137, 72-106 (1928).—The reaction $\text{MeCHBrCO}_2\text{H} + \text{H}_2\text{O} = \text{HBr} + \text{MeCH(OH)CO}_2\text{H}$ has been studied in aq. soln. at 90°. The reaction velocity may be represented by $dx/dt = k_{1/2}(a-x)/\sqrt{x}$ in which $(a-x)$ = concn. of MeCHBrCO₂H, and x = concn. of HBr. The av. exptl. value of $k_{1/2}$ at 90° is 0.000942. In the interval 80-90°, the temp. coeff. for $k_{1/2}$ is 2.99. The reaction is retarded by HBr and by H ions. In the presence of an excess of HBr (b), or HNO₃, the equation representing the velocity becomes: $dx/dt = k_{1/2}(a-x)/\sqrt{(b-x)}$. Expts. at 90° give av. values for $k_{1/2}$: 0.000937 (with HBr) and 0.000943 (with HNO₃) which are practically identical with the value given first. The presence of neutral salts (KBr or KNO₃) increases the velocity of the reaction by less than 4%, indicating that Br ions or metallic cations affect the hydrolysis negligibly. On the other hand, the presence of similar amts. of K₂SO₄ multiplies the velocity coeff. by 6; KCl has a decided retarding action which is to be explained by the fact that α -bromopropionic acid and KCl exchange their halogen atoms with a measurable velocity. ALBERT L. HENNE

Hydrolytic decomposition of succinimide. H. V. EULER AND ARNE OLANDER. Univ. of Stockholm. *Z. physik. Chem.*, Abt. A, 137, 393-8 (1928).—A new detn. of the dissocn. const. of succinimide gives $k_a = 2.6 \times 10^{-10}$ at 25°. The relation between the hydrolysis velocity and the alky. of the soln. was investigated for the reaction: succinimide \rightarrow iminosuccinic acid. A curve of K vs. p_{OH} was obtained, for which no satisfactory interpretation is forthcoming. In acid soln. (0.118-0.50 N HCl), the reaction const. at 90° is $k = 2.9 \times 10^{-4} h^+$. The velocity of hydrolysis of H₂NCOCH₂CH₂CO₂H gives $k_a = 2.72 \times 10^{-6}$ at 25°. ALBERT L. HENNE

Kinetics of the formation of dioximes. LII. G. B. SEMERIA AND B. SOMIGLIANA. *Atti accad. sci. Torino* 63, 325-34 (1928).—The reaction between AcCH:NOH and HONH₂ has been studied for $p_{\text{H}} = 1.2$ to 12, the rate of reaction being measured iodometrically by titrating the remaining HONH₂. Data showing results at various acid concns. are appended. The reaction rate is not that of the bimol. reaction $\text{AcCH:NOH} + \text{NH}_2\text{OH} = \text{HON:CMech:NOH} + \text{H}_2\text{O}$, but renders probable the equl. first suggested by Baly, Marsden and Stewart (*J. Chem. Soc.* 89, 966 (1906)). A. W. C.

Decomposition of carbonyl bromide. E. H. REERINK. *Rec. trav. chim.* 47, 989-99 (1928).—Previous observation by R. (Diss., Leiden, 1924) that the velocity of decompn. of COBr₂ first increases, then decreases is compatible with the observation by Lenher and Schumacher (*C. A.* 22, 3566) that the reaction is accelerated by org. impurities. The walls of the reaction vessel, covered with org. substances, act as a catalyst by adsorbing Br₂ mols. ALBERT L. HENNE

Rotatory dispersion of nicotine solutions in the ultra-violet. MAX MILWARD-LIQUIER AND ROBERT DESCAMPS. *Bull. soc. chim. belg.* 37, 345-50 (1928).—A continuation of J. Liquier's previous work in the visible range (*C. A.* 19, 620; 22, 16). From

the expts. It is concluded that aq. nicotine solns., to which HCl has been gradually added until one of the basic functions has been completely neutralized, behave like mixts. of 2 optically active constituents, whose dispersions are different and whose proportions vary with the p_H of the soln. One of the constituents is the nonelectrolytically dissoed. mol., the other being the optically active ion. These conclusions hold as well in the visible as in the ultra-violet range.

ALBERT L. HENNE

The catalytic decomposition of hydrogen peroxide in an acid chlorine-chloride solution. II. An interpretation of the rate measurements in concentrated solution. ROBERT LIVINGSTON. Univ. Minn. *J. Am. Chem. Soc.* 50, 3204-11(1928).—The Bronsted reaction velocity equation is combined with the Debye and McAuley equation for the activity of non-electrolytes to obtain the expression: $V = K (H_2O_2) (H^+) (Cl^-)^2$. 10^{-4} for the rate of decompn. of H_2O_2 in acid chlorine-chloride solns., which agrees with exptl. data. The activity of H_2O_2 in NaCl and in Na_2SO_4 solns. has been detd. by distribution measurements, and the results have been used to test a prediction based on the rate of reaction theory.

J. H. PERRY

The catalytic decomposition of gaseous acetaldehyde at the surface of various metals. P. C. ALLEN AND C. N. HINSHELWOOD. *Proc. Roy. Soc. (London)* A121, 141-55(1928); cf. *C. A.* 19, 3198.—The decompn. of acetaldehyde, the homogeneous decompn. of which is bimol., was studied at the surface of electrically heated wires of Au, Pt, W and Pt-10% Rh alloy. The surface reaction involves two mols., but at pressures above 150 mm., the surface becomes satd. with adsorbed mols. and the reaction appears unimol. The relation between reaction rate and pressure, the heat of activation and the absolute rate of reaction are markedly similar with all the metals, indicating adsorption of a loose, non-specific kind. The heat of activation is close to that of the homogeneous reaction, indicating that the wire acts merely as a source of energy without affecting the stability of the adsorbed mol. The mol. statistics indicate inelastic collisions with a duration of 10^{-6} – 10^{-8} secs.

Catalytic processes in solid phase. I. Decomposition of potassium permanganate. S. ROGINSKII AND E. SHULTZ. Wissenschaftlich Institut für physikalische Chemie, Dnjepropetrowsk, Ukraine, U. R. S. S. R. *Z. physik. Chem., Abt. A*, 138, 21-41(1928).

ALBERT L. HENNE

Sixth report of the committee on contact catalysis. ROBERT E. BURK. National Research Council, Washington, D. C. *J. Phys. Chem.* 32, 1601-45(1928).—A review summarizing the principal points of the 5 previous reports (cf. *C. A.* 21, 3150), and in addn. covering important new developments of the year 1927 in catalysis. R. L. D.

Systematic affinity principle. XLVII. The relation of mercury to a few metals. WILHELM BILTZ AND FRITZ MEYER. Hannover Techn. Hochschule. *Z. anorg. allgem. Chem.* 176, 23-45(1928); cf. *C. A.* 22, 3326.—Amalgams of Au, Ce, Tl and Na are prepd. and studied, the nature and stability of the compds. and their heat of formation being detd. Au and Ce amalgams are examd. by means of vapor-tension measurements, while Tl and Na amalgams are studied calorimetrically, by means of a Bunsen ice calorimeter. Au amalgams contg. 3-15% Hg are bright yellow in color; with 18-24.6% Hg they are a bright grayish yellow, and with more than 24.8% Hg they are gray. Up to 24.6% Hg Au amalgams can be cut with a knife; above this amt. they are brittle and can be pulverized. Isotherms at 253°, 300° and 315° are given, in which vapor pressure in mm. of Hg is plotted against % Hg. Between 0 and 25% Hg several series of mixed crystals exist and one compd. $HgAu_4$. Above 25% Hg, in addition to the compd. $HgAu_5$, Hg is present. The phase of the compn. $HgAu_5$ is a satd. mixed crystal. The amalgamation of Au with liquid Hg is weakly endothermic in this zone, with an affinity of less than 0.5 cal. per g. atom of Hg. In the Hg-rich zone, the unstable compds. Hg_3Au_2 and Hg_4Au occur at lower temps. or higher pressures. Ce amalgams contg. more than 15% Ce are pyrophoric, and precautions are taken to exclude air from the app. Below 15% Ce these amalgams are gray, above this amt. they contain black specks and as Ce increases they finally become coke-like in appearance. Only one compd. is formed, $CeHg_4$, unstable in the air, stable on heating, only slightly miscible with Hg and not at all with Ce. Its heat of formation from solid Ce and 1 g. atom of liquid Hg is +5.8 cal. In Tl amalgams, the compd. Hg_2Tl_3 occurs, its heat of formation being +0.5 cal. at 0°. The d. of solid Hg_2Tl_3 at 0° is found to be 13.16; that of the liquid compd. at 25° is 12.94. The mol. vol. at $T = 0^\circ$ is calcd. from the d. to be 105, in good agreement with the sum of the constituents (104). With Na, Hg forms the following compds., their heats of formation per g. atom of Hg being also given in cal.: $NaHg_4$ (5.6 cal.), $NaHg_3$ (9.4), Na_2Hg_4 (10.6), $NaHg$ (11.3), Na_2Hg_2 (10.4), Na_3Hg (9.3). The heat in cal. necessary to split off 1 g. atom of liquid Hg from a Hg-rich compd. to give the next lower compd. is given as follows: $NaHg_4$ —1.9, $NaHg_3$ —7.8, Na_2Hg_4 —5.3, $NaHg$ —13.2, Na_2Hg_2

—11.4, Na_2Hg —9.3. These amalgams, as that of Ce, are definite chem. compds., not at all or only slightly miscible with an excess of their components. H. STOERTZ

Systematic affinity principle. XLVIII. The heats of formation of UCl_3 , UCl_4 , and UO_3 . WILHELM BILTZ AND CURT FENDIUS. *Z. anorg. allgem. Chem.* 176, 49–63 (1928).—The heats of formation of UCl_3 and UCl_4 were detd. by an indirect method from the difference in the heats of soln. of the chlorides and that of the metal in 8 N HCl. An ice calorimeter was used for the calorimetric measurements. The values found were: $\text{U} + 2 \text{Cl}_2 = \text{UCl}_4 + 251 \text{ Cal.}$ and $\text{U} + 3/2 \text{Cl}_2 = \text{UCl}_3 + 213 \text{ Cal.}$ The heat of reaction for the oxidation of UCl_3 and UCl_4 to a hexavalent U compd. by a soln. of FeCl_3 in HCl, or by a soln. of ICl_3 , was compared with the heat of soln. of UO_3 in the same soln. media. Based on the values obtained for the heats of formation of UCl_3 and UCl_4 , the heat of formation of UO_3 is 294 Cal. A comparison of these results with those obtained for other metals shows that U is less noble than Fe and has about the same affinity for Cl as has Th.

H. F. JOHNSTONE

Systematic affinity principle. XLIX. The relation of chlorine and other halogens to gold. WERNER FISCHER AND WILHELM BILTZ. *Z. anorg. allgem. Chem.* 176, 81–111 (1928).—Methods of prepn. are described. D. is detd. in paraffin oil, d_4^{25} for AuCl_3 being 4.67. The dissocn. pressure of AuCl in mm. of Hg is detd. and given as follows: at 155.7° —9.5 mm., at 183° —27.3, at 209.3° —70, at 217° —92, at 231.4° —163.5. For AuBr the dissociation pressure is given: at 111° —21.4 and 18.3 mm., at 139° —71.1 and 67.4 mm., at 156° —132 mm. App. for detg. vapor pressure of the Au halides is described. The vapor of auric chloride has the formula Au_2Cl_6 rather than AuCl_3 . Its vapor pressure is given as follows in mm. of Hg: at 200° —0.23, at 220° —0.78, at 232° —1.33, at 245° —2.82. Metallic Au is prepd. by pptn. with $\text{H}_2\text{C}_2\text{O}_4$ from a soln. of 14 g. $\text{HAuCl}_4 \cdot 4\text{H}_2\text{O}$ in 7 liters H_2O , followed by drying in a vacuum over P_2O_5 at 50° , and also by pptn. as above using 5 times greater concn., followed by ignition at a deep red glow. The heats of soln. of these 2 forms as well as Au plate are detd. and found to be identical ($18.5 \pm 0.1 \text{ cal. per g. atom}$), indicating no difference in these modifications. Heats of soln. are detd. for halogens and Au halides in I-ICl_3 soln. and are expressed in cal./g. atom or cal./mol. as follows: $\text{Cl}_2 = 7.1 \pm 0.1$, $\text{Br (liquid)} = -1.0 \pm 0.1$, $\text{I (solid)} = 2.3 \pm 0.1$, $\text{AuCl} = 17.2 \pm 0.1$, $\text{AuBr} = 14 \pm 0.1$, $\text{AuI} = 21 \pm 0.2$, $\text{AuCl}_3 = 11.5 \pm 0.2$, $\text{AuBr}_3 = 2.4 \pm 0.2$. Heats of formation for these compds. are: $\text{AuCl} = 8.4 \pm 0.2 \text{ cal.}$, $\text{AuBr} = 3.4 \pm 0.2$, $\text{AuI} = -0.2 \pm 0.3$, $\text{AuCl}_3 = 28.3 \pm 0.3$, $\text{AuBr}_3 = 12.9 \pm 0.3$, $\text{HAuCl}_4 \cdot 4\text{H}_2\text{O} = 60 \text{ cal.}$, $\text{HAuBr}_4 \cdot 5\text{H}_2\text{O} = 48 \text{ cal.}$ The authors find no evidence for the existence of mixed Au halides such as expressed by $\text{AuCl} + \text{AuCl}_3 = \text{Au}_2\text{Cl}_4$. The m. p. diagram of the system KAuCl_4 is shown. Thermal decompn. of this salt is not through such compds. as KAuCl_3 or KAuCl_2 , but metallic Au and Cl_2 are directly formed as follows: $\text{KAuCl}_4 = \text{KCl} + \text{Au} + 3/2 \text{Cl}_2$. L. **Pneumatolytic transfer of gold by means of chlorine.** WILHELM BILTZ, WERNER FISCHER AND ROBERT JUZA. *Ibid* 121–42.—The vaporization of Au in a stream of Cl_2 , the compn. of the vapor, and the thermodynamics of the reactions involved are studied. In prepn. of the reaction mixt., silica gel is mixed with a soln. of Au in aqua regia, and this is then dried and ignited at 1300 – 1400° . The expts. are conducted in an electrically heated quartz tube. With a pressure of 1 atm. of Cl_2 , the Au in the reaction mixt. is in the form of AuCl_3 at temps. up to 254° , between 254° and 282° , it has the compn. AuCl , between 282° and 1063° it is solid metallic Au, and above 1063° it is molten Au. Above 475° , the compn. of the Au compd. in the gas phase is found to be Au_2Cl_6 . The partial pressure of Au_2Cl_6 in the gas phase is detd. for varying pressures of Cl_2 at 900° and 1000° . At 900° with $p_{\text{Cl}_2} = 189 \text{ mm. of Hg}$, $p_{\text{Au}_2\text{Cl}_6} = 0.234 \text{ mm. of Hg}$; with $p_{\text{Cl}_2} = 544$, $p_{\text{Au}_2\text{Cl}_6} = 0.708$; with $p_{\text{Cl}_2} = 771$, $p_{\text{Cl}_2\text{Cl}_2} = 0.975$; and with $p_{\text{Cl}_2} = 762$, $p_{\text{Au}_2\text{Cl}_6} = 0.919$. The ratio $p_{\text{Au}_2\text{Cl}_6}/p_{\text{Cl}_2} \times 10^3$ is given as 1.25 at 900° and 2.77 at 1000° . The heat of reaction for Au_2Cl_6 is calcd. to be -19 cal. , the heat of sublimation -36 cal. , at 900° . With exptl. temps. under 475° , thermodynamic measurements seem to indicate the formula Au_2Cl_6 for the compn. of the Au compd. in the gas phase, but some indications are given of a dissociation equil. in the gas phase as follows: $\text{Au}_4\text{Cl}_{12} \rightleftharpoons 2\text{Au}_2\text{Cl}_6$. With $p_{\text{Cl}_2} = 760 \text{ mm.}$, $p_{\text{Au}_2\text{Cl}_6} = 2.00 \text{ mm.}$ at 240° , 3.41 at 258° , 2.80 at 270° , 0.740 at 311° , 0.405 at 329° , 0.190 at 350° , 0.040 at 405° , 0.012 at 450° .

H. STOERTZ

Decomposition of carbon monoxide on nickel. H. A. BAHR AND TH. BAHR. *Ber.* 61B, 2177–83 (1928).—Metallic Ni or NiO catalyzes the reaction $2\text{CO} = \text{C} + \text{CO}_2 + 38.9 \text{ cal.}$ by first forming Ni_3C . Below 270° , the decompn. of CO continues until the Ni is completely transformed into Ni_3C ; then the reaction stops. Between 270° and 380 – 420° , the CO decompn. continues after this point has been reached, the catalyst being Ni_3C free from metallic Ni. This is proved by analysis which shows that the amt. of C bound

chemically by the catalyst corresponds to Ni_3C , excess C being present as the free element. (To determine the ratio of bound C to free C, H_2 is passed over the catalyst. The amt. of methane formed indicates the quantity of bound C. Free C remains inert.) Above $380\text{--}420^\circ$, free Ni again appears in the catalyst because Ni_3C dissociates at such temps. Ni_3C is probably an intermediary step in the decompn. of Ni_3C . It is believed that Ni_3C formed in the catalysis process is identical with that isolated from fusions of Ni in the presence of C.

ALBERT L. HENNE

Equilibrium between aluminum carbide and nitrogen at high temperatures. C. H. PRESCOTT, JR., AND W. B. HINCKE. Gates Chemical Lab., Cal. Inst. Technology. *J. Am. Chem. Soc.* 50, 3228–37(1928).—Equil. in the reaction $4\text{AlN} + 3\text{C} = \text{Al}_4\text{C}_3 + 2\text{N}_2$ was observed at pressures of about 0.01 mm. and temps. between 1700° and 1900° K. App. is described in some detail. Increases in free energy and heat content which would accompany this reaction between 1775° and 1910° K. and at 1 atm. pressure are given by the equations $\Delta F^\circ = 253,630 - 90.58 T$ and $\Delta H = 253,630$ cal. At 1875° the equil pressure is 0.0100 mm. and ΔF is 83,800 cal. Calcns. were also made for the reaction $\text{Al}_2\text{O}_3 + 3\text{C} + \text{N}_2 = 2\text{AlN} + 3\text{CO}$. Here $\Delta F^\circ = 127,065 - 67.5 T$ and $\Delta H = 127,065$ cal. These agree with Fraenkel's observations.

R. E. GIBSON

The system: $\text{KNO}_3\text{--HNO}_3\text{--H}_2\text{O}$ between 25° and 60° . G. MALQUORI. Reale Univ. Roma. *Atti accad. Lincei* [6], 7, 844–6(1928).—Isotherms of the system: $\text{KNO}_3\text{--HNO}_3\text{--H}_2\text{O}$ have already been studied at lower temps. (cf. *Bull. soc. chim.* [2], 47, 677 (1887); *Z. anorg. Chem.* 40, 1(1904); M., C. A. 21, 2414.—In the present paper measurements were at 40° and at 60° . The data, which are given in graphical and tabular form, show that at 40° and 60° (as at 25°) the quantity of KNO_3 which passes into soln. diminishes for low acidities and then increases gradually with increase in the acidity. The higher the temp. the greater the decreases in soly. Thus at 25° , 10.3% HNO_3 lowers the soly. of KNO_3 from 27.31 to 25.03%, whereas at 40° 7.01% HNO_3 lowers it from 39 to 32.13%. At 60° the decrease is still greater, so that 5.25% HNO_3 reduces it from 52 to 41.12%. On the other hand, the increase of soly. with high acidity decreases with increase of temp. Thus the soly. of KNO_3 in 100% HNO_3 at 25° , 40° and 60° is 49.99, 49.21 and 52.03%, resp., whereas its soly. in H_2O at these 3 temps. is 27.31, 39 and 52%, resp. The influence which HNO_3 exerts on the soly. of KNO_3 cannot therefore be ascribed to the existence of complexes in soln., the stability of which diminishes with increase of temp.

C. C. DAVIS

The system: $\text{KNO}_3\text{--Al(NO}_3)_3\text{--H}_2\text{O}$ at 0° , 40° and 60° . G. MALQUORI. Reale Univ. Roma. *Atti accad. Lincei* [6], 7, 846–8(1928).—The same method previously used for the isotherm at 25° (cf. C. A. 21, 2108) was followed. As at 25° , the only solids in contact with solns. at 0° , 40° and 60° are the 2 salts, KNO_3 and $\text{Al(NO}_3)_3 \cdot 9\text{H}_2\text{O}$. The quantity of KNO_3 in a satd. soln. of the 2 salts increases slightly with increase in temp. At 0° the soln. contains 5.25% of KNO_3 and at 60° it contains 7.22%.

C. C. DAVIS

The thermal decomposition of alumina (Bayer). II. N. PARRAVANO AND G. MALQUORI. *Atti accad. Lincei* 7, 970–5(1928).— $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ when heated shows three breaks, i. e., at 190° , 270° and 450° , indicating the changes to $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$, $\text{Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$ and finally Al_2O_3 .

A. W. CONTIERI

An application of the rule of Dulong and Petit to molecules. DONALD H. ANDREWS AND ELLIS HAWORTH. *J. Am. Chem. Soc.* 50, 2998–3002(1928).—Detns. were made of the heat capacities of mono-, di-, tetra- and hexachlorobenzene and of mono- and dibromobenzene from 101° to 335° K. The heat capacity per halogen atom approaches the Dulong and Petit value of 6 cal. per degree at about room temp. The observed values agree well with those calcd. from optically observed frequencies in the infra-red.

Critical potentials of molecular hydrogen. E. U. CONDON AND H. D. SMYTH. Princeton Univ. *Proc. Natl. Acad. Sci.* **14**, 871-5(1928).—The effects of electrons of different speeds on the H_2 mol. are interpreted in terms of energy levels and potential energy curves.

Experimental method for measuring molecular rays. H. MAYER. *Z. Physik* **52**, 235-48(1928).—By means of a torsion balance the intensity of a mol. beam is detd. and the appropriate formula of kinetic gas-theory is checked.

Atomic systems and planet systems. F. KONEK. *Természettud. Közlöny* **60**, 2-5(1928).—A summary of the theory of S. Arrhenius, describing the similarity of planet systems to subatomic systems.

The possibility of detecting individual cosmic rays. W. F. G. SWANN. Bartol Foundation, Philadelphia. *J. Franklin Inst.* **206**, 771-8(1928).—Because of the enormous energy available for ionization in a single cosmic ray, and of the relatively small no. of ions produced per sec. by the rays in a vessel of moderate size, the ionization should occur in spurts which may be observable under suitable conditions. The element which acts unfavorably to the purpose of the expt. is that concerned with the fact that the no. of primary cosmic rays absorbed per unit vol. is so small that it is very rarely that a cosmic ray is absorbed so near to the vessel as to cause by its secondary radiation a large ionization therein. Matters could be improved in this respect by surrounding the vessel with a highly absorbing material such as Pb.

The origin of the cosmic rays. R. A. MILLIKAN AND G. H. CAMERON. Calif. Inst. of Tech. *Phys. Rev.* **32**, 533-57(1928).—From Einstein's equation $Mc^2 = E$ and Aston's curve the max. possible energy that can be released in radioactive changes can be computed. The theoretical and exptl. values are in satisfactory agreement. No step-by-step atom building process can produce rays as penetrating as the observed cosmic rays. The absence of the radiations corresponding to such step-by-step processes probably means that atom-building does not in general occur in this way. About 80% of the observed cosmic rays appear to be due to the act corresponding to the sudden union of 4 pos. and 2 neg. electrons into the nucleus of the atom of He. This process produces a cosmic ray of absorption coeff. $\mu = 0.30$ per m. of water. The observed cosmic rays of absorption coeffs $\mu = 0.08$ and $\mu = 0.04$ appear to be produced by the sudden building of positive and negative electrons into atoms of O_2 and Si, the former act giving rise to a ray of absorption coeff. $\mu = 0.08$ and the latter to $\mu = 0.04$. This last is a definitely observed ray having an energy corresponding to the fall of an electron through 250,000,000 v. The cosmic-ray indications are reconcilable with the view that Fe is produced by the union in a single act of positive and negative electrons into the atom of Fe, but the cosmic rays show no direct indications of the transformation of the whole mass of the H atom into radiation. The observed cosmic-ray curve can be built up fairly satisfactorily by the assumption that the relative intensities of the cosmic rays reaching the earth's atm. are proportional to the abundance of the common elements in meteorites and the earth's crust, 96% of these bodies being made of the four elements O, Mg, Si and Fe. Evidence is presented to show that cosmic rays do not originate in the stars, but only in the depths of space where temp. and d. are practically zero. The observed properties of cosmic rays, indicating that the creation of common elements occurs only in the interstellar or intergalactic space, suggest the possibility of avoiding the "Warmistod," and of regarding the universe as already in a steady state. B. L.

The normal state of helium. J. C. SLATER. Harvard Univ. *Phys. Rev.* **32**, 519-60(1928).—An approx. wave formation for normal He is calcd., by using theoretically detd. functions for the limiting cases of large and small r 's and interpolating between them. The charge d. computed from the wave function is in good agreement with that found independently by Hartree (*C. A.* **22**, 1269). The diamagnetism of normal He is calcd., and it agrees with observation within exptl. error. The repulsive forces between 2 He atoms are calcd. by the method of Heitler and London and the attractive van der Waals forces are roughly estd. from Wang's (*C. A.* **22**, 721) results with H_2 . The potential curve so found gives a "mol. diam." in agreement with expt., and the min. of the curve leads to approx. correct d. and b. p. for the liquid. B. L.

Energy transfer during nuclear impact. W. KUHN. Univ. Heidelberg. *Z. Physik* **52**, 151-7(1928).—K. deduces that a fast α -particle can only transfer a small portion of its energy to a nucleus with which it comes into collision. The energy so transferred is taken as a criterion of nuclear stability. It is interesting that this view leads to the possibility that a transformation of elements may be expected in the interior of stars.

Partition coefficient in the fractional crystallization of radium-barium bromide solutions. ZACHARY T. WALTER AND HERMAN SCHLUNDT. Univ. of Mo. *J. Am.*

Chem. Soc. 50, 3266-70(1928).—The Ra-Ba bromide system can be made more than twice as efficient as the Ra-Ba chloride system. The crystals are sepd. from the mother liquor by centrifuging. The av. value for the partition coeff. in the Schlundt equation is 6.66 and in the Doerner-Hoskins equation 5.6.
L. D. ROBERTS

The production of color in glass and in gems by x-rays and radium rays. M. C. REINHARD AND B. F. SCHREINER. *J. Phys. Chem.* 32, 1886-7(1928).—Glass contg. Bi was colored yellow, but the depth of color does not depend on the concn. of the Bi. Topaz, aquamarine, amethyst, garnet, white and brown diamonds were not affected by intense x-radiation nor by β and γ rays from Rn. Natural quartz is unchanged, while fused quartz is colored brown in spots. White diamond fluoresced blue when exposed to the Rn tube.
L. D. ROBERTS

Electronic waves and the electron. J. J. THOMSON. *Phil. Mag.* [7], 6, 1254-81 (1928).—It is assumed that the electron consists of a nucleus and an outer sphere. This system is studied from the point of view of electrodynamics and gives a picture in accord with modern views of the electron.
GEO. GLOCKLER

Wave mechanics of the rotating electron and the fundamental equations of the electromagnetic field. J. FRENKEL. *Z. Physik* 52, 356-63(1928); cf. *C. A.* 22, 4353.—An attempt is made to establish the fundamental equation of the electron in wave mechanics as a generalization of the Maxwell and d'Alembert equation of classical electromagnetic theory. Mathematical.
GEO. GLOCKLER

Diffraction of cathode rays by calcite. SHOJI NISHIKAWA AND SEISHI KIKUCHI. *Inst. Phys. Chem. Research, Tokyo. Nature* 122, 726(1928); cf. *C. A.* 22, 3577.—The diffraction pattern consists of a no. of bands of different widths and also many black and white lines (black and white being referred to the negative). It resembles the pattern which is produced when the cathode rays are transmitted through a mica sheet. Usually a black line makes a pair with a white line parallel to it; when the distance between the lines becomes small, the pair looks like a band. Some of the bands show satellites which may be regarded as other pairs of black and white lines parallel to the main bands. An interpretation is given of the formation of the pattern.
C. J. WEST

Polarization of an electron beam. F. WOLF. *Z. Physik* 52, 314-7(1928).—If electrons are magnetic dipoles then an electron stream should attain a certain degree of polarization while passing through a magnetic field. Exptl. attempts to show this gave a negative result.
GEO. GLOCKLER

The electrification of air by friction. AGNES W. MCDIARMID. *Univ. of Glasgow Phil. Mag.* [7], 6, 1132-40(1928).—The passage of a rapid current of air through a tube causes the current to carry with it charged particles of air and leaves the tube oppositely charged.
GEO. GLOCKLER

Diffusion of slow electrons in rare gases. H. POSE. *Z. Physik* 52, 428(1928). The theories of G. Hertz (*C. A.* 19, 2908) are tested on Ne, A and He-Ne mixt. Furthermore the assumptions made are studied to find out how far they apply in the cases under consideration. It is concluded that the process is one of diffusion of electrons as has been assumed in the theory.
GEO. GLOCKLER

Ionization by electrons in a homogeneous electrical field. M. J. DRUYVESTEIN. *Z. Physik* 52, 197-202(1928).—The probability of ionization in a rare gas in a homogeneous elec. field is calcd. A differential equation of the second order is deduced for the density of electrons. The equation can be solved for certain conditions. A few curves are given for probability of ionization in Ne.
GEO. GLOCKLER

The quantum theory of electron impacts. J. R. OPPENHEIMER. *Calif. Inst. Techn. Phys. Rev.* 32, 361-76(1928).—The previous treatment of electronic collisions has been incomplete, the error consisting in the neglect of terms which correspond to an interchange of the colliding electron with one of those in the atom. The corrected first-order cross section for elastic collisions is evaluated by Dirac's method for at. H and He. The complete soln. for H is set up by Born's method. The elastic cross section becomes infinite, for low velocities, with the reciprocal of the velocity; further the first order cross section reduces to that already obtained. For H this is a monotonically increasing function; for atoms with completely paired electrons the monotonic increase is broken by a min. at velocities corresponding to about 1 v.; the higher the azimuthal quantum no. of the paired valence electrons, the more marked is the min., and the lower the voltage at which it occurs.
BERNARD LEWIS

The recombination of argon ions and electrons. CARL KENTY. *Princeton Univ. Phys. Rev.* 32, 624-35(1928).—Afterglow spectrum in A due to recombination. The arc spectrum of A persists approx. 0.001 sec. after an arc of 0.4 amp. in pure A at 0.5 mm. pressure is cut off. Lines involving jumps from high energy levels are relatively much stronger in the afterglow than in the arc. When Na vapor is present the D lines are

strong in the arc but absent in the afterglow, showing that the electron speeds in the afterglow are too low to excite the spectrum of A by direct electron impact. The highly excited A atoms must, therefore, be produced by the recombination of ions and electrons. The presence of 0.001 mm. of H does not affect the intensity of the afterglow; so the persistence of metastable atoms is not involved in the production of the afterglow. *Effect of applied potentials on the afterglow.*—Accelerating voltages of 3–10 v. quench the afterglow during the period of application of 0.001 sec. Retarding after-voltages up to 90 v. have practically no effect. Measurements with an intermittently connected exploring electrode show that the velocities of the electrons are increased by the applied accelerating voltage but unaffected by the retarding voltage. The quenching is apparently the result of the decreased probability of recombination because of the higher velocities of the electrons. When low accelerating voltages have been applied for 0.001 sec. the intensity of the afterglow and the cond. of the arc space in the period immediately following this application are both greater than they would be had the voltage not been applied. The intensity of the afterglow is thus directly related to the concn. of positive ions and the quenching of the afterglow is shown to be connected with a saving up of ions, as it should be if the effect of the after-voltages is to prevent recombination. Ordinary arc spectra are obtained under conditions which are here most unfavorable to recombination. They are presumably primary excitation spectra. The use of intermittent discharges for obtaining recombination spectra and strong high series members is suggested. The measurements show positive-ion concns. in the afterglow of the order 10^{12} per cc. The mean energy of the electrons is 0.4 v. From the measured rate of change of the concn. of ions there results a value of 2×10^{-10} for the coeff. of recombination. This value may be in error by a factor of 5 because of several unavoidable errors.

BERNARD LEWIS

The scattering of positive ions from a platinum surface. RONALD W. GURNEY. Princeton Univ. *Phys. Rev.* 32, 467–77(1928).—The velocity and intensity of positive ions scattered at various angles from a metal surface have been measured by allowing the ions scattered from a heated Pt target to pass through slits into the elec. and magnetic analyzing fields of a positive-ray box. The source, oxide catalyst emitting K, Cs or Li ions, could be rotated around the target, so that the latter could be bombarded from any angle. When the target was brought to a red heat the intensity of scattering was markedly increased, presumably because of the removal of a layer of adsorbed gas. With a homogeneous initial beam the ions scattered at a given angle are nearly homogeneous in velocity. But the energy retained by the ions varies continuously with the angle of incidence, rising from 20% of the initial energy to over 80% as grazing incidence is approached. The velocity of ions scattered from a cold target on which an adsorbed layer has formed is much less, the energy retained rising only to 40% of the initial energy near grazing incidence. A sep. app. was used to explore the intensity of scattering in all directions, by means of a collector which could be rotated around the source. For angles of incidence near the normal the intensity is very small, or even zero, but increases with increasing angle of incidence. The most intense scattering takes place in a forward direction, the no. of particles which suffer large deflections being small. Thus for a fixed angle of incidence the no. of particles scattered in a direction normal to the target is very small or even zero, but increases steadily with increasing angle of reflection. The intensity of scattering varies greatly with the energy of the incident ions, rising to a sharp max. at about 40 v. The crit. energy for intense scattering is the same for Cs, K and Li ions.

BERNARD LEWIS

Absorption coefficient of slow electrons in mercury vapor. T. J. JONES. Univ. of Minnesota. *Phys. Rev.* 32, 459–66(1928).—An account is given of measurements by two different methods of the absorption coeff. α in Hg vapor for electrons with energies of 0.5 v. up to 400 v. The expts. described in the first part were made by Ramsauer's method, in which a homogeneous electron beam is obtained by bending the electrons through a series of slits suitably arranged in a magnetic field. The second part deals with expts. made by an arrangement which gave a fairly homogeneous beam of electrons without the use of a magnetic field. In each method the fraction of the initial electrons which traversed a given distance through the vapor without suffering collision was measured, and this enabled α to be calcd. The results obtained by the two different methods were in fair quant. agreement. The absorption coeff. increased continually as the energy of the electrons was reduced down to 0.5 v. The results are in fairly good agreement with those of former workers.

BERNARD LEWIS

The motion of electrons in pentane. J. D. MCGEE AND J. C. JABOER. Univ. of Sydney. *Phil Mag.* [7], 6, 1107–17(1928).—Bailey (*C. A.* 16, 681) has given a detailed account of a method for investigating the motion of electrons in gases, which is particu-

larly applicable to those gases in which ions are formed by attachment of electrons to mols. as a stream of electrons moves through the gas. The same app. and method have since then been used to investigate the motion of electrons in pentane. A similarity exists between the curves of C_2H_4 and C_6H_{12} .
GEO. GLOCKLER

Capture of electrons by molecules. V. A. BAILEY AND J. D. MCGEE. Univ. of Sydney. *Phil. Mag.* [7], 6, 1073-89(1928).—The method of investigating the attachment of electrons to gas mols. which was described (*C. A.* 20, 11) has now been applied to the gases HCl and NH_3 . The former conclusion that h (= probability of attachment at one collision) may vary considerably with k (mean energy of agitation) in NH_3 and in air is again reached and it is certain that the method used by Loeb and Wahlen is liable in general to give erroneous results, for it depends on the assumption that h is a const. characteristic of the gas alone. Cf. I. B. Loeb, *Kinetic theory of gases*. MacMillan Co., New York, 1928.
GEO. GLOCKLER

Mobility of ions in air. IV. Investigations by two new methods. A. M. TYNDALL, L. H. STARR AND C. F. POWELL. *Proc. Roy. Soc. (London)* A121, 172-84(1928).—Ions are generated by α -rays from Po. In the first app. described the life of these is varied by means of the potential pulling them toward a metallic screen. After passing the screen they are filtered by an arrangement of superimposed alternating and steady voltages between screens, taken by a steady voltage to a further screen, filtered as before, and then go on to an electrometer plate. Only those ions reach the electrometer whose time for the passage of the screens is close to the duration of a cycle. In the second type, the field, after pulling the ions from the generating box through a slit, is changed by a commutator so as to pull the ions onto a course at right angles to the first. After passing through a slit into a second box, a second commutation changes the field so as to pull the ions to a course parallel with the first, through another slit to the electrometer collecting rod. The following results were obtained. The mean value for pos. ions of long ages in air is 1.25 cm./v./cm., and is independent of the humidity. If any initial pos. ions (cf. *C. A.* 20, 3383) exist in dry air or pure N they are all transformed in less than $1/100$ sec. The mobility of both pos. and neg. ions in air contg. alc. vapor is independent of the age of the ions from $1/65$ to $2/3$ sec. V. Transformation of positive ions at short ages. A. M. TYNDALL, G. C. GRINDLEY AND P. A. SHEPPARD. *Ibid* 185 94.—An app. is used similar in principle to those of the preceding article, but impurities from container walls are eliminated by using air under blast. It is shown that O_3 has a marked accelerating effect on the transformation of initial to final positive ions in air. The presence of final ions in increased amt. in pure N_2 shows that O_3 is not the only factor involved. Further speculation regarding the nature of this transformation is regarded by the authors as premature.
GREGG M. EVANS

Comparison of measurements of critical potentials of mercury vapor. J. C. MORRIS, JR. Princeton Univ. *Phys. Rev.* 32, 447-55(1928).—The crit. potentials of Hg vapor were examd. with a tube constructed to permit the use of a no. of different methods. For detecting crit. potentials other than those of ionization, the *Hertz method* proved the most satisfactory. Of the 13 crit. potentials found below ionization, 10 have definite spectroscopic interpretation and the remaining 3, which are probably due to Hg mols., confirm similar values by Messenger (*C. A.* 21, 3547). The *partial current method* of Franck and Hertz showed less resolving power, but otherwise gave good agreement with the Hertz method. The *Franck and Einsporn method* gave peculiar results, suggesting that it detected only photoelec. effects and not metastable atoms; and that the failure to show the other crit. potentials was due to features of tube design which eliminated inelastic impacts in the region around the filament where space charge acts to limit emission. *Compton's method* for studying ionization proved very satisfactory since no effects of other types of inelastic impacts were detected. Three *ultra-ionizing potentials* at 10.65, 11.34 and 11.78 were found in good agreement with Lawrence (*Phys. Rev.* 28, 945(1926); *C. A.* 21, 3308), although the present results do not show the regions of max. ionization probability near these values, as reported by him. An attempt to test the mol. origin of these high ionizing potentials led to neg. results.
B. L.

Ionization potentials of methane, ethane, ethylene and acetylene. J. C. MORRIS, JR. Princeton Univ. *Phys. Rev.* 32, 456 8(1928).—After prepn. and purification by the most approved methods, the gases methane, ethane, ethylene and acetylene were introduced into an ionizing tube of the Mackay type and their ionization potentials measured. The app. was calibrated against Hg and He as standards. The values found are: CH_4 , 14.4 v.; C_2H_6 , 12.8 v.; C_2H_4 , 12.2 v.; C_2H_2 , 12.3 v. These are believed to be correct to 0.2 v.
BERNARD LEWIS

Temperature of the cathode as a factor in the sputtering process. L. R. INGERSOLL AND L. O. SORDAHL. Univ. of Wisconsin. *Phys. Rev.* 32, 649-56(1928).—Au, Pt and

Ni show an increase in the rate of sputtering in A with increase in cathode temp. The lower the sputtering voltage the more pronounced the effect. Films sputtered from a hot cathode show considerable initial aging, i. e., suffer less change in resistance on baking and show a more definite crystal structure than those from a cold cathode. While evidence is presented to show that the "explosion theory" of sputtering may have a certain basis of fact, especially as regards starting conditions, the results are, on the whole, consistent with the explanation of sputtering as essentially a vaporization process. The indications are, however, that ordinary evapd. films even when produced under the same pressure as sputtered films, contain less gas, pointing to the excitation accompanying the discharge as an important factor in the process of gas occlusion in the films. B. L.

Theory of photoelectric effect. H. TH. WOLFF. *Z. Physik* 52, 158-60(1928).—The hypothesis is made that photoelectrons are conduction-electrons which have received addnl. energy from atoms by collisions of the second kind. The atoms have been excited optically. GEO. GLOCKLER

A photoelectric phenomenon which can be detected with audions. Q. MAJORANA. *Atti accad. Lincei* [6], 7, 801-6(1928).—The phenomenon was discovered during expts. with an amplifier of low frequency with transformers having 3 thermionic or audion lamps, and in a system so arranged that it was extremely sensitive to changes of potential. When light was coned. intermittently on the audions, a telephonic sound exactly corresponding to the frequency of interruption of the light was detected. It was proved that the effect was due to a photoelec. property of oxidized Cu imbedded in the vitreous mass, and is different from phenomena already known in that a gaseous medium is lacking and in that there is no variation of elec. resistance as in the Se cell. The phenomenon is of general importance in that it shows the great sensitivity of CuO to light under conditions such as those of the expt. C. C. DAVIS

The potential of photoactive cells containing fluorescent electrolytes. H. W. RUSSELL. Cornell Univ. *Phys. Rev.* 32, 667-75(1928).—*Variation with time of illumination of the potential of a cell contg. rhodamine B dissolved in abs. alc.* A theory of the variation of potential with time has been developed for the photoactive cell. It is assumed that the exciting light produces a chem. change in the electrolyte. Allowing for the effects of diffusion the expression $E = K \log [T^{1/2} - t^{1/2} + (t/2T^{1/2}) - (t^2/8T^{3/2}) + (B/I)] - K \log (B/I)$, where E is the e. m. f., T is the time of illumination, t is the time after illumination ceases, I is the intensity of illumination, and K and B are consts., has been derived. By the use of a cell with Pt electrodes contg. Rhodamine B in abs. alc. and illuminated with monochromatic light, results in good agreement with the theory are secured. Diffusion is shown to play an important part. Goldmann's theory is shown to be inadequate. No "limiting potential," independent of the intensity of illumination, was found. No evidence was found which indicated the presence of Hollwachs' photoelec. effect. BERNARD LEWIS

Photoelectric phenomenon. B. POGÁNY. *Technika* (Budapest) 9, 1-2, 8-11 (1928). A brief exposition. S. S. DE FINÁLY

Photoelectric thresholds and fatigue. GEORGE B. WELCH. Cornell Univ. *Phys. Rev.* 32, 657-66(1928). Using elements of the highest purity, clean surfaces were prepd. in a vacuum tube of the order of 10^{-6} mm. of Hg. by means of an electromagnetic filing device. A linear relation was found between the logarithm of the photoelec. current and the logarithm of the time elapsed since polishing the specimen. The rate of fatigue depends upon the element used and the factors which produce fatigue and, for a given substance, increases numerically as the threshold is approached. Increasing the pressure increases the rate of fatigue. The action of light has a negligible effect. The values of the photoelec. threshold for Ca, Fe, Cs, Ni, Cu, Zn and Ge are, resp., 4475, 3155, 3165, 3040, 2955, 3180 and 2880 A.U. Within a period of several hrs. at least photoelec. fatigue causes no change in these values when a high vacuum is used. Evidence for a shift toward shorter wave lengths is obtained for lower vacua. A theory in which contamination takes place at discrete areas of the surface of the element is proposed to account for the exptl. facts obtained. BERNARD LEWIS

The element of time in the photoelectric effect. ERNEST O. LAWRENCE AND J. W. BEAMS. Yale Univ. *Phys. Rev.* 32, 478-85(1928).—*Time of appearance and cessation of the photoelec. effect from a K hydride surface:* A method has been devised which has made possible the study of the time variation of the photoelec. emission from a metal surface illuminated by flashes of light 10^{-8} sec. in duration. The exptl. arrangement has also yielded information on the speed of operation of the Kerr cell electro-optical shutter described in earlier work, and has made possible for the first time the observation of the steepness of wave fronts travelling along wires resulting from spark discharges. Photoelec. emission begins in less than 3×10^{-9} sec. after the beginning

of illumination of a K hydride surface. The light shutter closes less abruptly than it opens and the exptl. observations indicate that the sum of the time required for the shutter to close plus the time during which the photoelec. emission persists after cessation of irradiation is less than 10^{-8} sec. A wave traveling along a wire resulting from a sudden change in potential of one end by a spark discharge is so steep that the time necessary for about $\frac{1}{2}$ the wave-front to pass a point 6 meters along the wire is 4.5×10^{-9} sec. Theoretical considerations bearing on these results are discussed. BERNARD LEWIS

The influence of deformation on the internal photo effect of rock salt crystals. ADOLF SMEKAL. *Naturwissenschaften* 16, 760(1928).—It has been shown by Podaschewsky (*Ibid* 653) that plastic deformation of crystals, concurrent with decrease in yellow coloration, of rock salt is accompanied by a decrease in internal photo effect. It remains to be studied whether this decrease is due to a direct destruction of the photo centers or to a decrease in the stability of them. Possibly the electron sepn. energy is lowered locally by the plastic changes. B. J. C. VAN DER HOEVEN

Magnetism and nuclear structure. D. ENSKOG. *Z. Physik* 52, 203-20(1928).—Correction of a slight error in the paper abstracted in *C. A.* 22, 1271. Further discussion of nuclear structure based on magnetic forces. Packing defects calcd. appear to have the right order of magnitude. GEO. GLOCKLER

Change of magnetization intensity of iron upon stretching. J. B. SETH, CH. ANAND AND M. DAYAL. *Z. Physik* 52, 382-8(1928).—An Fe wire located in various weak magnetic fields is put under various tensions. The magnetization intensity changes. The curves showing the intensity of magnetization for various fields as a function of the stretching are similar and also resemble the curves connecting stretching and load. GEO. GLOCKLER

Magnetostriction of single crystals of iron. N. AKULOV. *Z. Physik* 52, 389-405(1928).—A general equation of the expansion energy of dipole-lattices, electro-striction and magneto-striction is given. Comparison with exptl. curves shows satisfactory agreement. Conclusion: Fe ions have no marked elec. dipole moment and they act as simple magnetic dipoles as far as their mutual magnetic inter-action is concerned. G. G.

Anomalous magnetic rotation in excited neon. R. N. JONES. Univ. of Chicago *Phys. Rev.* 32, 681-8(1928).—The anomalous magnetic rotation of the plane of polarization was observed near 20 lines belonging to the transition, $s_3 - p_k s_4 - p_k$ and $s_3 - p_k$. Quant. measurements were made of the angle of rotation for different frequencies near 16 lines. The effect is the normal effect, sym. on both sides of the line, the direction of rotation being neg. From the angle of rotation the dispersion consts. were detd., the formula derived by Kuhn being used. This formula requires a knowledge of the relative intensities in the longitudinal Zeeman effect. They were calcd. from the theoretical rules of Hönl, and were found to give good results. The relative transition probabilities, for absorption lines having the same lower state, were calcd. from the ratios of the dispersion consts., Ladenburg's formula being used. The values so found are, in general, in good agreement with those previously detd. from the anomalous dispersion. B. L.

The direction of ejection of photoelectrons by polarized x-rays. C. J. PIETENPOL. New York Univ., Univ. Heights, N. Y. *Phys. Rev.* 32, 564-9(1928).—P. has studied the lateral distribution by means of Geiger counters which could rotate about the polarized beam. The electrons were ejected from air at a low pressure in which the mean free path of the electron is many times the distance through which the electron must move to enter the counter. Allowance being made for the fact that completely polarized beams are impossible to obtain in practice, the data strongly favor the cosine squared relation of Auger and Perrin rather than the relation deduced by Bubh. BERNARD LEWIS

Are characteristic x-rays polarized? E. O. WOLLAN. Univ. of Chicago. *Proc. Natl. Acad. Sci.* 14, 864-7(1928). K_α lines of Mo are not polarized in excess of 1%. D. D.

Precision-measurement of x-rays from Zn to Ru. B. EDLEN. *Z. Physik* 52, 364-71(1928).—The K_α lines of Zn, As, Se, Br, Rb, Sr, Yt, Zr, Cb and Ru are measured in first order. GEO. GLOCKLER

Intensity distribution in the Compton effect. F. SAUTER. *Z. Physik* 52, 225-34(1928).—An attempt is made to derive equations for the intensity of the Compton lines on the basis of pure quantum theory. By means of appropriate hypotheses theory and expt. check satisfactorily. GEO. GLOCKLER

Theory of x-ray diffraction in liquids. G. W. STEWART. Univ. of Iowa. *Phys. Rev.* 32, 558-63(1928); cf. *C. A.* 23, 30.—There are numerous exptl. results in the diffraction of x-rays in liquids that seek explanation by an adequate theory of which S. enumerates 9. The conception of mol. non-cryst. groupings in the liquid makes possible the use of the crystal powder theory as an idealized one for liquids. It is found that

used as an approxn. this theory explains all the phenomena listed. The Erhenfest formula, intended for gases but which has been used to obtain the mean mol. sepn. in liquids, and which varies from Bragg's law by about 19%, cannot be so applied to liquids.

BERNARD LEWIS

Fine structure of the scattered radiation from graphite. BERGEN DAVIS AND DANA P. MITCHELL. Columbia Univ. *Phys. Rev.* 32, 331-5(1928).—The analysis of the "undisplaced" scattered radiation was made with a double x-ray spectrometer. Four lines were observed: (a) an undisplaced line at position of Mo $K\alpha_1$; (b) a line displaced $80''$ (0.0012 A. U.) from $K\alpha_1$; position: (c) a line displaced $140''$ (0.002 A. U.) from $K\alpha$; (d) a line displaced $780''$ (0.0113 A. U.) from $K\alpha_1$. These are all on the long wave-length side of Mo $K\alpha$. The undisplaced line (a) is scattered from the whole atom. The line displaced (0.0113 A. U.) agrees closely with $h\nu' = h\nu - V_e$, where V_e is the energy level (287 v.) of the C atom. The line (b) is displaced 0.0012 A.U. This is equiv. to 29 v., which does not agree with the L_{III} level of C (11.2 v.) The line (c) is displaced 0.002 A. U. This is equiv. to 50 v. which does not agree with the L_I level of C (34 v.). With these 2 lines the relation $h\nu' = h\nu - V_e$ does not hold. A search was made for scattered radiation on the short wave-length side of the Mo $K\alpha_1$ position with neg. results.

B. L.

Investigation of continuous x-radiation from thin aluminum films. HELMUTH KULENKAMPFF. Tech. Hochschule, München. *Ann. Physik* 87, 597-637(1928).—Since loss of speed and diffusion of cathode rays veil the regularity of the process of emission of continuous x-radiation more with massive anti-cathodes than with thin layers of metal, K. has used thin Al foil as an anti-cathode in his expts. The intensity of the x-radiation is too small to use a spectrometer; the compn. of the radiation was obtained by measuring the absorption in Al filters. The max. of hardness of the radiation was found to be at an angle of 67° ; the radiation showed no marked difference between the angles of 90° and 55° , but was weaker at 30° and 140° . Through application of Sn, Ag and Zr, as absorbing substances, narrow spectrum limits could be filtered out of av. parts of the spectrum. This radiation is so homogeneous that in a small-voltage interval the course of the isochromator can be estd. For angles of 90° , this radiation showed decreasing intensity with increasing voltages. The azimuthal intensity distribution was investigated in respect to wave length with const. voltage (Al, Ag, Zr filters) and in respect to voltage for the same wave length. The direction of the most important emission is independent of the wave length and coincides with the direction of the max. of hardness. It depends only on the speed of the cathode rays and changes from 73° to 64° if the voltage is raised from 16.4 to 37.8 kv.

MALCOLM DOLE

The similarity in x-ray spectrum of fluid crystals and of the liquid phase of the same substance. J. R. KATZ. Univ. Amsterdam. *Naturwissenschaften* 16, 758-9 (1928).—Previously (*C. A.* 22, 4021) K. has shown that mols. of various substances (Me and Et salicylate, methylindole, etc.) in the true liquid state show x-ray interference lines indicating stiff mols. in some lattice-like arrangement. In order to elucidate the difference between this and the liquid cryst. state K. took x-ray spectra around the transition point liquid-fluid crystal, studying in particular the fine structure of the interference rings. Quite similar diagrams were found without any characteristic differences (*p*-azoxyanisole, *p*-azoxyphenetole, *p*-azoethyl benzoate, etc.). All diagrams indicated, parallel, i. e., lattice-like order of the stretched mols. It is improbable that the fluid crystals consist of a conglomeration of true crystals; however, the mol. bundles in the fluid crystals (order of 10^4 units, Ornstein) must be considerably larger than in the true liquid.

B. J. C. VAN DER HOEVEN

Absorption spectra of liquid-crystals. D. VORLÄNDER. *Naturwissenschaften* 16, 759-60(1928).—By means of a quartz spectroscope the absorption spectra of several liquid cryst. esters were detd. It appears from the reproduced spectra that the transition from "amorphous" liquid into cryst. liquid is very little marked as compared with considerable changes in spectrum at the transition from the latter into the solid cryst. state. Conclusion: Liquid crystals are an amphibious form, not an independent intermediary one.

B. J. C. VAN DER HOEVEN

Oven for x-ray investigations at high temperatures and preliminary results with pentaerythritol and quartz. WILLI M. COHN. *Z. Physik* 50, 123-36(1928).—A camera is described in which the fine structure of the x-ray spectrum of solid, non-conducting substances may be detd., the prepn. being brought to a known high temp. for long periods. Both with pentaerythritol and quartz, the effect of rising temp. was to cause a general weakening of the intensity of the bands with equal times of exposure and a falling off of the higher interference bands. On the other hand, the broadening of the lines which was anticipated on theoretical grounds was observed only with pentaerythritol.

A. L. HENNE

Alkali-halide crystals with copper impurity. A. M. MACMAHON. *Z. Physik* **52**, 336-41(1928).—Alkali-halide crystals are not stable when contg. an impurity of Cu ions. These ions deform the crystal lattice. The emission spectra of these crystals change in the course of time (a few months). The absorption bands behave the same on cooling as do the bands of Pb and Tl contg. halides. The bands due to the Cu impurity resolved into partial smaller bands on cooling. The absorption bands become more narrow and less tall upon cooling. GEO. GLOCKLER

Note on the effect of chemical combination on the structure of the K absorption limit. BERGEN DAVIS AND HARRIS PURKS. Columbia Univ. *Phys. Rev.* **32**, 336-8 (1928).—The structure of the K absorption limits of some chem. compds. was examd. with the double x-ray spectrometer. The K absorption limits of the elements Ag, Mo and Cu, and the compds. Ag_2S , Ag_2O , MoO_3 , MoS_2 and Mo_2O_3 were examd. for increase in width or fine structure. The width for the pure element decreases with increasing at. no. The general effect of chem. combination was to broaden the absorption limit but there was little displacement; in one case, Mo_2O_3 , there was evidence of fine structure. The Ag salts appeared to be reduced by the x-rays. Expts. of Read (*Phys. Rev.* **28**, 898(1926) and *C. A.* **20**, 2616) indicate an increase of absorption of the absorbing element due to temp. The results were interpreted as due to a shift in the absorption limit. This was examd. with the double spectrometer. A strip of Mo was heated to incandescence in vacuum. The position and form of the K limit was identical with that of the cold strip. No effect of temp. was detectable. The authors believe their method would detect $1/10$ the displacement estd. by Read. BERNARD LEWIS

Mechanism of abrasion. W. D. KUZNETZOV, N. A. BESSNOV AND N. F. PITCHENIN. *Z. Physik* **25**, 420-7(1928).—The work necessary to cause abrasion of the surface of a cubic crystal is studied. NaCl, KCl and KI behave according to theoretical prediction. As a result it is stated that the method of polishing can be used to det. the relative values of the surface energy of material of similar structure. GEO. GLOCKLER

Quantum-mechanical theory of the natural optical activity of liquids and gases. L. ROSENFELD. *Z. Physik* **52**, 161-74(1928).—A general formula for the optical rotatory power is derived on the basis of modern quantum mechanics. Mathematical. G. G.

The intensities of the lines in the spectrum of mercury. E. O. HULBERT. Naval Research Lab., Washington, D. C. *Phys. Rev.* **32**, 593-9(1928).—The total radiation, measured with a thermocouple, in the spectral region 6000 to 2300 Å. U. from a small quartz Hg lamp of known size filled with Hg vapor at a known pressure was 1.85×10^{-10} ergs per atom per sec. From this and the intensities of the lines it was found that each atom on the av. emitted each sec. 11.4, 8.9, 5.0, 2.3, etc., quanta of yellow, green, blue, violet, etc., light, resp. The intensities of 24 lines of the spectrum were measured with a quartz spectrograph, a thermocouple, and a photoelec. cell, all calibrated. In some cases a photographic densitometer was used. Plotting the logarithm of the intensity against the frequency for the lines of a series gave roughly straight lines of about the same slope for the sharp series ($2^3P_n - m^3S_1$) and for the diffuse series ($2^3P_n - m^3D_{1,2,3}$). The temps. of the excited atoms derived from the slopes were 3900° and 2600° K. for the sharp and diffuse series, resp. BERNARD LEWIS

The influence of foreign gases on the optical excitation of mercury. E. GAVIOLA. Johns Hopkins Univ. *Phil. Mag.* [7], **6**, 1167-91(1928).—The increases and decreases of the intensities of the Hg lines in the optical excitation of Hg vapor when foreign gases are admitted into the fluorescence tube are readily explained, using the results of the theory on the optical excitation of Hg vapor (cf. following abstr.). The influence of diverse gases upon the absorption of the line 4046 by the metastable Hg atoms has been studied experimentally to det. the amt. of metastable atoms produced by each of the gases at different pressures. Diffusion of metastable atoms has been directly demonstrated, showing their long lifetime. The higher metastable level 2^3P_2 is very sensitive to collisions with gas mols., and its lifetime when no foreign gas is present has been calcd. to be of the order 10^{-5} sec. The mean life of the lower metastable level 2^3P_0 has been calcd. to be of the order of $1/300$ of a sec. under the present conditions, and a further calcn. shows that it can increase to about 10 secs. under ideal conditions (in stars, for instance). The efficiency of quenching collisions of N_2 with excited atoms in the resonance level is of the order of magnitude 1. The no. of metastable atoms produced by the presence of a few mm. of N_2 or H_2O vapor is estd. to be about 100 times the no. of excited atoms in the resonance level. The different changes of the intensities of the lines along the slit of the spectrograph when gases are admitted and an image of the cross-section of the tube is formed upon it are explained for every one of the lines appearing in fluorescence. GEO. GLOCKLER

The power relation of the intensities of the lines in the optical excitation of mercury.

E. GAVIOLA. Johns Hopkins Univ. *Phil. Mag.* [7], 6, 1154-67(1928).—The intensity of the different lines of Hg vapor at room temp. when excited optically by a water-cooled Hg arc has been calcd. as a function of the primary intensities, and of the position of the emitting vol. element in the tube, and the results allow one to understand the special behaviors of some lines like 3650. The absorption laws for lines like 4358 and 3650 in excited Hg vapor have been calcd.

GEO. GLOCKLER

New contribution to the spectrum of bromine in the electrodeless discharge. N. SIRACUSANO. Reale Univ., Catania. *Atti accad. Lincei* [6], 7, 835-8(1928).—The method already developed for detg. the spectra of Cl and of As in a discharge without electrodes (cf. *Atti accad. gioenia Catania*, [Mem.] III, 1926) was modified and perfected so that it could be applied to the spectrum of Br. CuBr_2 was used. With the smallest distances of explosion (1-2 mm.) for 45-60 min., the spectrum was continuous, with faint lines which formed a characteristic group. The discharge was pale blue, with little intensity. The group of lines increased in intensity with increase in the excitation, finally becoming most intense at the center. These lines are in great part new and are tabulated, the data showing a practically const. sepn. of 3685^{-1} cm., which is the value noted by Turner (cf. *C. A.* 20, 2613) in the ultra-violet region.

C. C. DAVIS

The relative intensities of the Stark effect components of the Balmer lines $H\beta$ and $H\gamma$. H. MARK AND R. WIERL. I. G. Farbenindustrie Aktiengesellschaft, Ludwigshafen. *Naturwissenschaften* 16, 725-6(1928).—The relative intensities of Stark-effect components repeatedly found, the reverse of those expected from the Schrödinger theory, were now detd. in 2 different ways, in Stark's way by canal rays parallel to the lines of force of the field; addnl. to this, fields perpendicular to the rays were used. All other conditions were left the same; the field was 200 k.v. per cm. From 2 photometer curves of $H\beta$ $\Delta = 8$ and 10 Stark's observations were confirmed for the first method (10 stronger than 8); for the second method the ratio was reversed in agreement with Schrödinger's theory. The same holds for the $H\gamma$ components $\Delta = 5$ and $\Delta = 2$, not for $\Delta = 13$ or 10.

B. J. C. VAN DER HOEVEN

Interference of corpuscular rays. W. ELSASSER. *Naturwissenschaften* 16, 720-5 (1928).—A review is given of reflection of elec. rays on metals. The work of Davisson and Germer (*C. A.* 22, 350) is described in detail. Thomson's (*C. A.* 22, 1723) and Rupp's work is briefly mentioned.

B. J. C. VAN DER HOEVEN

The spark spectrum of neon. A. S. GANESAN. Imperial Coll., London. *Phys. Rev.* 32, 580-2(1928).—A list of lines in the spark spectrum of Ne between $\lambda 2300$ and $\lambda 1850$ is given. Many of the lines seem to belong to Ne III.

BERNARD LEWIS

The 29- and 30-electron <system spectra of arsenic and selenium. R. A. SAWYER AND C. J. HUMPHREYS. Univ. of Michigan. *Phys. Rev.* 32, 583-92(1928).—New vacuum-spark data in the extreme ultra-violet have been obtained for As and Se. By aid of previous classifications in the 29- and 30-electron-system spectra of Cu, Zn, Ga and Ge, it has been possible by extrapolation of the Moseley diagram, the irregular doublet law, screening const. data and the triplet interval ratios to predict the location of and to identify the lines arising from transitions between the lowest levels in the spectra of As IV, As V, Se V and Se VI. The ionization potential of As V is detd. as 62.4 v., that of Se VI as 81.4 v. The $(4P^2)^3P$ sepn. of the 30-electron-system spectra is observed to show a rapid increase with respect to the sepn. both of $(4s4p)^3P$ term and $(4p)^3P$ term of the next ion. The theoretical significance of this effect, which is observed here for the first time, and which does not appear in the corresponding isoelectronic spectra of the lighter elements, is discussed. The effect is believed to be due to a change of coupling of the quantum vectors with increasing nuclear charge.

BERNARD LEWIS

The structure of the induction spectra of rare gases—arc spectra of argon, krypton and xenon. ADOLFO T. WILLIAMS. *Proc. Phys. Soc.* (London) 40, 312-5 (1928), cf. *C. A.* 22, 4373.—The purpose of the paper is to establish the usefulness of the excitation by induction method to sep. different orders of the spectra of rare gases. An examn. is made of the arc spectra, const. sepn. and groups of lines obtained by Bloch and Dejaridin. The probable regions occupied by different series are given. Meissner's results in the arc spectrum of A do not agree with groups of lines deduced by Bloch and Dejaridin.

FRANK V. JOHNSON, JR.

The refractive index of sodium vapor and the width of the D lines in absorption. JOHN Q. STEWART AND SERGE A. KORFF. Princeton Univ. *Phys. Rev.* 32, 676-80 (1928).—Classical methods being employed, a theoretical relation is developed between the refractivity of Na vapor near the D lines and their observed width in absorption. A preliminary exptl. test of this relation is described. The method involved observation of the wave lengths of interference fringes produced by Na vapor when a Michelson interferometer was used in conjunction with a spectroscope and a source of white light.

This is a convenient means of detg. refractivity in cases where it varies rapidly with wave length. The approx. observations verify the classical theory, and serve to give a detn. of e^2/mc^2 which is correct in order of magnitude. As regards the scattering of radiation Na atoms may be considered as behaving in a manner analogous to Hertzian oscillators.

BERNARD LEWIS

Polarization of resonance radiation in mercury. HARRY F. OLSON. Univ. of Iowa. *Phys. Rev.* 32, 443-6(1928).— $1^1S_0 - 2^3P_1$ of Hg excited by plane polarized light shows incomplete polarization both in the absence and in the presence of a weak field parallel to the elec. vector. The amt. of initial polarization depends upon the relative intensities of the hyperfine structure lines in the exciting light. The polarization with various relative orientations of field and light vector and the variation with field intensity in weak fields may be interpreted successfully by means of a semi-classical model, with proper relativ. intensities parallel and perpendicular to the light vector, rotating after excitation with an angular velocity $g\hbar/2mc$ and emitting a damped wave. From curves connecting depolarization, rotation of max. of polarization, etc., with field intensity α , the damping const. has been found to be $1.02 (\pm 0.02) \times 10^7 \text{ sec}^{-1}$.

BERNARD LEWIS

Absorption bands in the spectra of mixtures of metallic vapors. R. K. WARING. Johns Hopkins Univ., Baltimore. *Phys. Rev.* 32, 435-42(1928).—It is shown by expt. that at a given temp. the amt. of Tl in the vapor is increased by adding Hg vapor. This indicates definitely that Tl-Hg mols. are formed. In a mixt. of Tl and Hg vapors a no. of bands appear in absorption, which are to be attributed to the HgTl mol. In no case was the resolving power sufficient to show structure. Asymmetric broadening of the at. Tl lines and of the Cd line 2288 due to Hg vapor has been observed. Two possible explanations are discussed: broadening due to a superimposed mol. band, and broadening due to transfer of kinetic energy by collisions. Absorption due to InCd mols. were observed in mixts. of In and Cd vapors at temps. of 400°, 500° and 800°. Their short wave-length limits are tabulated. A few showed traces of their structure but the resolving power was not sufficient to make measurements possible.

BERNARD LEWIS

Band spectra in the extreme ultra-violet excited by active nitrogen. HAROLD P. KRAUSS. Univ. of Cal., Berkeley, Cal. *Phys. Rev.* 32, 417-26(1928).—To det. the amt. of energy available in active N_2 for the excitation of spectra, a vacuum grating spectrograph was used to observe spectra between 2500 and 1000 A.U. excited in certain gases in the afterglow. The gases were mixed with glowing N_2 obtained from a stream of N_2 , passing through a discharge tube contg. an oscillatory discharge. H_2 , O_2 , N_2 , CO and NO were studied, of which only CO and NO showed bands in the region mentioned. In addn. to the β and γ bands of NO characteristic of the afterglow, a progression was found belonging to another system with the same final levels, i. e., levels assocd. with the normal electronic state of the mol. The initial level identified from published absorption data as an electronic state with zero vibration is designated as level C, and the new system as the δ band system of NO. The O-O δ -band is at 1915.7 Å corresponding to 6.44 v. A few bands of the 4th positive group of CO were obtained in the afterglow, corresponding to the excitation of vibration states $n' = 1$ to 6 of electronic level A. The total energy of these levels is from 8.2 to 9.0 v. The results are discussed. It is assumed that atoms of N can combine to form an excited diatomic mol. if the encounter is such that the energy of formation and the relative kinetic energies of the atoms go over into electronic, vibrational and rotational energies of the mol. Such encounters will be rare, because both energy and momentum must be conserved in the recombination, therefore, the active modification will have a relatively long life. On formation, the mols. have 11.4 ± 0.3 v. of energy; part of this is lost immediately by radiation of the α bands, leaving 9 to 10 v. in a configuration which is strongly metastable with respect to the normal electronic state. This metastable mol. is considered responsible for the excitation of spectra in the afterglow.

BERNARD LEWIS

Beryllium hydride band spectra. WM. W. WATSON. Univ. of Chicago. *Phys. Rev.* 32, 600-6(1928).—Two new band systems appear in a Be arc in H_2 , one in the green from 4800 A.U. to 5120 A.U. and the other from 3700 A.U. to beyond 2200 A.U. in the ultra-violet. Measurements of the bands of both systems at high dispersion are reported and the quantum analysis is given. The green band group belongs probably to the $^3P \rightarrow ^3S$ class due to BeH mols. It consists of the 0-0, 1-1, 2-2, etc., bands, degrading to the violet but all branches exhibit a marked shift to the red for $j > 30$. The analysis gives $I_0' = 2.6833 \times 10^{-40}$ g. per sq. cm. and $I_0'' = 2.7212 \times 10^{-40}$ g. per sq. cm. for the moments of inertia, $r''_0 = 1.35 \times 10^{-8}$ cm., $\omega_0' = 2053.4$, $\omega_0'' = 2025.7$. The ultra-violet system consists of singlet P, R branch bands degrading to the red, the equation for the zero points being $v = 39,059 + 1460.5 n' - 14.5 n'^2 - 2182.0 n'' + 41.0 n''^2$.

For this system $I_0' = 3.85 \times 10^{-40}$ g. per sq. cm and $I_0'' = 2.50 \times 10^{-40}$ g. per. sq. cm., $r_0' = 1.29 \times 10^{-8}$ cm. A discussion of the probable electronic transition for the ultra-violet bands is included.

BERNARD LEWIS

The less refrangible bands in the spectrum of tin monochloride. W. F. C. FERGUSON. New York Univ. *Phys. Rev.* 32, 607-10(1928).—Four groups of bands previously obtained by Jevons (*C. A.* 20, 1561) in a discharge through SnCl_4 vapor are now found also in streaming active N_2 . Two groups α and β were previously classified as a $^2S \rightarrow ^2P$ transition in SnCl_4 ; with the help of new measurements, and from an examn. of the band structure, it is concluded that the other two groups, $\lambda 3500$ and $\lambda 3800$, are a $D^2 \rightarrow ^2P$ transition with the same 1P state as the α and β bands. The Cl_2 isotope effect confirms the identity of the emitter as SnCl_4 as also the vibrational quantum no. assignments. The vibrational intensity distribution (intensity concn. in $n = 0$ sequence) is in qual. agreement with theory, for the ratio of ω_0'' to ω_0' . An attempt was made to obtain analogous bands by introducing SnI_4 vapor into active N_2 , but no new bands were obtained.

BERNARD LEWIS

The absorption spectrum of liquid benzene. JAMES BARNES AND W. H. FULWEITER. Bryn Mawr College. *Phys. Rev.* 32, 618-23(1928); cf. *C. A.* 22, 730.—A *precision method* is described for measuring the wave lengths of radiation in the rear infra-red region of the spectrum by using a six-foot Rowland concave grating with a thalofide cell. The results obtained are believed to be accurate within 0.001μ . By this method the wave length of an outstanding absorption band of liquid benzene was detd. The frequency of this band together with those of other bands previously measured substantiates the theory that the absorber of these radiations is a linear anharmonic oscillator, whose energy states are represented by odd multiples of half quanta.

B. LEWIS

Absorption band spectrum of iodine monochloride. EARL D. WILSON. Ohio State Univ. *Phys. Rev.* 32, 611-7(1928).—The visible absorption spectrum of ICl was photographed and measured. Eight new members have been located in the two series described by Gibson and Ramsperger (*C. A.* 22, 354) as corresponding to $n'' = 1$ and $n'' = 2$. The limit of convergence of the former series is at $v. = 17,430 \pm 5$ per cm., which makes the heat of dissocn. equal to $49,650 \pm 15$ cal. per mol. Four members of a new series for which $n'' = 3$ have been found. It is thus possible to compute the fundamental vibratory frequency of the mol. as 381.9 per cm. Still another series of 5 members is recorded whose presence may be due to the existence of a close electronic doublet having a sepn. of about 36 per cm. The ratio of the two *sp. heats* of gaseous ICl has been calcd. to be 1.30, in agreement with empirical results. The fine structure of 3 consecutive bands has been measured and the corresponding values of the parabolic parameter C have been computed to be in agreement with the theory of change of moment of inertia, I , with ω , the frequency of vibration of the mol. By combining both sets of data for band heads and fine structure the following approx. values for the *moment of inertia* have been computed $I'' = 575 \pm 100 \times 10^{-40}$ g. per. sq. cm.; $I' = 995 \pm 200 \times 10^{-40}$ g. per sq. cm.

BERNARD LEWIS

Experimental test of combination rules in band spectra. E. BENGTSSON AND E. HULTHÉN. *Z. Physik* 52, 275-9(1928).—Two band systems are known in AlH : $P \rightarrow ^1S$ and $^1S' \rightarrow ^1S$. A combination system was found, $^1S' \rightarrow ^1P$. The combination rules established by Kronig are tested exptly. Cf. *C. A.* 22, 1278; 23, 32.

G. G.

Band spectrum of helium. W. WEIZEL. *Z. Physik* 52, 175-96(1928); cf. *C. A.* 23, 504. Nine new bands of He are recorded. Partly they are higher series-members of known bands. They show great anomalies which have already been known to a slight extent in previously known bands. The anomalies are explained by the assumption that rotation affects the moment of momentum vector of the electron orbit, causing a component along the axis of rotation. This leads to a doubling of the rotation terms. The electron-energy levels of He_2 are systematized completely.

GEO. GLOCKLER

Electronic states and band spectrum structure in diatomic molecules. VII. $^2P \rightarrow ^2S$ and $^2S \rightarrow ^2P$ transitions. ROBERT S. MULLIKEN. Wash. Sq. College, New York Univ. *Phys. Rev.* 32, 388-416(1928); cf. *C. A.* 22, 355.—A survey is made of the varied empirical structure-types to be expected for $^2P \rightarrow ^2S$ and $^2S \rightarrow ^2P$ bands, and examples of these types are discussed individually. In agreement with Kemble's theory, the arrangement of the rotational levels in the 2P state changes continuously with the parameter $\Delta E/B$ (ΔE = elec. doublet sepn.), and these changes are responsible for a large part of the observed variations in band structure. Figures and tables are given showing how the arrangement of the 2P levels changes with $\Delta E/B$ and also how observed branches are related to energy levels, for the MgH , OH , HgH and $\text{NO } \gamma$ bands. Data on A and B are listed for a no. of mols. The mode of variation of the arrangement of

the rotational levels in 1P states appears to be in striking agreement with the quant. formulas of Hill and Van Vleck. *E. g.*, if $\Delta E/B = +2$ their equation becomes formally identical with the Kramers and Pauli formula which holds exactly for the 3P state of CH. A consistent notation is given here for the known branches of the MgH, CaH, OH, ZnH, CdH, HgH and NO bands. A more or less detailed discussion is given of the spectra mentioned, especially MgH and OH; some term values are given for 3P and 3S states of MgH, CaH and OH. In the bands just mentioned, band structure and missing lines show good agreement with theory. In the cases where $|\Delta E/B|$ is small for the 3P state (CH, MgH) there is agreement with the case *b* intensity theory (6 main branches, 4 weak satellite branches). As $|\Delta E/B|$ increases, the satellite branches get stronger and 2 new branches become evident. This tendency first appears distinctly in OH, where the satellite branches, although very weak, are much too strong for Hund's case *b*, and where a previously unclassified very weak branch is found to be 1 of the 2 new branches just mentioned. As $|\Delta E/B|$ increases still further, the 6 weak branches finally become equal to the other 6 in intensity. The observed relations, in particular the equality of intensity of the 6 weak and 6 strong branches when $|\Delta E/B|$ is very large, appear to be in excellent agreement with the quant. intensity formulas of Hill and Van Vleck. A conclusion of interest for the empirical study of $^3P \rightarrow ^3S$ and $^3S \rightarrow ^3P$ bands is the following: in four-headed bands of these types the *first* head should always be weaker than the rest unless $|\Delta E/B|$ is large and should disappear if $|\Delta E/B|$ is near zero. Intensity relations in $^3P - ^3S$, $^3P \rightarrow ^1S$, and other types of bands are briefly discussed for the case that one electronic state falls under Hund's case *a*, the other under his case *b*; some predictions are made.

BERNARD LEWIS

Polarization of the resonance radiation from degenerate systems. FRANK C. HOYT. *Phys. Rev.* 32, 377-87(1928) —The problem of resonance between light and an atom is treated by solving the wave equation through the method of variation of consts. An initial degeneracy is removed by the action of the light and there occur fluctuations between the two states involved. Calc. of the elec. moment of the perturbed atom on the Schrödinger d. hypothesis shows that when the incident light is linearly polarized the radiation has the same degree of polarization as though the atom were in a weak magnetic field parallel to the elec. vector of the light. For circular polarization this fictitious field is perpendicular to the plane of polarization. These results confirm the Heisenberg rule and deduced from the correspondence principle.

BERNARD LEWIS

Reversals in the arc spectrum of nickel. A. C. MENZIES. Univ. College, Leicester *Phil. Mag.* [7], 6, 1210-6(1928) —The ground-term of Ni (I) empirically is a term 3F_4 . Doubt exists that this is the ground-term to be expected theoretically; it might be a 1S_0 term. Fuse-spectra in air in the ultra-violet and *in vacuo* in the Schumann region have been examd. Many reversed lines in the former region have been found, but most of them can be accounted for as transitions to low levels already known, from middle terms already known and from new middle terms. In the Schumann region no long lines occur which could be attributed to the arc, they all appear to belong to the ground-terms 3D_2 and 3D_2 of Ni (II). It is concluded that the hypothetical term 1S_0 must give rise to lines below the region examd., if the term exists at all.

GEO. GLOCKLER

Theory of the single-leaf radiometer. TH. SEHL. *Z. Physik* 52, 249-63(1928). A theory of the single-plate radiometer is derived on the view that a plate represents the limiting case of an ellipsoid of revolution. Radiation falling on the plate produces a temp. gradient on the surface, causing thermal convection currents. The problem is now a hydrodynamical one and the force upon the radiometer is now the force produced by the gas-flow. This force has the correct dependence upon intensity of radiation, gas pressure and nature of the gas.

GEO. GLOCKLER

Experimental study of the radiometer. E. BRÜCHE AND W. LITWIN. *Z. Physik* 52, 318-35(1928). —The gases He, Ne, Ar, H₂, O₂, N₂, air, CO, NO, CO₂, N₂O and CH₄ were studied. At low pressure the radiometer-effect is a surface-effect, independent of the kind of gas used and the geometry of the arrangement and depends only on the concn. of gas. At somewhat higher pressures a max. effect is reached depending on the mean free path. At high pressure, the effect becomes an edge-effect directly proportional to the square of the mean free path and inversely proportional to the pressure. Similar gases CO, NO and CO₂, NO₂ give similar radiometer effects.

GEO. GLOCKLER

Note on Raman lines under high dispersion. R. W. WOOD. Johns Hopkins Univ. *Phil. Mag.* [7], 6, 1282-3(1928). —W. photographed the spectra scattered by C₆H₆ and CCl₄ with a 6-inch plane grating combined with a lens of 3-m. focus. Small portions of the spectra are reproduced. (cf. C. A. 23, 338).

GEO. GLOCKLER

Scattering of light in water. G. I. POKROVSKII. *Z. Physik* 52, 448-50(1928). —The Raman effect found is peculiar since no narrow lines but broad bands are found.

The Raman effect corresponds to an absorption at 3.04μ , which agrees with the absorption spectrum of H_2O .

GEO. GLOCKLER

The phosphorescence of fused quartz. A. C. BAILEY AND J. W. WOODROW. *Phil. Mag.* [7], 6, 1104-7(1928).—Many samples of fused quartz possess the properties of a phosphorescent body; that is, they can be excited by ultra-violet light, they will then emit a visible phosphorescent light of considerable strength upon the application of heat, and they can be completely deactivated by bringing to a red heat in a flame. This phosphorescent activity of fused quartz is not uniform, but there is a wide variation between samples and even within the area of a single small piece. Natural quartz crystals do not possess this property of emitting a phosphorescent radiation, but they can be brought into this condition by heating slowly in an elec. furnace to 1600° . Pyrex glass, calcite and fluorite exhibit a prominent phosphorescent activity, but gypsum does not.

GEO. GLOCKLER

Diffusion of metastable atoms in mercury vapor. J. HORACE COULLIETTE. Columbia Univ. *Phys. Rev.* 32, 636-48(1928).—The diffusion of metastable atoms in Hg vapor was studied with a 4-electrode tube of special construction, and with short voltage pulses sep'd. by variable time intervals actuating and accelerating the photoelec. gauzes. The change in the rate of arrival of metastable atoms at the outer boundary of a spherical vol. of gas was det'd. as a function of the time elapsed after a no. of atoms had been formed at the center. Observations were made at vapor pressures ranging from 3×10^{-9} mm. to 0.33 mm. A comparison of the exptl. results with the theoretical values of normal Hg atoms under the same conditions shows that the assumption made by Webb and Messenger that metastable Hg atoms travel across the exptl. tube and produce a direct action on the "photoelec." plate is correct. It is found that the effective radius of the metastable atom is about 1.5 times as large as that of the normal atom and that metastable and normal Hg atoms obey the same general laws of diffusion. Evidence of the loss of energy of excitation as a result of collision between normal and metastable Hg atoms was found.

BERNARD LEWIS

Photosensitized band fluorescence of OH, HgH, NH, H_2O , and HN_2 molecules. E. GAVIOLA AND R. W. WOOD. Johns Hopkins Univ. *Phil. Mag.* [7], 6, 1191-209 (1928).—The photosensitized fluorescence of HgH, OH, NH, Hg- H_2O , and Hg- HN_2 mols. has been observed, the conditions for the appearance of each of the bands have been det'd., and the most probable chem. processes which give rise to them have been suggested. The dissocn. energy of H_2O into H and OH is probably about 5.2 v., and not less than 4.9 as assumed by Sentfleben and Rehren (*C. A.* 20, 3390). The concn. of OH and NH in the fluorescence tube is, under the best conditions, of the order of magnitude of the concn. of excited Hg atoms (10^{-6} mm. pressure). The dissocn. energy of the N_2 mol. seems to be less, or about 9.8 v., and not 11.4 as calcd. by Sponer and Birge (*C. A.* 21, 3547). Collisions of excited Hg atoms in the resonance level 2^3P_1 with normal H_2O vapor mols. may lead to different processes: in most of the cases the excited Hg atom is thrown down to the metastable 2^3P_0 level; in a few cases (about 1 in 10,000 collisions) the H_2O mol. is dissoed. into H and OH; and finally in some cases (less than 1 in 1000) a complex quasi-mol. Hg- H_2O is formed which dissociates, emitting the continuous band at 2800 Å. U. Collisions of excited Hg atoms in the resonance level with N_2 mols. bring the first ones down to the metastable level; 3-body collisions of two excited atoms with a N_2 mol. may lead to dissocn. of N_2 .

GEO. GLOCKLER

The nature of active nitrogen. H. O. KNESER. Marburg Univ. *Ann. Physik* 87, 717-36(1928).—In his investigation to det. the nature of active N, K. first calcd. the dependence of the intensity of the N afterglow or phosphorescence upon the time in relation to the different assumption as to the nature of active N and with consideration of the deactivation through the walls of the app. He then measured, by a simple photometric method, the decline of the phosphorescence with different kinds of app. walls, different pressures and different amts. of A, and found that his results agreed with the assumption of deactivation through collision of 2 active atoms with a non-active particle. He further confirmed this quantitatively by obtaining a brightening up of the phosphorescence by the introduction of non-active particles.

MALCOLM DOLÉ

The deterioration of quartz mercury-vapor lamps and the luminescence of transparent fused quartz. A. E. GILLAM AND R. A. MORTON. Univ. Liverpool. *Phil. Mag.* [7], 6, 1123-32(1928).—Two results are involved in the deterioration of quartz mercury lamps: (a) a shortening of the spectrum confined to the extreme ultra-violet, and (b) a non-selective loss in transmission. The first factor preponderates for the first 150-200 hrs. and shows itself as a rapid fall in output. After this period the effect becomes fairly const. During the subsequent history of the lamp the second factor plays an increasingly important part, but manifests itself much more slowly. The first effect

may be due to the formation of SiO vapor inside the lamp, and the second effect may arise from the gradual deposition of a film of opaque Si. The luminescent properties of fused quartz after treatment with ultra-violet rays have been studied. There is little or no connection between these properties and the deterioration of quartz mercury lamps. Three types of luminescent phenomena have been observed with transparent fused quartz: (a) a brief visible phosphorescence; (b) a phosphorescence of long duration; (c) a thermoluminescence. The balance of evidence points to the view that traces of impurity must be present in those samples of fused silica which exhibit luminescence.

GEO. GLOCKLER

The quenching of mercury resonance radiation and its relation to reactions sensitized by excited mercury atoms. ALLAN C. G. MITCHELL. Bartol Foundation, Philadelphia. *J. Franklin Inst.* 206, 817-26(1928).—Zemansky's treatment (*C. A.* 22, 2324) of the quenching of resonance radiation is reviewed with conclusions unfavorable to the theory there proposed. The activation processes of sensitized reactions are discussed; these processes most probably occur in the gas phase. The high quenching efficiency of O for Hg resonance radiation is accounted for by assuming that O can take up energy of oscillation by collision of the second kind with excited Hg atoms. M. F.

Energetics, quantic action and temperature coefficients of photo-chemical reactions in radiations of various frequencies. A. K. BHATTACHARYA AND N. R. DHAR. Univ. of Allahabad, India. *Z. anorg. allgem. Chem.* 176, 372-84(1928).—The decompn. of $\text{Na}_2\text{Co}(\text{NO}_2)_6$ is a monomolecular reaction in the light and in the dark. Between 20 and 30°, the temp. coeffs. are: 3.5 (dark), 1.64 (sunlight), 2.34 (4725 Å. U.), 2.5 (5650 Å. U.), and 2.7 (7304 Å. U.). The quantic yield is very high. The decompn. of $\text{K}_2\text{S}_2\text{O}_8$ is a reaction of the zero order in sunlight. The quantic yield is very high. The temp. coeff. in sunlight is 1.2 between 17 and 27°. The reaction between KI and $\text{K}_2\text{S}_2\text{O}_8$ is bimol. in the light. Between 20° and 30°, the temp. coeffs. for the radiations enumerated above are: 1.9, 1.25, 1.5, 1.6 and 1.64. The quantic yield is very high. The reaction between Br and MeOH is monomolecular in the dark and in the light. Between 20° and 30°, the temp. coeffs. are: 2.5, 1.99, 2.4, 2.34, 2.42. The quantic yield is abnormally high. The temp. coeffs. of the reactions between Br and EtOH are: 2.84, 1.54, 2.36, 2.04, 2.67 between 20° and 30°. The quantic yield is high. The reaction between I and Me_2CO is monomol. in the dark and in sunlight. The quantic yield is abnormally high. Between 21° and 31°, the temp. coeffs. are: 3.21, 1.77, 2.7, 2.82, 2.94. The reaction between oxalic and chromic acids gives a high quantic yield and has the following temp. coeffs. between 20° and 30°: 1.9, —, 1.7, 1.65, 1.76. Reactions between lactic or tartaric acids and KMnO_4 in the presence of MnSO_4 are bimol. in the dark and 1.5-mol. in sunlight. In both cases, the quantic yield is abnormally high. Between 19° and 29°, the temp. coeffs. are 2.5, 1.5, 2, 2.2, 2.3 for lactic acid; for tartaric acid they are: 2.46, 1.45, 2, 2.1, 2.3 between 16° and 26°. The Einstein photochem. law does not apply to the above 9 cases. The no. of reacting mols. is higher than the no. of quanta absorbed. The quantic action increases with the temp. of the reagents. The quantic yield is decidedly higher in sunlight than in any other radiation; it increases with the frequency of the incident radiation. The temp. coeffs. of photochem. reactions are always greater than 1, and smaller than the corresponding coeffs. of the thermic reactions. The greater the acceleration of the reaction by light, the smaller are the temp. coeffs. The velocities of more than 25 photo reactions are accelerated by the radiation 7304 Å. U. Chem. reactions may also be accelerated by infra-red radiations.

ALBERT L. HENNE

Band spectroscopy and flame reactions. K. F. BONHOEFFER AND F. HABER. Kaiser Wilhelm Inst. *Z. physik. Chem.* A137, 263-88(1928).—The spectrum of the H flame contains a band in the ultraviolet which has been identified as characteristic of the uncharged OH radical. The band exists at 3064 Å. U. corresponding to 92.8 cal. It cannot be obtained at ordinary temps. in the absorption spectrum of mixts. of O, H and H_2O vapor, but may be identified at 1250°. The authors discuss the origin of the hydroxyl radical and conclude that it is formed either by the endothermic reaction, $\text{H}_2 + \text{O}_2 \longrightarrow 2\text{OH}$, or by the collision of a H_2 mol. with an excited H_2O mol. Once formed, it can take part in the reaction by the formation of the chain: (a) $\text{H}_2 + \text{OH} \longrightarrow \text{H}_2\text{O} + \text{H}$, (b) $\text{H} + \text{O}_2 \longrightarrow \text{H}_2\text{O} + \text{OH}$. In the presence of H_2O vapor, the CO flame also shows the OH band, as well as other bands in the visible spectrum which cannot be identified with the CO spectrum (cf. Weston, *C. A.* 19, 3427). The interpretation of the reactions in the CO flame on the basis of these results, however, is difficult. In hydrocarbon flames the Swan bands obtained in the absorption, as well as in the emission spectra, are characteristic of the carrier C_2 . These bands appear at 5160 Å. U., corresponding to 55 cal. There are also bands at 4317 Å. U. and 3888 Å. U. which are probably due to the group CH. The high cond. of the inner cone of the Bunsen flame may be

explained by the presence of the 3 radicals, OH, CH and C₂, each of which has a relatively low ionization tensi compared to the gases in the outer cone. H. F. JOHNSTONE

The photochemical dissociation of iron carbonyl compounds (carbon monoxide-hemochromogen, iron monoxide-ferrocysteine) and the rule of photochemical equivalence. OTTO WARBURG AND ERWIN NEGELEIN. Kaiser Wilhelm Inst., Berlin-Dahlem. *Biochem. Z.* 200, 414-58(1928); cf. *C. A.* 22, 3356.—The photochem. dissocn./light absorption ratio was detd. for CO-pyridine-hemochromogen and for CO-ferrocysteine, at 6 different wave lengths. The photochem. action depends upon the no. of absorbed quanta and not upon their energy, one absorbed light quantum splitting 2 iron carbonyl groups. Consult original for details. S. MORGULIS

The time function of the light rays of active nitrogen. A. KOENIG AND G. H. KLINKMANN. *Z. physik. Chem.* A137, 335-51(1928).—The rate of decrease of the intensity of the afterglow in active N, following an elec. discharge, was photometrically detd. to correspond to a bimol. reaction. It is evident, however, from the color changes, that not 1, but several reactions take place, and that some are faster than others. In order to measure the decrease of intensity not only of the integral light but of each band, the following method was used: A stream of active N at a low pressure and const. velocity was passed through a quartz tube. By means of a condenser lens, a small image of the glowing tube was thrown on the slit of a spectrograph. From the spectrogram obtained, an estn. was made of the decrease in intensity of each band over the length of the tube, and from the velocity of the gas the rate of decrease was calcd. The results show that the rate of decrease of intensity of the red bands at 6300, 6230 and 5800 Å. U., the so-called α -group, is much faster than that of the violet bands at 4310 and 4040 Å. U., the β -group, i. e., the short wave rays have the longest life. This indicates that the reactivity and the light intensity of active N do not parallel each other. The bands of the β -group possess no equiv. in the arc spectrum of N. The very weak band in the afterglow at 5050 Å. U. was not observed. H. F. JOHNSTONE

The fluorescence and absorption of a mixture of mercury and zinc vapors. J. G. WINANS. Princeton Univ. *Phys. Rev.* 32, 427-34(1928).—Light from the Al spark of wave length below 2000 Å. U. excites vapor distg. from slightly amalgamated Zn, causes the emission of the first triplet of the sharp series of Zn, but excites neither the non-distg. vapor nor that distg. from pure Zn. The same kind of Hg-Zn mixt. shows a continuous absorption from 2500 to <1850 Å. U. in distg. but not in stagnant vapor. The stagnant vapor and pure Zn vapor show in addn. to the absorption lines of Zn, 3 new absorption bands. Two of these correspond to absorption bands in Cd. The absorption spectrum of Hg alone is different from that of Zn amalgam. The fluorescence excited by the Al spark is emitted by ²¹³S Zn atoms, which may have been produced either through absorption by HgZn mols. and dissocn. into excited Zn and normal Hg atoms or through collisions of the second kind between normal Zn atoms and excited HgZn mols. B. L.

The chemical effects of cathode rays on oxygen, air, nitric oxide and carbon dioxide. WARREN F. BUSSE AND FARRINGTON DANIELS. Univ. of Wis. *J. Am. Chem. Soc.* 50, 3271-86(1928).—A Coolidge cathode-ray tube equipped with a nickel window and actuated by an induction coil furnished the source of energy for these expts. The reaction cell was not in direct contact with the window but was sepd. from it by a 2-3 mm. air space. The energy of the cathode rays was measured with an ingenious small calorimeter and varied from 3 to 16 cal. per min. Variation in current and voltage were studied and the chem. effects are expressed as M/C, the ratio of mols. produced per electron crossing the cathode-ray tube.

Reaction	Voltage kv.	Current mil. amp.	Micromoles per min.	M/C	Cals./min.	Cals./mole
C ₂ → O ₃	185	0.4	25	100	8.6	3.4 x 10 ⁵
Air → O ₃	185	0.4	11	44	9.6	7.8 x 10 ⁵
Air → NO	185	0.4	4	14	8.6	22.0 x 10 ⁵
NO → O ₂	185	0.4	57	230	8.6	1.5 x 10 ⁵
CO ₂ → CO	200	1.0	2	3	37	180 x 10 ⁵

In the ozonization expts. it was found that the ratio of mols. to gas ions was approx. the same as for α -particles. The similarity of the chem. behavior of α -particles and cathode rays is emphasized. WILLIAM E. VAUGHAN

The formation of ozone by cathode rays. ABRAHAM L. MARSHALL. Gen. Elec. Co., Schenectady, N. Y. *J. Am. Chem. Soc.* 50, 3178-97(1928).—A Coolidge cathode-ray tube operated from a 200 kv. transformer and provided with a resistal window was employed. Electrolytic O₂ was continuously circulated through the system by a compressor and the O₃ removed by scrubbing with alk. KI soln. The reaction apparently

occurs in the gas phase, since it is relatively uninfluenced by increase in surface area. Variations in yield of O_3 with voltage, cell length, tube current, pressure and rate of flow of O_2 have been detd. in detail. Energy of the rays falls off exponentially with increase in distance from the window. Cathode rays also decompose O_3 in a far more pronounced manner than the silent discharge. A steady state is reached with a concn. of one mol. of O_3 to 1700 of O_2 , this ratio being independent of tube current. The max. yield is 825 cc. of gas (NTP), obtained with a current of 0.001 amp. at 180 kv. Many graphs are given. The temp. of the window and its influence were not investigated. W. E. V.

Combination of hydrogen and oxygen under the influence of cathode rays. ABRAHAM L. MARSHALL. Gen. Elec. Co., Schenectady, N. Y. *J. Am. Chem. Soc.* **50**, 3197-204(1928); cf. preceding abstract.—The app. described in detail in the previous paper is utilized, operating at 180 kv. and 0.80 milliamps. Dried electrolytic tank gases are used without purification. H_2O_2 and H_2O are frozen out in a CO_2 snow-ether trap and O_3 is absorbed in alk. KI soln. M. concludes that H_2O_2 is not formed via water production and that both H_2O_2 and O_3 are decomposed as well as formed by high velocity electrons. Water formation is independent of the rate of flow of H_2 and O_2 while the yield of H_2O_2 is reduced as the rate of flow is diminished, for given concns. of H_2 and O_2 , but is insensitive to changes in concn. of the reactants. Speed of formation of H_2O and O_3 seem to parallel one another very closely, probably indicating a relationship of the mechanism of production; H_2O_2 seems to be produced by a different mechanism. W. E. V.

COLIN G. FINK

Advances in the electrochemical and electrometallurgical industries during 1926. W. DOMINIK. *Przemysl Chem.* **12**, 605-17(1928).—A general review with an extended bibliography. A. C. Z.

Some developments in the electrical industry in 1928. JOHN LISTON. *Gen. Elec. Rev.* **32**, 6-73(1929).—Chapters on elec. melting and refining furnaces; elec. welding; vacuum tubes, etc. C. G. F.

Electric furnace cast iron. C. E. WILLIAMS AND C. E. SIMS. Bur. of Mines, *Tech. Paper No. 418*, 48 pp.(1928).—Results are given of studies made by the North west Expt. Sta. of the Bureau of Mines, Seattle, in coöperation with the Coll. of Mines, Univ. of Washington, between 1920 and 1925. Elec. furnace cast iron made from both steel and cast iron scrap by the authors had transverse strengths of 5000 to 6000 lb. and tensile strengths up to 42,000 lb. In a basic elec. furnace desulfurization can be carried out so that in 30 min. the S will be reduced from 0.2% to a few hundredths of 1%. Production of molten cast iron in an elec. furnace is at rate of 500 to 700 kw-hr. ton. The authors discuss present and future uses of available ferrous scrap and the results of their studies of carburization. They used 2 different furnaces (50 and 100 kw) and conclusions are based on 78 melts made. Curves show the rate of absorption of C by molten Fe, different kinds of carburizers being used. Further investigations were made to study the effect of impurities in cast iron (Si, Mn, S and P). Reference is made to the production of cast iron in the elec. furnace during and after the war and to tests made in direct-arc and indirect-arc furnaces. Production cost figures are given. A. D. SPILLMAN.

Technical production of beryllium. GY. INCZE. *Természettud. Közlöny* **60**, 108-10(1928).—A review. S. S. DE FINÁLY.

Sullivan electrolytic zinc plant. U. C. TANTON. *Eng. Mining J.* **126**, 856-60(1928).—The plant was erected to treat Zn-bearing Coeur d'Alene district ores, which form large quantities of insol. Zn ferrite in roasting and yield considerable gelatinous silica in leaching. The ores contain much Co, which is most troublesome in making electrolytic Zn. The plant uses the Tainton high-acid process. The electrolyte for

leaching contains 28–30% free acid; in electrolysis a c. d. of 100 amp. per sq. ft. is used. Cu, Cd and Co are eliminated in the liquor-purification system by Zn dust. The tank house has 150 cells in a circuit, each taking 8000 amp. Each cell contains 10 cathodes, 4 sq. ft. each, of Al. Pure MnO_2 is produced as by-product. Anodes are of Pb alloy (almost 99% Pb) and other elements and oxides. The Zn produced is over 99.99% pure. The electrolytic load factor for first month was 97+%. C. E. MANTELL.

Factors affecting the relative potentials of tin and iron. E. F. KOHMAN AND N. H. SANBORN. *Ind. Eng. Chem.* 20, 1373(1928).—The single potential of Fe is but little affected by change in H-ion concn., but Sn becomes less noble as the p_H of the soln. with which it is in contact decreases. In some solns. the potentials of Sn and Fe will be equal; these equiv. points are p_H 1 for HCl, p_H 1.3 for H_2SO_4 , p_H 2.1 for citric acid, and p_H 2.9 for oxalic acid. The cathode polarization on Fe at low current densities (0.1–0.7 milliamperes per sq. dm.) is increased by the presence of stannous ion and (or) apple pomace. The corrosion of Fe is decreased by contact with Sn in solns. more acid than the equiv. point. It is also decreased by the presence of Sn or apple pomace. Gelatin and various protein-bearing products decrease the corrosion of Fe even in solns. in which Sn is more noble than Fe. B. M.

Direct electrolytic preparation of potassium permanganate. GASTON RAPIN. *Bull. soc. chim.* 43, 1174–89(1928).—See C. A. 22, 4386. E. H.

Chromium plating and its applications. F. LONGAUER. *Magyar Mernök Építészegylet Közlönye* 62, 49–50(1928).—Plating baths for Cr are described. There are two Cr-plating plants in Hungary operating successfully. S. S. DE FINÁLY

A study of chromium plating. RICHARD SCHNEIDEWIND. *Univ. Mich. Eng. Res. Bull.* No. 10, 141 pp.(1928).—The paper is divided into 4 parts: first, there is presented a non-technical account of the electrodeposition of Cr; second, a detailed description of the original research done at the Univ. of Mich. during the years 1927 and 1928, on the effects of bath compn., nature of anodes, and plating conditions; third, a review of the outstanding scientific articles and patent literature on Cr plating; fourth, a bibliography is given of 111 papers on the general subject of Cr plating. The following general conclusions are drawn from the results of the research: (1) In order to obtain smooth, bright plates these conditions must be maintained: (a) a Cr_2O_3 concn. between 150 and 600 g. per l., preferably between 250 and 300 g. per l.; (b) a sulfate concn. relative to the Cr_2O_3 concn. and expressed as the ratio by wt. Cr^{VI} : SO_4 of between 10 and 60, preferably, 50; (c) a Cr^{III} concn. under 15 g. per l., preferably as close to 0 as possible; (d) a temp. over 15° , (this is imperative for thin deposits); (e) a combination of c. d. and temp. resulting in a cathode current efficiency of 13%; (2) in order to favor a low rate of anode corrosion (a) a low sulfate concn. must be maintained, (b) too high a temp. should not be used; (c) with Fe or steel anodes too low an anode c. d., under 2 amp. per sq. dm., must not be used; (d) anodes are best of Pb and Fe. (3) Under fixed bath compn., anodes, and plating conditions the concn. of Cr^{III} of the soln. comes to equil. the factors favoring a low Cr^{III} concn. are (a) a low sulfate concn., (b) the inherent nature of the anode material, (c) a low temp., (d) a low anode c. d., (e) continuous electrolysis rather than alternate application and cessation of current.

DOWNES SCHAAP

Colloids in the electroplating of metals. WM. BLUM. *Colloid Symposium Monograph* 1928, 301–12 pp. —There is no entirely satisfactory simple definition of an addition agent; since the effects of such agents are closely associated with cathode polarization, they might be tentatively called "polarization agents." Colloids tend to decrease the growth of existing crystals, increase the formation of new crystals, and thus make the deposit "fine-grained." The action is often specific, inhibitory in some solns. and causing characteristic growths in others. In Cu refining, colloids permit the use of high current densities. Often, addition agents are found in the deposit, but not invariably. Sometimes they alter the proportions deposited, acting as brighteners in brass deposits. They tend to improve the "throwing power," i. e., the ability for the metal to deposit uniformly on a cathode of irregular shape. In acid Cu or Zn solns. small quantities of gelatin seem to produce slight, if any, effect on the static or equil. potential; but they make the dynamic potential markedly more negative; i. e., they increase cathode polarization. However, CS_2 used as a brightener in Ag cyanide baths, and $Na_2S_2O_4$ used similarly in cyanide Cu baths, both decrease polarization. Increase of the total voltage required is due, not to effects on cond. of the bath, but to cathode or anode polarization effects. Cathode efficiency may be increased or diminished, the former if the colloid increases the H polarization or overvoltage more than that of the metal polarization. It is still an open question as to what occurs at or near the cathode surface, where colloids obviously produce their effects. The views of Blum and Rawden (C. A. 17, 3841),

of Frölich, and of Fuseya and Murata, are discussed, as to the mechanism involved. Many crystalloids function favorably, and some contain inherent colloid impurities, which make them function. The inadequacy of our present knowledge is stressed.

Good and bad nickel plating. E. MOREL. *Plating* 1, No. 4, 4-7(1928).—A review. C. G. F.

The preparation of potassium ferricyanide without the use of a diaphragm with special regard to the use of alternating current superimposed on direct current. H. PAWEK AND P. HIRSCH. Tech. Hochschule, Wien. *Z. Elektrochem.* 34, 684-96 (1928).—The electrolytic oxidation of $K_3Fe(CN)_6$ to $K_2Fe(CN)_6$ without the use of a diaphragm is studied. Addn. substances ($(NH_4)_2WO_4$, $(NH_4)_2MoO_4$, and other compds.) are not permanently active in producing a cathodic diaphragm suppressing reduction. By covering the cathode with clay a diaphragm is mechanically produced which thoroughly suppresses it. The reduction is, also, diminished by superimposing a. c. on d. c., this being due principally to the ppt. formation which roughens the cathode, and also to depolarization and diaphragm action. Lab.-scale expts. with Ni sheet, bar and wire cathodes, Ni anodes, d. c. 0.8 amp., total current 1.2 amp. and effective current 0.895 amp. show that with increasing frequencies (0-300 periods) the current yield decreases when the sheet and bar cathodes are used, and increases to a max. and then decreases with the wire. The current yields increase with increasing c. d. of the a. c. Ni is found to be the best cathode material. In prepg. solid $K_3Fe(CN)_6$, the current yield using d. c. alone is 43%, is increased to 60% by using a. c. superimposed on d. c., and to 61.5% with a diaphragm and d. c.

Hot cathode neon arcs. CLIFTON G. FOUND AND J. D. FORNEY. *J. Am. Inst. Elec. Eng.* 47, 855-9(1928).—The hot cathode of Hull (*Ibid* 47, 798(1928)) has been employed to construct low-voltage Ne lights. A tube of this type, 2.2 cm. in diam. and 75 cm. long, can be operated on 125 v. d. c. The potential gradient in these tubes varies with the pressure, having a flat min. between 2 and 5 mm. of Hg. The v.-ampere characteristic is neg. The product of potential gradient and tube diam. is const. An inductance must be used in series with the tube to make the over-all v.-ampere characteristic pos. Circuit diagrams are given for a. c. and d. c. tubes. The tubes are started by suddenly stopping the current in an inductance in series with the tubes, the high voltage causing ionization. The efficiency of these lights is 10-15 lumens per watt, about the same as that of the 100 watt Mazda C lamp. The efficiency is approx. const. with load. The life should be 5000 hours or more. These lights may be used for advertising and fog penetration, and in combination with Hg vapor lamps for *panchromatic photography*.

BENJAMIN MILLER

High-voltage gaseous conductor lamps. Electrical characteristics of the high-voltage neon type. F. O. McMILLAN AND E. C. STARR. *J. Am. Inst. Elec. Eng.* 47, 901-4(1928).—The neg. v.-ampere characteristic of these lamps necessitates a high series inductance to limit the current. This results in low power factor. The power factor may be improved by using parallel capacitance on the low-voltage side of the transformer or series capacitance on the high-voltage side. If the series capacitance is used, resonance is produced, leading to abnormal voltages across the reactances. The insulation on the transformers now used would not be adequate for these voltages.

B. MILLER

Magnesium primary cell. ROBERT T. WOOD (to American Magnesium Corp.). U. S. 1,696,873, Dec. 25. A Mg electrode is used with a neutral electrolyte contg. a strong sol. oxidizing agent such as $Na_2Cr_2O_7$ adapted to reduce the rate of corrosion of the Mg electrode on open circuit.

Galvanic cell with a horizontal zinc electrode below the depolarizer and spare electrolyte. N. V. OLEKHOVICH. Russ. 4434, Jan. 31, 1928. The spare electrolyte, which is placed above the cell (under the cover) and insulated, enters the cell after the insulation has been destroyed by a tool through the opening in the upper cover.

Storage battery. GEORGES DROPSY. Fr. 640,586, Dec. 11, 1926. The construction of sepg. partitions is given.

Storage battery. PAUL O. GUNKEL (to Joseph Stokes Rubber Co.). U. S. 1,696,001, Dec. 18. Structural features.

Storage battery. A. POUCHAIN. Brit. 290,665, May 19, 1927. A battery with Zn and Pb electrodes has an electrolyte contg. H_2SO_4 of such strength that the quantity of free H_2SO_4 varies from 280 g. to 80 g. per l. of electrolyte according to the state of charge of the battery. The electrolyte may be formed from H_2SO_4 80-150 g., $ZnSO_4$ 450-650 g. and water 1000 cc. and 15-30 g. of "catalytic substances" such as H_2BO_3 or sulfates of Al, Hg, Na or K also may be added. For each 75 amp. hr. capacity of the battery, at least 800 cc. of electrolyte are used.

Storage batteries. LUCIEN A. H. ARNAUD. Fr. 640,781, Sept. 12, 1927. Construction of plates.

Storage battery electrodes. A. BLAUSZTAJN. Brit. 290,623, May 18, 1927. Structural features.

Storage battery electrodes. I. G. FARBERIND. A.-G. Brit. 290,193, May 9, 1927. Porous Pb is formed in the spaces of a Pb grating made by a special method which is described and the assembly is subjected to pressure and if too thick is cut to the required thickness. The grating is prepd. by casting prisms of a Pb alloy in a mold and inserting them in the openings of a Pb skeleton which has been separately cast, followed by dissolving out the metal which is alloyed with the Pb.

Hydrometer suitable for use with storage batteries. SAMUEL P. WILBUR (to U. S. L. Battery Corp.). U. S. 1,696,618, Dec. 25. Structural features.

Hydrometer suitable for testing electrolyte of storage batteries. HERMAN NGUWIRTH (to Testrite Instrument Co.). U. S. 1,694,138, Dec. 4.

Testing the charge of storage batteries. HARRY I. SHIRE. U. S. 1,696,334, Dec. 25. Current is passed from one terminal to the other of the battery through a resistance less than the normal internal resistance of the battery and the effect of the current is noted by an ampere meter.

Float-actuated electric indicating system for showing condition of storage battery electrolytes. G. H. O'BRIEN. Brit. 289,993, March 2, 1927. Structural features.

Electrolyte for batteries. RICKARD SCHUSTER. U. S. 1,695,667, Dec. 18. Water, H_2SO_4 and a silicate such as Na or K silicate are added to a soln. of $Na_2Cr_2O_7$ and the resulting mixt. is heated to evap. sufficient water to produce a solid mass.

Drying accumulator plates. ACCUMULATOREN FABRIK A.-G. Austrian 109,412, Dec. 15, 1927. Accumulator plates having a surface of finely divided Pb are placed, immediately after their prepn., in a cold sealed container, in which the drying takes place after the small quantity of O in the container has been absorbed by the Pb.

Rendering wax-like or soap-like surfaces conductive and suitable for electro-deposition of metals. GRAMOPHONE CO., LTD., and U. BONELLI. Brit. 290,406, March 21, 1927. The surface is made elec. cond. by treating it with a gas such as H_2S and subsequently immersing in a liquid such as a soln. of $AgNO_3$ or $SnCl_2$ with which the gas reacts to form a cond. film on the surface. The method is applicable to the manuf. of sound records.

Apparatus for electrodeposition of copper or other metals on nonmetallic roofing, etc. ELMER M. WANAMAKER (to Anaconda Sales Co.). U. S. 1,693,683, Dec. 4.

Electrodeposition of tin. SIEMENS & HALSKE A.-G. Brit. 290,552, Oct. 13, 1927. Sn is deposited by the process described in Brit. 286,673 (C. A. 23, 344) on another metal such as an iron plate, with either sol. or insol. anodes. The Sn soln. used may be obtained by leaching Sn ore or scrap tin and if scrap tin is used the leaching may be effected in an open-work iron vessel which serves as anode. A temp. of 70° is suitable for the electrolysis.

Electrodes with electrolyte pads at their ends for local electroplating. J. F. BENNETT and J. HADFIELD. Brit. 290,704, Jan. 22, 1927.

Electroplating tank and associated apparatus. WM. E. BELKE. U. S. 1,695,795, Dec. 18. Structural features.

Coating steel with copper. J. M. ROTH. Brit. 290,112, Nov. 7, 1927. In forming billets suitable for use in making wire, the surface of the billet is cut away, then electroplated with Cu, fluxed, and molten metal is poured around it. An app. is described in which water-cooled electrodes may be used for heating in a mold filled with CO_2 or other inert gas.

Coating with platinum. NAAMLooZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEK. Fr. 640,293, Aug. 30, 1927. See Brit. 280,697 (C. A. 22, 3128).

Coating bodies with tungsten. JOHANNES A. M. VAN LIEMPT (to N. V. Philips' Gloeilampenfabrieken). Can. 284,078, Oct. 16, 1928. In a porcelain crucible contg. Li_2WO_4 are placed a W anode and the body to be coated as cathode. A tension of 0.08 v. is supplied and a current d. of 75 milliamp. per sq. cm. A regular isolation of W occurs which rigidly adheres as a coherent layer to the cathode. If the body to be sheathed with W will not readily adhere thereto, the body should first be coated with a layer to which the W will readily adhere, for example Fe to be coated should first be coppered.

Electrolytically formed coatings on aluminum. C. H. R. GOWER and S. O'BRIEN & PARTNERS, LTD. Brit. 290,901, Oct. 20, 1927. Al or Al alloys are provided with a resistant coating by anodic treatment in a bath contg. a substantial proportion of H_2SO_4 or of a substance which forms H_2SO_4 at the anode. $K_2Cr_2O_7$, Na hyposulfite, Pb acetate, $BaSO_3$ or $KCNS$ or NH_4CNS or their mixts. may be added to color the coating formed on the Al. Many details of procedure are given. Brit. 290,903 specifies prepg. Al or Al alloys for plating by anodic treatment in a bath contg. H_2SO_4 or a substance which forms H_2SO_4 at the anode. In an example given the cathodes may be of Pb or C and the treatment may last 1-4 min. The plating baths used are preferably about 2° Bé. above the usual strength. Baths for plating with Cu and Ni are specified and some details for plating with Cd, Zn and Ag are also given.

Electrolytic cell for use as a condenser or rectifier. SAMUEL T. WOODHULL (to Amrad Corp.). U. S. 1,695,989, Dec. 18. Structural features.

Dielectric material for electrical condensers. ARTHUR MÖHRLE (to Robert Bosch A.-G.). U. S. 1,694,276, Dec. 4. See Brit. 269,874 (C. A. 22, 1287).

Per-compounds produced electrolytically. I. G. FARBENIND. A.-G. Brit. 290,750, Feb. 22, 1927. Electrolysis is so effected as to produce highly oxidized compds. in both the anode chamber and the cathode chamber of a divided cell; e. g., the anode chamber may contain satd. $(NH_4)_2SO_4$ soln. and the cathode chamber a 0.5% H_2SO_4 soln. through which O is passed, H_2O_2 being produced in the cathode chamber and NH_4 persulfate being produced in the anode chamber. The anode may be formed of Pt and the cathode of amalgamated Au. Various details are given and the production of perborate and percarbonate is also described.

Electrolytic production of zinc. SAMUEL FIELD, ELIAS F. PETERSSON and WILLIAM E. HARRIS (to the Metals Extraction Corporation, Ltd.). Can. 285,553, Dec. 11, 1928. Pb-Zn ores (finely crushed) are roasted with a current of air at 650° F. SO_2 is formed and collected for the manuf. of H_2SO_4 . When the S content of the ore is reduced to 9%, steam is admitted with the air until the Zn content of the ores is converted to oxide and sulfate. The process takes from 24 to 26 hrs. The quantity of steam is kept at a min. to avoid ferrites and manganites. The SO_2 in the outgoing gases is then not unduly dild. Ore thus treated is more amenable to extn. with acid than ore which

has been roasted without the introduction of steam to the muffle. After roasting the ore is introduced with agitation into heated H_2SO_4 and the Zn present is dissolved. The soln. is purified and electrolyzed.

Alumina. ELEKTRIZITÄTSWERK LONZA. Fr. 640,057, Aug. 26, 1927. In the electrothermal prepn. of Al_2O_3 from bauxite, etc., the ferrosilicon produced contg. Al is used for the preliminary reduction of a new charge. The ferrosilicon thus freed from Al is poured off and the reduction with C is carried out.

Salts of bismuth. RICARDO S. CARRERAS. Fr. 640,346, Sept. 1, 1927. Bi_2O_3 is prepd. electrolytically by using anodes of metallic Bi and cathodes of C, Zn, Fe or Al in an electrolyte, preferably a soln. of $NaClO_3$ through which CO_2 gas is passed. Salts of Bi are prepd. from the oxide.

Copper. CHARLES CASMAN. Fr. 640,645, Sept. 7, 1927. Cu is recovered from wash waters of cupriferous ores by inserting in the soln. electrodes of Cu and Al and short-circuiting them, the Cu being pptd. on the Cu electrode.

Light metals. PAUL L. HULIN. Fr. 640,105, Feb. 3, 1927. In the electrolytic prepn. of light metals such as Ca, Mg or Be which float on the electrolyte, the cathode is formed as several depending rods which may have a surface of Fe and a core of Cu or Cu alloy, or the upper portion may be of Cu and the part immersed of Fe. The upper portion may be cooled by water.

Thin flakes of nickel, etc. COMPAGNIE GÉNÉRALE D'ÉLECTRICITÉ. Fr. 640,601, July 5, 1927. Thin flakes of Ni used for addn. to the active mass of storage batteries are produced by depositing a layer of Ni electrolytically, the surface of which is then made passive by a treatment with concd. HNO_3 or a strong soln. of chromic acid or by polarization in an alk. bath and another layer is then deposited. The layers of Ni are sepd. by a weak acid such as 10% H_2SO_4 which penetrates between the layers and produces H. Flakes of Co and Fe may be produced similarly.

Alloys. RICHARD RÜBENACK. Swiss 126,830. May 17, 1927. Galvanic deposits of noble metal alloys and common metal alloys are formed successively in such thicknesses as to give a desired product.

Electric furnace. JOHN J. NAUGLE. Can. 285,459, Dec. 11, 1928. An elec. furnace for the production of an *activated carbon* by the treatment of leached carbonized lignin residues is specified.

Electric induction furnace. I. RENNERFELT. Brit. 290,460, June 29, 1927. Structural features.

Electric resistance heated furnace. ORA A. COLBY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,882, Dec. 18.

Electric resistance heated furnace. JAMES C. WOODSON (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,874, Dec. 18. Structural features.

Electric resistance heated furnace for annealing or heating various articles. WILHELM ROHN (to Siemens-Schuckertwerke G.m.b.H.). U. S. 1,695,860, Dec. 18. Structural features.

Electric resistance furnace suitable for heating drills, forgings, etc. ALBERT N. OTIS and CARL L. IPSEN (to General Electric Co.). U. S. 1,696,728, Dec. 25. Structural features.

Tiltable electric resistance furnace suitable for melting metals. GEORG SCHMITT (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,863, Dec. 18.

Inclined electrically heated furnace suitable for heat treatment of metal rivets, bars, etc. CRANSTON H. CARPENTER (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,950, Dec. 18. Structural features.

Electrically heated muffle. ÖSTERREICHISCHE SIEMENS-SCHUCKERT-WERKE. Austrian 109,388, Dec. 15, 1927. Constructional details.

Electrically heated boiler for generating vapors of carbon tetrachloride or similar material under pressure. AUGUST EIMER. U. S. 1,695,803, Dec. 18.

Electric resistance heater units. WALTER E. HUDSON (to Hudson Heating Systems). U. S. 1,694,178, Dec. 4. Structural features.

Electric resistance heater unit. ERNEST E. SUTHERLAND and FRANK F. FORSHEE (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,869, Dec. 18.

Heat-resistant composition suitable for arc deflectors. WILLARD R. STEELE (to General Electric Co.). U. S. 1,696,614, Dec. 25. Zirconia 65, slaked lime 5 and asbestos 30% are used together. Cf. C. A. 22, 1663.

Electrically heating oil. MASCHINENFABRIK OERLIKON. Ger. 467,586, Sept. 6, 1927. The heat generated in elec. motor driving a circulating pump is applied.

Electrodes. SOCIÉTÉ D'ÉLECTROCHIMIE, D'ÉLECTROMETALLURGIE ET DES ACIÉRIES ÉLECTRIQUES D'UGINE (Jean Michel and Victor Makow, inventors). Fr. 640,835,

Feb. 21, 1927. Anodes are made of Al intimately combined with another metal which acts as the active anode, while the Al serves as a support and conductor for the current.

Carbon electrodes. COMPAGNIE LORRAINE DE CHARBONS, LAMPES ET APPAREILLAGES ELECTRIQUES. Fr. 640,506, Feb. 16, 1927. C electrodes for high c. d. are made from pure C incorporated with mineral substances which may be denser at the core than at the outside. An example is given which contains C 45, oxides of rare earth metals 20, fluorides of rare earth metals 30, magnesia 2, anhyd. H_3BO_3 , Al_2O_3 , or blue oxide of W 1 part.

Electrode for water-resistance steam generators. HOWARD W. MATHESON and JULIAN C. SMITH. U. S. 1,693,794, Dec. 4. Structural features.

Electric purification of gases. A. A. BULAKH and P. P. PORFIROV. Russ. 4637, Feb. 29, 1928. A condenser of a much higher capacity than the gas-purification app. is connected between the transformer and the gas purifier.

Electrical purification of gases. HERMANN ROHMANN and ELEKTRISCHE GASREINIGUNGS G. M. B. H. Ger. 467,554, Dec. 10, 1921. In an elec. gas-purifying plant having sep. electrode systems for charging and sepn., these systems being charged at relatively low and relatively high voltages, resp., the charging electrodes and the sepg. electrodes are charged with alternating e. m. f. from transformers of different secondary e. m. f., the primary currents supplied to the transformers being of either equal or diff. phase.

Electrical gas purifying plant. "FLGA" ELEKTRISCHE GASREINIGUNGS-GESELLSCHAFT M. B. H. Ger. 468,972, Feb. 26, 1924.

Recovering reaction gases from electric arc furnaces. BERTHOLD BLOCK. Ger. 466,139, May 28, 1925. The gases are withdrawn through a movable tube let into a channel in the hollow electrode. Side channels leading to the main channel may be made in the electrode.

Electrical precipitation apparatus for treating gases and vapors. LODGE-COTTRELL, LTD., and L. LODGE. Brit. 290,030, April 23, 1927. Structural features.

Removing hydrogen sulfide from gases. F. FISCHER. Brit. 289,885, May 5, 1927. In purifying gases contg. H_2S by an alk. soln. of $K_3FeC_6N_6$, with formation of S and $K_4FeC_6N_6$, the soln. freed from S is revived by electrolysis and the H liberated at the cathode is added to the purified gas. Alkali formed by the electrolytic action is mixed with the revived $K_3FeC_6N_6$.

Phosphoric acid. JACQUES SIGRIST. Fr. 640,287, Aug. 30, 1927. The energy disengaged in the production of phosphoric acid in an elec. furnace from phosphates is recovered by using a mixt. of CO_2 and air as oxidizing gas, whereby a gas rich in CO is obtained. Superheated steam is eventually added to recover the heat resulting from the combination of the phosphoric anhydride with water. An app. is described.

Pasteurizing milk. JOHN O. TEMPLETON (to Electropure Corp.). U. S. 1,695,300, Dec. 18. An app. is described in which milk is heated between electrodes by an elec. current. The electrodes may have an elec. cond. approx. the same as that of the milk.

Thermal and electric treatment, etc., of cables in telephone circuits. WERTVERKEHRSKABEL GES. Brit. 290,257, May 11, 1927. In order to equalize the differential capacities of cables in telephone circuits, an elec. current is passed, after the line has been laid, through the cable core or an auxiliary conductor arranged between the cores or in their insulation. In using the thermic heat of the current, a temp. above the normal drying temp. of the cable and below that which might damage the paper insulation (suitably about 120°) is preferred. When metal is used as a capacity equalizer, the conductor, before insulation, may be thinly coated with metal m. 120° and after the cable is finished the current is passed to soften or melt the metal so that it partly sats. a cord of paper surrounding the conductor, or a metal may be used which sublimates and is partly pptd. on the insulation when heated, or a salt such as an NH_4 salt may be distributed on the conductor or in the insulation so as to be decompd. into a metal and a gas.

Treatment of electrical conductors containing aluminum. TH. GOLDSCHMIDT A.-G. Swiss 126,012, Apr. 12, 1927. Elec. conductors made of Al alloys are heated and chilled and then, before subjection to the usual tempering process, are stored at room temp. for a day or so, with or without a preliminary cold pressing.

Electric apparatus for indicating and controlling humidity of air. WALTER R. STARKINS. U. S. 1,694,107, Dec. 4.

Electric control for remote electric apparatus. THOMAS U. WHITE and JOHN E. GARDNER (to Westinghouse Elec. & Mfg. Co.). U. S. 1,695,908, Dec. 18.

Metallic-vapor lamps. "CLARUM" GLASWAREN ERZEUGUNGS & HANDESGES. M. B. H. Austrian 109,303, Dec. 15, 1927. The inert gases in the lamp are freed from

polyatomic impurities by lining the inner surface of the lamp with a very thin layer of an adsorbent such as powdered glass or silica gel.

Glass and quartz bulbs for mercury vapor lamps. E. GOLTSTEIN. Brit. 290,682, May 18, 1927.

Mercury arc rectifier. CHRISTIAN KRÄMER (to General Electric Co.). U. S. 1,694,328, Dec. 4. An evacuated vessel is provided with an anode and cathode and also contains a vessel of porous material such as porous clay in which P_2O_5 or other hygroscopic material may be placed and through the walls of which water vapor may pass without passage of Hg vapor.

Filaments for electric vacuum tubes, etc. G. R. SHAW and B. F. TELLKAMP (to British Thomson-Houston Co.). Brit. 289,837, May 3, 1927. In treating metal filaments while incandescent with a gas contg. C or other non-metal (such as a mixt. of C_2H_6 vapor and H), the duration of the exposure is controlled by the increase in the resistance of the filaments and the app. is arranged to prevent the filaments being heated outside the gas chamber. Various details of the app. used are described.

Leading wires for evacuated electric lamps, etc. JOHN A. YUNCK. U. S. 1,695,791, Dec. 18. A composite wire having a mean coeff. of expansion approx. equal to that of the glass used in making incandescent elec. lamps comprises a core of the approx. compn. Ni 40 and Fe 60% and a welded-on sheath of an alloy mainly composed of Ag and which may also contain Cu.

Activating thoriated tungsten filaments. GEORGE D. O'NEILL (to Westinghouse Lamp Co.). U. S. 1,695,819, Dec. 18. The filaments are intermittently incandesced in a C-bearing atm. such as C_2H_6 vapor and H. An app. is described.

Applying "getter" material to filaments for incandescent lamps. GEORGE E. INMAN (to General Electric Co.). U. S. 1,694,265, Dec. 4. Mech. features. An app. is described.

5—PHOTOGRAPHY

C. E. K. MEES

Hot cathode Ne arcs (for use in panchromatic photography) (FOUND, FORNEY) 4.

Films. SOCIÉTÉ DU FILM EN COULEURS KELLER-DORIAN. Fr. 640,118, Feb. 5, 1927. To regulate the degree of hygrometry and to draw off any elec. charge which may have formed, photographic, etc., films are passed through a chamber before rolling, through which a current of warmed air is passed, and the rolling cylinders are either entirely of metal or have a thin layer of metal, or are combined with brushes rubbing against the films and earthed.

Photographic films. SPICERS, LTD. Ger. 468,743, Mar. 5, 1927. Supports for photographic emulsions, etc., are formed of derivs. of carbohydrates such as esters or ethers of cellulose mixed with finely divided pure cellulose and a white pigment. An example given contains: finely divided cellulose 10, ZnO or TiO_2 or other pigment 10, cellulose acetate 10, cedar wood oil 4, acetone 100 and plastifying agent 4 parts.

Photographic plates. PHILIPPE DAVID. Fr. 640,847, Feb. 22, 1927. A thin layer of collodion contg. $AgNO_3$ 20 g., warm water 20 g., nitrocellulose 7 to 8 g., ether 300 cc., and 95% alc. 700 cc., is spread on a glass plate and after coagulation is emulsified by dipping in a bath contg. water 11, KBr 100, gelatin 1 g. At the end of 15 min. the plate is sensitized in a bath contg. water 11, alkali bromide 40, gelatin 1 g. and AgBr 1 cg.

Photographic sensitive material. I. G. FARBENIND. A.-G. Brit. 289,895, May 6, 1927. Processes such as are described in Brit. 286,233 (C. A. 23, 49), Brit. 286,736 (C. A. 23, 349) and Brit. 289,386 (C. A. 23, 572.) are modified by employing as the sensitive medium, instead of a salt of 1,2-naphthoquinone-4-sulfonic acid or a substitution product, a salt of another sulfonic acid of 1,2-naphthoquinone such as the 6-sulfonic or 3,7-disulfonic acid or a halogen, hydroxy or other suitable substitution product; e. g., paper may be treated with a layer of Na 1,2-naphthoquinone-3,6-disulfonate and resorcinol, exposed to light, and developed with vapor contg. NH_3 to obtain a violet positive which turns bordeaux on exposure to air.

Radiophotography. FRANZ SIMON. Fr. 639,924, Aug. 23, 1927. The differences in absorption of the x-rays are utilized to increase the differences of intensity of the image or are transformed into colors or visible tints. Between the sensitive layer and the object a screen is placed which comprises elements having different absorptive powers for the rays, such as a mixt. of starch grains, some of which are satd. with a Pb salt, some

with a Cu salt and some with an Al salt. The 3 kinds of grains are colored differently such as green, blue and red.

Color photography. J. K. HERTZBERG. Brit. 289,845, May 4, 1927. Continuous-tone color-record component negatives are printed successively, through suitable color filters, in register on a multicolor screen plate or film with fine screen elements and a fine-grained emulsion.

Color photography. FREDERIC E. IVES (to Carl W. Fenninger). U. S. 1,695,284, Dec. 18. A colloid layer contg. a photographic Ag image and AgBr is prepd. for printing of a second image by converting the Ag image to AgBr and a pigment blue image by treatment in a bath contg. bromide and ingredients such as $K_3FeC_6N_6$ and $FeCl_3$ which will produce the blue image and then treating with an alkali sulfate such as Na_2SO_4 . Cf. C. A. 22, 921.

Color cinematography. R. GSCHÖPF. Brit. 289,827, May 3, 1927. Double-coloring of superposed 2-color images as described in Brit. 283,560 (C. A. 22, 4073) is produced either by first converting the Ag image into a metallic mordant such as V ferrocyanide and dyeing the mordanted image with the first color, or by dyeing the image with a loose dye of the first color, and then in either case washing to free the half-tones from dye and then applying the second dye. When the V method is used, rhodamine red and thioflavine yellow may be used for the dyeings.

Optical system for color photography. CLIFFORD L. TRELEAVEN (to Color Cinema Productions, Inc.). U. S. 1,696,739, Dec. 25.

Sensitive material for color photography. SOC. CIVILE POUR L'ETUDE DE LA PHOTOGRAPHIE ET DE LA CINEMATOGRAPHIE EN COULEURS. Brit. 289,864, May 6, 1927. A sensitized layer may comprise dichromated gelatin which after exposure is treated with a black dye to color the unexposed parts of the layer; or it may comprise "cellophane" impregnated with a mixt. of light-sensitive diazo compds. and phenols which after exposure is treated with an alk. bath or NH_3 vapor to blacken the unexposed parts. The layer may be used with or without a support such as celluloid and when a support is used a refractive network may be located at the contacting surfaces.

Reproduction of color films. SOCIÉTÉ DU FILM EN COULEURS KELLER-DORIAN. Fr. 640,139, Feb. 9, 1927. To obtain true reproduction with direct light of original cinematographic films, the original image is constituted either of a compd. of Ag, such as AgCl, AgBr or AgI or by a colored compd. of lower actinic density such as a compd. obtained by toning the image blue, these compds. permitting, after inversion of the original image, a contrast equal to the first contrast of this image.

Reproduction in colors by optical projection of images made on films with a lenticulated layer. SOC. FRANÇAISE DE CINEMATOGRAPHIE ET DE PHOTOGRAPHIE FILMS EN COULEURS KELLER-DORIAN. Ger. 466,246, Feb. 10, 1928. A copy is produced having contrasts equal to those of the original image by transforming this image, before copying, into an image having reduced contrasts. E. g., the Ag image may be toned by conversion of the Ag into chloride, bromide, iodide or ferrocyanide, or by mordanting.

Touching-up or coloring photographs. FIRMA A. W. FABER. Ger. 466,112, Feb. 9, 1928. The photograph is given a transparent layer which is overlaid with a colored coating, this coating being removed or strengthened at the required points. A suitable colored coating comprises 75% hydrogenated naphthalene, 15% linseed oil and 10% tincture.

Photographic diazotype process. ZAIDANHOJIN RIKAGAKU KENKYŪJO. Brit. 290,565, May 14, 1927. Paper is sensitized with an aq. soln. of either a tetrazo compd. of diaminodiphenylamine or a diazo compd. of aminodiphenylamine or suitable derivs. of these compds. mixed with an org. or inorg. acid and either with or without addn. of an azo-color component. Several examples are given.

Diazotype photographic processes. KALLE & Co. A.-G. Ger. 466,111, Mar. 12, 1927. The neutral brown to black tints obtained from a sensitive layer contg. a diazo compd., an azo coupling component and a Ti salt are modified by treating the developed print with a small quantity of moisture. E. g., a print from a layer contg. 1,2,4-diazonaphtholsulfonic acid, dichlororesorcinol, and Ti K oxalate, after development with gaseous NH_3 , may be toned by varying degrees of exposure to moist air to any shade from yellowish brown to brownish black. Cf. C. A. 22, 3361.

Photographic dichromated colloid process. LUXOR-FILM GRS. Brit. 289,858, May 4, 1927. Finely detailed prints are formed on dichromated colloid layers with a short exposure (suitably about 0.2 sec.) by treating the layer after printing with cold and preferably supersatd. water vapor which may contain weak volatile acid such as HOAc or CO_2 ; the prints may then be developed directly in cold water and colored in the usual way, or they may first be subjected to a uniform addnl. exposure. Various details are given.

Photographic sensitive layers. R. SCHWICKERT *Ges.* and E. BURG. *Brit.* 290,557, May 14, 1927. To layers such as are described in *Brit.* 284,253 (*C. A.* 22, 4395), which are developed by means of gases or vapors, there are added hygroscopic salts and also non-hygroscopic salts of aliphatic acids in such proportions that a colored image is produced by exposure only and development after exposure is unnecessary. Examples are given of sensitive layers contg. nitrosophenacetin, benzcatechin, KHSO_4 and NaOAc and diazotized H-acid, Na biphosphate, NaOAc and Na citrate. Na, Al or Ca salts of acetic, oxalic, citric, tartaric or other acids may be used in various mixts.

Light-sensitive silver halide emulsions. PETER WULFF and BRUNO WENDT (to I. G. Farbenind. A.-G.). U. S. 1,696,830, Dec. 25. A compd. of the iminazole series such as iminazolealanine is incorporated in the emulsion to prevent fogging.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Calcium compounds. ED. DONATH. *Chem. Ztg.* 52, 885-7(1928).—Burnt lime made from dolomite has hydraulic properties, but whether this was due to SiO_2 or Al_2O_3 present was not certain. Therefore pure MgO was prepd. by igniting the purest Magnesia alba obtainable, and CaO by igniting pptd. CaCO_3 to const. wt. The MgO was converted into $\text{Mg}(\text{OH})_2$ by moistening and then drying at 120° . MgO and CaO were mixed in equiv. amts. and then ignited. The ignited mass was treated with H_2O ; heat developed, and in 3 to 4 hrs. the mass was hard and solid, showing true hydraulic properties. It is assumed that the compd. formed at first was HO-Ca-O-Mg-OH , and

on ignition CaMgO_2 or $\begin{array}{c} \text{Ca}-\text{O} \\ | \quad | \\ \text{Mg}-\text{O} \end{array}$ was produced. Similarly, mixts. of CaO , CaCO_3 , and H_2O show hydraulic properties. These are ascribed to the formation of the compd.

In France and Russia cements are made that owe their hydraulic properties to the formation of this substance. Expts. with pure CaO , CaCO_3 , and H_2O confirmed the above view. Another proof is offered by the fact that CaCl_2 pptd. by NaOH yields $\text{Ca}(\text{OH})_2$, and if this be redissolved in H_2O and an amt. of Na_2CO_3 insufficient for complete pptn. be added, the ppt. formed ought to contain the basic carbonate from which the excess of NaOH and $\text{Ca}(\text{OH})_2$ could be washed out. The product dried at 150° showed a compn. corresponding to the basic carbonate. W. C. E.

Hydrates of beryllium halides. V. ČUPR and H. ŠALANSKÝ. Masaryk-Univ., Brünn. *Z. anorg. allgem. Chem.* 176, 241-57(1928).—A method for the purification of large quantities of Be material is described. After conversion into sulfate, still contaminated with Fe and Al, the concd. soln. is pptd. with NH_4OH and evapd. to dryness at 100° without filtration. After further drying at 130° , the residue is washed with hot H_2O , dried again, dissolved in concd. AcOH , and pptd. as basic acetate, which is purified by sublimation in N_2 . Beryllium chloride tetrahydrate is prepd. by dissolving BeO in concd. HCl the soln. being evapd. several times with fresh addn. of HCl until a clear soln. is obtained. This is allowed to stand in a desiccator over concd. H_2SO_4 for several weeks, prismatic crystals of the tetrahydrate, $\text{Be}(\text{H}_2\text{O})_4\text{Cl}_2$, being deposited. This compd. is very unstable, deliquesces rapidly in moist air, giving off HCl gas as a result of hydrolysis. $\text{Be}(\text{H}_2\text{O})_4\text{Br}_2$ is prepd. in an analogous manner and resembles the chloride in cryst. form and properties, but does not lose HBr on deliquescing. Efforts to prep. the iodide were unsuccessful. By passing HCl gas into a suspension of $\text{Be}(\text{OH})_2$ in Et_2O and a little H_2O , delicate needle-like crystals sep., having the compn. $[\text{Be}(\text{H}_2\text{O})_4(\text{C}_2\text{H}_5\text{O})]\text{Cl}_2$. This compd. is also unstable, deliquescing in moist air with slow liberation of Et_2O and HCl . It is nearly insol. in Et_2O , easily sol. in H_2O . Because of escaping Et_2O , the crystals ignite when brought near a flame. The bromide is prepd. in a similar manner, but is even less stable. Its crystals are light yellow in color. Attempts to isolate the iodide failed, but indications were given of the existence in soln. of the compd., $[\text{Be}(\text{H}_2\text{O})_4(\text{C}_2\text{H}_5\text{O})_2]\text{I}_2$.

H. STÖERTZ

Oxides and hydroxides of cobalt. G. NATTA and M. STRADA. Reale Politecnico, Milano. *Gazz. chim. ital.* 58, 419-33(1928).—The present paper, which is an amplification of earlier ones (cf. N. and Reina, *C. A.* 20, 3399; N. and Schmid, *C. A.* 21, 214), is an attempt to det. what oxides of Co really exist and their cryst. structure, and thus to end the confusion which prevails in the literature. Three oxides of definite chem. compn. and structure were identified, viz., CoO , Co_3O_4 , and Co_2O_3 . CoO has a cubic

structure of the face centered type and an elementary cell, with $a = 4.22$ A. U., and contg. 4 mols. of the NaCl type. Co_2O_3 has a cubic structure with a lattice of the spinel type and with an elementary cell, with $a = 8.05$ A. U., and contg. 8 mols. Co_2O_3 probably has a hexagonal or a rhombohedral structure, and an elementary cell, with $a = 4.64$ and $c/a = 1.24$, contg. 2 mols. and with a calcd. d. of 5.34 (exptl. d. 5.09). All methods described in the literature for the prepn. of Co_2O_3 and all attempts to prep. it at temps. above 265° have yielded only Co_3O_4 , indicating that Co_2O_3 is unstable at the higher temps.; in fact by heating Co_2O_3 at 280° it is finally converted wholly into Co_3O_4 . A new method was therefore developed, which consists of dehydrating $\text{Co}(\text{OH})_2$ at 250° . Products described as Co_2O_3 in the literature consist of mixts. of Co and CoO . Among the hydroxides of Co, only $\text{Co}(\text{OH})_2$ has a definite chem. compn. and cryst. structure. The latter is rhombohedral, of the brucite type, with an elementary cell having $a = 3.19$ A. U. and $c/a = 1.46$, and contg. 1 mol. $\text{Co}(\text{OH})_2$ could not be obtained as a substance with a definite cryst. structure, and by x-ray examn. it showed the same lines as pure Co_2O_3 , which it forms on dehydration. The other oxides and hydroxides below Co_2O_3 and $\text{Co}(\text{OH})_2$, described in the literature could not be isolated as definite individual compds., and represent only mixts. of the oxides and hydroxides described above, with compns. which depend upon the particular conditions under which they were formed. No oxide above Co_2O_3 in the dry state could be obtained. C. C. DAVIS

The composition of crystals obtained from solutions containing sodium sulfate and iodides. III. EMMA FABRIS. Reale Univ., Pisa. *Ann. chim. applicata* 18, 326-32(1928); cf. C. A. 22, 2722.—The previous expts. were extended to include LiI, the same method being used as before. Na_2SO_4 and LiI were used in various proportions from 2.5 to 25 parts of LiI per 100 parts of $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ at 13.5 – 18° . The cryst. products were transparent and sharply defined crystallographically. The results, which are recorded in graphical and in tabular form, show that with increase in the concn. of LiI, there is a progressive increase in the content of LiI in the mixed crystals. A comparison of these results with those of the earlier expts. (*loc. cit.*) shows notable differences in the behavior of various iodides. By using the particular iodide, crystals of Na_2SO_4 contg. different proportions of I can be obtained, between limits as follow: with NaI, 0–0.3893% I; with KI, 0–0.5029% I; with NH_4I , 0–0.6358% I; with LiI, 0–0.5751% I. C. C. DAVIS

Basic carbonates of zinc and cadmium. TSUNEKICHI NISHIMURA AND TAKEMARO YAMAMOTO. Tokyo Inst. of Phys. and Chem. Research. *Chem. News* 137, 307(1928).—Normal Zn carbonate ($\text{ZnCO}_3 \cdot 0.5\text{H}_2\text{O}$) prepd. at low temp. in the presence of CO_2 gas was stable when exposed to air for 183 days. When it was suspended in H_2O and a rapid air current passed through the suspension, it lost CO_2 for 19 days and then maintained the compn. $\text{ZnO} \cdot 0.421\text{CO}_2 \cdot n\text{H}_2\text{O}$ (I). $\text{Zn}(\text{OH})_2$ absorbed CO_2 from air for 73 days and then maintained the compn. $\text{ZnO} \cdot 0.363\text{CO}_2 \cdot m\text{H}_2\text{O}$. It seems doubtful whether I is identical with the basic salt $5\text{ZnO} \cdot 2\text{CO}_2 \cdot 3\text{H}_2\text{O}$. Normal Cd carbonate is stable in air and boiling H_2O ; however, when it was prepd. at low temp., suspended in H_2O and a rapid air current passed through the suspension, it lost CO_2 for 15 days, till it contained 0.93 mol. CO_2 for each mol. CdO . Then it started absorbing CO_2 , and after 235 days the original compn. was restored. $\text{Cd}(\text{OH})_2$ absorbed CO_2 from the air, the amt. taken up after 208 days corresponding to 0.88 mol. CO_2 for 1 mol. CdO . G. SCHWOCH

Bivalent and quadrivalent compounds of the rare earths. I. Samarium halides. WILHELM KLEMM AND JOACHIM ROCKSTROH. Hannover Techn. Hochschule. *Z. anorg. allgem. Chem.* 176, 181-99(1928).— SmCl_2 is prepd. by heating the oxide in a stream of Cl_2 – S_2Cl_2 , holding the temp. at 400 – 500° for 1 hr., at 500 – 600° for about 3 hrs., and at 600 – 650° for 2–3 hrs. SmBr_2 is prepd. by heating the oxide in a stream of CO – Br_2 at 500 – 650° , followed by treatment of the product with HBr gas. The dihalides are prepd. by reduction of the trihalides in H_2 at 600 – 650° , the product even after 30 hrs. reaction contg. at the most 90–92% dihalide. SmCl_2 and SmBr_2 behave like typical dihalides, closely resembling Sr and Pb dihalides, as shown by the following values for mol. vol.: SrCl_2 51.9, SmCl_2 48, PbCl_2 47.3, SrBr_2 58.9, SmBr_2 60, PbBr_2 55. M. p. of $\text{SmCl}_2 = 740^\circ$, SmBr_2 about 700° . The Sm halides are characterized by the formation of addition compds. with NH_3 . Thus SmCl_2 forms compds. with 13, 8, 5, 4, 2.66, 2 and 1 NH_3 . These ammoniates exhibit a strong tendency to form mixed crystals, particularly between 8 and 5 mols. of NH_3 . SmCl_2 forms compds. with 8 and 2NH_3 , between these 2 mixed crystals being formed. SmCl_2 also reacts with NH_3 by ammonolysis, analogous to hydrolysis. Thus: $\text{SmCl}_2 + \text{NH}_3 = \text{Sm}(\text{NH}_2)\text{Cl} + \text{H}$, and $\text{Sm}(\text{NH}_2)\text{Cl} + 2\text{NH}_3 = \text{Sm}(\text{NH}_2)_2\text{Cl} + \text{NH}_4\text{Cl}$. Density detns. in a pycnometer give for d_4^{25} : $\text{SmCl}_2 = 4.31 \pm 0.01$, $\text{SmBr}_2 = 5.40 \pm 0.02$, $\text{SmCl}_2 -$

4.5 ± 0.07 , SmBr_2 — 5.1 ± 0.05 . The m. p. of SmCl_2 is 677° and of SmBr_2 626° . *Mol. magnetic susceptibility* is detd. and expressed as $\chi \cdot 10^6$ as follows: Sm_2O_3 —9900, SmBr_2 —15,600, SmBr_3 —71,000.

H. STOKERTZ

Phosphates and arsenates of quadrivalent manganese. V. AUGER AND AL. YAKIMACH. *Compt. rend.* 187, 603–5(1928).—Analyses of compds. prepd. agree with the formulas: $\text{O:Mn}:[\text{P}_2\text{O}_4(\text{NH}_4)\text{H}]$, $\text{Mn}(\text{AsO}_4\text{H}_2)_4$, and $\text{O:Mn}:[\text{As}_2\text{O}_4(\text{NH}_4)\text{H}]_4$. The first is obtained by heating cautiously a soln. of $(\text{NH}_4)_2\text{HPO}_4$ and KMnO_4 . The brown soln. on cooling gives brilliant black plates. $\text{Mn}(\text{AsO}_4\text{H}_2)_4$ is more stable than the corresponding compd. of P.

L. D. ROBERTS

Univalent iron, cobalt and nickel. IV. The action of nitric oxide on ferrous mercaptide. W. MANCHOT AND H. GALL. *Tech. Hochschule, München. Ber.* 61B, 2393–4(1928); cf. *C. A.* 22, 2892.—In reply to Reihlen (*C. A.* 22, 4476) M. and G. find that the interaction of $\text{Fe}(\text{SC}_2\text{H}_5)_2$ and NO is so vigorous at room temp. that decomposition occurs. At -40° the reaction requires several hrs., red oily drops of $\text{NO} \cdot \text{SC}_2\text{H}_5$ appearing on the solid mercaptide according to the equation: $\text{Fe}(\text{SC}_2\text{H}_5)_2 + 3\text{NO} = \text{Fe}(\text{NO})_2 \cdot \text{SC}_2\text{H}_5 + \text{NO} \cdot \text{SC}_2\text{H}_5$. Vacuum distn. of this product was effected by evacuating, cooling the previously attached receiver with $\text{Et}_2\text{O} + \text{CO}_2$, and allowing the reaction vessel to warm up to room temp. The reaction occurs very slowly at room temp. with NO diluted with 9 pts. of N_2 .

DAVID DAVIDSON

The chemistry of rhenium. WALTER NODDACK. *Z. Elektrochem.* 34, 627–9 (1928).—Re heated in O at 300° forms volatile white Re_2O_7 , m. $26-30^\circ$ and yellow cryst. ReO_3 , m. 160° . Aq. solns. of the latter are not affected by common acids and alkalis; $\text{Ba}(\text{OH})_2$ and AgNO_3 form white ppts.; reducing agents cause a yellow color after a long time in contrast to Mo, W, Ru and Os; tartaric, oxalic and phosphoric acids do not prevent the formation of the sulfide. Five reactions distinguish Re from Mo: its yellow-red color with KSCN; K acid xanthate shows only S; NH_4 phosphate and K ferrocyanide are both neg.; ReO_3 mixed with MoO_3 sublimes before MoO_3 distills. Re is pptd. quantitatively by H_2S . Three sulfides prepd. were Re_2S_7 , ReS_3 and ReS_2 . ReCl_6 forms in Cl. The properties of the Re compds. conform to those of an element between W and Os in the periodic table. In the most stable compds., Re has a valence of 6 and 7. The ion diam. of Re^{IV} is 0.68 A. U.

MARY E. LEAR

Aluminum arsenide. G. NATTA AND L. PASSERINI. *Reale Politecnico, Milano. Gazz. chim. ital.* 58, 458–60(1928).—The system Al–As has never been carefully studied (cf. *Jahrb. prakt. Chem.* 91, 206(1864); *Pogg. Ann.* 11, 61 (1827)), and its structure has never been detd. The arsenide was prepd. by heating a mixt. of Al and a small excess of As at 800° . It was a gray mass, with a metallic luster, which could be easily pulverized. Its analysis corresponded to AlAs . It did not fuse up to 1200° . An x-ray study of its cryst. structure showed that it belongs to the monometric or cubic system, of the blende class, and is therefore isomorphous with AlSb . Its elementary cell has an a value of 5.62 A. U., and contains 4 mols. It has a non-ionic structure. Its calcd. d. was 3.81, while its exptl. d. was 3.598.

C. C. DAVIS

The constitution of the boron hydrides. FRITZ EPHRAIM. *Helv. Chim. Acta* 11, 1094–8(1928).—The constitution of BH_3 can only be explained by unusual electron distribution. By assuming that the binding of two atoms by means of an electron can result or that an electron is related to four different atoms, BH_3 constitution can easily be explained by the octet theory. BH_3 must consist of a form with 6 outer electrons, 3 from the B atom and 3 from the H atom polymerized into a mol. Through so called covalence of 4 electrons a form originates consisting of two complete octets. Accordingly, the polymerization of BH_3 to B_2H_6 can be imagined. The constitution of the tetraborons B_4H_{10} are explained on the same principle. B_4H_{10} is split into $\text{B}_2\text{H}_6 + \text{BH}_3$. It consists now of a diboron B_2H_6 united with a second diboron which has lost two hydrogen atoms. With the aid of this loss a constitutional formula is derived having 22 outer electrons. The 3B hydrides B_3H_8 , B_3H_{10} and B_3H_{12} can be split in the same way. $\text{B}_3\text{H}_8 = \text{B}_2\text{H}_6 + 3\text{BH}$; $\text{B}_3\text{H}_{10} = \text{B}_2\text{H}_6 + 4\text{BH}$; $\text{B}_3\text{H}_{12} = \text{B}_2\text{H}_6 + 5\text{BH}$. The group BH contg. 4 outer electrons $3\text{B} + 1\text{H}$ forms an edge of a cubic face. This edge with another similar one forms a complete new cube. Each new BH group then forms a new octet. Through chain ramifications there are also conceivable isomers which have not so far been found.

C. SCOTT

Chlorine fluoride. OTTO RUFF, ERNST ASCHER, JOSEPH FISCHER AND FRIEDRICH LAAS. *Tech. Hochschule, Breslau. Z. anorg. allgem. Chem.* 176, 258–70(1928).—Gaseous HCl is passed into a vessel contg. F_2 and cooled in liquid air. Green luminosity is apparent, a mist is formed and white flakes slowly sink to the bottom. After removal of HF by distn. at -50° , the contents are fractionated and each fraction is analyzed. The results indicate the presence of a chlorine fluoride in the fraction between

—80 and —110° which has been decompd. by reaction with the glass to form Cl_2O . Expts. are conducted with mixts. of F_2 and Cl_2 in various proportions in quartz, glass and Cu vessels, the most satisfactory results being obtained when Cl_2 reacts with a large excess of F_2 at 250° in a Cu vessel, no explosion occurring under these conditions. The reaction product also contains F_2 and Cl_2 ; it is liquefied and sepd. into its constituents by fractionation. ClF is an almost colorless gas with a strong odor, differing from Cl_2 or F_2 . In quartz glass it has a yellowish brown color, due probably to traces of Cl_2O . When solidified it is white, m. —161 ± 0.5°, b. —103 ± 3°. Its reactions are in general similar to those of F_2 , but are somewhat more vigorous with metals, particularly As and Sb.

H. STOERTZ

The constitution of tungsten carbide. KARL BECKER. *Z. Elektrochem.* **34**, 640–2(1928).—In the system W–C, 3 carbides were proved; WC formed below 1900°, $\alpha\text{W}_2\text{C}$ between 1900° and 2400°, and its allotropic modification $\beta\text{W}_2\text{C}$ above 2400°, which loses its stability at room temp. A curve of the concns. of CH_4 in H for the different temps. shows a break at 2400° which also occurs in the cond. curve. $\beta\text{W}_2\text{C}$, identified by its x-radiogram, was obtained in cryst. form. $\alpha\text{W}_2\text{C}$ was obtained in hexagonal crystals of the Cd iodide type with the atom coordinates, C (000), W ($\frac{2}{3}$, $\frac{1}{3}$, $\frac{1}{4} + p$) ($\frac{1}{3}$, $\frac{2}{3}$, $\frac{3}{4} - p$). The hexagonal crystal measurement of WC agreed with those of Westgren and Phragmen (*C. A.* **21**, 46). The calcd. mol. vol. of $\alpha\text{W}_2\text{C}$ is 22.1; that of WC is 12.94. The radiographic calens. of the linear coeffs. of expansion given for WC and W_2C show the latter to have greater isotropy. M. E. L.

Peroxides of titanium, zirconium, hafnium and thorium. ROBERT SCHWARZ AND HERMANN GIESE. *Chem. Inst. Frankfurt a. Main. Z. anorg. allgem. Chem.* **176**, 209–32(1928).—The elements of the Ti group, as well as Ce, are pptd. by H_2O_2 in alk. or ammoniacal soln. as *peroxide hydrates*; in every case but Th the product contains 1 peroxide O atom to 1 mol. of dioxide and 2 mol. of H_2O of constitution. The Th compd. is richer in O and contains 4 mols. of H_2O , having the formula $\text{Th}_2\text{O}_7 \cdot 4\text{H}_2\text{O}$

The others are written $\text{MeO}_3 \cdot 2\text{H}_2\text{O}$ and are considered *orthoperoxy acids*, $\begin{array}{c} \text{HO} \diagup \text{Me} \diagdown \text{OH} \\ \text{HO} \diagdown \text{Me} \diagup \text{OOH} \end{array}$.

$\text{HfO}_3 \cdot 2\text{H}_2\text{O}$, previously not isolated, is prepd. by pptn. with H_2O_2 and NH_4OH from a soln. of the sulfate. Extn. with liquid NH_3 removes H_2O from the slimy ppt., NH_3 being removed in a high vacuum at 0°. The product is a white powder, stable at room temp., and almost insol. in ice-cold alk. H_2O_2 (distinction from $\text{ZrO}_3 \cdot 2\text{H}_2\text{O}$). When heated, the active oxygen (O_A) is easily driven off. In analysis O_A is detd. by soln. in dil. H_2SO_4 and titration with KMnO_4 . In this reaction, the KMnO_4 is decolorized slowly, and the liberation of I from a cold KI soln. is also slow, indicating slight hydrolytic splitting up of an —O—O— bond. This, together with behavior in $\text{Et}_2\text{O} \cdot \text{H}_2\text{O}$ mixts. is taken to indicate that O_A is combined in the form —O—O—. Ce likewise forms the compd., $\text{CeO}_3 \cdot 2\text{H}_2\text{O}$, a dark, reddish brown, flocculent ppt. It is even less stable than the Ti group peroxides, decompg. at 0° in a few days. From acid Zr sulfate solns., an excess of H_2O_2 slowly ppts. *zirconium peroxo-sulfate*, $\text{Zr}_2\text{O}_6\text{SO}_4 \cdot 8\text{H}_2\text{O}$. It is poorly sol. in H_2O and dil. acids, easily sol. in concd. H_2SO_4 . Boiling in dil. HCl

liberates Cl_2 . The constitutional formula is written $\begin{array}{c} \text{O} \diagup \text{O} \diagdown \\ | \quad \text{O} \quad \text{O} \quad \text{O} \\ \text{SO}_4 \end{array} \text{Zr} \begin{array}{c} \text{O} \diagdown \text{O} \diagup \\ | \quad \text{O} \quad \text{O} \quad \text{O} \\ \text{SO}_4 \end{array} \text{Zr} \begin{array}{c} \text{O} \diagup \text{O} \diagdown \\ | \quad \text{O} \quad \text{O} \quad \text{O} \\ \text{SO}_4 \end{array} \cdot 8\text{H}_2\text{O}$.

Ti, Th and Hf do not form analogous compds. With Ti and Zr, if the peroxide hydrate is dissolved in an excess of a cold soln. of H_2O_2 and alkali, alc. ppts. from this soln. a *perbitanate* or *perzirconate* with the compn. $\text{K}_4\text{TiO}_8 \cdot 6\text{H}_2\text{O}$. They are regarded as salts of *tetra-orthoperoxy acids*; corresponding compds. with Hf and Th are not formed. With Ti, Zr and Hf, salts of the type $\text{K}_2[\text{TiO}_2(\text{SO}_4)_2] \cdot 3\text{H}_2\text{O}$ are formed. Thus *potassium peroxozirconyl sulfate* is prepd. by dissolving sufficient hydrate to contain 1.0 g. ZrO_2 in 18.5 cc. of 65% H_2SO_4 , and adding to this 1.4 g. K_2SO_4 and 5 cc. of 30% H_2O_2 . After standing 1 hr. at 0°, the salt is pptd. by adding cold acetone. Hydrolysis proves these to be actually complex salts rather than mixts. The Zr and Hf compds. had not been previously prepd. The colorimetric detn. of F, based upon the decolorization of the reddish yellow soln. of $\text{K}_2[\text{TiO}_2(\text{SO}_4)_2]$, is studied and found to involve the reaction: $\text{K}_2[\text{TiO}_2(\text{SO}_4)_2] + 3\text{H}_2\text{F}_2 = \text{K}_2(\text{TiF}_6) + 2\text{H}_2\text{SO}_4 + \text{H}_2\text{O}_2$, the presence of *peroxyfluorides* such as $\text{TiO}_2\text{F}_2 \cdot 2\text{NH}_4\text{F}$ and $\text{TiO}_2\text{F}_2 \cdot 3\text{NH}_4\text{F}$ being assumed as intermediate products. Cond. measurements show the latter, *ammonium peroxotitanyl fluoride*, to possess 4

ions and therefore the complex ion, $\left[\text{F}_6\text{Ti} \begin{array}{c} \text{O} \diagup \text{O} \diagdown \\ | \quad \text{O} \quad \text{O} \quad \text{O} \\ \text{O} \end{array} \right]^{111}$, is confirmed. In this the —O—O— group occupies only one of 6 coordination positions.

H. STOERTZ

Triphenyl chromium, as well as contribution to the knowledge of tetraphenyl chromium and diethyl thallium. FR. HEIN AND E. MARKERT. Univ. Leipzig. *Ber.* 61B, 2255-67(1928).— Ph_3Cr (I) is obtained as an amorphous, brownish yellow deposit by the electrolysis of Ph_3CrI in anhyd. NH_3 . I is even less stable than Ph_4Cr (II), readily splitting off Ph_2 . In air it becomes pasty and is transformed into Ph_3CrOH (III). I can be quantitatively converted into III, which can be titrated with acids. Preps. of I contain some NH_3 which disappears in moist air or EtOH . Under certain conditions amide formation appears to occur as in the case of II. I can also be prepd. by the action of NH_3 solns. of Na on Ph_3CrI . II is produced by the electrolysis of Ph_3CrOH in NH_3 , and contains $\frac{1}{3}$ of a mol of NH_3 , which disappears in moist air or EtOH . II dissolves in $\text{C}_6\text{H}_5\text{N}$, forming a red-brown soln without chem. action being apparent. In 0.062-0.086 *N* solns. II is practically monomol. II lacks the metallic nature of the tetra-alkyl NH_4 radicals and the alkali metals in that it does not form amalgams or blue solns. in NH_3 . Its reaction with H_2O is its only metallic character, since a strong base is formed; although this is unlike the behavior of the alkyl derivs. of Pb, Sn, and Hg. I and II are poor conductors and show no definite decompn. potential. Attempts to prep. Et_4Tl in an analogous way were unsuccessful, Tl being obtained.

DAVID DAVIDSON

Hydrazine selenate. JULIUS MEYER AND WILLI AULICH. *Ber.* 61, 1839-40 (1928).—By the action of $\text{H}_2\text{NNH}_2 \cdot \text{H}_2\text{O}$ on dil. aq. H_2SeO_4 , $\text{H}_2\text{NNH}_3\text{HSeO}_4$ (I) is obtained as a colorless cryst. powder which soon colors red. It is difficultly sol. in cold, but readily sol. in hot water. The addn. of HCl to this soln. causes sepn. of Se. I when rubbed with a glass rod or treated with concd. HCl explodes; this is due to an inner oxidation. It is recommended in the detns. of selenates and H_2SeO_4 first to convert these to the selenious compd. (II) by boiling with strong HCl , and then to reduce II with $\text{H}_2\text{NNH}_3\text{HSO}_4$.

FREDERICK C. HAHN

Action of carbon monoxide on metallic chlorides. L. BELLADEN, M. NOLI AND A. SOMMARIVA. Reale Univ., Genova. *Gazz. chim. ital.* 58, 443-9(1928).—CO was passed over PbCl_2 , AgCl , CuCl and NiCl_2 at different temps. and the equil. reaction: $\text{MCl}_2 + \text{CO} \rightleftharpoons \text{M} + \text{COCl}_2$, was studied. The data, recorded in tables, show that reduction appreciable, the quantities of COCl_2 formed being great enough to be detd. and therefore much greater than the theory predicts. There can, however, be no doubt of the measurements of the dissocn. of COCl_2 of Bodenstein (cf. *C. A.* 2, 1223; 18, 2848) and of Christiansen (cf. *C. A.* 17, 917), so that secondary reactions must take place under the conditions used by B., N. and S. Expts. to settle this problem showed that in the presence of the metallic chlorides, CO decomps thus: $2\text{CO} \rightleftharpoons \text{C} + \text{CO}_2$. The CO_2 formed decomps. thus: $2\text{CO}_2 \rightleftharpoons 2\text{CO} + \text{O}$, and the O reacts with the metallic chloride, thus $2\text{MCl}_2 + \text{O} \rightleftharpoons 2\text{MO} + \text{Cl}_2$. At the high temps. employed, viz., 450-750°, the yields of COCl_2 from the action of CO_2 on metallic chloride are as great as those with CO. The expts. show that the reactions which take place are complex and difficult to study quantitatively, but the expts. are conclusive in proving why the actual yields of COCl_2 differ so greatly from those calcd. from known dissocn. data. C. C. D.

The simplest silicic acids—with observations on aluminum hydroxide. XI. **Hydrates and hydrogels**. RICHARD WILSTÄTTER, HEINRICH KRAUT AND KARL LOBINGER. Bayer. Akademie Wissenschaften, München. *Ber.* 61B, 2280-93(1928).—12.5 g. SiCl_4 was maintained at 60-65° while a stream of dry air or N_2 was passed through it and into a beaker contg. 750 g. H_2O + ice which was rapidly stirred and kept at 0°. Freshly pptd. Ag_2O was introduced simultaneously to maintain the acidity at 0.01 *N*-0.04 *N* in HCl . By filtering through charcoal a clear filtrate was obtained contg. 80% of the silica introduced and having a f. p. which when corrected for the HCl present corresponded to a mol. wt. referred to SiO_2 of 72-75, indicating a monosilicic acid of 75-80% purity. If the acidity is greater or less a disilicic acid (mol. wt. 120-30) is obtained. That the latter are not mixts. of mono- and higher acids was shown by dialysis. The f. p. of these solns. rose in the course of several days until the mol. wt. was over 1000 and no longer determinable. The stability of these solns. is max. at p_H 2-3. Monosilicic acid is not pptd. by org. solvents such as MeAc. The authors assume its condensation to occur through intermol. loss of H_2O , thus: $2\text{Si}(\text{OH})_4 \longrightarrow \text{O}[\text{Si}(\text{OH})_2]_2 + \text{H}_2\text{O}$. Those acids above the hexasilicic give ppts. with solns. of egg albumin. Silica gels prepd. by the action of concd. HCl or NH_3 + NH_4Cl showed the compn. $2\text{SiO}_2 \cdot \text{H}_2\text{O}$. Potentiometric titration curves of the silicic acids show an inflection point at one equiv. of NaOH , hydrosols and gels behaving in the same way. With the aging of a soln. there is a slight displacement toward higher potentials of a portion of the curve but agreement exists from below the equiv. point onward. SiO_2 , however, does not titrate like an acid. Silica gels, therefore, are not simply hydrated silica. The formulas of

Biltz and Lehrer (*C. A.* 22, 3365) for the various forms of Al hydroxide are criticized as not being representatives of their chem. behavior. DAVID DAVIDSON

Silicophosphoric acid. ROBERT SCHWARZ. *Z. anorg. allgem. Chem.* 176, 236-40 (1928).—Silica gel with a definite H_2O content is added to a slight excess of H_3PO_4 at 200° , the reaction mixt. then being held at 125° until a small quantity gives a clear soln. in H_2O (240-300 hrs.). The product is dried over P_2O_5 and is found to have the compn. $SiO_2 \cdot 2P_2O_5 \cdot 4H_2O$. It is a *heteropoly acid*, its constitution being best represented by the formula, $H_8[Si(PO_4)_4]$ or $H_8[SiO_4(P_2O_5)_2]$. The complex is very weak, cond. detns. and electrolysis indicating instantaneous and complete dissocn. in H_2O ; the irreversibility of the reaction is due to the sepn. of SiO_2 in colloidal form: $H_8[Si(PO_4)_4] + 2H_2O = 4H_3PO_4 + SiO_2$. Alkalies, NH_4OH and concd. HCl produce the same effect. Alkali phosphates, SiO_2 and Na_2CO_3 are fused together in various proportions, a homogeneous melt with a definite crystn. temp. of 961° being obtained with the proportions $4Na_2O \cdot SiO_2 \cdot 2P_2O_5$, and this is the Na salt of *silicophosphoric acid*, $Na_8[Si(PO_4)_4]$. Attempts to prep. the analogous *silicoarsenic acid* failed. H. STOERTZ

Molybdc acid—selenic acid. ERWIN WENDEHORST. Tech. Hochschule, Braunschweig. *Z. anorg. allgem. Chem.* 176, 233-5(1928).— $MoO_3 \cdot SeO_3$ is prepd. by heating a mixt. of *molybdic acid* and *selenic acid* for several days upon a water bath. The liquid is poured off and the excess SeO_3 is driven off from it by heating below 230° . Yellow, transparent crystals are formed, which are quickly washed with acetone and Et_2O ; they agree closely with the formula, $MoO_3 \cdot SeO_3$. This compd. can also be prepd. by adding finely powd. MoO_3 to hot H_2SeO_4 until no more goes into soln. After standing about 6 hrs. the soln. is poured off, dild. with H_2O after cooling, filtered and dried to a yellow sirup in a desiccator. Analysis shows this to be a soln. of MoO_3 in H_2SeO_4 . The excess SeO_3 is driven off as above. Addn. of a few drops H_2O to $MoO_3 \cdot SeO_3$, followed by drying at 110° , forms a yellow, glassy substance with the compn. $MoO_3 \cdot SeO_3 \cdot 2H_2O$. This is extremely hygroscopic. Electrolysis shows the compd., $MoO_3 \cdot SeO_3$, to be actually a complex rather than a mixt. It is very sensitive to reducing agents, alc. and acetone, producing a blue coloration and sepn. of Se. H_2O_2 produces the orange-yellow color of *permolybdate*. With Et_2O a loosely held addn. compd. is formed, a bluish green, oily liquid, insol. in excess Et_2O . H. STOERTZ

A new compound of lithium, iron and nitrogen. W. FRANKENBERGER, L. ANDRUSOW AND F. DÜRR. *Z. Elektrochem.* 34, 632-7(1928).—Pure finely divided Fe and Li nitride of highest purity (1:1), heated in N to $280-730^\circ$ in an app. of special design, forms a complex compd., $Li_3N \cdot FeN$, proven by analysis, its Debye-Scherer absorption, thermodynamic properties and other measurements. The heat curve shows a sudden upward bend between 480° and 520° , when the reaction is most evident. Decompn. begins at 730° and the reaction reverses on cooling. Thermal measurements in a differential app. show the reaction is not univariant. A table is given showing the results of varying the mol. proportions of Fe and Li_3N . Conclusion: The opposing results of previous investigators as to the action of Fe on N is due to differences in the purity and division of the Fe. Also Fe nitride is not formed as an intermediate compd. in the *catalytic NH_3 synthesis*. MARY E. LEAR

Complex nickel ammines. E. KOCIS. *Magyar Chem. Folyóirat* 34, 33-39(1928).—Examn. of complex Ni hexammines shows that the concn. of solns. or mixts. has some relation to the structure of the complex compd. formed. A compd. contg. 2 mols. of water is formed from 10-15% solns., another contg. 1 mol. of water from a 30-40% solns. and an anhyd. compd. from a soln. of 50% or more concn. Ni hexamine chlorides, bromides, iodides, nitrates, sulfates and chromates have been examd. Anhydrous complex compds. were the most stable and those with 1 mol. of water were the least. All of these compds. are sol. in dil. acids. The water content can be characterized as water of crystallization, since it does not belong to the structure of the complex ion. The compds. have varying colors with some regularity. Water content has no influence on the crystal form of the compds. S. S. DE FINÁLY

Lithium chloride ammonia complexes. S. C. COLLINS AND F. K. CAMERON. U. of N. Carolina, Chapel Hill. *J. Phys. Chem.* 32, 1705-16(1928).—The mono-, tri- and tetraammino Li chlorides were investigated, vapor measurements on the first disagreeing with the results of Bonnefoi (*Ann. chim. phys.* [7] 23, 317(1901)), while measurements on the other 2 agree with those of B. No evidence could be found for the existence of the diammino complex described by B. At temps. $0-66^\circ$ either tetra-, tri-, or monoammino- $LiCl$ may be formed. Pressure-temp. limits for the existence of each were detd. The system $LiCl-NH_3-H_2O$ at 25° yields as a solid phase $LiCl \cdot H_2O$ in contact with solns. up to 15% NH_3 , $LiCl \cdot NH_3$ for solns. with 15-27% NH_3 , and $LiCl \cdot 3NH_3$ for solns. with 32-40% NH_3 . Vapor-pressure measurements were made

on this system. There is a steady increase in the amt. of LiCl dissolving in H_2O when NH_3 is added until there is present a mole of NH_3 per mole of LiCl , at which point $\text{LiCl}\cdot\text{NH}_3$ becomes the stable solid phase.

An experiment in quantitative analysis for group performance. LYMAN E. PORTER. Univ. Ark. *J. Chem. Education* 5, 1429–31(1928).—To illustrate a reaction that is progressing slowly, it is suggested to have different students in a group det. on different days some constituent in a salt that is taking up or losing H_2O .

W. T. H.

An improvement in the technic of spectroscopic analysis: application to forensic chemistry. E. BAYLE AND L. AMY. Service d'Identité Judiciaire, Paris. *Ann. méd. légale criminol. police sci.* 8, 525–31(1928); cf. *C. A.* 20, 1640; 21, 3579.—The extreme sensitiveness of the method previously described requires the use of reagents absolutely free from the metal in question; incineration and electrolysis should be carried out in closed vessels to prevent contamination with dust, and in the detection of Cu incineration should be carried out in an elec. muffle to avoid the use of burners. By this method, Cu was detected on cloths through which Cu, brass or Ni-brass bullets had been fired; Ni and Zn were detected inside the bore of a fire-arm through which a Ni-brass bullet had been fired; Cr was detected in the ink of a small portion of a letter of text and Mn on a written text which had been treated with a KMnO_4 ink eradicator and thoroughly washed; and Zn and Pb were detected on a steel bit which had been used to bore wood having a coating of BaSO_4 -ZnO-white lead paint.

A. P. C.

Simplified methods of potentiometric and conductometric analysis and their industrial application. T. CALLAN AND S. HORROBIN. *J. Soc. Chem. Ind.* 47, 329–43T (1928).—The theory of electrometric titrations is discussed and practical examples of such titrations are described. In potentiometric work, it is shown how the expensive potentiometer is often unnecessary. Thus alkali hydroxide added to an acid soln. with the quinone electrode shows the same e. m. f. at the end point as is obtained in titrating TiCl_3 with Fe^{+++} alum so that with such a cell, a tapping key and a simple reduction flask, which is shown, a great many dyes can be analyzed by TiCl_3 . In titrating aniline, toluidine, phenol, nitrophenol, dinitrophenol and sulfanilic acid with KBrO_3 , the end point is reached in every case at 0.64 v. and this e. m. f. can be obtained easily by means of a Pt wire immersed in an acid soln. of KBr contg. a trace of Br. For some reason resorcinol titrated with bromate shows 0.54 volt at the end point. For pptn. work, Treadwell has devised a simple arrangement for using alternating current and a thermionic valve for rectifying the current before measuring. Treadwell's arrangement is modified advantageously by introducing a step-down transformer so that the app. is not connected directly with a high e. m. f. A no. of conductometric titrations with this simplified app. are described.

Elementary microanalysis. R. GOUBAU. Univ. of Ghent. *Natuurw. Tijdschrift* 10, 129–36(1928); *Bull. soc. chim. belg.* 37, 335–44; cf. *C. A.* 21, 3576.—To eliminate the use of absorption trains in microanalysis, G. describes methods for the detn. of H_2O and CO_2 by direct condensation. The combustion takes place in a long quartz

tube with ground joints filled according to Pregl, the PbO_2 being heated by electricity in an Al block. The O_2 used is passed through H_2SO_4 , soda lime and CaCl_2 , a quartz tube contg. Pt heated to redness, a bubble flask, and a U tube with Ag spirals cooled with liquid O (not liquid air) before entering the combustion tube. The products of combustion go through a U tube cooled in solid CO_2 + alc. (H_2O condensed) and a second one with liquid O (CO_2 condensed). All glass work is ground, the absorption U tubes are of thin glass 3 to 4 mm. wide, 15 cm. long with constrictions at tops and bottoms; they contain Ag spirals for better cooling efficiency. After the combustion the U tubes are sealed off at the constriction nearest to the combustion tube, the tube is rapidly evacuated from the other end (1 mm. by oil pump) and the other top constriction sealed, all before the cooling bath is removed. The loss by the evacuation is negligible. The individual sealed tubes are then turned over with one leg outside the Dewar vessel to distil the H_2O or CO_2 over into the cool leg and the latter is in turn sealed off at the bottom constriction. The containers so obtained are much lighter than Pregl's and easier to weigh. The glass tare is weighed subsequently after removal of the condensate by repeated evacuation and heating; the tubes are not to be touched by hand. Examples are given showing the correction for O_2 and air in the tubes; samples of 10 mg. material are advised.

Standards for titration, their significance and tests. N. SCHOORL. *Chem. Weekblad* **25**, 534-7(1928).—A lecture.

B. J. C. VAN DER HOEVEN

The electrometric titration of manganese by the Volhard method. B. F. BRANN AND M. H. CLAPP. Univ. Me. *J. Am. Chem. Soc.* **51**, 39-41(1929).—Various methods for detg. the end point of the Volhard reaction electrometrically proved unsuccessful until the "dead stop end point" described by Foulk and Bawden was tried with a short piece of Pt wire as cathode and Ag wire as anode. Then, by adding a few drops of 6 N HCl to the soln., the anode became depolarized as soon as an excess of KMnO_4 had been added. Moreover, an e. m. f. results between the 2 electrodes at the start so that the 2 electrodes can be connected directly with a galvanometer without using any outside source of current. The electrodes should be cleaned after each titration. The results are quite satisfactory, the max. error reported on some 18 titrations being about 2 drops of 0.1 N KMnO_4 .

W. T. H.

Determination of calcium in calcium glycerophosphate, calcium lactophosphate and calcium mono- and di-hydrogen phosphates. E. LETRUC. Établissements Darasse. *Ann. fals.* **21**, 534-6(1928).—In the Fr. Codex method for the detn. of Ca in $\text{CaH}_2(\text{PO}_4)_2$ (soln. in dil. AcOH and pptn. with $\text{H}_2\text{C}_2\text{O}_4$ in presence of AcONa), considerable trouble is encountered in filtering the ppt., and the latter is always contaminated with more or less P_2O_5 . These causes of error are eliminated in the following technic: for glycerophosphate and lactophosphate dry 0.5 g. at 150° for 4 hrs., incinerate carefully to a grayish white ash, take up in dil. HCl, filter, ignite the residue and filter to a white ash, take up with dil. HCl, filter, add the filtrate to the 1st filtrate, and ppt. with $\text{H}_2\text{C}_2\text{O}_4$ from AcOH + AcONa soln.; for CaHPO_4 and $\text{CaH}_2(\text{PO}_4)_2$, dissolve in dil. AcOH, ppt. with $\text{H}_2\text{C}_2\text{O}_4$ and AcONa , wash the ppt. by decantation, transfer the ppt. to the filter, dry the filter, ignite in the same manner as for glycerophosphate and ppt. as usual.

A. PAPINEAU-COUTURE

Rapid method for the determination of selenium. ERWIN BENESCH. *Chem.-Ztg.* **52**, 878-9(1928).—Amorphous Se dissolves readily in cold, satd. Na_2S , forming a red soln. which can be titrated with KCN, the end point being reached when the soln. assumes a light yellow color corresponding to the formation of KCNSe . To apply the method it is only necessary to ppt. Se by a suitable reducer, e. g., $\text{Na}_2\text{S}_2\text{O}_3$, added to an acid soln., wash the ppt., dissolve it in Na_2S and titrate.

W. T. H.

Microestimation of bismuth. P. DUMONT AND M. BOUILLENNE. *Compt. rend. soc. biol.* **99**, 1247-8(1928).—The color reaction of Bi in the presence of an excess of KI is applicable to the microestn. of Bi. L. W. RIGGS

Quantitative separation of alkali metals from calcium and magnesium by means of amyl alcohol. D. KÖSZEGI. *Acta Sci. Regiae Univ. Hung. Francisco Iosephinae* **II**, 214-25(1927).—Gooch stated that amyl alc. has a very small solvent effect on NaCl and KCl. Amyl alcohol therefore may be used for sepg. CaCl_2 and MgCl_2 from Na and K because anhyd., hot amyl alc. dissolves CaCl_2 , MgCl_2 and LiCl. The Lawrence-Smith has been much used for detg. alkalies in silicates, and the removal of Ca^{++} has been tedious. If the anhyd. chlorides of CaCl_2 , $\text{NaCl} + \text{KCl}$, etc., are extracted with anhyd. alc. much time will be saved. S. S. DEF.

Investigations on quantitative spectral analysis. I. Determination of potassium, magnesium and copper in flame spectrum. HENRIK LUNDEGÅRDH. *Arkiv. Kemi. Mineral Geol.* **10**, No. 1, 26 pp.(1928).—By using the nozzle spraying app. of Gouy, and photographing with varying concn. it is possible with 60 sec. exposure and 3 cc. of soln. to det. 0.36 mg. of K, 0.20 mg. of Mg and 0.1 mg. of Cu. The method is probably more accurate than other methods of microanalysis. This paper is published in excellent English and can be obtained from Wheldon & Wesley, Ltd., of Arthur St., London. It will be found interesting to all workers in spectral analysis. A bibliography is given. W. T. H.

Zirconium. II. Detection of potassium by zirconium sulfate in the presence of ammonium ions. RUFUS D. REED AND JAMES R. WITHROW. Ohio State Univ. *J. Am. Chem. Soc.* **50**, 2985 7(1928).—A 10% soln. of $\text{Zr}(\text{SO}_4)_2$ in dil. H_2SO_4 will serve to detect 0.48 mg. of K in 2 cc. of reaction mixt. and the test is equally reliable when considerable NH_4 salt is present, whereas other pptn. tests for K^+ also give ppts. with NH_4^+ . W. T. H.

The quantitative determination of palladium by means of 6-nitroquinoline. S. C. OGBURN, JR. AND A. H. RIESMAYER. Bucknell Univ. *J. Am. Chem. Soc.* **50**, 3018-22(1928).—By means of a satd. soln. of 6-nitroquinoline, Pd is pptd. as $\text{Pd}(\text{C}_8\text{H}_6\text{NNO}_2)_2$. The ppt. can be washed with hot water and weighed as such or it can be ignited in H_2 and the residual Pd weighed. The flocculent ppt. is yellow and insol. in dil. mineral acids. The reagent does not give ppts. with other metals of the Pt group; so it will doubtless prove of value in sepgs. W. T. H.

Ceric sulfate as a volumetric oxidizing agent. VIII. The determination of chromium in the presence of manganese, iron and vanadium. IX. Preparation and stability of ceric sulfate solutions. H. H. WILLARD AND PHILENA YOUNG. Univ. Michigan. *J. Am. Chem. Soc.* **51**, 139 49, 149-52(1929).—A high-grade hydrated CeO_3 has been obtained from the Welsbach Co. and also purchased on the market which, when heated with sufficient H_2SO_4 to form the sulfate and leave the soln. 1-2 N in H_2SO_4 , will yield a soln. of $\text{Ce}_2(\text{SO}_4)_3$ satisfactory for use as an oxidant in titrations. Such a soln. is remarkably stable, as shown by the fact that the titer does not change in 40 weeks, and the CeO_2 for 1 l. of 0.1 N soln. costs only a few cents. With such a soln. Cr can be detd. very rapidly. The expts. here described were made with 100 cc. of aq. chromic alum soln. contg. about 0.046 g. of Cr. The addition of 5 cc. of concd. HNO_3 or of 70% HClO_4 is advantageous. Three methods of continuing the analysis were tested and found satisfactory; (a) Titrate the excess of oxidant in acid soln. with standard NaNO_2 or $\text{Na}_2\text{C}_2\text{O}_4$ soln. With the proper temp. and acidity, these reagents reduce quadrivalent Ce without affecting the oxidized Cr. (b) Remove the excess Ce^{++++} with a slight excess of NaNO_2 and add urea to remove all nitrite. Then titrate the CeO_3 with standard FeSO_4 soln. (c) Remove the excess Ce^{++++} with 0.1 molar NaCN and titrate the $\text{Cr}_2\text{O}_7^{--}$ with FeSO_4 soln. These methods of detg. Cr are not only very rapid but meet with little interference. Fe does not interfere and although V will be detd. with the Cr, the soln. can be used for a subsequent detn. of V. A large quantity of Mn can be present. In method (b) diphenylbenzidine or diphenylamine can be used as indicator, otherwise it is necessary to det. the end points electrometrically. W. T. H.

Microcolorimetric estimation of uranium salts. Application to the estimation of sodium following the technic of Blanchetière. (MILLE.) MARGUERITE TISSIER AND HENRI BÉNARD. *Compt. rend. soc. biol.* **99**, 1144-6(1928).—The object was to det. the influence of the reaction of the medium, the concn. of the ferrocyanide and the concn. of the UO_2 salts on the intensity of the brown color produced by the reaction between ferrocyanide and UO_2 salts. The triple acetate of Na-Mg and UO_2 was used. In concns. of 0.04 to 5.0% of AcOH in the medium, the intensity of coloration was independent of the acidity. The coloration is not produced in an alk. medium. With

0.2% solns. of the U salt a 1% soln. of $K_4Fe(CN)_6$ is the optimum concn. With a 1% soln. of $K_4Fe(CN)_6$ and 2% AcOH acidity in the medium the intensity of coloration varied directly as the concn. of the U salt. By converting the Na to the triple acetate, this method may be used in the quant. detn. of Na according to the method of Barrenscheen and Messiner (cf. C. A. 22, 607).

L. W. RIGGS

Critical studies on the fusion of rare-metal ores. III. Determination of tantalum and columbium. GEORGE W. SEARS. U. S. Bur. Mines. *J. Am. Chem. Soc.* 51, 122-9 (1929).—When fused at about 650° with $Na_2S_2O_7$, Fe and Ti oxides are converted into sulfates sol. in hot 3 N HCl. It is best to digest the melt with cold water, filter and then treat with hot HCl. The residue insol. in dil. HCl contains all of the Ta_2O_5 and Cb_2O_5 , together with a little SiO_2 in most cases. By treatment with HF and H_2SO_4 , the pure oxides can be weighed. Then, by fusing with more $Na_2S_2O_7$ at $835-850^\circ$ for 10-15 min., leaching with water and washing the residue with hot, 3 N HCl, a residue is obtained from which $Cb(SO_4)_2$ can be removed by digesting with hot concd. H_2SO_4 ; fuming for 15 min., cooling and pouring slowly into cold water. Ta_2O_5 resists this treatment. By adding NH_4OH and filtering, a ppt. is obtained from which pure Cb_2O_5 can be obtained by ignition and treatment with H_2SO_4 and HF.

W. T. H.

Use of methyl orange for the detection of free chlorine and chloramines. BERSMANN. *Chem.-Ztg.* 52, 826(1928).—Methyl orange is sensitive to Cl_2 or $HClO$ only in acid soln. Thus if dil. Cl_2 water is made alk. with NaOH and then methyl orange is added, the indicator retains its yellow color. On making acid, the methyl orange is bleached. Similarly by adding NH_4OH or an amine to Cl_2 the bleaching effect of Cl_2 is lost but now on making the soln. acid there is no bleaching effect although other reagents for Cl_2 are affected. Conclusion: Methyl orange serves to differentiate between free Cl_2 and chloramines. Only the former is active toward methyl orange whereas KI, toluidine or benzidine is sensitive to the latter. This probably explains Grassberger's "apparently free" and "actually free" tests for Cl_2 in drinking water.

W. T. H.

The gasometric determination of carbon dioxide by the Chittick method. RAYMOND HERTWIG AND J. S. HICKS. Hecker H-O Co. Inc., Buffalo, N. Y. *Cereal Chemistry* 5, 482-4(1928).—The addn. of a measured vol. of reagent acid to the dry decomposition flask causes a greater displacement in the gas-measuring tube than the vol. of acid added. This may amount to 3 to 5 cc., depending on barometric pressure, the temp and the acid concn. The increase in vol. is attributed to the vapor tension of the reagent acid. Tables are given showing exptl. results.

Attempt to develop a titrimetric determination of the albumin content of solutions. W. D. TREADWELL AND W. EPPENBERGER. *Tech. Hochschule Zürich Helvetica Chim. Acta* 11, 1053-62 (1928).—It is improbable that there will ever be a satisfactory direct method for titrating a colloid such as egg albumin or gelatin and expts. using $K_4Fe(CN)_6$ as precipitant with electrometric detn. of the end point, confirmed this view. Egg white and gelatin have a marked tendency to adsorb colloidal Prussian blue. The amt. of colloidal Prussian blue that can be added to a tannin-albumin gel before a distinct blue is recognizable in the supernatant soln., can be taken as a measure of the albumin content provided the colloidal Prussian blue soln. has been standardized against the same protein. In the expts. here described a soln. of gelatin contg. 5-10 g. per l. was used and the white from a fresh egg was shaken for 1 hr. with 300 cc. of water and filtered through cotton and paper. It was found that 1 g. of gelatin corresponded to 23 millimol. of ferrocyanide ion and 1 g. of egg albumin to 1.1 millimol. of ferrocyanide. To a measured vol. of the protein soln. (contg. about 30 mg. of protein) add 200 mg. of tannin in 0.5-1% soln. and after the resulting ppt. has settled, add colloidal Prussian blue in small portions. The titrating soln. is prepared by mixing 25 cc. of 0.2 N $K_4Fe(CN)_6$ with 18.8 cc. of 0.2 N $FeCl_3$ and dilg. to 500 cc. Add the blue colloid at first in 2-cc. portions, then in 1-cc. portion and finally in 0.5-cc. portion. After each addn. shake 10 min. and, when near the end point, take 10 cc., centrifuge and note whether the soln. is blue.

W. T. H.

Detection of methanol in ethyl alcohol, alcoholic beverages, tinctures, etc. Y. KINUGASA, Y. HATTORI AND K. AKIYAMA. *Tokyo Imp. Hyg. Lab. J. Pharm. Soc. Japan* 48, 767-90(1928).—After studying the sensitiveness and practical usefulness of various methods for the detection of MeOH, especially the Japanese official, U. S. P., Reif's (*C. A.* 20, 2965) and Wright's (*C. A.* 21, 2240), the following procedure was adopted. If the sample contains more than 60% EtOH, use 10 cc. and dil. with 10 cc. H_2O ; if 20-60% EtOH, use 10 cc.; if less than 20%, use 20 cc. sample. Introduce the sample into a 50-cc flask provided with a small glass tube 75 cm. long, bent twice nearly at right angles, which serves as a condenser. If the sample is distinctly acid, neutralize with 0.1-0.5 g. of pptd. $CaCO_3$. By means of a small flame distil carefully 1 cc. into a small test tube cooled by ice- H_2O . The last vertical column of the condenser should not become heated. Place 0.1 cc., 0.2 cc. and 0.3 cc. of the distillate separately into 3 test tubes; fill each to 5 cc. with H_2O ; add 0.4 cc. of 50% H_2SO_4 and 5 cc. of 1% $KMnO_4$. Allow the mixt. to stand 2 min.; decolorize by adding 1 cc. of 8% $(CO_2H)_2$ followed by 1 cc. of concd. H_2SO_4 . Then add 5 cc. of fuchsin-sulfurous acid soln. and mix. If MeOH present, a violet or reddish purple color is developed in 1-2 hrs. If it is desired to distinguish a small amt. of MeOH spontaneously generated by fermentation, etc. from that intentionally added, add 2 cc. (instead of 1 cc.) concd. H_2SO_4 after decolorization with $(CO_2H)_2$. In the former case (0.05% MeOH or less), no color reaction is obtained.

NAO UYBI

Volumetric estimation of reducing sugars. R. BIAZZO. *Ann. chim. applicata* 18, 447-53(1928).—Dil. sugar solns. can be titrated, by adding Fehling soln. in excess to a measured vol. of the soln., dissolving the pptd. Cu_2O with $(NH_4)_2SO_4$ and NH_4OH excluding air, and then measuring the Cu_2O by adding $AgNO_3$ soln. according to the reaction $Ag_2O + Cu_2O = 2 Ag + 2CuO$, KCNS being used to measure the excess $AgNO_3$. To 10 cc. dil. sugar soln. add 50 cc. Fehling soln. boil 2 min., and close with a stopper carrying a separating funnel that contains a soln. of 220 g. Na_2SO_4 and 300 cc. concd. NH_4OH . Run in this soln. with stirring until Cu_2O is dissolved, then add 10 cc. $AgNO_3$ (3.5%) through the separating funnel. The soln. may now be exposed to the air during final titration with KCNS. The results are good to 3%.

A. W. CONTIERI

Studies on the polarimetric determination of small quantities of glucose. C. LUNDGAARD, CHR. N. J. GRAM, S. A. HOLBØLL AND E. RUD. *Med. Univ., København. Biochim. Z.* 201, 341-52(1928).—Even with a polariscope reading in 0.01° the error with small quantities of glucose does not exceed 0.02 mg.

Analysis of liquids. THE GRASSELLI CHEM. CO. Ger. 468,912, May 13, 1926. An app. for the analysis of a liquid by measuring its heat of reaction with another liquid is described. The 2 liquids flow in unbroken streams from 2 vessels, in which their temp. is measured, to a vacuum flask, in which the temp. of the mixt. is measured, and the mixt. flows away from the top of the flask.

Moisture determinations. FRANKFURTER FORSCHUNGSINSTITUT FÜR GETREIDE-CHEMIE GES. Brit. 290,645, May 18, 1927. The moisture content of granular or pulverulent solids such as grain or flour (and also of other liquid, semi-liquid, pulpy, pasty or solid materials) is ascertained by detg. the dielec. const., *c. g.*, by capacity measurements, and comparing it with the const. of the normal material.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRES

The double dispersion method of mineral determination. R. C. EMMONS. *Am. Mineral.* 13, 504-15(1928).—The method described has as an objective the detn. of the *ns* of a mineral to ± 0.001 instead of the usual ± 0.005 , and an increase in speed. A set of 13 liquids chosen on a basis of both wave length and thermal dispersion covers the *n* range from 1.40 to 1.78, usually with considerable overlap. The actual procedure consists in changing the *n* of the liquid by a temp. change first, and then going back by a change in the wave length until the mineral and liquid again agree. Three detns. suffice to give the dispersion curve of the mineral, from which the *n_D* or *n* for light of other wave lengths can be easily read. The app. consists of a water heated cell for the microscope stage in series with a refractometer, with thermometers to check temps. The mineral is mounted in the appropriate liquid and the same liquid is placed in the refractometer. At a given temp. the monochromator is adjusted until the *n* of the mineral and that of the liquid agree. The temp., monochromator and refractometer readings are recorded. The temp. is then raised a few degrees and the monochromator again adjusted; and this is repeated. There are now available 3 correct *ns* on one ray, and a curve can be drawn. A description of the app. is given and also graphs of the optical properties of the liquids used.

A. M. BRANT

Dyscrasite and the silver-antimony constitution diagram. G. M. SCHWARTZ. *Am. Mineral.* 13, 495-503(1928).—The Ag-Sb constitution diagram is given and the application of the data to veins is discussed. An intergrowth of native Ag and dyscrasite is described with photomicrographs of etched surfaces. It is concluded that the formula of dyscrasite is Ag₃Sb which is also a known compd. in the system Ag-Sb. Compns. other than Ag₃Sb are due to the solid soln. of Sb and Ag, or a mixt. of Ag₃Sb and this solid soln. An intergrowth, such as is found in the ores at Cobalt, Ont., may originate by: (a) crystn. of the solid soln. Ag-Sb above 560° and of Ag₃Sb at 500°; (b) formation of solid soln. Ag-Sb in range 10-15% Sb and its breakdown into Ag-Sb solid soln. and Ag₃Sb on cooling. Mixts. of types described can be recognized only by etching the polished surfaces and examn. under the microscope.

A. M. BRANT

The occurrence of linnéite in the coal measures of South Wales. W. E. HOWARTH. *Geol. Mag.* 65, 517-8(1928).—Crystals of linnéite (Co₃S₄) as minute octahedrons or aggregates of octahedrons (sometimes twinned) averaging about 0.4 mm. were found loosely attached to dolomite or ankerite lining cracks in the clay ironstones of East Glamorgan. Associated minerals were millerite, kaolinite, chalcopyrite, quartz, barite, sphalerite, galena and a hydrocarbon (hatchettine?). The mode of occurrence indicated that its formation was subsequent to that of dolomite and millerite.

A. M. BRANT

Xanthoconite and associated minerals from the General Petite Mine, Atlanta District, Idaho. EARL V. SHANNON. *Am. Mineral.* 13, 469-75(1928).—A description of a specimen in which the rare mineral xanthoconite is assocd. with quartz, Au, arsenopyrite, argentite, proustite and polybasite. Crystallographic data for the last 3 are given.

A. M. BRANT

Calcite crystals from Vodelée. VALÉRE BILLIET. Univ. Gent. *Natuurw. Tijdschrift* 10, 158-9(1928).—On specimens from the marble quarries of Vodelée, Bel-

gium a new form $d^7 = \{71\bar{8}6\}$ was found. Several crystals were measured in detail and tabulated data are given.

B. J. C. VAN DER HOEVEN

Structural relationships in the silicates. B. GOSSNER. *Ber.* 61B, 1634-8(1928).—There are groups of silicates which have a structural type common to the group. By structural type is meant a mol. contg. a certain no. of O atoms and a certain no. of other atoms (excepting H which is too small to affect the space lattice appreciably). Silicates having a common structural type show unit cells, under x-ray analysis, which have very similar dimensions and vol., although their crystallography may be entirely different. Examples of 3 groups are given: (1) babingtonite, anorthite, epididymite; (2) beryl, cordierite; (3) diopside, tremolite.

DAVID DAVIDSON

Structural relations of rhodonite to other silicates. B. GOSSNER AND K. BRÜCKL. *Centr. Mineral. Geol.* 1928A, 316-22. The unit cell of rhodonite has $a = 7.77$, $b = 12.45$, $c = 6.74$ A. U.; $\alpha = 85^\circ 10'$, $\beta = 94^\circ 4'$, $\gamma = 111^\circ 29'$. This is not similar to diopside, but resembles babingtonite. To express this relationship, the formula is written $Mn_3CaSi_4O_{12} MnSiO_3$, that of babingtonite being written $Ca_2Fe_2Si_4O_{12} Si_2O_4$. J. E. GILL

The systematic placing of neptunite and babingtonite. B. GOSSNER AND F. MUSSGUG. *Centr. Mineral. Geol.* 1928A, 274-81. The unit cell of neptunite has $a = 16.54$, $b = 12.64$, $c = 10.04$ A. U.; $\beta = 115^\circ 38'$, with 8 mols. $Na_2FeSi_2O_6 \cdot Si_2TiO_6$. Apparently, there is no close relation in structure between aegirite and neptunite. The formula for neptunite is written as above to express this essential difference in structure. Babingtonite has a unit cell with $a = 6.73$, $b = 7.54$, $c = 12.43$ A. U.; $\alpha = 112^\circ 22'$, $\beta = 93^\circ 48'$, $\gamma = 86^\circ 9'$, and 4 mols. $CaSi_2O_6 \cdot (0.292 FeSiO_3, 0.295 MnSiO_3, 0.285 Al_2O_3, 0.127 CaSiO_3)$. It is pointed out that this resembles anorthite, the principal differences being in the angles, α , β and γ . Chem. and possibly also phys. relations between these minerals are explainable by substitution of SiFe for Al_2 . The neptunite-aegirite relationship is considered to be similar in that it is explainable on the basis of substitution with the general relation $M_2''' = M^{IV}M''$.

J. E. GILL

Analcite from Brewster County, Texas. JOHN T. LONSDALE. *Am. Mineral.* 13, 449-50(1928). The analcite was found in basalt. Many of the crystals were euhedral, of a light gray to white color and showed chiefly the trapezohedron. The $n = 1.484$. An analysis is given. There is distinct double refraction, and x-ray examn. shows this mineral to be not isometric in crystn.

A. M. BRANT

X-ray and chemical investigation of the thermal changes of serpentine. HAARON HARALDSEN. *Centr. Mineral. Geol.* 1928A, 297-315. Serpentine from Snarum, Norway, gave: SiO_2 37.39, MgO 40.77, FeO 1.96, CaO 0.62, Fe_2O_3 2.63, Al_2O_3 2.66, H_2O 14.08%. Most of the H_2O passed off between 500° and 700° , the crystal structure of serpentine being destroyed. At 700° the substance showed a structure similar to that of olivine. At higher temps., mixtures of olivine, amorphous silica and enstatite were obtained. Enstatite increased at the expense of the silica with rising temp.

J. E. GILL

Euxenite from Sabine Township, Nipissing District, Ontario. H. V. ELLSWORTH. *Am. Mineral.* 13, 484-7(1928); cf. *C. A.* 22, 2905. Euxenite, next to allanite, is the commonest rare element mineral in Canadian pegmatites, and this new area contains fine material in considerable quantities. A chem. analysis of the best obtainable is given, together with a description of its occurrence and phys. properties.

A. M. BRANT

The constitution formulas of the salts occurring in the potash salt deposits, from the standpoint of coördination studies. H. JUNG. *Centr. Mineral. Geol.* 1928A, 182-5. The formulas derived are: halite $[NaCl_6]$; $[ClNa_6]$; sylvite $[KCl_6]$; $[ClK_6]$; bischofite $[Mg(H_2O)_6]Cl_2$; carnallite $[Mg(OH)_6] \begin{smallmatrix} KCl \\ Cl_2 \end{smallmatrix}$; rinneite $[FeCl_6] \begin{smallmatrix} K_3 \\ Na_4 \end{smallmatrix}$; anhydrite $Ca[SO_4]$; langbeinite $2[SO_4]Mg \cdot [SO_4]K_2$; apthitalite (glaserite) $[SO_4]K_2 \cdot [SO_4]Na_2$; thenardite $Na_2[SO_4]$; glauberite $[SO_4]Ca \cdot [SO_4]Na_2$; vanthoffite $3 \cdot [SO_4]Na_2 \cdot [SO_4]Mg$; kieserite $Mg[SO_4]H_2$; epsomite $[Mg(OH)_6] [SO_4]H_2$; syngenite $\begin{smallmatrix} Ca \\ H_2 \end{smallmatrix} [SO_4] \cdot K_2[SO_4]$; gypsum $\begin{smallmatrix} Ca \\ H_2 \end{smallmatrix} [SO_4]$; blödite $\begin{smallmatrix} Mg \\ H_4 \end{smallmatrix} [SO_4] \cdot \begin{smallmatrix} Na_2 \\ H_4 \end{smallmatrix} [SO_4]$; and leonite $\begin{smallmatrix} Mg \\ H_4 \end{smallmatrix} [SO_4] \cdot \begin{smallmatrix} K_2 \\ H_4 \end{smallmatrix} [SO_4]$.

J. E. GILL

The chemical formula of boracite. JOHN W. GRUNER. *Am. Mineral.* 13, 481-3(1928). An x-ray examn. of the structure of boracite showed the hitherto accepted formula to be incorrect. The av. of new analyses is: $MgCl_2$ 12.35, MgO 26.39, B_2O_3 62.26%, FeO trace. The more probable formula is $Mg_3Cl_2B_{14}O_{26}$, or $Mg_3Cl_2B_7O_{13}$ if boracite is orthorhombic-holohedral instead of hemimorphic as usually claimed.

A. M. BRANT

Gypsum and anhydrite. FRANK A. WILDER. *Am. Mineral.* 13, 476-80(1928).—An inference is made that many important gypsum beds were originally anhydrite.

At least half the U. S. deposits are associated with anhydrites. A careful study of the relationship between gypsum and anhydrite is recommended. A. M. BRANT

Mineralogical contributions from Hungary. Two new minerals. JOSEF KRENNER. *Centr. Mineral. Geol.* 1928A, 265-71; cf. C. A. 22, 1303.—Tabular orthorhombic crystals with the compn. SO_4 49.27, Fe_2O_3 24.54, FeO 0.35, CuO 0.03, CaO 0.10, MgO + Na_2O 0.15, H_2O [25.54]% are named *rhomboclase*. Pyramidal monoclinic crystals with the compn.: SO_4 47.96, FeO 39.42, Fe_2O_3 1.36, CuO 1.20, CaO 0.07, MgO 0.25, $\text{Na}_2(\text{K}_2)\text{O}$ 0.31, ZnO 0.14, H_2O 10.36%, are named *szomolnokite*. Both minerals occur in the Kiesgruben in Szomolnok. *Berthierite* from Felsőbánya has sp. gr. 4.622 and compn.: S 29.28, Sb 55.96, Fe 12.61, Cu 0.06, Pb 0.94, Zn 0.24, Mn 0.31, As trace, insol. 0.05%. J. E. GILL

Thucholite, a remarkable primary carbon mineral from the vicinity of Parry Sound, Ontario. H. V. ELLSWORTH. *Am. Mineral.* 13, 419-39(1928).—A pegmatite dike in this district carries a no. of rare mineral species including uraninite, calciosamaraskite, allanite, cyrtolite and a new species. The last, a black mineral, named thucholite, occurs assocd. with both uraninite and calciosamaraskite embedded in feldspar quartz or mica or in a mixt. of all 3, and is as much of a primary mineral as are any of those mentioned. It takes the form of irregular rounded nodules or roughly globular masses 1-25 mm. in diam. Thucholite is jet black with brilliant luster and perfect conchoidal fracture, cleavage none, very brittle; hardness = 3.5-4; opaque; sp. gr. 1.777 at 17.74°. The mineral appears to vary greatly in compn. It contains about 50% carbon, about 13% H_2O , and about 28% ash of which one-half is ThO_2 . The gas content is high as is the radioactivity of the ash. The fact that it is a carbon containing 25 to 28% of rare element compds. yielding no visible evidence of their presence, and has an enormous gas content in which hydrocarbons are practically absent, may be of remarkable chem. and geological significance. Other reported occurrences of the mineral are noted. The occurrence of C as a magmatic mineral is established, and it appears that in it is absorbed a sample of the final gases of the Precambrian granite magma; with the exception of He. A. M. BRANT

Cyrtolite intergrowth with the Parry Sound thucholite. H. V. ELLSWORTH. *Am. Mineral.* 13, 439-41(1928); cf. preceding abstract.—The Parry Sound thucholite nodules almost always carry on their outer surfaces more or less imbedded or intergrown cyrtolite. An analysis of the intergrowth is given. The cyrtolite group of minerals, contg. Hf, U and the rare earths are always considerably altered. A. M. BRANT

Thucholite and uraninite from the Wallingford Mine near Buckingham, Quebec. H. V. ELLSWORTH. *Am. Mineral.* 13, 442-8(1928); cf. preceding abstract.—Thucholite, uraninite and cyrtolite occur in close assoc. as at Parry Sound. An approx. analysis is H_2O 13.53, gases 28.70, ash 19.84, fixed C 37.93%. One pseudomorph after tourmaline was found, indicating that thucholite could also be produced by late pneumatolytic action. It appears that C must be included with B, F, etc., as one of the constituents of the residual solns. of granite magmas. A. M. BRANT

Anthraxolite from the Northwest Territories of Canada. RALPH L. RUTHERFORD. *Am. Mineral.* 13, 416-8(1928).—The material found in the district of Mackenzie is strikingly similar to that of the Sudbury district in mode of occurrence, mineralogical associations and inclusion in Precambrian rocks. A. M. BRANT

Hungarian minerals. S. KOCH. *Természettud. Közöny* 60, 62-8(1928).—The minerals which have been discovered first in Hungary are: sylvanite (named later on as nagyágit), wehrlite, libethenite, euchroite, tetradymite, thombolite, petzite, hauerite, partschinite, felsőbányite, rézbányite, hörnesite, száibelyite, evansite, fauserite, allosclase, ludwigite, vészelyite, krennerite, pseudobrookite, stützite, herrengrundite, semseyite, dognácskaite, szmikite, kornelite, szomolnokite, andorite, vashegyite, warthaite (named later on as goongarrit), muthmannite, fizelyite and schafarzikite. The history of their discovery is told. S. S. DE FINÁLY

Famous mineral localities: Wodgina, North West Australia. EDWARD S. SIMPSON. *Am. Mineral.* 13, 457-68(1928); cf. C. A. 22, 46.—The recent invention of malleable Ta sheet has led to the reopening of the Wodgina mines which hold first place as sources of supply of Ta. The mines comprise an area of a 20-mile radius of coastal plain out of which rise low granite domes and hills of Archean greenstone. The granite and greenstone are seamed with pegmatite veins in which are found Sn and Ta ores, as well as many other minerals. The following species have been described as new from this district; their analyses are given: pilbarite and hydrothorite genetically related to mackintoshite; calciotantalite, a calciferous tantalite named by S.; and tanteuxenite, a titano-tantalate of Yt, also named by S. A. M. BRANT

Ore deposits of the Harz. IV. The occurrence of pyrrhotite and the origin of

the antimony, nickel and cobalt content in the Rammelsberg ores. GEORG FREBOLD. *Centr. Mineral. Geol.* 1928A, 161-7; cf. *C. A.* 22, 44.—Pyrrhotite occurs with sphalerite. Small amts. of pentlandite and cobaltite are believed to be present, though not certainly identified. J. E. GILL

Bauxite, laterite and red clay. T. KORMOS. *Bányás Kohás Lapok* 61, 32-5 (1928).—Sharp distinction should be made between genetically primary and secondary bauxite occurrences. New examns. of bauxite occurrences in the Bakony mountains, Hungary, showed that the original chem. character of primary bauxite changes during geologic transferring. When evaluating a bauxite occurrence, both chemists and geologists should be consulted. S. S. DE FINÁLY

Cellular forms in rhyolite. I. A. HERRERA. *Lab. Altí Studií Biol. Messico. Atti accad. Lincei* [6], 7, 807-11 (1928).—Rhyolite from the Contepec district, Mexico, which is profoundly silicized, contains an abundance of cellular forms visible with the naked eye. These forms are bluish, yellow, white or reddish, of circular shape, and contain nuclei of a darker and different color from the surrounding portions. In size they vary from 1 to 15 mm. Various other visible characteristics of the nucleated cells, which are described in detail, show in general similarity to various plant forms. Their formation depends upon the presence of SiO_2 , which as an antagonistic colloid also influences the character of living and pseudo-living forms. C. C. DAVIS

Petrographic notes on three rock types from the Shetland Islands. F. COLES PHILLIPS. *Geol. Mag.* 65, 500-7 (1928).—Descriptions are given of (1) an epidote granite contg. primary allanite assocd. with xenotime and later stages of grass-green epidote; (2) chloritoid-garnet-andalusite schist; and (3) secondary serpentine. A. M. BRANT

The petrography of the Triassic sandstone of northeast Ireland. DORIS L. REYNOLDS. *Geol. Mag.* 65, 448 (1928).—The purpose was to trace the origin of the Triassic in Ireland through its mineralogical constitution. A description of the minerals identified and a tabular summary of their distribution at the various localities are given. The older sediments apparently furnished some material, but the main part of the sandstone was derived directly from the metamorphic rocks, quartzite and gneiss. This was indicated by the high % of feldspar in the north of the area, microcline being the most abundant, and in the south by the richer % of heavy minerals present than in the neighboring older sediments. The Triassic sandstone forms one continuous series in which no lithological or mineralogical change was found. A. M. BRANT

Cenozoic "marl" of the Dniester bank. I. V. PUSTOVALOV AND M. F. SMIRNOV. *Centr. Mineral. Geol.* 1928A, 185-92.—Replacement of CaCO_3 by opal-like material has occurred in the upper part of the "marls." A transition from carbonate-rich to siliceous rocks was noted. Several analyses are given. J. E. GILL

Metamorphism in the upper Devonian of North Cornwall. F. COLES PHILLIPS. *Geol. Mag.* 65, 541-56 (1928).—From a petrographic study it was concluded that many of the changes in the phyllites, notably the formation of porphyroblastic white mica, chlorite and chloritoid, hitherto ascribed to the action of Bodmin Moor granite, were due to an earlier dynamic metamorphism. A. M. BRANT

Shugo: a mud volcano of the western Caucasus, with a theory of the origin of mud volcanoes and their significance with regard to oil products. FELIX OSWALD. *Geol. Mag.* 65, 494-9 (1928).—A brief description of this and other mud volcanoes is given. The gas emitted consists of 93.2% CH_4 , which likewise predominates in all gases of the mud volcanoes of the region, analyses of 9 of which are tabulated. O. advances a theory that mud volcanoes are the final stages in a process of torsional fracturing due to the mountain pressure being exerted on concave folds whose strata are no longer plastic enough to fold any more. The oil stored in the anticlinal domes escaped either along the fractures laterally into porous Pliocene and recent beds or to the surface. Mud volcanoes appeared only when gas and saline water remained in the anticlinal domes. The mud volcanoes of the Caucasus occur only at its eastern and western extremities where the Tertiary folds have been deflected from the normal direction. Their presence is not a favorable indication of oil. A. M. BRANT

The Karst water of the brown-coal area of Esztergom, Hungary. Z. SCHRÉTER. *Hydrol. Kozlöny* 1, 45-51 (1921) (publ. 1928).—Karst water occurs in lime and dolomite layers of upper Triassic age under the brown coal area surrounding Esztergom. The horizon of this water is anywhere about 132 m. above sea level, being also considerably higher than that of the neighboring Danube. The Karst water takes its origin from the rain pptd. in remote mountain ranges. S. S. DE FINÁLY

Unchangeableness of composition of spring waters. I. FELBER. *Balneol. Értésítő* 13, 5-7 (1928).—A brief summary of grouping of mineral waters made by Than. Fresenius long ago showed that those of Wiesbaden, Niederselters, Ems and Schlangenbad have

only slight changes in 36 (or 20) years. According to Ludvig and Mautner, Karlsbad water has not changed since 1770. The mineral waters of Fachingen had a const. compn. during 20 years, as found by C. Meineke. Hankó demonstrated that also the thermal waters of Szováta and Buda, Hungary have a const. compn. Mineral waters of shallow borings can have unchanging compn. only in case their enclosing rock excludes soil water and rain.

S. S. DE FINÁLY

Mineral waters of Csik county, Transylvania. S. DE SZINYEI-MERSE. *Hidrol Köz-löny* 1, 27-37 (1921) (publ. 1928).—Samples of 10 different springs have been analyzed both chemically and physically. Data of the analyses made by S. and K. Emszt show that the springs rich in MgO take their origin from phyllites, and those rich in CaO from limestones. Some of the springs contain much gypsum, formed by the S content of ore impregnations in the phyllite. It can be stated on the basis of the examn. of K. de Telegdi-Róth that the acid mineral waters of Csik county are of postvulcanic nature.

S. S. DE FINÁLY

Newest chemical analysis of the thermal springs of Harkány, Hungary. K. Emszt. *Balneol. Értesítő* 13, 7-9 (1928).—The results are given of E.'s analysis of the so-called "older" spring bored in 1866 (analyzed first in 1867 by K. Than) and that of the "new" spring bored in 1887 which has not yet been analyzed. Both borings supply a hot water of almost the same compn. belonging to the group of sulfuric thermal waters. The compd. COS is said to be present.

9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

Gravity concentration and flotation at Mount Morgan, 1925-1927. R. D. NEVETT. *Chem. Eng. Mining Rev.* 21, 7-13 (1928).—The concn. made throughout the concn. plant were mainly pyrite carrying varying quantities of chalcopyrite and Au. The ore from the mine 6" max. size was crushed to 4" in 1 K6 and 1 D6 Gates gyratory breakers, and then to 2 1/2" in 2 K4 Gates gyratory breakers. The gravity concn. section consisted of 4 sets of rolls 36" in diam. in closed circuit with two 9/16" hole trommels when the jigs were used, and with 8 King screens fitted with 5-mesh wire when the jigs were out of action. The jig concentrate was treated in hydraulic classifiers and the clean concentrate sent to the smelter. The overflow of the classifiers was run over Wilfley tables to remove SiO₂. From the King screens the oversize was sent back to the rolls and the undersize went to 6 primary tube mills after being dewatered by cone classifiers. The flotation section consisted of 4 regrind tube mills 16 ft. long by 5 ft. in diam. in closed circuit with 5 Dorr classifiers and 1 automatic cone classifier. The discharge from the classifiers went to the tube mill and the overflow to 4 24-ft. Dorr thickeners. The discharge from the thickeners was run to the flotation boxes and the overflow to the mill sump. Various kinds and quantities of flotation materials were used, but the best results were obtained by using a standard mixt. contg. 60% residual oil, 20% essential

C oil and 20% eucalyptus oil. Recovery of the Au amounted to 82% and that of the Cu to 88%.

DOWNES SCHAAP

Flotation and surface charges of minerals. THOMAS M. BAINS, JR. *Mining J.* (Phoenix, Ariz.) 12, No. 12, 7-9(1928).—A rept. of expts. conducted to det. the liquid-mineral contact potential. The app. consisted of a Compton electrometer suspended by wires from the ceiling, a calomel half-cell, an aeration cell, and a potential cell for the minerals under test. The app. is illus., also five arrangements of the connections. The features of each arrangement are outlined. Negative charges can be secured on the positive, and positive charges on certain negative minerals in certain other solns. Where the "metal" in the mineral has a great affinity for the negative element or radical of the salt in soln., the electrometer seems to read negative. Thus Cu in the chalcocite radical has a great affinity for the CN in the NaCN. S is negative and registers its polarity on the electrometer. In the case of H_2SO_4 , H₂ and S have greater affinity than the Cu and the SO_4 , thus the Cu being positive registers its polarity on the electrometer. Differences in detns. of the single potential have been proved due to elec. conditions in the soln. Ion adsorption may be prevented by the addn. of certain salts which are indicated for the minerals tested. Adding HNO_3 to a soln. or NaOH, or Na_2CO_3 and NaCN gives blende a negative charge, while pyrite remains positive. Tests from actual flotation practice are feasible. The extreme sensitiveness of the electrometer is its chief drawback for general use in mill practice.

W. H. BOYNTON

Preparation of ore pulps for flotation. H. S. MARTIN. *Mining J.* (Phoenix, Ariz.) 12, No. 13, 7-8(1928).—Grinding, pulp diln., reagents, iron depressors, collectors and frothers must all be considered in the flotation of ores. Each ore offers its own problem. Most changes in type of grinding tend to get the bulk of the flotation feed just below the critical mesh and as little as possible in the very fine sizes; pulp d. is made as high as possible; a pH range of 9.0-12.0 is best maintained. Reagents should be added in the following order: lime, cyanide or other depressor, the selector and last the frother.

W. H. BOYNTON

Economies and increased production achieved at the Silver King Coalition plant. H. D. KEISER. *Eng. Mining J.* 126, 748-50(1928).—A flow sheet is given of the remodeled selective flotation mill of the Silver King Coalition Co. near Park City, Utah. The ore is crushed to 2" in a No. 6 KD Allis-Chalmers gyratory and to $\frac{3}{8}$ " in a 4-ft. Symons cone crusher before passing to the grinding section, composed of 3 ball mills, each in a closed circuit with a 6 × 20-ft. duplex Dorr classifier. The circulating load on the grinding section is 2000 tons. In the flotation department there are 28 MacIntosh machines, each driven through a Foote gear reduction unit by an individual 1 h. p. 1200 r. p. m. motor. Concentrates are dewatered on Oliver filters. The ball mills are charged with 3" forged Cr-steel balls at the rate of 1 lb. for each ton of ore ground. Quantities of reagents used per ton of ore treated are: soda ash, 3 lb.; thiocarbamide, 0.25 lb.; $ZnSO_4$, 200 cc. of a 1-lb.-per-gal. soln.; cyanide, 100 cc. of a 1-lb.-per-gal. soln.; phosphoric acid, 7 cc. of a 15% Aerofloat; 15 cc. of Yarmor pine oil is added in the Pb section, and 1 lb. of $CuSO_4$ and 4 to 5 cc. of xanthate soln. in the Zn section.

DOWNES SCHAAP

Refractory patio tailing responds to leaching. P. ANDRUS BABB. *Eng. Mining J.* 126, 832-3(1928).—The Blaisdell Coscotitlan Syndicate, of Pachuca, Mexico, has benefited 750,000 tons of old patio tailings by a modification of the Russell process, the novelty of which is the use of metallic Cu as the precipitant, com. $Na_2S_2O_3$ being added to the top of the leaching charge. The idea of using metallic Cu as precipitant, instead of adding $CuSO_4$ to a $Na_2S_2O_3$ soln., is credited to Albert Delissalde, a French metallurgist. All the chem. combinations of Au, Ag and Hg, likely to be present in patio tailing deposits, are subject to solution in an aq. soln. of the so-called Delissalde salt. They combine with cuprous-Na thiosulfate through replacement with Cu or Na to make corresponding metal-sodium thiosulfate. By contacting this pregnant soln. with granulated Cu, the 3 metals, Au, Ag and Hg, are pptd. in the metallic form and replaced in the double salt by Cu. At present the Delissalde process is being used in treating Hg bearing tailings. Recovery of a kg. of Hg per ton of tailing leaves \$2.60 net to a shipper today in Mexico.

DOWNES SCHAAP

The extraction and utilization of cobalt. G. MALCOLM DYSON. *Chem. Age* 19, No. 188, Met. Sect. 33-5, and No. 492, Met. Sect., 41-2(1928).—There are 3 main types of raw materials for the manuf. of Co: (1) high-grade Co minerals (e. g., the Cloncurry deposits of Queensland averaging 20% of this element); (2) the residues from the Mond process for the extn. of Ni contg. Co, much Fe and very little Ni; (3) by-products from the extn. of Au and Cu in certain Canadian minerals, the residues contg. approx. 8% Co and 6.6% Ni, and the speiss 17.5% Co and 19% Ni. The residues or minerals are

smelted in a low-pressure blast furnace or cupola with the addn. of various slag-making materials; the As and S combine with the Fe, Ni and Co present, forming a heavy speiss. The speiss, finely ground and calcined in a mechanically stirred rabbling furnace, has much of its As volatilized as As_2O_3 . Further treatment is almost purely chem. and involves 2 stages: (1) the removal of the residual As; (2) the sepn. of Co from Ni. The ground speiss is treated with HCl and sufficient $FeCl_3$ to convert the As to ferric arsenate, which is thrown out of soln. by the addn. of milk of lime and H_2S . Sufficient $CaOCl_2$ is added to the clear soln. after the removal of the As, Fe and Cu to ppt. the Co as the hydrated oxide. Co metal may be obtained by smelting the oxide with charcoal in a small blast furnace. The elec. properties of Co steels are eminently suitable for the manuf. of magneto magnets. Co-Cr steels are much used for valves for internal-combustion engines, since they are not scored by grit and do not scale at 1000° . Tool steels of the Stellite class contain large proportions of Co. Various salts of Co (the acetate, oleate, borate, linoleate, tungstate and oleo-resinate) are added in small proportions to varnish in order to hasten the absorption of O and the formation of the dry film. In the ceramic art, Co is used as a body stain, as a glaze stain or in the form of under- or over-glaze colors.

DOWNES SCHAAF

Charging cupolas mechanically. JOHN A. MURPHY. *Foundry* 56, 1023-4(1928).—A marked tendency for direct movement from stockpile to cupola without placing on the charging floor is noted. Bucket charging permits the use of a deep-well cupola without any cumbersome paraphernalia and eliminates the necessity of heavy expensive cupola-house floors. Storage bins may be on ground level or of gravity type, depending upon the size and shape of the foundry yard.

W. H. BOYNTON

The calculation of the useful height of a foundry cupola. MICHAEL KARNAOUKLOV. *Iron Steel Ind.* 2, 83-5(1928).—The limitation of the hearth area at the tuyère level being detd. by the hourly capacity of the cupola, and for small cupolas, the area (on a ton/hr basis) varies inversely with the height in accordance with the capacity of the cupola. K. proposes a new method of calcg. the useful height of a cupola based on the nature of the heat distribution within the cupola. A formula is derived and applied in a cupola with a diam. of 1 m. and a useful height of 3.345 m. Increasing the height of the cupola saves coke but involves expense in breaking up the pig iron and scrap. In Germany it is more profitable to increase the cupola height and to break up the pig iron, while in American foundries lower cupolas are favored. Too great a cupola height in relation to its diam. has the great disadvantage of increasing the chances of the charge scaffolding.

W. H. BOYNTON

Melting practice in the foundry. HENRY M. LANE. *Iron Age* 122, 1359-62(1928).—Prime requisites for securing high-grade metal with min. fuel consumption are outlined. Points discussed include: powd. coal as a cupola fuel; development of special furnaces; the use of elec. furnaces in the foundry; melting of very low-C steel scrap at the Century Elec. Co., St. Louis, Mo.; elec. furnace advantages over cupola; advantages of indirect arc melting of borings; planning to utilize borings; and use of com. borings from the open market.

W. H. BOYNTON

Dovel type blast put on test. JAMES P. DOVEL. *Blast Furnace Steel Plant* 16, 1555-8, 1570(1928).—Ore used in the Birmingham, Ala., district is of the hard type. A 6-day run on ore crushed to 1 inch was made. The burden and mixt. were: ratio of ore to coke: 2.4:1; mixt., hard ore 76% and brown ore 24%; dolomite 600 lb. (273 kg) per charge; coke 6300 lb. (2864 kg.). Analyses of ore, flue dust, limestone and coke, and operating data are tabulated.

W. H. BOYNTON

Die casting. A. H. MUNDEY. *Metal. Ind. (London)* 33, 467-8(1928).—The general equipment used in the production of die castings and the technic involved in the actual operation of casting in a plunger machine are briefly described. A short list of the com. applications of die casting is given.

DOWNES SCHAAF

Blast furnace metal for castings. DAVID BAKER. *Iron Age* 122, 1501-2(1928).—A discussion indicating a saving of approximately \$9 per ton (909 kg.) by direct casting of pipe from a blast furnace. Combination of the blast furnace and foundry with two 10-hr. shifts in the latter, and resultant savings in foundry equipment contribute to these savings. Lower Si content also aids.

W. H. BOYNTON

Converting core ovens to gas heating. JOHN F. LANGNER. *Iron Age* 122, 1424(1928).—Conversion from coke to gas heating in one instance resulted in increased production with the attendant lower labor, fuel, time, space and equipment costs. In addn., the atm. control was attained. A sketch shows the burner assembly. Fuel cost was \$1.876 per ton (909 kg.) of dried cores. Insulation of the ovens should result in still lower cost.

W. H. BOYNTON

A theoretical consideration of the desulfurizing action of manganese. ZEN-ICHI

SHIBATA. *Tech. Repts. Tohoku Imp. Univ.* 7, 299-303(1928).—In the removal of S from Fe and steel by Mn, it is quantitatively demonstrated from theoretical considerations that the degree of desulfurization increases on decreasing the temp. and increasing the concn. of Mn.

DOWNES SCHAAP

Progress in iron and steel. G. T. SNYDER, F. C. BIGGERT, JR., C. SNELLING ROBINSON, W. W. MACON AND W. TRINKS. *Mech. Eng.* 51, 49-52(1929). E. H.

Wrought iron and the puddling process. GEORGE A. RICHARDSON. *Blast Furnace Steel Plant* 16, 1566-70(1928).—High-grade wrought iron is still manufd. for certain purposes for which it is considered superior to any other. Wrought iron is defined and specifications are given for remelted muck bar, staybolt iron (Bethlehem special muck) and engine bolt iron. Mfg. operations begin in the puddling plant. Here are found: a mill for grinding the ore used for lining the furnaces, puddling furnaces, mono-rail tracks for transferring balls of iron to the squeezer, muck bar mill, weigh scales, shears, etc. The puddling process as conducted at the Lebanon, Pa., plant of the Bethlehem Steel Co. is described.

W. H. BOYNTON

The physical chemistry of steel making: Deoxidation with silicon and the formation of ferrous silicate inclusions in steel. C. H. HERTY, JR., AND G. R. FITTERER. *Carnegie Inst. Tech. Mining Met. Investigations Bull.* 36, 1-92(1928).—This bulletin deals only with inclusions composed of iron oxide and silica—the ferrous silicates. In most steels the silicates formed are more complex than those resulting from deoxidation with silica alone, but it is necessary to have a quant. knowledge of the reactions between iron oxide and silica before quant. information on the more complex silicates may be obtained. Synthetic slags were prepd. by starting with 100% SiO_2 and finishing with 100% FeO , the compn. being varied in steps of 10%. The m. p. of these slags was detd. by means of a Burgess micropyrometer (Bur. of Standards, *Bull.* No. 3, 345(1907)) and a phase equil. diagram of the system FeO-SiO_2 was constructed. The m. p. of FeO lies between 1355° and 1377° but is probably nearer 1355° . Two eutectics were found. The first contained 22% silica, the eutectic temp. being 1240° ; the second contained 35% silica and the eutectic temp. was 1260° . Most of the samples used in the m.-p. detn. were also examd. microscopically. This served as a check on the compn. of the eutectics and the compd. The formation of silicate inclusions in steel was studied by adding ferro silicon to low-carbon steel. The mechanism of deoxidation with silicon is shown to consist of (1) the formation of silica particles by the reaction $\text{Si} + 2\text{FeO} \rightleftharpoons \text{SiO}_2 + 2\text{Fe}$ and (2) a subsequent fluxing of dissolved FeO by the silica so formed. The extent of deoxidation for a given FeO content of the steel depends upon the amt. of silicon added and the type of silicate formed. The relation $K = [\text{Si}] [\text{FeO}]^2 = 1.49 \times 10^{-4}$ holds when the metal is satd. with pure silica; but under this condition only. As the concn. of dissolved silica decreases the amt. of deoxidation will increase because the true equil. const. is $K = [\text{SiO}_2]/[\text{Si}] [\text{FeO}]^2$. From a study of the forging of steels containing various types of ferrous silicate inclusions it was concluded that: (1) Steels contg. ferrous silicates high in FeO forge readily and show no red-shortness. (2) When high silica inclusions are present in large amts. the steel is extremely red-short in consequence of the solubility of these inclusions at forging temps. Practically no Mn oxide was present in the inclusions. (3) The forged steels contained 0.033% S, but in spite of this the steels with fairly high iron oxide content forged well. A bibliography of 34 references is included.

Nature of recrystallization nuclei. A. E. VAN ARKEL. *Intern. Congress Testing Materials* 1927, I, 157-60.—A new theory on the nature of recrystn. nuclei is presented. The fact that the no. of these centers increases with increasing mech. deformation seems to exclude the possibility that the nuclei are crystals which escaped injury by the defor-

mation. Where the deformation energy is greatest the transformation temp. is most likely to be exceeded, and strained crystals already present are most apt to be transformed into new, strain-free crystals, which act as recrystn. nuclei. H. STOERTZ

Conductivity and cold-rolling. M. MASIMA AND G. SACHS. Kaiser Wilhelm Inst. Berlin-Dahlem. *Z. Physik* 51, 321-7(1928).—The change in elec. cond. of brass crystals was studied. There is no connection between the relation of elec. cond. and cross-section and the relation of load and cross-section. Similarly there is no connection between elec. and mech. resistance as increasing annealing temps. are employed. GEO. GLOCKLER

Elasticity of metals and alloys. GEORG WELTER. Frankfurt a/Main. *Intern. Congress Testing Materials* 1927, I, 559-68.—A discussion of the significance of elastic limit detns. in testing metals and alloys. In making a no. of detns. on hardened Al alloy, 40% of all tests gave an elastic limit of 19 kg./sq. mm., while about 96% of all samples gave values between 17 and 22 kg./sq. mm., an av. value therefore of 19 ± 2.5 kg./sq. mm. A large part of this variation is probably accounted for by variation in the quality of the material itself. A close relationship is claimed between elastic limit and fatigue strength. Tests on more than 200 Fe alloys give values for fatigue strength of 40-60% of the breaking strength, most values being between 40 and 49%, while the elastic limit for these alloys varies from 30 to 50% of the ultimate strength. Discussion is included. H. STOERTZ

Nickel brasses. A. C. STURNEY. *Metal Ind.* (London) 33, 485-8, 494, 521(1928).—A lecture in which the theory of the Cu-Ni-Zn system, methods of prepn., effects of impurities, etc., are discussed. J. BALOZIAN

A new method for determination of internal energy absorption of materials under load. E. VOIGT. *Z. tech. Physik* 9, 321-37(1928).—Plastic hysteresis is a common property of most metals; it may be attributed to slip in the lattice or twin formation. A test machine was built for exptl. purposes; it consists of one 150-kg. cast steel block, stationary, and a second 6.7-kg. block forming the anchor of a stationary magnet. The app. can be enclosed and worked in vacuum; the test rods fastened to both blocks are from 30 to 50 mm. long, 5 to 7 mm diam., the magnet is run on 500-cycle a. c. (i. e., in resonance with the mech. system). By photographic arrangement the longitudinal vibrations of the 6.7-kg. mass can be followed. From the decrement of the vibration amplitude registered after disconnecting the magnet current the damping of the material could be evaluated. It represents the energy absorption. Evacuation of the instrument showed negligible effect of air resistance below 37 mm. Hg pressure; careful hardening of the test rods is required for uniform results. Four steels were examd.: (I) Thomas steel, 0.33% C; (II) Siemens-Martin steel H, 0.42% C; (III) Si steel, 0.14% C, 0.68% Mn, 0.86% Si, 0.60% P, 0.04% S, 0.14% Cu, and (IV) Böhler Mn-Si steel, 0.5% C, 1.0% Mn, 2.2% Si. For small loads the damping decreased from the initial value to a const. after about 1 million load vibrations. No decrease in damping was found for Cu, little for brass, none for barium crown glass. From the measurements the dynamic elastic limit can be detd. No tabulated data are given; all results are represented in graphs. B. J. C. VAN DER HOEVEN

Non-destructive detection of flaws. ELMER A. SPERRY. *Iron Age* 122, 1214-7 (1928).—Hidden fissures in rails are located and measured by means of intense d. c. energization. The main primary energizing current is made to traverse the rail, or a section thereof, as by main brushes in contact with the track. Intermediate between these brushes are 3 searching brushes which are connected to 2 opposite primary coils constituting the primary of the transformer. These coils are oppositely wound and produce opposite magnetic excitation of the transformer. All variations in the primary current will be picked up by the 2 outer brushes and there be completely neutralized as to their influence on the secondary. In passing along the track, when a fissure occurs between one end brush and the middle brush, the first coil will become excited to a greater extent than the other. The transformer will become active and in the secondary will be induced half (e. g., the pos. side) of a sine wave curve. In the next instant the fissure passes between the middle and the rear brushes, giving an opposite excitation to

the secondary, completing the alternating wave by adding the neg. side. This wave then passes to the amplifiers and may be examd. as to both its magnitude and characteristics. By this method the size, characteristics and location of fissures or flaws are accurately detd. in rails either on the inspection bench at the mill or when in use in a track.

DOWNES SCHAAP

The use of temperature gradients in metallographic studies. O. TESCHE. *Z. tech. Physik* 9, 419-22(1928).—Expts. on the Metcalf test are described in which steel rods contg. 0.9, 0.75 and 0.65% C were heated on one end, a temp. gradient over the rod being established and the microstructure of a section parallel to the rod length studied. Results obtained confirm previous data.

B. J. C. VAN DER HOEVEN

Thermal expansion of iron alloys. ALFRED SCHULZE. *Phys. tech. Reichsanstalt, Berlin. Z. tech. Physik* 9, 338-43(1928).—For Fe-Si, Fe-Al and Fe-Mn alloys the thermal expansion was measured by the tube method (Henning) up to 500°. Four Fe-Si rods were used (0.15 to 0.32% C, little Mn) annealed at 900°. Between 20° and 100°, 100° and 300°, 300° and 500° the calcd. linear $\beta \cdot 10^6$ is for 0.08% Si, 12.37, 13.64, 15.01, resp.; for 1.03% Si, 12.22, 13.41, 15.00; for 2.40% Si, 12.03, 13.32, 14.76; for 8.37% Si, 11.31, 12.73, 14.19. The behavior is typical for mixed crystals. For four Fe-Al alloys β was found to be in the same temp. intervals for 0.52% Al, 11.60, 13.19, 14.42; for 2.17% Al, 11.74, 13.21, 14.50; for 5.66% Al, 11.96, 13.42, 14.88, for 10.52% Al, 12.20, 13.70 and 15.12. These data can be considered characteristic also for mixed crystals. On Fe-Mn rods the data found indicated up to 7.81% Mn a normal behavior; a break in the curve occurs at 200° for 10.3% Mn, for 12.3% and higher a hysteresis loop appears between 200° and 300°. The values of $\beta \cdot 10^6$ between 20°, 100°, 200°, 300°, 400° and 500° intervals are for 0.09% Mn, 12.42, 13.2, 13.55, 14.55, 15.5. For 2.76% Mn, 12.60, 13.54, 14.3, 15.1, 15.7; for 4.20% Mn, 12.88, 14.3, 15.1, 15.4, 16.0; for 7.81% Mn, 13.56, 14.4, 15.4, 17.1, 18.0, for 10.3% Mn, 15.75, 16.5, 22.9, 22.2, 21.4; for 12.34% Mn, 16.55, 18.7,—, 22.9, 22.0; for 14.41% Mn, 16.91, 19.2,—, 22.8, 23.0. It is apparent that the β -x curves below 8°C lie above the straight mixing line, the Fe-Mn alloys are abnormal like those of 2 ferromagnetic metals. To allotropic transformations (found in the magnetic qualities by Gumlich, *Wiss. Abh. Phys. tech. Reichsanstalt* 4, 377(1918)) are attributed the discontinuities around 10% Mn.

Armco pure ingot iron. EUGÈNE DUPUY. *Rev. métal.* 25, 637-47(1928).—A description of its manuf., properties and uses.

A. PAPINEAU-COUTURE

Connection between grain size and the magnetic properties of pure iron. G. J. SZOOS. Philips' Lampwork, Eindhoven, Holland. *Z. Physik* 51, 557-64(1928).—Vacuum-melted electrolytic Fe was studied in relation to the size of crystals and the magnetic properties. As crystal size increases coercive force and hysteresis work decrease and max. permeability increases. Retention is independent of crystal size as is elec. cond. and its temp. coeff.

GEO. GLOCKLER

The use of rubber as a core binder. FRED. GROVE-PALMER. *Foundry Trade J.* 39, 392(1928).—Rubber dissolved in naphtha or gasoline may be used as a binder for cores instead of linseed oil; such cores dry easily in air at normal temp., are stronger before use, and fall into loose sand after metal has solidified around them. Precautions must be taken against the fire hazard arising from the use of inflammable solvents. Screen tests of suitable sands for the rubber binders are given; the clay content must be very low. Fresh rubber must be used, S of course being avoided. Small cores made in this way from coarse sand may be used at once; larger cores require a few hrs. air-drying. Stronger cores resulted from the addn. of benzidine or *p*-aminophenol to the rubber binder. Balata in benzene made cores that were soft at 37° and hard when cool. Thermoprene binders used in sufficient vol. produced cores that were much stronger than those made in the usual way with linseed oil.

GEO. F. COMSTOCK

The physical chemistry of steel making: A study of the Dickenson method for the determination of non-metallic inclusions in steel. C. H. HERTY, JR., G. R. FITZGERER AND J. F. ECKEL. *Carnegie Inst. Tech. Mining Met. Investigations Bull.* 37, 1-37(1928).

The results are given of a critical study of the Dickenson method (cf. *C. A.* 20, 2643) for the detn. of non-metallic inclusions in steel. The study consisted chiefly of the detn. of the percentage recovery of the more common types of inclusions after their subjection to the procedure of the D. method and an explanation of the methods and of the types of inclusions with which it can be used successfully. Synthetic melts, each weighing 200 g., of the following binary systems (1) FeO-SiO₂, (2) MnO-SiO₂, (3) FeO-MnO, (4) FeO-Al₂O₃ were made either in a C resistor or in an induction-type furnace. The compn. of the mixts. was varied in steps of 10% from 100% of one component to 100% of the other. Each synthetic melt was then crushed to 200 mesh, and a 3-g. sample was treated by the D. method. As a result of the study the authors conclude: (1) The D.

method has been found to be satisfactory for steel killed with S or Al. It is not satisfactory for rimming steel or those steels in which the predominant inclusions are MnO or FeO. (2) In the system FeO-SiO₂, good recoveries are obtained if the inclusions analyze more than 60 or 65% SiO₂. The compd., 2FeO.SiO₂ (29.45% SiO₂), is completely dissolved by the HNO₃ treatment. (3) No recoveries are obtained on FeO or MnO alone or on combination of these 2 oxides. (4) Good recoveries are obtained in the system MnO-SiO₂ if the inclusions analyze more than 30-40% SiO₂. (5) Al₂O₃ is completely recoverable by this method. In the system FeO-Al₂O₃ the compd., 2FeO.Al₂O₃, is recoverable, but FeO existing in any other state is lost. (6) A decrease in the acid strength has no appreciable effect on recoveries of the more sol. oxides. After one week's extn., further treatment gave no extra loss of non-metallic matter. The D. method as modified by the authors is described. It is claimed that the modified method is just as reliable for most purposes and much faster. A brief review of the halogen and electrolytic extn. methods is also included.

E. G. MEITER

Steel castings from the molder's viewpoint. J. JEFFERSON. *Foundry Trade J.* 39, 393-4(1928).—Various defects in castings are discussed. Globular blowholes with bright surfaces are due to faulty steel; those with tarnished surfaces are probably due to the molds being too wet. Washing of sand from the mold, insufficient feeding of the shrinking metal, and cracks due to hindered contraction, are other causes of defects. The last two causes are the most important. Steel is very weak soon after solidification, and the contraction of thin parts of a casting tends to cause pulling away from the weak, thicker parts that solidify more slowly. The proper way to feed the shrinkage of a T-shaped casting is shown; when not properly fed, the metal showed only 15% elongation instead of 25%. The cost of proper feeding, and of the extra machining thus required, is discussed. Coöperative research on foundry engineering problems is advocated. In making round, hollow castings, the mold should have a greater chilling effect than the core. It is impossible to make a complicated casting with exactly the same properties in every part.

GEO. F. COMSTOCK

The relation between the quantity and the depth of carburization. GENSUKÉ TAKAHASHI. *Science Repts. Tohoku Imp. Univ.* 17, 1135-56(1928).—As a result of cementation tests on Fe for various intervals of time at different temps. and with several kinds of carburizing agents, the following results were obtained, the quantity of C diffused into Fe being detd. by the wt. increase and the thickness of the cemented zone being measured by a microscope: (1) the amt. and the depth of carburization differ greatly for different carburizing agents; (2) it was confirmed that, for a given depth, the amt. of carburization becomes greater with the efficiency of the carburizing agent; (3) the relation between the amt. and the depth of carburization at a given temp., different carburizing agents being used, is expressed by a single parabola; (4) the relation between the amt. and the depth of carburization is the same, whether the carburizing agent is one of the CO or hydrocarbon series, provided the carburization is carried out under the same conditions; (5) in a range of the ordinary carburizing temps. (900-1000°), the amt. of carburization for the same depth is the greater the higher the temp.; (6) when the temp. of carburization is in a range between 900° and the A₁ point, the C density in the innermost layer is the greater the lower the temp.

DOWNES SCHAAF

The mechanical characteristics of steel wires, drawn at elevated temperatures, as a function of the rate of reduction, the working temperature and the carbon content. A. POMP AND W. KNACKSTEDT. *Stahl u. Eisen* 48, 1705-12(1928); *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Düsseldorf* 10, 117-74. Four samples of steel wire were used, (5 mm. diam.) A a low C-steel, with 0.03% C, B, C and D heat-treated C steels, with a C content of 0.35, 0.70, 0.84%, resp. A showed a perlitic, B, C and D a sorbitic structure. The drawing operation was carried out at room temp., then at 50°, 100°, 150°, 200° and 300°. The wire samples were drawn without annealing, with a 20% reduction for each drawing operation. A could be drawn to 0.20 mm. between 20 and 200°, a reduction of 99.84%; at 300° it was not possible to draw the wire below 0.78 mm., a reduction of 97.8%. The wire samples from the high-C steels were drawn as far as possible: B to 0.94-0.485 mm., 96.5-99.1% reduction, C to 1.61-1.17 mm., a reduction of 89.2-94.0%, and D to 2.33-1.82 mm., 78.2-86.7% reduction. The samples so obtained were subjected to tensile, bending and torsion tests. The limit of elasticity, yield point, modulus of elasticity, tensile strength, elongation, reduction in area and the ratio, expressed in %, of the yield point and tensile strength were also detd. and the results tabulated by plotting these various values against the no. of passes and the rate of reduction, for the various temps. No structural differences could be observed between the wires drawn at various temps. For practical steel drawing the following deductions are made: The increase of the elastic limit, yield point and tensile strength and the de-

creased tenacity of the low-C steel, at higher temp. is of no great importance in actual wire drawing, because of the limited use of this material. The fact, however, that a slight increase of the temp. of drawing, of the wire from heat-treated high-C steel, improves its yield point and tensile strength and considerably improves its elastic limit, without decreasing its tenacity, is of great importance in the manuf. of steel wires, such as used in airplane construction, which, even when subjected to unusual loads, must show only very little tendency for permanent deformation. The drawing of such wires at 200° appears to be very promising.

J. A. SZILARD

The investigation and rating of case-hardening agents. F. HEBLER. *Chem.-Ztg.* 52, 775-6(1928).—The activity of various case-hardening mixts. (contg. bars, brown or anthracite coal, charcoal, alkali or alk. earth carbonates) whose action has previously been doubtful are studied. The pieces are hardened in a Wisnegg furnace, reheated to 900-950° and quenched in tap water, and heated again to 760-780° and quenched in water. The case depth is measured microscopically on a fractured piece. The compns. and hardness obtained of 20 mixts. are tabulated. The action of barks and brown coal (or charcoal) is slight, no difference between them being detectable. For hardening in a short time, charcoal is equaled by most and surpassed by many materials. The activity of carbonates increases in the series: chalk, soda, SrCO_3 and BaCO_3 . J. B.

Steels used by the automotive industry. W. J. MACKENZIE. Interstate Iron & Steel Co., Chicago. *Blast Furnace and Steel Plant* 16, 1439-43, 1460; *Am. Metal Market* 35, 2nd Sec., 12-6(1928).—Alloy steels were developed commercially by the automotive industry, and 81% of all alloy steel is made in basic open-hearth furnaces. The care required for making a satisfactory product is described. The present uniformity and reliability of the various grades of alloy steels are essential for confidence in design and manuf. The useful S. A. E. steel specifications are quoted in a table, and the properties of the various types of steel are discussed. The detn. of cleanness is too much a matter of opinion, and a definite measure of this property is needed, as well as a good test for dynamic properties. The choice of one alloy steel rather than another for a given part is often due to the individual opinion of the designer.

G. F. C.

Steel requirements of the aircraft industry. H. J. FRENCH. Bur. of Standards. *Blast Furnace and Steel Plant* 16, 1436-8, 1445, 1579-83; *Iron Age* 122, 1161-4(1928).—Airplane production increased almost 380% in 1928, and metals, including steel, have been applied successfully to all parts of the plane. The strength per unit of wt. of heat-treated alloys steels is about the same as that of Al alloys like duralumin, but the latter are more bulky and parts made of them are therefore stiffer. Uniformity and cleanness are demanded in steels for aircraft for the sake of reliability, and these requirements will probably become more exacting as experience is gained. Microscopic examn. is used to det. cleanness, and steel is rejected if prominent inclusions are seen in it. The super-clean steels are generally made in basic elec. furnaces, and are often coarse-grained, and difficult to heat-treat so as to obtain high impact values. Corrosion-fatigue may be very damaging to airplane parts, and can be resisted most effectively by duralumin and stainless steels. Most airplane motors are 50% steel, all but the cylinders being alloy steels. The compns. of the steels used for various parts are tabulated. Better steel is needed to resist the severe service of exhaust valves. For parts of the plane itself steel, when used, is generally in the form of light seamless tubing with welded joints. Cr-Mo steel contg. 0.3% C, 0.5% Mn, 0.9% Cr and 0.2% Mo is easily cold-drawn and welded, and the welded parts have satisfactory properties. To discourage competition by non-ferrous alloys, E. C. Smith in discussion urged that only the highest quality of steel should be offered for aircraft use. Z. Jeffries believed that the greatest use of steel in this industry would be for manufg. plants and ground equipment rather than in the airplanes themselves.

GEO. F. COMSTOCK

Stainless steel. EDWIN A. BROPHY. *Chem. Eng. Mining Rev.* 21, 15(1928).—The heat treatment and the effects produced by different concns. of C, Si, Mn and Cr are described for a stainless steel of the following compn.: C 0.25-0.40%, Si less than 0.30%, Mn less than 0.35%, S less than 0.030%, P less than 0.030%, Cr 12.50-14.50%.

DOWNS SCHAAF

A study of the mechanical properties of low-manganese steel. MATSUJIRO HAMASUMI. *Tech. Repts. Tohoku Imp. Univ.* 7, 305-41(1928).—Static and dynamic tests are recorded for 21 low-Mn steels varying in compn. from 0.1 to 0.4% C and from 0.4 to 5.0% Mn. A structural diagram is advanced from a study of the microstructure as shown in 12 photographs which differs from Guillet's, in that all the samples contained troostite or martensite with or without ferrite, except those in the 0.1% C series contg. under 4% Mn, those in the 0.15-0.20% C series contg. less than 2.5% Mn, and those in the 0.35-0.37% C series contg. less than 1.5% Mn, which are pearlitic. The sorbitic

steels contg. from 0.15 to 0.2% C and from 1.5 to 2% Mn have the max. toughness according to the notched-bar impact tests at both low and high temps. The cold brittleness and the blue shortness which appear in the notched-bar impact test are explained by the idea of max. normal resistance and max. slip resistance on a slip plane of a crystal.

DOWNES SCHAAP

X-ray investigation of the changes in the alloy copper-gold. V. GORSKII. *Z. Physik* 50, 64-81(1928).—An alloy consisting of 1 atom Cu and 1 atom Au is heated to various known temps., quenched and examd. by Debye's method. A tetragonal lattice without systematic distribution of the Cu and Au atoms is the stable form below 385°. The ratio a/c changes from 1.07 at 380° to 1.08 at 300° and $\sqrt[3]{a^2c} = 3.860$ A. U. The transition from cubic into tetragonal forms and *vice versa* occurs through a process of recrystn. The gradual change in the axial ratio brought about by sudden change in temp. occurs according to an exponential equation. The observed phenomena are explained by thermodynamic and statistical methods.

A. L. HENNE

The keys to good babbitt bearings. JAMES SILBERSTEIN. *Power* 68, 1000-2 (1928).—Sn-base babbitts contain up to 2% Pb, 3 to 5% Cu and up to 1% As. Zn and Al should be absent. Pb-base babbitts may have up to 30% Sn, 1% Cu and 0.5% As. It is questionable whether increasing Sn above 10% is beneficial in a Pb-base babbitt.

D. B. DILL

Recrystallization of single crystals of aluminum. W. G. BURGERS AND J. C. M. BASART. *Z. Physik* 51, 545-56(1928).—The crystals formed from one single crystal of Al when the latter was stretched a little (10-15%) show to some extent a preferential direction in the same sense as the mother-crystal. It also appears that the direction of the deforming force has a slight influence on the situation of the crystals formed.

Recrystallization phenomena of zinc. A. E. VAN ARKEL AND J. J. A. PLOOS VAN AMSTEL. Philips' Lampworks, Eindhoven, Holland. *Z. Physik* 51, 534-44(1928).—Phenomena are noticed similar to those in Al. Cf. preceding abstract.

GEO. GLOCKLER

Cadmium coating. G. DE LATTE. *Rev. métal* 25, 630-6(1928). From a discussion of the relative advantages and disadvantages of Cd coating (by immersion in molten Cd) L. concludes that: (1) It constitutes an effective and more durable protection of Fe and its alloys than does galvanizing, the coating being very adherent, ductile, homogeneous and brilliant. (2) All the drawbacks of galvanizing are avoided. (3) Pure Cd gives very satisfactory results; but the hardness of the coating is relatively low and the m. p. of the metal is too high to permit of wiping the coating with palm oil. (4) The Cd-Zn eutectoid may be used to advantage to increase the hardness of the deposit and lower the m. p. of the bath, the quant. compn. of the bath being readily controlled by microscopic examn. of a polished section etched with FeCl_3 . (5) The consumption of metal is of the same order as that of pure Sn, and the unwiped coating has an av. thickness of 20 μ . (6) The resistance to atm. corrosion is perfect. (7) Metalization of Cu can be advantageously carried out either with pure Cd or with the Cd-Sn eutectoid.

Corrosive action of sulfur monochloride. ILLERY H. HARVEY. *Chem. Met. Eng.* 35, No. 11, 684(1928).—Compilation of an exhaustive bibliography covering S_2Cl_2 , to be published elsewhere, failed to reveal exact information on its metal-corrosive properties. H. reports the percent loss in wt. of Al, Sb, As, Bi, Cd, Cr, Co, Cu, Pb, Ni, Mn, Ag, Sn and Zn after one year in S_2Cl_2 out of contact with air. Bibliography.

E. H. H.

Watch the outside surface of your boiler. I. S. CHAMBERLAIN. *Power* 68, 998-9 (1928).—External corrosion of boilers is often overlooked.

D. B. DILL

Rust, acid and heat-resisting steels. W. H. HATFIELD. *Iron Age* 122, 1164-5; *The Nucleus* 6, 56-60; *Am. Metal Market* 35, No. 240, 2nd section, 22-6(1928).—Phys. properties of corrosion-resistant steels are tabulated for 6 grades of the following chem. analyses: (1) C 0.30, Mn 0.30, Si 0.20, Cr 13.0, Ni 0.30; (2) C 0.30, Mn 0.30, Si 0.40, Cr 14.5, Ni 0.30; (3) C 0.09, Mn 0.18, Si 0.14, Cr 13.4, Ni 0.28; (4) C 0.15, Mn 0.28, Si 0.20, Cr 14.8, Ni 10.9; (5) C 0.14, Mn 0.30, Si 0.30, Cr 18.1, Ni 7.9; (6) C 0.28, Mn 0.30, Si 0.16, Cr 21.0, Ni 5.8. The advisability of supplementing lab. tests by actual work tests is strongly advised. Correct heat treatment is necessary, since an incorrect one may destroy the homogeneity of the steel with the consequent setting up of electrolytic corrosion. The good influence of the Cr content of rust, acid and heat-resisting steels is believed to be due to its facility of producing (by oxidation through atm. corrosion and like oxidizing influences) a protective film.

Influence of composition and cold-hardening on corrosion and grain growth of aluminum. LEON GUILLET AND BALLAY. *Compt. rend.* 187, 585-7(1928).—Pure Al is attacked less than ordinary Al (Fe, 0.72%; Si, 0.47%) by HNO_3 (36° Baumé), HCl (2% HCl, d. = 1.19) and 3% NaCl soln. and about the same in 5% H_2SO_4 and 5% HNO_3 . The influence of hardening on 98.81% Al is much more marked than on pure Al. Another series of tests to show corrosion as a function of hardening and mode of deformation was carried out. The corrosion passes through a max. for a certain value of cold deformation and then decreases. Pure Al shows much larger grain growth after cold-hardening and annealing than does impure Al.

Treating ores. AKTIEBOLAGET FERRICONCENTRAT. Fr. 639,934, Aug. 23, 1927. See Brit. 279,797 (*C. A.* 22, 2916).

Treating ores with acid solutions of chloride. NIELS C. CHRISTENSEN. U. S. 1,696,471, Dec. 25. In effecting the treatment of ores such as oxidized ores contg. Pb and Ag with acid solns. of chloride, dissolved metal is pptd. from the soln. by use of a Ca compd. such as CaCO_3 or lime so as to leave in the soln. as CaCl_2 the Cl combined with the metals of the soln. before pptn., and thereafter the soln. contg. the CaCl_2 is mixed with comminuted ore and H_2SO_4 is added to ppt. the Ca as CaSO_4 and to form HCl in the soln. which serves to dissolve the metals from the ore.

Magnetic ore-separating drum. MASCHINENBAU-ANSTALT HUMBOLDT. Ger. 468,936, July 4, 1925.

Ore-sintering apparatus. JOHN KNOX (to Dwight and Lloyd Sintering Co., Inc.). Can. 285,168, Nov. 27, 1928.

Treating iron ores. THOMAS P. CAMPBELL. U. S. 1,696,188, Dec. 25. Comminuted Fe ore is reduced to produce Fe sponge and the latter is then partially reoxidized and the mixt. is passed over a magnetic separator.

Treatment of iron from oxide ores. GRANULAR IRON CO. Ger. 467,485, April 25, 1925. Addn. to 466,756 (*C. A.* 23, 366). Iron obtained by the method of Ger. 466,756 is charged into crucibles either immediately after production or after mech. purifying and (or) briquetting in known manner.

Jig screen, water sprays and associated apparatus for recovery of gold or other fine values from sand. EDWIN A. SPERRY. U. S. 1,695,614, Dec. 18. Structural features.

Treating impure lead containing tin and antimony. GEORGE E. DALBEY and THOMAS P. HANFORD (to Stanley Chemical Co.). U. S. 1,693,639, Dec. 4. The metal is treated in molten or finely divided condition with a Na-Sb salt such as Na antimonate or antimonite and the Sb in the salt is caused to be reduced to metallic Sb and the Sn in the metal replaces the Sb in the salt, forming Na stannate which may be reclaimed. U. S. 1,693,640 specifies treating impure Pb for the removal of As, Sn, Sb, etc. by action of PbO on the molten metal while at the same time gradually adding an aq. caustic alkali soln. and maintaining a temp. which will always allow the reacting materials on the surface of the molten metal to remain in a powdery or granular condition. U. S. 1,693,641 specifies treating mixts. contg. Na-metallic salts, by dissolving any NaOH present and sepg. it from undissolved materials, dissolving the metal salts other than Na plumbate and plumbite and any Na pyroantimonate which may be present due to action of water on Na antimonate in the original mixt., sepg. the soln. from undissolved materials and treating the latter to obtain metallic Pb and Na pyroantimonate, and treating the sepd. soln. to obtain stannic acid. U. S. 1,693,642 specifies treating metallic particles which may contain Pb, Sn and As, at temps. below the fusion point, with an aq. soln. such as NaOH in the presence of Pb oxide or other suitable oxidizing agent, in order to form Na salts such as arsenate, stannate and antimonate.

Treating zinc waste. E. BURY and F. W. WALKER. Brit. 290,035, May 3, 1927. In effecting recovery of Zn and Pb from zinc waste, it is heated with coke or coke dust contg. S in an oxidizing atm. and the S required to transform the Pb into sulfate is supplied by using coke or coke dust of a sufficiently high S content that the sep. addition of S is unnecessary. Lime, limestone or sand may be added to the mixt. treated and when lime or limestone is used a *hydraulic cement* is obtained as a by-product. ZnO and PbSO_4 pass off as a fume from which values are recovered by condensation or by scrubbing with acid to react with the ZnO selectively. Cf. *C. A.* 22, 2547.

Reduction of zinciferous substances. THE NEW JERSEY ZINC CO. Fr. 639,972, Aug. 24, 1927. Zinciferous material agglomerated with a reducing agent is heated to reduce the Zn compds. and volatilize the Zn, the charge passing progressively through a reducing chamber practically horizontal and exteriorly heated, in such a manner as to avoid any relative motion of the particles of the charge. The charge is supported on a bed of coal dust, or a layer of larger material may be interposed between the charge and the dust. The app. used is described in detail. Cf. *C. A.* 23, 569.

Zinc. JAMES A. SINGMASTER, FRANK G. BREYER and EARL H. BUNCE (to the New Jersey Zinc Co.). Can. 285,005, Nov. 20, 1928. An agglomerated or briquetted charge of zinciferous material and carbonaceous reducing agent is progressively passed through a vertically disposed retort externally heated to a sufficiently high temp. to reduce compds. of Zn and volatilize the resulting metallic zinc without fusing or sintering the charge. The metallic Zn vapor is conducted upward from the retort to a condenser and recovered, and the exhausted charge is drawn off from the bottom of the retort in a pulverulent condition. Cf. C. A. 23, 368.

Prevention of oxidation of metals. GILBERT MICHEL. Swiss 126,864, May 5, 1927. Gaseous sulfurous anhydride is employed to produce a non-oxidizing atm.

Refractory metals. ERNEST A. LEDERER (to The Canadian Westinghouse Co., Ltd.). Can. 284,952, Nov. 20, 1928. Substantially pure refractory metals as W or Mo are produced from the sulfides by pressing into slugs at moderate pressures and heating in a vacuum or in a reducing atm. such as H. The resultant slug consists of pure coherent metal. W produced in this way is entirely free from such impurities as O, C and S and when reduced in a vacuum is also free from H. In this extremely pure condition W is ductile and can be rolled, swaged or drawn into wire.

Concentric nozzle or tuyère devices for introducing crushed or powdered materials into furnaces for producing pig iron. GASTON DE BETHUNE. U. S. 1,693,916, Dec. 4.

Attachment to a crucible for melting metals and alloys. L. Y. POLUNOV and I. A. PETKEVICH. Russ. 4636, Feb. 29, 1928.

Apparatus for making foundry molds. JOHN J. LAWLOR (to New Process Multi-Castings Co.). U. S. 1,695,925, Dec. 18.

Apparatus for foundry molding. EDWARD HARMES (to New Process Multi-Castings Co.). U. S. 1,695,921, Dec. 18.

Permanent metal mold. HARRY D. RINDSBERG (to Harry J. Hater). U. S. 1,696,690, Dec. 25. Structural features.

Wash for protecting metal molds. ARTHUR J. HESS (to Earl Holley). U. S. 1,693,923, Dec. 4. A suspension of graphite and silica in kerosene is mixed with a dil. aq. soln. of Na silicate.

Shrink-head for ingot molds. EMIL GATHMANN. U. S. 1,696,395, Dec. 25. Structural features.

Shrink-head casing for ingot molds. FRED H. CHAPIN (to Bourne-Fuller Co.). U. S. 1,695,797, Dec. 18. Shrink-head casings are formed of a mixt. of cement 1 and slag 4 parts.

Mold for centrifugal pipe casting. JOHN H. UHRIG (to U. S. Iron Pipe and Foundry Co.). U. S. 1,693,703, Dec. 4. Structural features.

Centrifugal pipe-casting apparatus. SOC. D'EXPANSION TECHNIQUE. Brit. 290,671, Mar. 19, 1927. Mech. features.

Centrifugal pipe-casting. JOHN H. UHRIG (to U. S. Cast Iron Pipe & Foundry Co.). U. S. 1,695,514, Dec. 18. Mech. features. An app. is described.

Apparatus for die-casting under pressure. J. POLAK. Brit. 290,936, Jan. 2, 1928. Structural features.

Metallic castings. SIEMENS & HALSKE A.-G. Ger. 466,239, Jan. 16, 1928. Manipulative details.

Casting steel ingots. REINHOLD C. KRAUSE. Fr. 640,163, June 13, 1927. Two sides of the molds for steel ingots are protected against absorption and radiation of heat, whereas the other 2 sides favor radiation and absorption. The cover can slip as a telescopic element on the mold, and its sides are constructed in the same way as the sides of the mold.

Pump for stereotype metal or other molten metal. ISIDOR TORNBORG (to Wood Newspaper Machinery Corp.). U. S. 1,696,656, Dec. 25.

Hardening metals. HEINRICH LINDHORST. Fr. 640,681, Sept. 8, 1927. Metal objects to be hardened are placed in a sealed furnace, preferably rotating, with a powder which completely sublimes, yielding C and CO₂ when heated, these products with the aid of the pressure produced performing the necessary hardening. A suitable powder contains ground coke, BaCO₃ and an NH₃ salt or substance yielding NH₃ when heated.

Hardening metals by nitrogenizing. P. F. M. AUBERT, A. J. P. DUVAL and H. A. M. DUVAL (trading as Aubert et Duval frères). Brit. 290,214, May 10, 1927. In hardening by nitrogenization, portions of articles which are not to be treated are coated with a suitable metal such as Sn or a Sn alloy. A coating of waterglass and powd. Al also may be used. Before nitrogenization, the entire article or the tinned parts may be dipped in a bath of HNO₃ or NaNO₃ heated to about 400°.

Hardening the heads of railway rails. EISENWERK-GES. MAXIMILIANSHÜTTE.

Brit. 290,182, May 5, 1927. The hot rail is straightened and clamped and then the head is immersed in flowing water or water which is agitated.

Material for carburizing or case hardening. FREDERICK C. LANGENBERG (to E. F. Houghton & Co.). U. S. 1,695,337, Dec. 18. Ca acetate or other suitable org., O-contg. salt of a "carburizing oxide" is used together with a salt such as KNO_3 comprising a combination of a "carburizing oxide" and an acid radical contg. both N and O, and with BaCO_3 and charcoal or the like. U. S. 1,695,338 specifies carbonaceous material such as charcoal together with BaCO_3 or other "energizing material" and an org. salt of a metal, e. g., Co acetate or Fe oxalate.

Liquid for carburizing metals. GEORGE W. HEGEL and GERALD R. BROPHY (to General Electric Co.). U. S. 1,696,603, Dec. 25. Bone oil is used with kerosene and oil of mirbane.

Roll for rolling metals. FRANCIS D. CORBIN (three-eighths to Llanelly Foundry & Engineering Co., Ltd. and one-third to Richard Nevill & Co., Ltd.). U. S. 1,694,251, Dec. 4. Rolls are made with a case-hardened portion of hard structure and the remaining portion of a soft perlite or similar structure; both structures are obtained by the same slow rate of cooling from high temps. Cf. C. A. 22, 2735.

Rolling brass, etc. SUNDWIGER EISENHÜTTE MASCHINENBAU A.-G. Brit. 289,812, May 2, 1927. In hot rolling brass or other metals, a large reduction at one heat is obtained by utilizing one pass through rolls with a slow surface speed and sufficient friction to draw in the metal. An app. and various mech. details are described.

Refining aluminum or its alloys. ELEKTRIZITÄTWERK LONZA. Swiss 126,014, Jan. 28, 1927. The metal is brought into intimate contact with Al_2O_3 , e. g., by adding Al_2O_3 to the fused electrolyte from which the metal is prep'd. or to the fused metal to be alloyed.

Refining magnesium and its alloys. GUSTAV PISTOR (to I. G. Farbenind. A.-G.) Can. 384,768, Nov. 13, 1928. Mg and its alloys contg. at least 85% Mg is melted and has stirred therein MgCl_2 and a substance adapted to act as a thickening medium (MgO , CaF_2) on MgCl_2 ; Ca metal and MnCl_2 are introduced into the molten metal and the temp. is raised to 900° , the treatment being continued until the refined metal contains 0.1% of Ca at most, and up to 0.4% of Mn.

Recovery of tin. LUIGI UGHETTI LA CORSA. Fr. 640,205, Aug. 23, 1927. In the recovery of Sn from waste such as residues of tinned sheet Fe by the action of a soln. of a ferric or stannic salt with the production of ferrous or stannous salts, the ferric or stannic salt is continually reproduced by the addn. of the anion of the salt used. Thus if FeCl_3 or SnCl_4 is used, Cl is bubbled through the liquid or liquid Cl is added.

Apparatus for galvanizing iron by the lead-zinc process. RUDOLF PASSEKER Ger. 467,471, Sept. 13, 1925. Constructional details.

Platinum and other metals. ÉTABLISSEMENTS MÉTALLURGIE DE VIENNE (ISÈRE) and GEORGES A. L. R. COLLARD. Fr. 640,110, Feb. 4, 1927. In the usual treatment of goldsmith's ash with Pb, about 1% of Cu with respect to the Pb is added, whereby during cooling 2 distinct masses are obtained, one of which contains Au and Ag mixed with Pb and a small proportion of Cu, the other, which lies as a paste on top, all the Pb, most of the Cu and some Au and Ag. The mass contg. the Pt is cupelled with Pb to eliminate Cu.

Wiredrawing tungsten. LA RADIOTECHNIQUE. Fr. 640,525, Feb. 17, 1927. Rods or bars of W are made ductile for wiredrawing by immersion in a bath of molten salt in which a chem. action takes place so as to heat the metal to 1300 – 1400° , or in a bath of molten metal to 400 – 500° , or first into the metal bath and then into the salt bath, which may be an alkali nitrite.

Feeding device for metallurgical furnaces, particularly rotary furnaces. FRIED. KRUPP GRUSONWERKE A.-G. Ger. 466,134, Dec. 11, 1925. Constructional details.

Furnace for treating ores with heated gases. FRANCIS M. SIMONDS. U. S. 1,693,702, Dec. 4. The furnace hearth is formed in sections, each of which comprises a floor and a perforate confining wall at one end forming an angle with the floor.

Continuous furnace for heating metal blanks. CHARLES E. LEHR (to Bethlehem Steel Co.). U. S. 1,696,805, Dec. 25. Structural features.

Continuous furnace for heating metal articles. JOHN B. TYTUS (to American Rolling Mill Co.). U. S. 1,696,822, Dec. 25.

Inclined chamber apparatus for heat treatment of metal articles. LESLIE E. HOWARD (to Simonds Saw and Steel Co.). U. S. 1,696,801, Dec. 25.

Furnace for annealing cast-iron pipes. U. S. CAST IRON PIPE & FOUNDRY CO. Brit. 290,365, Feb. 12, 1927.

Furnace and conveying apparatus for annealing cast-iron pipes. JOHN H. UHRIG

(to U. S. Cast Iron Pipe & Foundry Co.). U. S. 1,695,515, Dec. 18. Structural features.

Packing for closing plugs of smelting furnaces. WERNER HANDELSGES. Ger. 466,236, Dec. 8, 1927. Graphite 4, kaolin 1, coke dust 1 and shredded flax 1 part are beaten to a stiff paste with undild. sulfite lye of molasses.

Blast-furnace practice. AUGUSTIN G. A. CHARPY and LÉON F. G. J. BRUN. Fr. 640,400, Feb. 14, 1927. A material having a content of Fe and Si suitable for addn. to blast furnaces working on calcareous ores is made by heating the dust from blast furnaces with a suitable proportion of siliceous material either to fritting or fusion point.

Gas-vent for blast furnaces. ALBERT DAUB. Ger. 468,760, Jan. 25, 1927.

Tuyère construction for blast furnaces. GUTHOFFENUNGS-ÜTTE OBERHAUSEN A.-G., A. WAGNER and E. POHL. Brit. 290,861, July 22, 1927.

Crucible furnace for melting metals. LUDWIG WEISS. Ger. 466,237, Jan. 21, 1928. The furnace has 2 crucibles connected by a channel passing from the upper part of one to the lower part of the other. The app. is a modification of an earlier construction (Ger. 437,170) which has the 2 crucibles connected by a channel near the bottom.

Crucible furnace for melting type metal. Soc. LE MATIN. Ger. 466,234, July 17, 1926. Constructional details.

Shaft furnace. ALBERT EBERHARD. Ger. 468,782, Dec. 25, 1926. App. for the introduction of gas and air into a shaft furnace is described.

Shaft furnace. GUTHOFFENUNGS-ÜTTE OBERHAUSEN AKTIENGESSELLSCHAFT. Fr. 640,209, Aug. 26, 1927. The blast is introduced in such a way as to have little suction effect on the gas from the hearth of the furnace and not to produce premature combustion of this gas.

Inner lining for shaft furnaces. MATTHIAS FRÄNKEL. Ger. 467,563, April 7, 1925. The lining is built up of superposed sections so constructed and connected that the lining, as it wears out, can be lowered through the shaft while fresh sections are added from above.

Preheating the charge in shaft furnaces. ALEXANDER L. FEILD (to Linde Air Products Co.). U. S. 1,695,953, Dec. 18. In operations such as smelting iron ores, a hot, non-smelting gas comprising O and N with the ratio of O to N less than in atm. air is passed into the furnace above the smelting zone.

Method of and means for spraying water into a shaft furnace. VULCAN-FEUEERUNG A. G. Ger. 466,235, Dec. 17, 1927. To prevent premature evapn., the water is supplied in excess to a nozzle in the tuyère. Alternatively, water in excess may be circulated through a jacket surrounding the tuyère and the spraying nozzle connected to the jacket.

Tier furnace for roasting and calcining ores. GUSTAVE VERNON. Fr. 640,429, Sept. 5, 1927. A drying oven for the ore is placed above the furnace and communicating tubes are placed between the tiers for regular circulation of gas and to avoid the sweeping along of dust.

Tier furnace for roasting ores, etc. VEREIN FÜR CHEMISCHE UND METALLURGISCHE PRODUKTION. Fr. 640,489, Feb. 14, 1927. Means for cooling the rotating scrapers are described.

Metallurgical operations. FRANK G. BREYER and EARL H. BUNCE (to the New Jersey Zinc Co.). Can. 285,006, Nov. 20, 1928. Briquets employed in metallurgical operations are fed directly from the briquetting machine to the furnace without drops or falls, the briquets being heated on their way to the furnace by furnace gases.

Cutting holes in iron by fusion with a blowpipe. H. HENTSCHEL and H. GREGGENSEN. Brit. 290,391, March 2, 1927.

Cleaning iron and steel. J. H. GRAVELL. Brit. 290,458, June 24, 1927. An acid, oil solvent and adhesive and "control agent" are used together, e. g., H_3PO_4 may be used with H_2O or $BuOH$ or both, an adhesive size, starch or gelatin and quinoline, pyridine, Al_2O_3 , CH_3O or thiocyanates.

Rustproofing iron and steel. W. H. COLE. Brit. 289,906, Jan. 1, 1927. Iron or steel is treated with a soln. of phosphates of Al, Zn, Fe and Cr which are used together in soln. in specified proportions and may be assoc. with $(NH_4)_2HPO_4$, Na biborate and $K_2C_2O_7$.

Cleaning and rustproofing steel. JAMES D. KLINGER. U. S. 1,695,430, Dec. 18. A soln. contg. a hydroxycarboxylic acid such as a soln. of citric acid contg. also alc., H_2SO_4 and acetone is used to prepare surfaces for painting.

Reconditioning rusted iron or steel drums. ROBERT C. HEINZMAN. U. S. 1,696,036, Dec. 18. Drums which may have been used for holding alc. or other substances and which are interiorly rusted are treated with an oxalic acid soln. and then treated with Al acetate, which serves to form a rust-resisting waterproof coating.

Steel. FREDERICK C. LANGENBERG and MARCUS A. GROSSMANN. U. S. 1,695,594, Dec. 18. A non-hot-short steel suitable for automobile bodies, fire boxes, etc., contains C less than 0.05% and O less than 0.03% and may contain Cu 0.15–0.60, Mo 0.03–0.25 and Mn over 0.15%.

Steel from iron ore. J. W. HORNSEY. Brit. 290,317, Jan. 5, 1927. Reduction of phosphatic iron ore as described in Brit. 284,040 (C. A. 22, 4101) is conducted so that a sufficient proportion of unreduced Fe oxide remains in the Fe to prevent the P from being released in elemental form during subsequent conversion of the Fe into steel.

Steel from iron ore. J. W. HORNSEY. Brit. 290,318, Jan. 5, 1927. Reduction of iron ore by a process such as is described in Brit. 284,040 (C. A. 22, 4101) is effected so as to produce iron free from S and suitable for steel manuf., by mixing with the ore before reduction a small proportion of flux (such as 5% of lime) which combines with the S. If the ore contains metallic sulfides, burnt lime is added with the coal, or limestone is added to the ore before it enters the preheater.

Steel and steel alloys. F. A. DESILVA and C. G. CARLISLE. Brit. 290,442, May 18, 1927. In producing steel and steel alloys directly from titaniferous ores, the ores are first subjected to magnetic concn. and the concentrate together with reducing material is supplied to an elec. furnace and the temp. of the bath in the furnace during the main portion of the reducing operation is controlled so that it does not exceed 1600° so that the Ti oxide passes at least mainly into the slag. After sepn. of the slag the molten metal is further refined and may be combined with alloying elements such as Cr, Ni, Si, Mn, W, Mo, V or Co.

Heat-treating steel. LEBARON W. KINNEY and GEORGE H. BIERMAN (to White Motor Co.) U. S. 1,695,922, Dec. 18. A compn. for preventing decarbonization during heat treatment comprises kieselguhr, water and borax. This compn. may be used as a coating on steel gears or other articles.

Liquid bath for quenching and tempering tool steel. JOHN F. EDWARDS. U. S. 1,696,297, Dec. 25. An aq. bath is formed with specified proportions of glycerol, sweet spirit of niter, NH_4Cl , ZnSO_4 , NH_4 alum, NaCl and CuSO_4 . Cf. C. A. 22, 377.

Annealing sheets or strips of steel or similar materials. JOHN B. TYTUS (to American Rolling Mill Co.). U. S. 1,693,800, Dec. 4. The pieces of material are rolled with excess length at the ends to allow for removal of end irregularities and are temporarily united by their excess end portions for passage through a heating chamber for annealing. After annealing the original pieces are severed from each other and cut to exact desired length.

Alloy. JOHN W. HORNSEY (to The Granular Iron Co.). Can. 284,058, Oct. 16, 1928. Granular Fe ore is heated to approx. the temp. of reduction, granular or pulverized coal is introduced to reduce the metal, and the material is cooled below the temp. of reoxidation. During the heating, the reduction and the cooling, air is excluded with the exception of such air as is required for heating, this air being under control. After cooling the metal is sepd. from the gang by magnetic or other sepn. The solid Fe produced is used as an alloying ingredient or as a base. It produces steel of high grade (attributable to the fact that there is no ferrite-dissolved nitride or because there is no occluded O or N or perhaps a combination of both factors).

Alloy. HANS G. A. VON KANTZOW. Can. 284,524, Nov. 6, 1928. A fire-resistant alloy with high elec. resistance contains as principal constituents Fe with Al 1–5%, Co 1–6% or Al 1–5%, Cr 5–22% and Co 1–4%. The addition of Co alone or together with Ti to alloys of this type, especially those contg. Cr, increases the fire resistance by several hundred percent and the elec. considerably, for instance by about 20% or more.

Alloys. F. B. COYLE (to International Nickel Co.). Brit. 290,267, May 13, 1927. White or mottled cast iron has added to it, after tapping it from the furnace, Al, Si, Ni or Mn, to induce the formation of graphite and produce a gray cast iron of high tensile strength. Al 0.5% or Si 0.75% or Si 0.25% or Ni 1.25% may be added, with an addn. in each case, of Mn about 0.5%.

Alloys. JEAN ECABERT, XAVIER ECABERT and PAUL DE STEINHEIL. Fr. 640,503, Feb. 16, 1927. An alloy of low coeff. of friction, particularly for motor cylinders, contains Zn 80–87, Cu 7–11, Al 2–3, Ni 0.5–2, Fe 0.2–3%, the total of Ni and Fe not exceeding 3.5%. Fr. 640,504 describes an alloy with similar properties, preferably contg. Zn 86–88, Cu 3–6, Al 5–7, Sn 4–6, Pb 1–2%. If more than 5% of Pb is used Ni is also added.

Alloys. I. G. FARBERIND. A.-G. Fr. 640,596, June 18, 1927. Alloys resistant to chem. agents, particularly HCl, contain up to 78% of Ag, and up to 22 of Al or Mn or 22 of a mixt. of these 2 metals. Zn, Sn, Mg, As, Sb or Si may also be added. Alloys

are also described contg. up to 70% Ag and up to 30, preferably 10-20, of Ti; about $\frac{1}{2}$ the Ti may be replaced by Al.

Low-carbon alloys. A. P. VOLKOV. Russ. 4628, Feb. 29, 1928. In the production of low-C alloys, particularly cast iron, in a cupola furnace, air or O is blown through the molten metal by a special arrangement.

Alloys resistant to corrosion. J. T. HAY. Brit. 290,487, Sept. 5, 1927. Fe alloys contain also Cu 0.2-0.5, up to about 0.2 of Mo and less than 0.2% of C and the total content of C, Mn, Si, S and P does not exceed 0.25%.
